## IMPROVING OUTCOMES FOR LONG-TERM CARE RESIDENTS WITH DEMENTIA: AN EVIDENCE-BASED REVIEW

W.L. Anderson<sup>2</sup>, S. Zimmerman<sup>1</sup>, P.D. Sloane<sup>1</sup>, S. Brode<sup>1</sup>, L.J. Lux<sup>2</sup>, A.S. Beeber<sup>1</sup>, L. Watson<sup>1</sup>, D. Jonas<sup>1</sup>, *1. Univ North Carolina Chapel Hill, Chapel Hill, North Carolina, 2. RTI International, Research Triangle Park, North Carolina*

While long-term care settings for persons with dementia differ in their characteristics, structures and processes, there is no evidence-based guidance as to which settings best meet residents' needs. This evidence-based review compared nursing homes and other residential settings for people with dementia. An exhaustive search of 7 databases from 1990-2011 identified 13 studies meeting review criteria. Overall, we found low or insufficient evidence regarding the effect of organizational characteristics, structures, and processes of care on health and psychosocial outcomes for people with dementia, and no evidence on informal caregivers' outcomes. There is moderate evidence that pleasant sensory stimulation reduces agitation and limited evidence that protocols for individualized care and to improve function relate to better outcomes. Also, while data are insufficient, they do not indicate a difference between nursing homes and residential care/assisted living except when medical care is indicated. Additional research is needed to help inform decisionmaking.

## SESSION 865 (SYMPOSIUM)

### MISSING DATA IN AGING RESEARCH: CHALLENGES, INNOVATIONS, AND BEST PRACTICES

Chair: *M. Shardell, University of Maryland School of Medicine, Baltimore, Maryland*

Discussant: *K. Bandeen-Roche, Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland*

Missing data is a common problem in aging research. Researchers are concerned that selection bias due to missing data from the sickest, most disabled participants may produce results not generalizable to the study population. Although numerous statistical methods have been developed to address missing data, not all methods are readily able to handle or leverage the nuanced design features of aging research without some adaptations. In this symposium, we present missing-data problems that are particularly relevant to aging research, and we propose both analytic and design-based solutions to help reduce bias. First, Dr.

Qian-Li Xue will provide an overview of missing data concepts including types of missing data and general guidelines for good practice. Dr. Scott Brown will then present a literature review describing current gerontological practice with missing data. Third, Dr. Rich Jones will illustrate the impact of item missingness in summed measurement scales on group- and individual-level inference. Fourth, Dr. Michelle Shardell will propose statistical methods for missing self-report data that leverage reports from proxy respondents such as relatives or care givers. Lastly, Dr. Donald Royall will illustrate planned missingness as a strategy to reduce costs, reduce assessment burden, and expand assessment opportunities in longitudinal studies. The objectives of this symposium are to provide session participants with 1) a working knowledge of missing-data concepts and challenges, and 2) analytic and design-based solutions to challenging missing-data problems that are commonly encountered in aging research.

### OVERVIEW OF KEY CONCEPTS OF MISSING DATA ISSUES IN GERONTOLOGICAL RESEARCH

Q. Xue, *1. Johns Hopkins School of Medicine, Baltimore, Maryland, 2. Johns Hopkins Center on Aging and Health, Baltimore, Maryland*

In studies of old adults, missing data are the norm rather than the exception. Analyses that exclude incomplete observations lose precision when the proportion of incomplete cases is large, and they may also yield biased inferences if the complete cases are not representative of the original cases. Therefore, proper handling of missing data is critical for valid inference. Although statistical tools for treating missing data are becoming widely available, application of these methods without a clear understanding of model assumptions and limitations will run the risk of deriving misleading conclusions. Using real data examples, this talk aims to (1) define different types of missing data in both observational (e.g., participant refusal) and experimental settings (e.g., non-compliance), (2) describe modern analytic approaches to handle different types of missing data, with particular focus on results interpretation, and (3) present general guidelines for good practice with missing data.

### MISSING DATA: EMERGENT ISSUES IN THE JOURNALS OF GERONTOLOGY: SOCIAL SCIENCES 2001-2010

J. Brown<sup>1</sup>, S.M. Lynch<sup>2</sup>, A. Bardo<sup>1</sup>, *1. Sociology and Gerontology, Miami University, Oxford, Ohio, 2. Princeton University, Princeton, New Jersey*

To detail how gerontologists address missing data in analysis of social surveys and to understand the trends in the field, we examined the last 10 years of publications in the Journals of Gerontology: Social Sciences (2001-2010). First, we note some disturbing trends, such as the incorrect application of listwise deletion as a missing data technique. We also look for patterns regarding how authors address missing data. For example, are more complex missing data techniques utilized if a statistician/methodologist is an author of or acknowledged in a manuscript? Overall, our findings suggest that missing data are a major issue for survey based gerontological research, and that missing data techniques need to be addressed more clearly in published work in gerontology.

### ITEM MISSINGNESS: IMPACT ON PARAMETER ESTIMATION AND INDIVIDUAL INFERENCE

R.N. Jones, *1. Hebrew SeniorLife, Institute for Aging Research, Boston, Massachusetts, 2. Harvard Medical School, Boston, Massachusetts*

Background. Clinicians and data analysts often have different views on the problem of item missingness. Method. A simulation study: Parameters were drawn from a study involving the prediction of clinical depression (CIDI) with the Geriatric Depression Scale (GDS). Data were simulated with varying amounts of missing data under completely random, random, and non-ignorable conditions. Two main outcomes were: (a)

the regression of CIDI on the prorated total GDS score, and (b) the bias in the estimate of a person's level of depressive symptom burden. Results. Population regression parameter estimates were unbiased when the complete sample was used, but biased when only persons with complete data were used. Conversely, even a small amount of randomly missing data was sufficient to bias estimates of individual's depressive symptom burden. Discussion: The impact of item missingness depends on the goals of the analysis. Conclusion: Differing views of clinicians and data analysts are justified.

#### ADDRESSING MISSING DATA USING PROXY REPORTS SUBJECT TO MISCLASSIFICATION

M. Shardell<sup>1</sup>, E.M. Simonsick<sup>2</sup>, G. Hicks<sup>3</sup>, B. Resnick<sup>4</sup>, L. Ferrucci<sup>2</sup>, J. Magaziner<sup>1</sup>, 1. *University of Maryland School of Medicine, Baltimore, Maryland*, 2. *National Institute on Aging, Baltimore, Maryland*, 3. *University of Delaware, Newark, Delaware*, 4. *University of Maryland School of Nursing, Baltimore, Maryland*

In studies of older adults, missing data due to nonresponse most likely occurs among the sickest, most cognitively impaired participants. To reduce selection bias and improve generalizability, researchers often recruit proxy respondents such as relatives or informal care-givers to report on behalf of participants who do not respond for themselves. However, proxy reports may be subject to misclassification error, which can produce biased results if simply substituted for missing participant self-reports in statistical analysis. We propose a statistical method using propensity score stratification that leverages proxy reports' ability to reduce selection bias and adjusts for misclassification bias. Since proxy reports are typically obtained only for participants with missing self-reports, the magnitude of misclassification bias cannot be determined empirically. Thus, we describe use of the proposed method for sensitivity analysis and demonstrate this approach to assess recovery of mobility after hip fracture in the Second Cohort of the Baltimore Hip Studies.

#### PLANNED MISSINGNESS

D.R. Royall, 1. *Psychiatry, UTHSCSA, San Antonio, Texas*, 2. *STVHS GRECC, San Antonio, Texas*

Longitudinal study designs are the sine qua non for investigating aging-related trends. There are now well-established methods for addressing missing data in such studies. Modern missing data methods minimize the problems formerly associated with missing data (e.g., loss of power and biased parameter estimates). "Planned Missingness" takes full advantage of these methods by incorporating them into the very design of longitudinal studies in order to purposefully plan missing data. This discussion will describe two state-of-the-art statistical methodologies for addressing longitudinal data: statistical measurement models and growth curve analysis, and then how the purposeful planning of missing data in these designs can reduce subject burden, improve data quality and statistical power, and manage costs.

### SESSION 870 (SYMPOSIUM)

#### WHAT CAN THE FEDERAL GOVERNMENT DO FOR YOU? UPDATE FROM THE NATIONAL INSTITUTE ON AGING

Chair: *M. Bernard, National Institute on Aging, Bethesda, Maryland*  
Discussant: *R. Hodes, National Institute on Aging, Bethesda, Maryland*  
Discussant: *R. Barr, National Institute on Aging, Bethesda, Maryland*

The National Institute on Aging (NIA) at the National Institutes of Health, Department of Health and Human Services conducts and supports biomedical and behavioral research with a focus on understanding basic processes of aging, improving prevention and treatment of diseases and conditions common in later years, and improving the health of older persons. The NIA also supports the training and career development of scientists focusing on aging research and the development

of research resources. The symposium provides an update on the latest research findings from the NIA, presented by the Institute Director, followed by a brief update on funding mechanisms. An opportunity is provided to meet and consult with representatives from the Office of the Director and extramural staff from the divisions of Extramural Activities, Geriatrics and Clinical Gerontology (GCG), Behavioral and Social Research (BSR), Neuroscience (DN) and Aging Biology (DAB).

### SESSION 875 (PAPER)

#### CARDIOVASCULAR DISEASE AND THE OLDER ADULT: INCIDENTS, PREDICORS AND PROSPECTS

#### ASSOCIATION OF ANDROGEN AND ANDROGEN RECEPTOR LEVELS WITH CORONARY ARTERY DISEASES IN OLD MALES

X. Li, X. Zhang, *First Department of Geriatric Cardiology, Chinese PLA General Hospital, Beijing, China*

Background Association between androgen status and prevalence of coronary artery diseases (CAD) has not been fully understood. The aim of this study is to investigate the correlation of endogenous androgen and androgen receptor (AR) level with CAD in old males. Methods 296 old male patients ( $\geq 60$  years) from different centers were enrolled and divided into the CAD ( $n = 237$ ) and control group ( $n = 59$ ) according to the results of coronary angiography. Serum levels of free testosterone (FT), total testosterone (TT), estradiol (E2), luteotrophic hormone (LH), follicle-stimulating hormone (FSH), sex hormone-binding globulin (SHBG) and dehydroepiandrosterone (DHEA) were measured in all participants. The androgen receptors of peripheral lymphocytes were assessed by flowcytometry. Results The serum level of FT was lower in the CAD group than that in the control group [ $(24.1 \pm 22.2) \times 10^{-9}$  mmol/L vs  $(34.1 \pm 31.8) \times 10^{-9}$  mmol/L,  $P = 0.06$ ]. But two groups showed no statistic differences in the levels of TT, E2, LH, FSH, SHBG, DHEA and lymphocyte AR. The logistic regression analysis showed that the level of FT was negatively correlated with the CAD risk ( $OR = 0.98$ ,  $P = 0.0049$ ) and positively correlated with the peripheral lymphocyte AR level. However age was negatively correlated with the levels of FT and AR. Conclusions Deficiency of endogenous androgen contributes to a high prevalence of CAD in old males. Age-related decreases of FT and AR may impair the physiological functions of androgen to accelerate the progression of coronary atherosclerosis.

#### EXERCISE TREADMILL TEST IN ASSESSING EARLY LESIONS OF THE LOWER EXTREMITY ATHEROSCLEROSIS

X. Li, H. Zhang, *First Department of Geriatric Cardiology, Chinese PLA General Hospital, Beijing, China*

Background Early detection of atherosclerotic lesions in lower extremity is important to patients of high risk for cardiovascular disease. The aim of this study is to assess the value of exercise treadmill testing in diagnosing early atherosclerotic lesions of the lower limb. Methods 173 outpatients with high risk for PAD were enrolled from the cardiology clinic. All patients were subjected to exercise treadmill testing (Bruce's protocol) and ankle-brachial index (ABI) determination, as well as lower limb artery ultrasonography within one week. Using ultrasonic findings as diagnostic criteria, the diagnostic value of exercise treadmill testing for early atherosclerotic lesions of the lower limb were analyzed. Results After exercise, ABI decrement (R value) increased in subjects with high risk for PAD with atherosclerotic lesions of the lower limb aggravating. Using the categories of large atherosclerotic plaques (area  $>20\text{mm}^2$ ), atherosclerotic plaques, and atherosclerotic lesions as positive diagnostic criteria, the area under ROC curve for R values were 0.802 (95%CI, 0.722, 0.882), 0.78 (95%CI, 0.708, 0.852) and 0.599 (95%CI, 0.44, 0.757), respectively. Using the presence of large atherosclerotic plaques in lower extremities as positive

diagnosis, R value was 0.85, with a sensitivity of 70.0%, a specificity of 91.9%, a LR+ of 8.64, and a LR- of 0.33. Conclusions Exercise treadmill testing in combination with ABI determination is a safe, accurate and objective tool for detecting early atherosclerotic lesions of the lower limb. Immediately after exercise, 0.85 is the cut-off R value appropriate for diagnosing large atherosclerotic plaques of the lower limb (area >20mm<sup>2</sup>).

#### **METABOLIC PREDICTORS OF ISCHEMIC HEART DISEASE AND CEREBROVASCULAR ATTACK IN ELDERLY DIABETIC INDIVIDUALS: THE ROLES OF HDL-CHOLESTEROL AND THE LDL-C/HDL-C RATIO**

T. Hayashi<sup>1</sup>, K. Ina<sup>1</sup>, H. Nomura<sup>1</sup>, T. Ohru<sup>2</sup>, K. Yokote<sup>3</sup>, H. Watanabe<sup>4</sup>, *J. Geriatrics, Nagoya University Graduate School of Medicine, Nagoya, Japan, 2. Tohoku University School of Medicine, Sendai, Japan, 3. Chiba University Hospital, Chiba, Japan, 4. Hamamatsu University School of Medicine, Hamamatsu, Japan*

**Objectives:** Dyslipidemia, especially LDL-cholesterol(LDL-C) is a risk factor for ischemic heart disease(IHD) in middle-aged diabetic individuals. However, the factors predicting IHD and cerebrovascular attack(CVA) in older patients are not well known. **Research Design and Methods:** This study was designed as a prospective cohort study(Japan Cholesterol and Diabetes Mellitus Study) with 4,014 type 2 diabetic patients(1,936 women; mean age 67.4±9.5years, median age 70 years, n=1261 <65years, n=1731 from 65 to 74years and n=1016 >75years; disease duration 9.6±8.0years). The levels of lipids, glucose, and other factors like blood pressure, were investigated relative to IHD or CVA by a multivariate Cox hazard model. **Results:** One hundred fifty-three cases of IHD and 104 CVAs(7.8 and 5.7/1000 people per year) occurred over 5.5 years. Lower HDL-cholesterol(HDL-C) and higher LDL-C was correlated with IHD in patients ≥75years(HR:0.629, P<0.01, 1.176, P<0.05), in contrast to higher systolic blood pressure, hemoglobin A1C(HbA1C) and LDL-C in subjects <65years and higher LDL-C/HDL-C in all generations. HDL-C was also correlated with CVA in patients ≥65years(HR:0.612, P<0.01). Kaplan-Meier estimator curves showed that IHD was more frequent in patients <65years in the highest quartile for LDL-C/HDL-C ratio and in patients ≥75years in the lowest quartile for HDL. CVA was most frequent in patients ≥75years in the lowest quartile for HDL-C. **Conclusions:** IHD and CVA in elderly diabetic patients are predicted by HDL-C. LDL-C, HbA1C and systolic blood pressure are risk factors for IHD in non-elderly, and LDL-C/HDL-C may represent the effects of both LDL-C and HDL-C. These differences in risk by age are important for individualized strategy to prevent atherosclerotic diseases.

#### **IMPORTANCE OF HDL CHOLESTEROL LEVELS IN DIABETIC INDIVIDUALS WITH TYPE IIB DYSLIPIDEMIA - 5-YEAR SURVEY OF CARDIOVASCULAR EVENTS-**

K. Ina, T. Hayashi, *Geriatrics, Nagoya University Graduate School of Medicine, Nagoya, Japan*

**Introduction** We investigated the relationship between lipid levels and ischemic heart disease (IHD) and cerebrovascular accident (CVA) in diabetic individuals with type IIB dyslipidemia. **Method** The Japan Cholesterol and Diabetes Mellitus Study is a prospective cohort study of 4,014 type 2 diabetic patients (1,936 women; age 67.4±9.5 years). The primary end points were onset of IHD or CVA. Patients with type IIB dyslipidemia were defined both triglycerides(TG) ≥150 and LDL-cholesterol ≥120mg/dl. 492 subjects showed type IIB dyslipidemia. **Results** IHD and CVA occurred in 4.0% and 2.7% of participants, respectively, over a 5-year period in the whole study. While occurrence of IHD and CVA in participants with type IIB dyslipidemia were 4.5% and 3.3% respectively. Participants with type IIB dyslipidemia showed higher proportions of occurrence of cardiovascular events. 492 participants with type IIB dyslipidemia were divided into those aged <65 years, 65–74years, and <75 years (n=180, 204, and 108, respectively). Lower

HDL cholesterol was significantly associated with the risk of CVA in diabetic individuals with type IIB dyslipidemia aged <65 years over a 5-year period, on the other hand, HDL cholesterol was associated with CVA in diabetic individuals older than 75 years in total patients analyses. **Conclusions** Lower HDL cholesterol was an important risk factor for cardiovascular events in diabetic individuals with type IIB dyslipidemia aged <75 years. Risk factors for diabetic individuals with type IIB dyslipidemia might be change with advancing age.

#### **PROXIMAL UPPER EXTREMITY WEAKNESS: A NOVEL RISK FACTOR FOR INCIDENT HEART FAILURE IN A COMMUNITY-DWELLING OCTOGENARIAN AND OLDER POPULATION: FINDINGS FROM A PROSPECTIVE STUDY**

K. Patel, A. Ahmed, *University of Alabama at Birmingham, Birmingham, Alabama*

**Background:** Little is known about risk factors for incident heart failure (HF) in late life when traditional risk factors may not play important roles. **Methods:** We studied 898 community-dwelling adults, age 80 years and older, free of baseline heart failure (HF) in the Cardiovascular Health Study. Upper extremity weakness was defined as self-reported difficulty with lifting, reaching, or hand gripping. Overall, 283 (32%) patients had upper extremity weakness, of whom 178 had difficulty with lifting, 59 had difficulty with reaching and 141 had difficulty with hand gripping. **Results:** Patients had a mean (±SD) age of 83 (±3) years; 51% were women; and 17% were African American. During 13 years of follow-up, centrally-adjudicated incident HF occurred in 35% and 29% of participants with and without upper extremity weakness. Unadjusted, age-sex-race-adjusted, and multivariable-adjusted associations of upper extremity weakness with incident HF were 1.36 (95% CI, 1.06–1.74; p=0.014), 1.61 (95% CI, 1.24–2.07; p<0.001), and 1.34 (95% CI, 1.01–1.78; p=0.040), respectively. When we categorized upper extremity weakness as proximal (reaching and lifting) and distal (hand gripping), the association was only significant for proximal upper extremity weakness. Similar significant associations were observed with all-cause and cardiovascular mortality but not with non-cardiovascular mortality. **Conclusions:** Among community-dwelling octogenarian and older adults, self-reported proximal upper extremity weakness was associated with increased risk of incident HF and all-cause mortality including cardiovascular mortality.

#### **SESSION 880 (PAPER)**

#### **OLDER ADULT FUNCTION: RISKS IMPAIRMENTS, AND INTERVENTIONS**

#### **THE RISK OF POTENTIALLY AVOIDABLE HOSPITALIZATIONS FOR ELDERLY RESIDENTS IN NURSING HOMES (NHS): ESTIMATES FROM A COMPETING RISK (CR) MODEL**

W.D. Spector<sup>1</sup>, R. Limcangco<sup>2</sup>, C. Williams<sup>3</sup>, W. Rhodes<sup>4</sup>, D.T. Hurd<sup>4</sup>, *J. Agency for Healthcare Research & Quality, HHS, Rockville, Maryland, 2. Social & Scientific Systems, Inc., Silver Spring, Maryland, 3. Abt Associates, Durham, North Carolina, 4. Abt Associates, Cambridge, Massachusetts*

Hospitalizations of long-stay NH residents are common, but as many as 60% have been estimated to be potentially avoidable. No consensus exists for which hospitalizations are deemed “avoidable,” and prevalence estimates vary greatly depending on which measure is chosen. Although individual risk is influenced by variation in clinical, facility, and policy factors, it also depends on the definition of “avoidable.” A quality improvement measure to identify NHs with more than expected hospitalizations is being developed; it is therefore important to understand how different measure specifications affect estimates and which factors are needed for case-mix adjustment. The sample is a cohort of long-term NH residents from 10/1/2006-12/31/2008. Data are from the

NH Stay file (10% facility sample), MDS assessments, OSCAR, and State policy data. We analyze the risk of hospitalizations accounting for the CR of death and unavoidable hospitalizations. Three hospitalization outcomes were compared: All Hospitalizations (ALLH), Ambulatory Care Sensitive Conditions (ACSC) and NH Avoidable Conditions (NHAC). Twenty-seven percent of hospitalizations are identified with ACSC and 56% with NHAC. For all models, having a prior hospitalization (past 90 days), number of prescribed medications, CHF, COPD, receiving oxygen, and diabetes were significant risk factors. Being male, serious infection, renal disease, pressure ulcers, IV medications, and catheter or ostomy were risks only for ALLH and NHAC. Significant facility characteristics and policy variables also differ by outcome definition. The analysis suggests that the ACSC compared to the NHAC would miss important avoidable hospitalizations, as well as important risk adjustments.

### **THE FINGER RUB TEST: IS IT VALID FOR SCREENING FOR HEARING LOSS?**

M.I. Wallhagen, W.J. Strawbridge, *Physiological Nursing, University of California, San Francisco, San Francisco, California*

Hearing loss (HL) is common in older adults yet screening rates are low. Use of audiometers in primary care settings can be expensive. A simple, quick (2 minutes) alternative is a standardized finger rub test. Practitioners stand behind patients who have their eyes closed, hold their arms to the sides of the individual's ears with arms either extended (70 centimeters) or with elbows bent (35 centimeters), and rub their fingers together. Both strong and faint finger rubs have been recommended. Yet despite its ease of use, minimal data are available comparing the results of the finger rub test with results of audiometric testing in ambulatory persons. We conducted the finger rub test on 40 older ( $\geq 60$ ) individuals (80 ears) for whom full audiograms were available. 62% were female, 35% were minorities. Hearing loss was defined as a high frequency pure tone average (at 1,000, 2,000, and 4,000 Hz) over 25 dB. Sensitivity of the strong finger rub at 70 centimeters was 95%; specificity and positive predictive value were 100%. At 35 centimeters sensitivity dropped to 81% while the other two values stayed high. Results for the faint finger rub at 70 and 35 centimeters were comparable for sensitivity and positive predictive value but much lower for specificity (53% & 77% respectively). Using the strong 70 centimeter parameters, this simple yet effective screening test could improve identification and referral of older primary care patients with hearing loss.

### **ASSESSING ADJUSTMENT TO AGING: A CROSS-VALIDATION STUDY FOR ADJUSTMENT TO AGING SCALE (ATAS-33)**

S. von Humboldt, I. Leal, *Research Unit in Psychology and Health, I&D, ISPA – Instituto Universitário, Lisbon, Lisbon, Portugal*

Aims: Adjustment to aging (AtA) is a multifactor adjustment process with implications on quality of life and well-being of aging adults. This study aims to develop and validate a scale to assess the factors that older adults recognized as determinant for their AtA, adding a cross-cultural comparative perspective towards aging well. Methods: Measures were completed, including demographics and the proposed original set of 127 items. Complete data was available for 709 older adults aged between 74-102 years ( $M=82.4$   $SD=6.45$ ). Factor exploratory and confirmatory factor analyses were run for dimension reduction and for exploring the factorial structure. Results: The 33-items AtA 8-factor scale showed overall good psychometric properties (in terms of factorial, convergent, discriminant and criterion validity, as well as reliability and sensitivity). The sampling adequacy was confirmed ( $KMO=0.789$ ) and the total variance explained by this eight-factor structure was 74.55%. Eight factors resulted from ATAS-33: (a) Accomplishment, creativity and challenges; (b) body and health; (c) stability and comfort; (d) interpersonal attachment and intimacy; (e) autonomy, mobility and safety; (f) spirituality, existential and personal beliefs; (g) zest and humour; and (h)

simplification and relaxation. All factorial weights were statistically significant ( $p<.05$ ). Conclusions: We present a valid and reliable 33-items/eight factor scale for estimation of AtA in a multicultural elderly population. Results emphasize that communication approaches in clinical practice and program development may benefit from clearly understanding AtA as an important component for reducing health disparities and for aging well, across cultures. Key Words: Adjustment to aging, aging well, older adults, scale, validation.

### **DOES COGNITIVE AND PHYSICAL FUNCTION INFLUENCE OLDER ADULTS PAIN MANAGEMENT? THE MOBILIZE BOSTON STUDY**

C.L. Stewart<sup>1</sup>, S.G. Leveille<sup>2,3</sup>, P. Schofield<sup>4</sup>, *1. Centre of Academic Primary Care, University of Aberdeen, Aberdeen, United Kingdom, 2. College of Nursing & Health Sciences, University of Massachusetts, Boston, Massachusetts, 3. Division of General Medicine & Primary Care, Beth Israel Deaconess Medical Center, Harvard Medical, Boston, Massachusetts, 4. School of Health & Social Care, University of Greenwich, London, United Kingdom*

The influences of cognitive and physical function upon older adults' pain management remains under-researched. This study explored associations between cognitive and physical limitations and use of pain management approaches by older adults with persistent pain. We studied 599 persons aged  $\geq 70$  in the population-based MOBILIZE Boston Study who reported persistent pain (Brief Pain Inventory severity subscale) at baseline. Limited physical function was defined as SPPB score  $<9$  or self-reported difficulty in ADL. Reduced cognitive function was defined as Mini-mental State Examination (MMSE) score  $<24$  or Trail Making Test A and B (TMT) decrement score  $>127.5$  seconds. Average age of participants was 77.8y, two-thirds were female and 77% were white. Regardless of function, use of pain management approaches was consistently associated with pain severity ( $p<.001$ ). Those with limited physical function (SPPB or ADL) combined with moderate to severe pain were more likely to use analgesics (SPPB,  $OR=5.7$ , 95% CI 2.5, 12.9), specifically opioid analgesics (SPPB,  $OR=18.4$ , 95% CI 5.4, 62.6), compared to those without limited function who had mild pain. Those with lower MMSE scores ( $<24$ ) and more severe pain were also more likely to use analgesics ( $OR=5.7$ , 95% CI 2.3, 13.9) and specifically, opioid analgesics ( $OR=12.3$ , 95% CI 4.3, 35.5). Few differences were observed using TMT scores. Functional associations with specific non-pharmacologic modalities varied widely. In general, function was more strongly associated with pharmacologic pain management than non-pharmacologic. Further research is needed to understand reasons behind pain management choices. Clinicians should consider possible influences of functional status when recommending pain management.

### **HIP IMPAIRMENTS AND FUNCTION IN OLDER ADULTS WITH CHRONIC LOW BACK PAIN: THE DELAWARE SPINE STUDIES**

G. Hicks, M. Sions, T. Velasco, *Physical Therapy, Univ Delaware, Baltimore, Maryland*

Background: Rehabilitation professionals have often cited a relationship between hip dysfunction and chronic low back pain (CLBP). Whether clinical hip impairments are more common and associated with greater functional limitations among older adults with chronic LBP is unknown. Methods: Participants in this comparative study included 86 community-dwelling older adults ( $>65$ ) with a primary complaint of CLBP and an age/gender matched group without LBP. CLBP was characterized as pain of at least moderate intensity on most days for the past three months. Clinical hip impairments included hip joint pain, morning stiffness and pain with hip internal rotation (IR). Function was assessed with the Oswestry LBP-Disability Questionnaire (ODQ) and the Medical Outcomes Short Form 36 (SF-36). Results: Hip joint pain, morning stiffness and pain with IR were more common among older adults with CLBP ( $p<.05$ ). Presence of at least one clinical hip

symptom was associated with a 7-fold greater odds of having CLBP [OR (95% CI): 7.15 (2.30-22.21)]. Participants with CLBP and co-existing hip impairments had greater pain severity (4.2 +/- 2.4 vs. 2.8 +/- 1.7,  $p=.01$ ) and worse ODQ scores (39.6 +/- 11.3 vs. 29.6 +/- 11.7,  $p=.03$ ) than individuals with LBP only. Among older adults with CLBP, presence of hip symptoms was associated with greater deficits in social function and role limitations due to both physical and emotional problems as measured by the SF-36 ( $p<.006$ ). Conclusions: Clinical hip impairments are more prevalent among older adults with CLBP and are associated with greater functional limitations and participation restrictions.

## SESSION 885 (SYMPOSIUM)

### CHARTING NEW FRONTIERS IN LONG-TERM CARE: EXPLORING ALTERNATIVES TO INSTITUTIONALIZATION

Chair: *K.S. Thomas, Brown University, Providence, Rhode Island*

The national move from an over-reliance on nursing home care to more home and community-based care has taken hold in recent years. Most states have developed nursing home transition programs to help older adults return to the community and many states are committed to helping older adults avoid unwanted nursing home placement altogether. Presenters in this symposium will discuss state variation in home and community-based services (HCBS) expenditures, differential outcomes of HCBS and institutional care, transitions out of institutions, and the effect of using home care services on the costs of institutional care. Specifically, one presenter will discuss the relationships among states' Older Americans Act expenditures, Medicaid investments in HCBS, and prevalence of low-care nursing home residents over a 10-year period. The second presenter will discuss the variation in the rates of potentially preventable hospitalization in HCBS and institutional care using Medicaid data from five states. Another speaker will identify and compare predictors of community discharge among nursing home residents enrolled in a Social HMO in Southern California, with implications for targeting strategies. Because limited evidence exists on whether home care expenditures substitute for institutional long-term care expenditures, the final presentation will estimate the causal effect of home care services on the costs of institutional medical care using Medicaid claims data from the Cash & Counseling Demonstration and Evaluation program in Arkansas, New Jersey, and Florida.

### THE RELATIONSHIP BETWEEN OLDER AMERICANS ACT TITLE III STATE EXPENDITURES AND PREVALENCE OF LOW-CARE NURSING HOME RESIDENTS

*K.S. Thomas, V. Mor, Brown University, Providence, Rhode Island*

Previous studies have suggested that anywhere from 5- 30% of nursing home (NH) residents have low-care needs and could perhaps be better served in the community. Using data for years 2000-2009 from the Older Americans Act (OAA) State Program Reports and NH facility-level data (including characteristics of the facility, the market, residents, and state policies) we examined the relationship between state investment on OAA Title III services and prevalence of low-care NH residents. Controlling for Medicaid HCBS spending, facility characteristics, and market characteristics, results from a two-way fixed effects model suggest that every additional \$10 a state spends per older adult on home-delivered meals is associated with a decrease in the low-care NH population of .3 percentage points. These findings highlight the

need for states to invest in OAA services, specifically home-delivered meals, in an effort to reduce the prevalence of low-care residents in NHs.

### POTENTIALLY PREVENTABLE HOSPITALIZATIONS AMONG ELDERLY MEDICAID LONG-TERM CARE USERS

*A. Wysocki, R. Kane, University of Minnesota, Minneapolis, Minnesota*

Elderly long-term care (LTC) users are at high risk for hospitalization. Some of these hospitalizations may be unnecessary if they result from conditions that could be prevented and/or managed in an individual's current setting. Given the substantial investment in HCBS, it is important to understand how those receiving HCBS compare to nursing home residents in terms of potentially preventable hospitalizations. This research compares the risk for a potentially preventable hospitalization between elderly Medicaid HCBS users and nursing home residents using person-quarter Medicaid and Medicare data from seven states from 2003-2005. An instrumental variables approach was used to control for the potential endogeneity of an individual's type of LTC use. HCBS users were found to have an increased risk compared to nursing home residents for both a potentially preventable and a non-potentially preventable hospitalization. These results suggest a need for more proactive integration of medical and LTC among HCBS users.

### COMMUNITY TRANSITIONS: PATTERNS & PREDICTORS OF NURSING HOME DISCHARGE FOR SHORT- AND LONG-STAYS

*A. Rahman, Z.D. Gassoumis, K. Fike, S. Enguidanos, K. Wilber, Davis School of Gerontology, USC, Los Angeles, California*

Discharge patterns for residents aged 65+ were examined using Minimum Data Set assessments from January 2001 to December 2003 for all members enrolled in a Social HMO in Southern California in 2000 and a propensity-matched Medicare sample. Time-to-discharge was examined for 3,762 episodes of care using Kaplan-Meier survival estimates, and logistic regression identified predictors of community discharge. Half of all new admission episodes ended in community discharge within one year. Of these discharges, 90% occurred within the first 90 days; only 10% occurred after 90 days. Only two resident characteristics predicted community discharge after 90 days: cancer (OR=0.38,  $p=.04$ ) and severe cognitive impairment (OR=0.44,  $p=.02$ ) both decreased the odds of discharge. Findings underscore the challenge of targeting transition program support to residents who are both capable of residing in the community and who will not otherwise discharge to the community on their own.

### THE CAUSAL EFFECT OF HOME CARE USE ON INSTITUTIONAL CARE EXPENDITURES

*J. Guo, Health Studies, The University of Chicago, Chicago, Illinois*

Using Medicaid claims data from the Cash & Counseling Demonstration and Evaluation program in Arkansas, New Jersey, and Florida (N=5555), this study empirically estimated the effect of using home care services on the costs of nursing facilities, inpatient medical care, and total institutional care while controlling for selection bias using an instrumental variables approach. The results suggest that using home care services significantly decreased expenditures on institutional medical care. A 10 percent increase in home care expenditures lowers annual Medicaid institutional expenditures by \$64 across the full sample, \$56 of which is a reduction in nursing facility expenditures. Neglecting to address endogeneity would have led to a conclusion of a net complement of home care to inpatient care, whereas controlling for the endogeneity of home care reveals the opposite. Therefore, receiving home care services appears to help avoid institutional medical care, which usually generates much higher costs.

## SESSION 890 (SYMPOSIUM)

### CONNECTING THE MICRO, MACRO AND MEZZO SYSTEMS FOR TRANSPORTATION AND HEALTH

Chair: C. Irmiter, American Medical Association, Chicago, Illinois

Discussant: R. Golden, Rush University, Chicago, Illinois

Healthcare providers are challenged to deliver quality care to older patients with multiple, chronic physical conditions, functional and mental impairments. At the same time, older patients are facing their diminishing health and well-being in a fragmented healthcare system, with a shortage of physicians and an increasing demand to improve their self care with limited help from the system. One problem for older patients that falls below the radar is how transportation impacts access to healthcare services. This symposium examines the research, practice and policy that is emphasizing the critical link between non-emergency medical transportation access and health care for older patients. Presenters will highlight the importance of national policy efforts to address older driver safety and mobility, of key research findings that describe and infer the use/cost of non-emergency medical transportation options for older patients of effective educational programs for healthcare professionals to assess, treat, and counsel older drivers

### POLICY RATIONALE FOR ADDRESSING OLDER DRIVER SAFETY AND MOBILITY BY PHYSICIANS

E. Wagner, National Highway Traffic Safety Administration, US Department of Transportation, Washington, District of Columbia

With each passing year, safe mobility for an aging population becomes increasingly important. Engaging the people who are likely to be able to influence older drivers' behavior is a key strategy in the National Highway Traffic Safety Administration's (NHTSA's) approach to ensure safety and mobility of older people. Educational materials are tailored to the different audiences and to the ways that they can influence driver behavior. For example, because older people are likely to listen to their physicians and other clinicians, it is critical that clinicians understand why they should and how they can address driving safety with patients and caregivers. Clinicians must also have resources and access to educational content that supports the guidance they provide. After attending this activity, participants will be able to discuss the rationale for addressing older driver safety in clinical visits. Participants will also be able to identify key resources on older driver safety.

### ASSESSING, TREATING, AND COUNSELING OLDER ADULTS ABOUT DRIVING AND TRANSPORTATION OPTIONS

C. Irmiter<sup>1,3</sup>, J. Schwartzberg<sup>1</sup>, L.D. Manning<sup>1</sup>, K. Peters<sup>2</sup>, 1. American Medical Association, Chicago, Illinois, 2. University of Illinois, Chicago, Illinois, 3. Loyola University, Chicago, Illinois

Clinicians lack knowledge and/or training of how and when to approach fitness-to-drive, and are even less knowledgeable about transportation options. To improve this, AMA developed a web-based curriculum educating medical residents/students, physicians, and healthcare providers in the evaluation and management of driving fitness concerns in the routine care of older patients. Six sites across the country were evaluated to understand what knowledge, skills, and abilities were gained from the curriculum. Pre and post surveys from 149 resident/fellows, 56 physicians, 26 non-physician health care professionals, and 20 medical students were analyzed using ANOVA and t-tests. Overall, 88% learned new strategies/ tools to use in practice, and there was a 70% (p<.0001) difference in change from pre to post test for all regarding familiarity with driving rehabilitation options available to patients. Moreover, there were statistically significant differences between groups for all other responses regarding attitudes, knowledge, and skills.

### NON-EMERGENCY TRANSPORTATION: PATTERNS OF USE AND MODELS FOR ACCESS

T. Prohaska<sup>1</sup>, A. Eisenstein<sup>1</sup>, K.L. Hoggard<sup>2</sup>, 1. Center for Research on Health and Aging, University of Illinois Chicago, Chicago, Illinois, 2. Logisticare Solutions, LLC, Atlanta, Georgia

Availability of non-emergency medical transportation (NEMT) services is critical to maintaining health and independence among older adults in the community. While Medicaid funded NEMT is available for older adults in over 40 states, underutilization remains an issue. This study report demographic and health characteristics among older (age 65+) NEMT users as well as use and cost for NEMT in two states (Delaware, n=2,467, Oklahoma, n= 6,804). A total of 54,164 NEMT trips were taken by older adults in Delaware in 2010 (93,826 Oklahoma). The majority of older NEMT trips were ambulatory users followed those needing wheelchair and stretcher assistance (58%, 33%, 8.8% Delaware, 67%, 32%, .01% Oklahoma, respectively). Two legged round trips were the most commonly requested NEMT service. These findings are applied to education and screening strategies to promote access to NEMT through medical care settings as point of entry.

## SESSION 895 (SYMPOSIUM)

### EXPLORING NEW RESEARCH TO BETTER SUPPORT FAMILY CAREGIVERS IN POLICY AND PRACTICE

Chair: S.C. Reinhard, AARP Public Policy Institute, Washington, District of Columbia

Discussant: S.H. Zarit, The Pennsylvania State University, State College, Pennsylvania

Families are the most important source of support to older adults. Increasingly, family caregivers monitor chronic and sometimes acute health conditions as well as provide long-term services and supports (LTSS) at home. These family members, who are often unprepared for carrying out these tasks, provide assistance in areas that once were provided by trained health professionals. Family caregiving in the rapidly changing systems of health care and long-term services and supports (LTSS) can have a significant impact on the family members who provide care. A key concern is that the continued reliance on family caregivers, without better recognition of and attention to their own support needs, could negatively affect the ability of family caregivers to provide care in the future. Ignoring family needs can increase strain and health risks that can impede a caregivers's ability to provide care, prevent unnecessary hospitalizations, and prevent or delay nursing home care. This symposium explores new frontiers in caregiving research sponsored by the AARP Public Policy Institute. Presenters will highlight the national economic value of caregiving, present results from research identifying the health care tasks that family caregivers perform, describe the extent to which states assess family caregiver needs within Medicaid home and community-based services waiver programs, and review the findings from a pilot program designed to improve the knowledge and skills of informal family caregivers for beneficiaries enrolled in waiver programs. Implications for health care and social service professionals to better recognize and support families as partners in care will be addressed.

### WHAT ARE THE HEALTH-RELATED TASKS THAT CAREGIVERS DO?

C. Levine, United Hospital Fund, New York, New York

Family caregivers are increasingly carrying out health-related tasks with little training or preparation. In December 2011, a national survey of 1,679 family caregivers was conducted to determine whether they performed health-related tasks such as wound care and medication management and administration, the type of health tasks that they performed, their difficulties in this area, and their level of stress. Of the total sample, almost half (50%) of the caregivers were performing some type of medical/nursing task, and about one-third were also assisting with ADLs

and IADLs, as well as medical/nursing tasks. This is the first national survey about this neglected area of caregiving research. This presentation will review the key findings, including detailed descriptions of the health-related tasks. The findings suggest that the conventional ADL/IADL framework for measuring caregiver responsibilities is inadequate to capture caregiver responsibilities in the current health care system. Recommendations for policy and practice will be offered.

#### **FAMILY CAREGIVING IN AN AGING AMERICA: THE NEW NORMAL**

L. Feinberg, S.C. Reinhard, R. Choula, *AARP Public Policy Institute, Washington, Maryland*

The challenges and pressures of family caregiving for older relatives or friends are a reality of daily life today. Although family caregivers are the backbone of our health and long-term services and supports (LTSS) systems, the significance of their role, and their own care-related strain and compromised health are often overlooked. This presentation examines, from an historical perspective, why family care matters to older people and to the nation's health care and LTSS systems. It discusses the "new normal" of family caregiving today for an aging relative or friend, and presents data on the economic value of the unpaid contributions of family caregivers in the U.S. The presentation also summarizes research about the impact of family care on caregivers themselves. Areas in which public policies can respond to the needs of family caregivers are highlighted.

#### **ASSESSING FAMILY CAREGIVER NEEDS IN MEDICAID HOME AND COMMUNITY-BASED SERVICES (HCBS) WAIVER PROGRAMS: THE NEXT FRONTIER**

K. Kelly, S. Coffey, *Family Caregiver Alliance, San Francisco, California*

Home and Community Based Services (HCBS) provided through Medicaid waivers, enable older and disabled adults to remain in their homes and can support family caregivers. The assessment process for HCBS is also a key opportunity to assess the caregiving situation, especially the needs, resources and strengths of the family caregiver. Where appropriate, the results of an assessment can be used to connect caregivers with supportive services. This presentation will present preliminary findings from a 50-state survey examining the state of the states in assessing caregiver needs within Medicaid HCBS Aged and Aged/Disabled waiver programs. The process for conducting a caregiver assessment in Medicaid waiver programs, the types of questions included to assess caregiver needs, and how the information collected is used to support family caregivers will be highlighted. Implications for policy and practice will be discussed.

#### **NEW JERSEY CARE PARTNER SUPPORT PILOT PROGRAM: PROGRAM AND PROCESS EVALUATION**

A.M. Tripp<sup>1</sup>, C.H. Woodcock<sup>2</sup>, *1. The Hilltop Institute, Baltimore, Maryland, 2. IMPAQ International, LLC, Columbia, Maryland*

The New Jersey Care Partner Support Pilot Program was designed to improve the knowledge and skills of family caregivers caring for older adults enrolled in New Jersey's Medicaid Global Options home and community-based services waiver and the Jersey Assistance to Community Caregivers program. The Hilltop Institute completed an assessment of the pilot program. Hilltop will describe the pilot program, including the process for developing and administering the caregiver assessment instrument. They will compare profiles of the caregivers at time of initial assessment and at three-month follow-up. Outcomes will be reviewed related to caregiving activities, available support systems, caregiver burden and other measures used in the assessment. The session will conclude with a discussion of implications for implementing caregiver support programs on a larger scale.

## **SESSION 900 (SYMPOSIUM)**

### **MULTIPLE PERSPECTIVES ON TRANSGENDER AGING**

Chair: *V. Fabbre, SSA, University of Chicago, Chicago, Illinois*

Co-Chair: *T.M. Witten, Virginia Commonwealth University, Richmond, Virginia*

Discussant: *B. De Vries, San Francisco State University, San Francisco, California*

This symposium will highlight multiple perspectives on transgender aging, in order to highlight this burgeoning area of research and to broaden gerontological theory and methodology with respect to gender identity and expression. Two presenters will report on findings from studies in the interpretive tradition. Analysis of life story interviews suggests that building upon the concept of a "third age" may be helpful in understanding experiences of gender throughout the life course, conceptualizations of the aging body, and the effects of a lack of knowledge on transgender issues at critical points in later life. An ethnographic analysis of participant observation at national transgender conferences illuminates the ways in which male-to-female identified adults make decisions about pursuing a gender transition in later life. In addition, two presenters will report on results of survey research. Structural equation modeling of data gathered from a national sample of 200 transgender people in midlife suggests that transgender adults face unique challenges in enacting resilience as they age. Findings and challenges from the third wave of an ongoing international survey of transgender adults emphasize resilience and spirituality at midlife and beyond. The discussant will draw attention to the challenges of developing a body of knowledge on the topic of transgender aging that is cohesive and adequately encompasses diverse theoretical and methodological perspectives on the topic while contributing to our overall understanding of aging in all of its complexity.

### **GENDER TRANSITIONS IN LATER LIFE**

*V. Fabbre, SSA, University of Chicago, Chicago, Illinois*

This presentation will illuminate the ways in which I am using Extended Case Method (ECM) to investigate the nature of gender transitions in later life. Multi-systemic analyses of data collected through participant observation at three national transgender conferences, along with the first wave of interviews conducted with older adults who contemplate and/or pursue a gender transition past the age of 50, will be used to present: 1) the ways in which male-to-female identified adults make decisions about gender transitions in later life; 2) perspectives on agency and social structure relevant to the unique social context in which transgender older adults navigate these decisions; and 3) implications for taking a life course perspective to study transgender aging and late life gender transitions.

### **TRANSFORMING LIFE COURSES: GENDER, AGE AND THE BODY IN TRANSGENDERED LIFE COURSES**

*A. Siverskog, National Institute for the Study of Ageing and Later Life, Linköping University, Norrköping, Sweden*

This paper is based on life story interviews with persons identifying as transgender aged 65 to 77 years old and explores age and ageing in relation to transgender identities. The theoretical frame used consists of social gerontology and queer theory. Three themes are focused: 1) the relation to gender throughout the life course; 2) the ageing body; and 3) the lack of knowledge on trans issues. The results illustrate how trans identities and practices have been seen as inaccessible during big parts of life, but that a different context in combination with being in "third age" can offer new possibilities to be open. There are also experiences of attempts to undergo sex reassignment surgery, but facing realities of health and the ageing body are making this impossible in some cases. Some interviewees also express worries for future needs of care where they fear they might be discriminated.

## ANTICIPATED ADAPTATION TO AGING AMONG TRANSGENDER PEOPLE IN MIDLIFE

K. Knochel, *Social Work, Augsburg University, Minneapolis, Minnesota*

This presentation reports the findings of a secondary data analysis of responses given by a national sample of 200 transgender people in midlife (ages 45 through 64) to the 2009 MetLife Mature Market Institute survey of LGBT midlife adults. I used structural equation modeling to test the effects of support network, adaptation to gender identity, and aging resources on the participants' anticipated adaptation to aging. Surprisingly, neither support network nor adaptation to identity was significantly associated with a participant's anticipated adaptation to aging. The results suggest that structural oppression and the fear of it are experienced by midlife transgender people whether or not they have built their capacity to enact resilience. This presentation provides preliminary insight into the resources and challenges that may impact transgender people's ability to enact resilience in old age and suggests future avenues of research with this population.

## WHAT 1,467 TRANS-PERSONS TELL US ABOUT SURVEY RESEARCH IN THE GLOBAL TRANS-IDENTIFIED COMMUNITY

T. Witten, *VCU, Richmond, Virginia*

In this third in a series of ongoing research surveys on aging, we received 1,467 hits to our survey on elder aging preparation, perceptions, needs, fears and identities. We discovered a number of fascinating insights into how the current trans-elders and young trans individuals are perceiving and preparing for old age. We found a number of respondents who were remarkably resilient in the face of numerous challenges. In addition, we found a number of respondents who indicated that they planned to end their lives before facing the challenges of later life. In my presentation I will provide a brief overview of the three surveys, how they were sampled, challenges in reaching elders of these populations and how our team faced some of the difficulties of inclusion in order to obtain the largest possible number of respondents. I will address the challenges of body, sex, gender and sexuality and how they impact our work in this field.

## SESSION 905 (SYMPOSIUM)

### POLICY SERIES: BREAKING THE SOCIAL SECURITY GLASS CEILING: A PROPOSAL TO MODERNIZE WOMEN'S BENEFITS

Chair: *C.L. Estes, University of California - SF, San Francisco, California*

Co-Chair: *D. Lifsey, Nat. Com. to Preserve SS & Medicare, Washington, District of Columbia*

The U.S. workforce looked very different in 1946, at the start of the Baby Boom generation, than it does today. A big part of this workforce transformation has been due to the contributions of women. While it is true that some women have broken through the glass ceiling and have entered the corporate board rooms of some of our largest and most successful companies, inequities remain. An enduring pay gap, under which women earn 19 percent less than men, means lower lifetime earnings for many women. Lower earnings, in turn, mean the accumulation of fewer assets. And a lifetime spent juggling the competing needs of career and family means employment patterns that contain frequent periods of unemployment and part-time employment. Over a lifetime these disparities aggregate and become glaring in retirement, especially for those from communities of color and those who live to an advanced age. For too many women, retirement is the culmination of an entire career – an entire lifetime – of pay and income inequality. The National Committee to Preserve Social Security & Medicare Foundation joined with the National Organization for Women and the Institute for Women's Policy Research to call for our retirement system to catch up with the chang-

ing needs of women in the workforce. The concept of retirement must be strengthened to reflect the needs of today's generation of women – those currently in retirement, those nearing retirement, and those at the height of their wage-earning potential. Discussants - Pam Herd (confirmed); Maya Rockeymoore, Eric Kingson(invited).

## SESSION 910 (PAPER)

### ASSISTED LIVING DEFINITIONS, REPORTING AND INFORMATION SYSTEMS, AND RESIDENT EXPECTATIONS

#### EXPECTATIONS OF CARE IN ASSISTED LIVING: A RESIDENT'S PERSPECTIVE

P. Nash, V. Burholt, *Centre for Innovative Ageing, Swansea University, Swansea, Wales, United Kingdom*

There are high levels of interest in assisted living environments for older people within the UK with the creation of new, and expansion of existing 'extracare' schemes. The key assumptions behind extracare developments are that they will enable older people to live for longer in their own homes, utilising a range of care and support services, promoting their health and well-being. A mixed methodological approach was taken, using validated scales and quantitative measures with physical assessments and semi-structured interviews. The Survey of 180 older people in Wales showed, of those in receipt of care, the fittest older people (cognitively & physically) resided in extracare facilities. Further, through one-to-one interviews, extracare residents were the least sure about their future. Residents highlighted concerns about their ability to remain in place citing perceptions about the inability of facilities to meet their changing needs especially regarding cognitive decline. By 2051 it is estimated that 17% (115.4 Million) of the global population will be living with, and requiring some form of support for dementia (US Census, 2010). Of those people with dementia, increasing numbers will be living in assisted living/extracare environments. The Welsh Government pledged £41 million stating "...currently we do not know whether extracare accommodates the changing needs of both fit and frail older people.". Current findings demonstrate the need to inform both residents and policy makers about what can be expected from assisted living and whether it can indeed meet the needs of fit and frail older people.

#### PREDICTORS OF ELECTRONIC HEALTH RECORD USE IN RESIDENTIAL CARE FACILITIES: EVIDENCE FROM THE 2010 NATIONAL SURVEY OF RESIDENTIAL CARE FACILITIES

D. Dobbs, A.A. Holup, K. Hyer, H. Meng, *University of South Florida, Tampa, Florida*

To improve the quality and safety of healthcare, it is important to provide a comprehensive understanding of electronic health records (EHR) use within the long-term care industry. Little is known about EHR utilization in residential care facilities. The purpose of this study was to identify structural predictors of EHR use in residential care facilities using facility level data (n=2302) from the 2010 National Survey of Residential Care Facilities, a nationally-representative, probability sample using multivariate logistic regression analysis. Predictors included: facility size, profit status, chain membership, and staffing hours per resident day for three staff categories - registered nurses, licensed practical nurses, and certified nurse aides, and resident case-mix factors which included the percent of Caucasian residents, female residents, and residents with Medicaid as the primary payment source. Results indicated that 19.4% of residential care facilities are currently using EHRs with the most commonly reported function being the ability to record resident demographics (43.4%). Chain membership (OR=21.5, 95% CI: 1.354-2.109, p<.001), nonprofit ownership

(OR=17.3, 95% CI: 1.314-2.135,  $p < .001$ ), and resident case mix factors (percent of Caucasian residents and the percent of residents with Medicaid as the primary payment source,  $p < .05$ ) were predictive of EHR use. The findings presented here provide benchmark evidence that the majority of facilities are not using EHRs and that structural characteristics do play a role in determining the use of EHRs among residential care facilities.

### **OH, GIVE ME A HOME: THE DEBATE OVER “HOME” AND “COMMUNITY” IN THE MEDICAID WAIVER PROGRAM**

D.L. Redfoot, *Public Policy Institute, AARP, Washington, District of Columbia*

In April 2011, the Centers for Medicare & Medicaid Services (CMS) issued a proposed rule defining what qualifies as “community living” with respect to services funded by state Medicaid home and community-based (HCBS) waiver programs. The discussions and debates regarding “community living” that have ensued raise major issues around the meaning of terms like “institutional,” “community,” “home” or “aging in place” – and for that matter, “social” versus “medical model” services or “person-centered” care or “independence and autonomy” – when it comes to promoting HCBS services. While aging and disability groups use some of the same terms to promote change in long-term services and supports, all groups do not necessarily agree about how to operationalize those terms. The proposed rule specifically addressed the challenge of defining assisted living as an HCBS option. As a residential services option, assisted living has attributes in common with institutional services as well as with housing-based options. The definition in the proposed rule came under criticism from aging organizations as well as provider groups and organizations representing state governments – though it was generally supported by groups representing persons with disabilities. Data from the National Survey of Residential Care Facilities indicate that few existing facilities would meet the definition in the proposed rule. This paper reviews the debate over how to define the experiences of “home” and “community” for the purposes of the Medicaid HCBS waiver program, drawing from both the research literature on these issues and the public comments submitted in response to the proposed CMS rule.

### **PUBLIC REPORTING AND RESIDENTIAL CARE/ASSISTED LIVING: CHARTING A NEW FRONTIER?**

D. Potter, *AHRQ, Rockville, Maryland*

Public reporting refers to any effort to provide a broad audience of health care consumers with information that allows rating or comparison of providers according to certain performance standards of quality, resource use, or a combination of the two (AHRQ, 2012). Public reporting on long-term care providers has a long history; the Centers for Medicare and Medicaid Services (CMS) first released national nursing home data in 2002, state-specific efforts began earlier. National reporting on residential care assisted living (RC/AL) providers has yet to occur, although a recent national survey reports that 43 percent of RC/AL residents receive Medicaid financing (NCHS, 2011). Limited public reporting on RC/AL exists for some states (Mollica, 2006); but, facility performance information is generally provided in a non-consumer friendly format, data on resource use is scarce, and comparisons across states is difficult. In 2008, AHRQ began collaborating with the Center for Excellence in Assisted Living (CEAL) to develop an instrument that could ultimately be used for national public reporting about RC/AL providers. The instrument was developed via a voluntary consensus process involving consumers, providers, and researchers (<http://www.ahrq.gov/research/aldc.htm>). This paper provides results from a 2012 test of the instrument with providers across eight states. A particular focus is on the voluntary reporting of information on staffing, costs and services by providers. Empirical results include modeling of provider non-response. Results are compared to key state efforts on RC/AL reporting.

### **THE USE OF ELECTRONIC INFORMATION SYSTEMS IN RESIDENTIAL CARE FACILITIES**

J.A. Davis<sup>1,2</sup>, K. Zakoscielna, L. Jacobs, *1. Management and Marketing, The University of Alabama, Tuscaloosa, Alabama, 2. The Center for Mental Health and Aging, Tuscaloosa, Alabama*

Research on the use of electronic information systems (EIS) in health care is steadily increasing. Adding to this literature, this study describes the various types of EIS used by residential care facilities (RCFs). Prior research suggests that use will vary by profit status and chain affiliation. Using resource dependency theory as the conceptual framework, the study hypothesizes that chain affiliated facilities and for profit (FP) facilities will have access to the resources necessary to implement EIS. The data came from the 2010 National Survey of Residential Care Facilities (NSRCF). There were 2,302 facilities in the sample. The data were analyzed using the chi-square statistic accounting for the stratified nature of the survey. Approximately 64 percent of RCFs use EIS with FP RCFs (72%) more likely to use EIS than not for profit (NFP). However, there were no significant differences in EIS use by chain-affiliated (50%) and independent RCFs. From highest to lowest EIS use are FP/chain, FP/independent, NFP/independent, and NFP/chain. The NSRCF included 27 different types of EISs (e.g. electronic health records). FP RCFs were significantly more likely to use each of the EIS of interest than were NFP RCFs. Use by chain versus independent RCFs varied the type of EIS being analyzed. In summary, this study revealed that EIS use has penetrated the long-term care market. And providers are attempting to use various types of EIS, which includes both those focused on resident care and managerial activities. However, EIS use does not extend to electronic communication with other providers.

### **SESSION 915 (SYMPOSIUM)**

#### **CONTROVERSIES IN THE BIOLOGY OF AGING: ARE THE EFFECTS OF GROWTH HORMONE AND IGF-1 DEFICIENCY ON LIFESPAN ONLY EFFECTIVE WHEN INITIATED PRIOR TO ADOLESCENCE?**

Chair: *J. Kirkland, Mayo Clinic, Rochester, Minnesota*

Co-Chair: *J. Kirkland, Mayo Clinic, Rochester, Minnesota*

Co-Chair: *G.L. Sutphin, University of Washington, Seattle, Washington*

The goal of this symposium is to bring current controversies in the Biology of Aging to the attention of the audience. The topic for 2012 will be devoted to the effects of growth hormone and IGF-1. It is abundantly clear from studies in *C. elegans*, *Drosophila* and rodents that growth hormone and IGF-1 deficiency initiated early during life decreases age-related pathology and increases lifespan. However the relevance of these studies to lengthening human lifespan appears limited. Importantly, growth hormone and IGF-1 replacement later in life clearly improves both brain and cardiovascular function but increases the risk for cancer. The focus of this symposium is to bring speakers with highly diverse points of view together to discuss these issues, resolve controversies whenever possible and identify areas for further research.

#### **SOMATOTROPIC SIGNALING, PRE-PUBERTAL GROWTH AND LONGEVITY**

A. Bartke, O. Arum, R. Westbrook, *Geriatric Research, Southern Illinois University School of Medicine, Springfield, Illinois*

Mice with mutations producing growth hormone (GH) deficiency or resistance are small and live longer than their genetically normal siblings. In Ames dwarf mice, six weeks of GH replacement therapy started at two weeks of age accelerates growth and can reduce life expectancy (Panici, et al., *FASEB J* 24:5073, 2010). This and the report of extended lifespan in mice subjected to pre-weaning food restriction (Sun, et al., *J. Gerontol A Biol Sci* 64:711, 2009) indicate that manipulation of early growth can have a profound impact on aging and longevity. Preliminary data on insulin and glucose tolerance in juve-

nile and adult Ames dwarf mice after prepubertal treatment with GH indicate that mechanisms other than altered glucose homeostasis may be involved. We are interested in the possible role of alterations in metabolism and metabolic fuel preferences as detected by indirect calorimetry. In GH-deficient or resistant mice, oxygen consumption per unit of body weight is elevated while respiratory quotient is reduced. This may reflect primarily an increased energy requirement for thermoregulation because these differences disappear at thermoneutral temperature. Studies in Ames dwarf mice treated with GH at different stages of life history should indicate whether prepubertal and adult somatotrophic signaling influence aging by different or overlapping mechanisms. (Supported by NIA)

#### **NEW INSIGHTS INTO THE ROLE OF THE GH-IGF SYSTEM IN THE REGULATION OF LIFESPAN AND AGING-RELATED DISEASES IN HUMANS**

P. Cohen, *Pediatrics, UCLA, Los Angeles, California*

Female offspring of centenarians have higher serum IGF-I but reduced heights compared to age-matched controls, suggesting a state of IGF-resistance. The IGF1R gene of centenarians disclosed a common longevity-associated SNP and 3 novel mutations. Lymphocytes from affected individuals demonstrated a decrease in IGF-1 receptor number and signaling suggesting it is a genetic determinant of longevity in a gender specific manner. A polymorphism of the GH receptor (D3GHR) showed that homozygosity rose with age and was 4-fold more common in centenarians versus controls. d3/d3-GHR male centenarians carriers were shorter than their cohort, and had lower serum IGF-I. Patients with GHR mutations in Ecuador had a dramatically reduced cancer incidence, a moderate reduction in diabetes incidence (in the presence of an increased rate of obesity), but normal mortality rates. Our findings provide intriguing possibilities regarding genotype-specific pharmacologic interventions to enhance healthy aging and provide insights regarding the potential effects of GH/IGF replacement.

#### **AGE- AND TISSUE-SPECIFIC EFFECTS GROWTH HORMONE AND INSULIN-LIKE GROWTH FACTOR-1: IMPLICATIONS FOR AGE-RELATED DISEASE, HEALTHSPAN AND LIFESPAN**

W.E. Sonntag, A. Csiszar, Z. Ungvari, *University of Oklahoma HSC, Oklahoma City, Oklahoma*

Since the initial reports demonstrating that circulating growth hormone and insulin-like growth factor (IGF)-1 decrease with age in laboratory animals and humans, there have been numerous studies on the importance of these hormones for healthy aging. Nevertheless, the role of these potent anabolic hormones in the genesis of the aging phenotype remains controversial. Here, we review the studies demonstrating the beneficial and deleterious effects of growth hormone and IGF-1 deficiency and explore their effects on specific tissues and pathology as well as their potentially unique effects during early development. In adults growth hormone and IGF-1 have numerous beneficial/protective actions on skeletal muscle and the cardiovascular and nervous systems but decrease insulin sensitivity and increase cancer risk. These hormones have differential effects on healthspan and lifespan based on age-specific tissue dysfunction and tissue pathology evident for each species and strain. Evolving data strongly suggest that circulating levels of growth hormone and IGF-1 during development rather than levels in adult life exert a key role in regulation of lifespan in rodent models. Importantly, recent data indicate that the increase in these hormones during adolescence has beneficial effects on brain and vascular function that are manifest throughout life and may alter age-related disease incidence. Thus, tissue-specific effects of alterations in IGF-1 signaling during development should be addressed. We conclude that the perceived contradictory roles of growth hormone and IGF-1 in the genesis of the aging phenotype should not be interpreted as a controversy on whether these hormones

increase or decrease lifespan but rather as an opportunity to explore the complex roles of these hormones during specific stages of the lifespan.

### **SESSION 920 (SYMPOSIUM)**

#### **STUDIES USING BIOMARKERS TO UNDERSTAND MULTISYSTEMIC DYSREGULATION IN AGING**

Chair: *K. Bandeen-Roche, Biostatistics, Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland*

Co-Chair: *A.A. Cohen, Université de Sherbrooke, Sherbrooke, Quebec, Canada*

Discussant: *E. Crimmins, University of Southern California, Los Angeles, California*

There is increasing evidence that multiple biological processes and systems are implicated in aging. Many researchers now believe that aging results from multi-systemic dysregulation itself, with feedback loops resulting in diffuse effects across systems. This model posits a highly complex aging process and presents numerous methodological challenges, including high dimensionality and system dynamics. However, long-term efforts at longitudinal collection of biomarkers in epidemiological studies also presents a unique opportunity to address these challenges, with the biomarkers serving, metaphorically, as multiple shadows on the wall by which we might infer the form of the underlying dysregulatory process. Here, we invite four groups who have been tackling these challenges to present their results. These exciting findings are described in the abstracts to follow. While there may be no silver bullet approach, taken together these four studies show substantial evidence for a complex, multivariate, dynamic process such as that posited by the multi-system dysregulation model.

#### **CONNECTION BETWEEN INDIVIDUAL AGING AND MORTALITY: THE RESULTS OF BIO-DEMOGRAPHIC ANALYSES**

A.I. Yashin, K.G. Arbeev, I. Akushevich, A. Kulminski, P. Stallard, D. Wu, L. Arbeeva, S.V. Ukraintseva, *Sociology, Duke University, Durham, North Carolina*

The changes in parameters of mortality or survival curves in response to genetic manipulation or exposure to external conditions are often explained in terms of changes in the rate of individual aging. Taking into account that mortality rate results from complicated interplay among aging and other processes affecting chances of death, such interpretation looks oversimplified. More appropriate interpretation requires mortality models whose parameters do describe aging related changes in biomarkers. In this paper we develop such models and show how they could be used in the analyses of longitudinal data about aging, health and longevity. The models incorporate relevant information about aging into their structure by introducing variables which influence age trajectories of biomarkers partly observed in longitudinal studies. We show that analyses of the Framingham data using such models allows for addressing new research questions about changes developing in aging human body including changes stress resistance and adaptive capacity.

#### **ELECTROLYTE DYSREGULATION IN AGING: A NEW TYPE OF DYSREGULATION IDENTIFIED BY MULTIVARIATE DISTRIBUTION ANALYSIS**

A.A. Cohen<sup>1,2</sup>, S. Yasar<sup>3</sup>, T. Fulop<sup>1,2</sup>, K. Bandeen-Roche<sup>4</sup>, Q. Xue<sup>4</sup>, J. Yong<sup>1</sup>, L.P. Fried<sup>5</sup>, L. Ferrucci<sup>6</sup>, *1. Université de Sherbrooke, Sherbrooke, Quebec, Canada, 2. Groupe de Recherche PRIMUS, Centre Hospitalier Universitaire de Sherbrooke, Sherbrooke, Quebec, Canada, 3. Johns Hopkins University, Baltimore, Maryland, 4. Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, 5. Columbia University Mailman School of Public Health, New York, New York, 6. National Institute of Aging, Baltimore, Maryland*

Traditional studies of dysregulation have focused on systems such as the immune or endocrine. Here, using the Women's Health and Aging

Study II, we conducted a broad survey of 65 blood biomarkers and their longitudinal changes. We selected 16 biomarkers for further analysis based on the criterion that the deviance (i.e., distance from the population mean) increase with age. Five of these 16 were all five of the electrolytes included in the original data set: calcium, magnesium, sodium, potassium, and chloride. Deviances for these measures were not just correlated with age, but showed average positive slopes with age within individuals and predicted subsequent mortality. Joint measures of multivariate distance for these five measures together showed increasing power to detect these effects. The effects persist after control for creatinine, suggesting that the effect is not solely attributable to renal pathology. Results were successfully replicated in the InCHIANTI dataset.

#### **MULTIDIMENSIONAL RELATIONSHIPS AMONG BIOLOGICAL MARKERS AND FRAILITY: EVIDENCE FROM THE WOMEN'S HEALTH AND AGING STUDY (WHAS) II**

C.L. Seplaki<sup>1,6</sup>, A.R. Cappola<sup>2</sup>, C. Weiss<sup>4,3</sup>, Q. Xue<sup>3,6</sup>, R. Semba<sup>3,5</sup>, K. Bandeen-Roche<sup>5,6</sup>, L.P. Fried<sup>7</sup>, 1. *Department of Community & Preventive Medicine, University of Rochester School of Medicine and Dentistry, Rochester, New York*, 2. *University of Pennsylvania School of Medicine, Philadelphia, Pennsylvania*, 3. *Johns Hopkins University School of Medicine, Baltimore, Maryland*, 4. *Michigan State University, Grand Rapids, Michigan*, 5. *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland*, 6. *Johns Hopkins Center on Aging and Health, Baltimore, Maryland*, 7. *Columbia University, New York, New York*

Research suggests that an important part of frailty etiology is degradation in functioning spanning multiple physiological systems (Fried, Xue, Cappola et al., 2009). Improvements in our understanding of frailty require exploration of the interplay across physiological systems. We explore the multidimensional relationships among physiologic systems associated with frailty by conducting multivariate analyses of biomarkers and their associations with frailty, using data from the Women's Health and Aging Study (WHAS) II. The WHAS II is a longitudinal study of the etiology of disability comprising 436 higher-functioning women aged 70-79 at baseline living in and around Baltimore, MD. Preliminary results from a multiple correspondence analysis (MCA) using the baseline wave of WHAS II (n=278 women with non-missing information) suggest the co-occurrence of high and low levels of biomarkers spanning different systems; subsequently overlaying frailty status onto the MCA mapping highlights, for example, the co-occurrence high inflammatory and low nutritional measures with frailty.

#### **MULTI-SYSTEM DYNAMICS IN THE OLDEST-OLD: INSIGHTS AND LESSONS LEARNED FROM THE WOMEN'S HEALTH AND AGING STUDY**

R. Varadhan<sup>1</sup>, A.R. Cappola<sup>2</sup>, L.P. Fried<sup>3</sup>, 1. *Geriatric Medicine, Johns Hopkins Center on Aging and Health, Baltimore, Maryland*, 2. *University of Pennsylvania School of Medicine, Philadelphia, Pennsylvania*, 3. *Mailman School of Public Health, Columbia University, New York, New York*

The Women's Health and Aging Study II (WHAS-II) is a prospective, observational study aimed at understanding the causes of declines in physical function of community-dwelling older women. In 1994, the study enrolled 436 high functioning women of ages between 70-79 years. During 2008 and 2009, a subset of women of ages between 84-93 years, participated in a series of experiments where the response of different physiological systems to stimuli was monitored. These experiments included oxidative phosphorylation of skeletal muscle during mild exercise using magnetic resonance spectroscopy, glucose metabolism using glucose tolerance test, HPA axis response using ACTH stimulation, and immune system response to flu vaccination. These experiments were unique for several reasons: the wide-ranging array of systems studied; stimulus-response experiments nested within a well

characterized cohort, and the participation of oldest-old women. In this talk, we will discuss the major insights from this study. We will also highlight the challenges of conducting these types of experiments nested within a prospective cohort study. We will conclude with lessons learned and some suggestions for future experimental studies in aging.

### **SESSION 925 (SYMPOSIUM)**

#### **CHARTING NEW FRONTIERS IN AGING THROUGH SHARE-ISRAEL—THE LONGITUDINAL SURVEY OF ADULTS AGED 50+**

Chair: *H. Litwin, IGDC, Hebrew University, Jerusalem, Israel*  
Discussant: *D. Weir, ISR, University of Michigan, Ann Arbor, Michigan*

SHARE-Israel is the Israeli component of the Survey of Health, Aging and Retirement in Europe. Study of aging in the Israeli context provides a unique opportunity to examine important aspects of late life, among them, the effects of cumulative lifelong trauma, the correlates of cultural diversity and the health concomitants of accessible public health care. This symposium presents a selected set of papers drawn from analyses that employ, for the first time, data from the second wave of SHARE-Israel, collected in 2009-2010. Paired with the data from the first wave, collected in 2004-2005, these analyses constitute the first longitudinal examinations stemming from this data set. The paper by Shrira considers the long-term effect of lifetime cumulative adversity on psychological impairment and physical disability across the two waves. The paper by Ayalon looks at cognitive changes over the four year period between the two waves and their population-group correlates. The work by Spalter and colleagues considers functional changes across the two waves of SHARE-Israel, taking into account the associations of potential explanatory variables. Soskolne and colleagues investigate oral health over time given the relatively high rate of forgone dental care among older Israeli adults. Finally, a paper by Achdut, Troitsky and Tur Sinai analyzes transitions into retirement, inequality and living standards. The papers and their implications will be considered by David Weir from the American Health and Retirement Study, which served as the prototype for the development of SHARE and similar longitudinal aging surveys around the globe.

#### **A DEEPER LOOK INTO THE LONG-TERM EFFECT OF LIFETIME CUMULATIVE ADVERSITY ON LATE-LIFE FUNCTIONING**

A. Shrira, 1. *The Hebrew University of Jerusalem, Jerusalem, Israel*, 2. *Tel Aviv University, Tel Aviv, Israel*

This study focused on different categories of cumulative adversity and the subjectively perceived impact of adversity on one's life. 1,248 respondents in SHARE-Israel completed the inventory of potentially traumatic events in Wave 1 and reported depressive symptoms and disability across two waves. When effects by adversity were net of each other, bereavement and physical hardships were positively related to depressive symptoms and disability in Wave 1, but war, terror, and victimization (i.e., exposure to other types of violence and sexual abuse) were not. Only physical hardships predicted Wave 2 depressive symptoms and disability. The findings were stronger when examining events perceived as having the strongest impact on one's life. In conclusion, events which assault one's physical integrity have a long-term effect on psychological and functional status at the second half of life. However, the modest effect attests that resilience to lifetime hardships is a common phenomenon among older adults.

#### **PREDICTORS OF SUCCESSFUL AGING IN THREE POPULATION GROUPS OF ISRAELIS**

L. Ayalon, *Bar Ilan University, Ramat Gan, Israel*

One of the most widely used definitions of successful aging was introduced by Rowe and Kahn (1987). Accordingly successful aging is

defined as, "avoidance of disease and disability, maintenance of high physical and cognitive function, and sustained engagement in social and productive activities" (p. 439). The present study uses this definition to evaluate the prevalence rates of successful aging in three populations of Israelis: veteran Israeli Jews, Israeli Arabs, and Jews from the former Soviet Union (FSU). Results show that veteran Israeli Jews enjoy the highest levels of successful aging in both waves of the Survey of Health Ageing and Retirement. A dramatic reduction in successful aging was evident for all three population groups. Once adjusted for demographics and health behaviors, Jews from the FSU were less likely to be classified as successful agers. Results are discussed in relation to the socio-cultural characteristics of Israeli society.

### **CHANGING FUNCTIONING IN LATE LIFE – IMPROVEMENT AND DECLINE**

T. Spalter, J. Brodsky, Y. Shnoor, *Ageing, MYERS-JDC-BROOKDALE INSTITUTE, Jerusalem, Israel*

Disability and activity limitations are the main causes for loss of independence in late life, as well as for institutionalization, hospitalization and death. However, little is known about changes in functional impairments and their causes among the elderly population. The current study depicts improvement and decline in activity limitations among 50+ year-old Israelis and examines their health and socio-cultural correlates, using longitudinal data from 2005 and 2010 Survey of Health and Retirement (SHARE) in Israel. Findings are discussed as implications for health policy as well as for interventions aimed to prevent or reverse disability.

### **PREDICTORS AND EXPLANATORY VARIABLES OF UTILIZATION OF DENTAL SERVICES OVER TIME**

G. Auslander<sup>1</sup>, V. Soskolne<sup>2</sup>, A. Soskolne<sup>3</sup>, *1. Social Work, Hebrew University, Jerusalem, Israel, 2. Bar Ilan University - Social Work, Ramat Gan, Israel, 3. Hebrew University - Dental School, Jerusalem, Israel*

Maintaining oral health is particularly important among elders, yet utilization of dental services is lower among older persons compared to younger people in most countries. This study examines factors related to utilization of dental services, using Andersen's Behavioral Model including predisposing (background variables), enabling (e.g., income, mobility) and need factors (e.g., dentate state). The study uses Israeli data from two waves of the international SHARE study (N=773). Utilization of dental services decreased from 39% in T1 to 34% in T2; only 48% respondents used dental services at both times. Oral health deteriorated (ability to bite on hard foods decreased from 67% to 61%), as did other health measures. Besides younger age, economic factors (no difficulties in making ends meet), better health and functioning status, no outside help and ability to bite were related to greater utilization at each time period. Several of these measures at T1 predicted utilization at T2.

### **LABOR MARKET TRANSITIONS AND WELL-BEING INDICATORS AMONG OLDER ISRAELIS**

A. Tur-Sinai<sup>1</sup>, L. Achdut<sup>2</sup>, R. Troitsky<sup>3</sup>, *1. Ben-Gurion University of the Negev, Beer Sheva, Israel, 2. Ruppin Academic Center, Emmek Heffer, Israel, 3. Shamoon College of Engineering, Beer Sheva, Israel*

Based on data from the two first waves of SHARE- Israel, conducted in 2004 -2005 and 2009 -2010, this study examines the extent to which individuals moved in or out of paid work and the extent to which these labor market transitions are associated with policy changes introduced in the years 2004 -2008 (delay of pensionable age and expansion of pension coverage), and with changes in pension wealth, health status, job characteristics and other background variables. In addition this study analyzed the impact of retirement on the well-being of the recent retirees by several objective and subjective indicators.

## **SESSION 930 (SYMPOSIUM)**

### **COPING AS A COUPLE: DYADIC PERSPECTIVES ON CHRONIC DISEASE IN MID TO LATE LIFE**

Chair: *R.C. Hemphill, Psychology, Kent State University, Kent, Ohio*  
Discussant: *C.A. Berg, University of Utah, Salt Lake City, Utah*

Many middle-aged and older adults coping with a chronic condition do so with the help of a spouse, yet research on chronic disease has traditionally taken an individualistic perspective that fails to consider the social context in which illness often occurs. Emerging dyadic perspectives on chronic disease suggest that one partner's illness is best understood as a shared stressor that requires behavioral and emotional adjustments from both relationship partners. This symposium presents research examining the coping efforts and well-being of chronic disease patients and their spouses across a range of disease contexts frequently encountered in mid to late life. First, Martire will discuss how marital closeness and gender impact spouses' emotional responses to pain experienced by arthritis patients. Next, Monin will consider how the attachment orientations of patients with Alzheimer's disease and of their caregiving spouses relate to partners' perceptions of patients' suffering. Barrineau will then discuss associations among the loving interactions, communication difficulties, and well-being of men with prostate cancer and their wives. Hemphill will examine how partners' perceptions of collaboration in disease management relate to marital satisfaction among patients with type 2 diabetes and their spouses. Finally, August will discuss cultural and gender differences in correlates of spouses' involvement in the dietary management of patients with type 2 diabetes. Presentations highlight the importance of considering chronic disease as a shared stressor with implications for both patients and their spouses. Our discussant (Berg) will identify themes across presentations and discuss directions for future research.

### **MARITAL CLOSENESS, GENDER, AND THE EFFECTS OF DAILY SUFFERING ON SPOUSE MOOD**

L.M. Martire<sup>1</sup>, R. Schulz<sup>2</sup>, M.P. Stephens<sup>3</sup>, J. Mogle<sup>1</sup>, F. Keefe<sup>4</sup>, *1. HDFS, Penn State University, University Park, Pennsylvania, 2. University of Pittsburgh, Pittsburgh, Pennsylvania, 3. Kent State University, Kent, Ohio, 4. Duke University, Durham, North Carolina*

Chronic illness symptoms take an emotional toll on the well spouse, but the extent to which this negative contagion occurs on a daily level and is stronger within specific types of couples is unknown. Some studies suggest that contagion is stronger when the couple is emotionally close, and that this is especially true for husbands' mood. Using a sample of 128 arthritis patients and their spouse, we tested the hypothesis that effects of pain on spouse mood would be strongest for male spouses in a close marital relationship. Participants completed a measure of dyadic closeness and reported on mood and patient pain 3 times per day for 22 days. Multilevel lagged models indicated that the effects of patient afternoon pain on spouse mood at the end of day depended on both marital closeness and spouse gender. Contrary to prediction, male spouses with high marital closeness experienced increased positive mood.

### **ALZHEIMER'S DISEASE PATIENTS' AND CAREGIVING SPOUSES' ATTACHMENT ORIENTATIONS AND THEIR REPORTS OF PATIENTS SUFFERING**

J. Monin, *Yale School of Public Health, New Haven, Connecticut*

Attachment theory is a useful framework for understanding how couples regulate emotions and maintain feelings of security in reaction to chronic illness. In this study we examined the extent to which Alzheimer's disease patients' and their spouses' attachment orientations (anxiety and avoidance) were associated with each partner's perception of the patient's suffering using the Actor-Partner Interdependence Model (Kenny, Kashy & Cook, 2006). Each partner completed a self-report measure of attachment orientation (Brennan, Clark, & Shaver, 1998) and rated the patient's physical and psychological symptoms over the

past two weeks (Schulz, et al., 2010). Data from patients were used after determining that patients were able to provide reliable responses. Results revealed that when one or both partners were high in attachment insecurity (anxiety or avoidance) reports of patient suffering were highest. These findings have implications for how clinicians develop tailored interventions and interpret symptom-reporting by spouses and patients.

#### **PERCEPTIONS OF COMMUNICATION DIFFICULTIES AND DAILY AFFECT IN COUPLES DEALING WITH PROSTATE CANCER**

M. Barrineau<sup>1</sup>, S.J. Wilson<sup>1</sup>, C.A. Berg<sup>2</sup>, 1. *Penn State University, University Park, Pennsylvania*, 2. *University of Utah, Salt Lake City, Utah*

A cancer diagnosis brings challenges for the family with loving interactions reducing difficulties in communication and promoting effective adjustment. In the current study 61 prostate cancer patients and their wives rated difficulties in their communication, the affiliation or love in their interactions and negative affect experienced across 14 days. Actor-partner interdependence models revealed that the husband's greater perception of the wife as loving was related to his report of fewer difficulties with communication surrounding cancer ( $p < .05$ ) and marginally to his wife's reports of difficulties. Difficulties in communication were also related to husbands' and wives' negative affect with the wife's report of greater communication difficulties related to her greater negative affect and to her husband's greater negative affect. The results are described in terms of the quality of the relationship as a basis for communication difficulties surrounding chronic illness and gender differences in perceptions of those communication difficulties.

#### **COLLABORATIVE COPING AND MARITAL SATISFACTION AMONG PATIENTS WITH TYPE 2 DIABETES AND THEIR SPOUSES**

R.C. Hemphill<sup>1</sup>, M.P. Stephens<sup>1</sup>, M. Franks<sup>2</sup>, K.S. Rook<sup>3</sup>, 1. *Psychology, Kent State University, Kent, Ohio*, 2. *Purdue University, West Lafayette, Indiana*, 3. *University of California, Irvine, Irvine, California*

Collaborative efforts to manage one partner's chronic disease (e.g., solving problems jointly, sharing concerns) appear to benefit the psychosocial adjustment of both relationship partners. Few studies, however, have considered the impact that collaborative coping may have on partners' relationship satisfaction over time. In this study of 126 patients with type 2 diabetes and their spouses, we used the Actor-Partner Interdependence Model to examine patients' and spouses' perceptions of collaborative coping in relation to changes in each partner's marital satisfaction over the course of one year. Interestingly, patients' perceptions of collaborative coping were related to increases in their own marital satisfaction over time, but were related to decreases in spouses' marital satisfaction. Spouses' reports of collaborative coping were not associated with changes in either partner's marital satisfaction. Findings highlight the importance of considering both partners' perceptions of coping, as they may have differential associations with partners' adjustment.

#### **CULTURAL AND GENDER DIFFERENCES IN CORRELATES OF SPOUSAL INVOLVEMENT IN A PARTNER'S DIABETIC DIET**

K.J. August<sup>1</sup>, D. Sorkin<sup>2</sup>, 1. *Rutgers University, Camden, New Jersey*, 2. *University of California, Irvine, Irvine, California*

Social network members can positively or negatively influence individuals' health behaviors, or engage in health-related social control (HRSC) or undermining, respectively. Spouses, in particular, are an important influence on the dietary behaviors of patients with type 2 diabetes, but little is known about the correlates of such influence attempts. This study accordingly examined whether relationship and disease-related factors were associated with spouses' influence attempts on their

partners' diabetic diet. Data were analyzed from a sample of 197 non-Hispanic white, Mexican-American, and Vietnamese-American older adult spouses whose partners had type 2 diabetes. Results from regression analyses revealed that perceptions of more diabetes-related worries were associated with more HRSC among white female spouses, but less undermining among Mexican-American male spouses. Higher marital quality was associated with more HRSC and more undermining among Vietnamese-American spouses. The findings from this study underscore cultural and gender differences in how spouses influence their partners' diabetic diets.

### **SESSION 935 (SYMPOSIUM)**

#### **CUTTING-EDGE INNOVATIONS IN LONGITUDINAL STRUCTURAL EQUATING MODELING FOR AGING RESEARCH**

Chair: *A.L. Gross, Institute for Aging Research, Harvard Medical School, Boston, Massachusetts*

Co-Chair: *Q. Xue, Center on Aging and Health, Johns Hopkins University, Baltimore, Maryland*

Discussant: *J. Newsom, School of Community Health, Portland State University, Portland, Oregon*

Structural equation modeling (SEM) provides a powerful vehicle for testing hypotheses using multiple outcomes simultaneously. In particular, it offers a rich array of techniques for longitudinal analysis, a staple in aging research, that features more flexibility and power than traditional bivariate regressions or ANOVA, while empowering researchers to tailor analyses to predetermined hypotheses. Presentations in this symposium provide novel substantive examples from gerontologic research that illustrate strengths and limitations of several cutting-edge longitudinal SEM designs. Roth and Bentley describe roles for latent variable modeling in randomized controlled trials. They address implementation issues when analyzing latent outcomes using the Complier Average Causal Effect (CACE) model to adjust intervention effects for non-compliance. Applications are illustrated using data from existing behavioral interventions. The second presentation by Krall and colleagues investigates bidirectional relationships between physical and cognitive function using cross-lagged autoregressive structural equation models in the Women's Health and Aging Study. Findings suggest early interventions aimed at maintaining cognitive function may prevent initial physical decline, but maintaining physical function into late-life may also be instrumental in preserving cognitive function. Gross and colleagues present findings from parallel process latent growth models of cognitive change in healthy controls and participants with MCI from the Alzheimer's Disease Neuroimaging Initiative. Findings suggest decline in non-memory functions may be an important distinguishing feature between cognitively healthy older adults and persons with MCI. Finally, Bentley and Roth note limitations in causal inferences for parallel process SEM growth models of mediation and report results of a study contrasting them with a two-stage piecewise parallel-process mediation model.

#### **INCORPORATING LATENT VARIABLE ADVANCES INTO STANDARD RANDOMIZED TRIALS**

D.L. Roth<sup>1</sup>, J.P. Bentley<sup>2</sup>, 1. *Center on Aging and Health, Johns Hopkins University, Baltimore, Maryland*, 2. *University of Mississippi, University, Mississippi*

Latent variable models offer important measurement advances that have been widely used in observational research. However, latent variable advances have not been well-integrated into randomized controlled trials (RCTs). When analyzing latent variables as outcomes or mediators, specific implementation issues include how to accomplish covariate or autoregressive adjustments and whether correlated measurement residuals will be estimated over time. Our simulations studies indicate that failing to account for these mechanisms can result in substantial

bias in estimated treatment effects. Latent variables can also be analyzed as treatment moderators. The complier-average causal effect (CACE) model estimates a latent compliance classification for controls, then tests whether a treatment works specifically for those who comply with it. Applications of these techniques will be briefly illustrated using data from previous RCTs (e.g., NYU Caregiver Intervention Trial, REACH, ACTIVE). Future randomized trials should be designed to take better advantage of latent variable measurement and modeling advances.

#### **LONGITUDINAL CHANGE IN NEUROPSYCHOLOGICAL PERFORMANCE USING LATENT GROWTH MODELS**

A.L. Gross<sup>1</sup>, J.K. Johnson<sup>2</sup>, J. Pa<sup>2</sup>, D.G. McLaren<sup>3</sup>, L.Q. Park<sup>4</sup>, J.J. Manly<sup>5</sup>,  
1. Harvard Medical School, Boston, Massachusetts, 2. University of California, San Francisco, San Francisco, California, 3. Massachusetts General Hospital, Boston, Massachusetts, 4. University of California, Davis, Davis, California, 5. Columbia University Medical Center, New York, New York

We examined cognitive change in healthy controls (n=229) and participants with mild cognitive impairment (MCI) (n=397) in the Alzheimer's Disease Neuroimaging Initiative. We modeled baseline levels and longitudinal changes over 3 years in five domains (memory, executive functioning, language, attention, visuospatial) using parallel process latent growth curve methods. Latent variables were constructed on the same scale to compare change across domains. At baseline, participants with MCI demonstrated lower performance than controls in all domains (ps<0.001). Annual rates of decline over 3 years were present in the MCI group in all domains and in the control group for memory only (ps<0.001). Within the MCI group, executive functioning declined fastest and was steeper than memory by 1.7SD annually (p<0.001). Findings suggest different patterns of cognitive decline in healthy older adults and participants with MCI. Decline in non-memory domains may be an important distinguishing feature for healthy older adults and persons with MCI.

#### **ADVANCES IN LONGITUDINAL MEDIATION MODELING**

J.P. Bentley<sup>1</sup>, D.L. Roth<sup>2</sup>, 1. University of Mississippi, University, Mississippi, 2. Johns Hopkins University, Baltimore, Maryland

Mediation modeling is frequently used, including in gerontology, to answer questions about how or why one variable exerts its influence on another variable. Rigorous longitudinal analysis methods are becoming more common to test mediation relationships. One such method uses latent growth curve (LGC) modeling, and includes parallel-process mediation models. These models fail to establish that prior changes in the mediator are related to future changes in the outcome. A model extension, the two-stage piecewise parallel-process mediation model, can be used to establish such temporal precedence. This presentation reports the results of a simulation study that demonstrates that LGC mediation models are quite sensitive to model misspecifications that fail to account for the true state of temporal precedence, suggesting that caution should be exercised in the interpretation of parallel-process mediation models. Comparisons between LGC mediation models and other longitudinal mediation models, such as autoregressive mediation models, also will be discussed.

#### **ASSESSING THE FEED-FORWARD AND FEEDBACK RELATIONSHIP BETWEEN COGNITIVE AND PHYSICAL FUNCTIONS**

J.R. Krail<sup>1</sup>, M. Carlson<sup>1</sup>, L.P. Fried<sup>2</sup>, Q. Xue<sup>1</sup>, 1. Center on Aging and Health, Johns Hopkins University, Baltimore, Maryland, 2. Mailman School of Public Health, Columbia University, New York, New York

Most previous work assessing the association between cognitive and physical function has not comprehensively assessed directions of association. Using cross-lagged autoregressive structural equation models, this study simultaneously assessed both directions of the physical-cognitive function association over time using data from the Women's Health

and Aging Study II. This study found that the cross-lagged effect of cognitive on physical function was stronger initially, with a standardized effect of Trail Making Test Part B (TMT-B) on walking speed (WS) of 0.12 (p=0.03) at year 3 compared to -0.01 (p=0.88) at year 9. Conversely, the effect of WS on TMT-B at year 3 was 0.01 (p=0.75) compared to 0.11 (p=0.03) at year 9. This study demonstrates that both directions of the physical-cognitive function association are important. Early interventions aimed at maintaining cognitive function may prevent initial physical decline; however maintaining physical function into late life may also be important in preserving cognitive function.

### **SESSION 940 (SYMPOSIUM)**

#### **DAILY EXPERIENCES AND BIOMARKERS OF FAMILY CAREGIVERS: THE EFFECTS OF HIGH AND LOW STRESS DAYS**

Chair: S.H. Zarit, Human Development & Family Studies, Penn State University, University Park, Pennsylvania

Co-Chair: D. Almeida, Human Development & Family Studies, Penn State University, University Park, Pennsylvania

Discussant: S.T. Charles, University of California-Irvine, Irvine, California

Considerable research has examined the effects of daily stressors on well-being and stress biomarkers, but most work has been conducted on adults experiencing low levels of stressors. Less is known about people with chronically high levels of daily stressors or about the effects of providing relief from those stressors. This symposium reports on the results of a study of family caregivers of people with dementia who are using adult day care (ADC). Taking advantage of a natural experiment, we compared participants on high stress days when they do not use ADC and low stress days when they use ADC. Steven Zarit and Elia Femia present an overview of the design and measures of the study. Kyungmin Kim and MaryJon Barrineau describe differences in exposure to stressors on high and low stress days and the effects on well-being and health symptoms. Laura Klein reports on the effects of ADC use on cortisol, showing that many participants display a burnout (flat) pattern of daily cortisol on high stress days, but show more normal patterns on low stress (ADC) days. Courtney Whetsel and Laura Klein examine the effects of daily stress on another stress hormone, DHEA-S, and report a lagged effect of ADC use on DHEA-S and positive emotion. Amanda Leggett and Kyungmin Kim demonstrate the relation of daily levels of cortisol to negative emotions. Taken together, these presentations break new ground in examining variability in affect and biomarkers under conditions of chronic stress. The discussant will be Susan Turk Charles.

#### **DAILY STRESS AND HEALTH OF FAMILY CAREGIVERS: OVERVIEW OF DESIGN AND MEASURES**

S.H. Zarit, E. Femia, Human Development & Family Studies, Penn State University, University Park, Pennsylvania

Research on family caregivers of people with dementia has documented substantial daily differences in stress exposure related to use of Adult Day Care (ADC). The present study builds on this observation by collecting information on 8 consecutive days that included days on which caregivers used ADC (lower stress) and days they did not (higher stress). This approach allows us to examine daily responses to stressors among people with high levels of chronic stress, and whether predictable breaks from providing care affect daily well-being and stress biomarkers. The sample was comprised of 150 family caregivers of people with dementia who shared the same household and where the person with dementia attended ADC between 2 and 5 days a week. Measures included daily stressors, positive experiences and well-being. Five saliva samples were collected across each of the 8 days to test for fluctuations in three critical biomarkers, cortisol, dehydroepiandrosterone-sulfate, and alpha-amylase.

## DAILY VARIABILITY IN STRESSORS AND WELL-BEING WITH ADULT DAY CARE USE

K. Kim, M. Barrineau, S.H. Zarit, *Human Development and Family Studies, The Pennsylvania State University, University Park, Pennsylvania*

We examine how daily stressors vary for dementia caregivers on days they use adult day care (ADC) and days they do not and the implications for health symptoms and affect. Caregivers (N = 150) were interviewed for 8 consecutive days about daily experiences, which included days they used and did not use ADC. Using MLM, we found that daily dementia-related behavior problems were lower on ADC days and non-care positive events were higher, but non-care stressors were also higher. Daily variability in both types of stressors and positive events were significantly associated with positive and negative affect. Daily health symptoms, however, were related to levels of behavior problems and positive events and to daily variability in non-care stressors. These results confirm that ADC use is associated with variability in exposure to stressors and positive events, and that this variability has implications for daily affect, but not health symptoms.

## SALIVARY CORTISOL AND CHRONIC STRESS IN CAREGIVING: EFFECTS OF HIGH AND LOW STRESS DAYS

L.C. Klein, S.H. Zarit, K. Kim, D. Almeida, C.A. Whetzel, *Penn State University, University Park, PA, Pennsylvania*

High daily stress has been found to result in increased levels of salivary cortisol marked by area under the curve (AUC) and high morning rise (MR), though people experiencing chronic stress may exhibit a burnout pattern of low AUC and no MR. We explored daily variability of cortisol in a sample of family caregivers of individuals with dementia (IWD), comparing high stress days when patient and caregiver were together and low stress days when patient attended Adult Day Services (ADS). Controlling for age, gender and mean level of MR and AUC on non-ADS days, we found that caregivers with the lowest cortisol levels showed greater morning rise on ADS days while those with higher mean cortisol showed decreases on ADS days. These findings suggest that relief from stressors through respite care restores a more normal diurnal cortisol pattern in individuals with very low levels and produces a typical stress reduction response for caregivers with normal daily patterns.

## THE RELATION OF DHEA-S TO VARIABILITY IN CHRONIC STRESS IN CAREGIVING

C. Whetzel, K. Kim, L.C. Klein, *Penn State University, University Park, Pennsylvania*

Dehydroepiandrosterone-sulfate (DHEA-S) is associated with better mood as people age, but has not been studied on people with high stress. We explored daily variability of DHEA-S in family caregivers of individuals with dementia (IWD), comparing high stress days when IWD and caregiver were together and low stress days when IWD attended Adult Day Care (ADC). Caregivers (N=130) provided 5 saliva samples a day over an 8 day period that included ADC days and days when IWD and caregiver were together. Using multilevel models that controlled for age and gender, we found a lagged effect for DHEA-S output, with higher levels following ADS use. These results are consistent with the long half-life of DHEA-S which results in a slower response to daily events. We also examined relation of AUC to well-being and found that on days where the caregiver had higher levels of DHEA-S their positive affect was also higher.

## DEPRESSIVE SYMPTOMS AND DAILY CORTISOL FOR CAREGIVERS ON HIGH AND LOW STRESS DAYS

A.N. Leggett, K. Kim, *Human Development and Family Studies, The Pennsylvania State University, State College, Pennsylvania*

We examined the association of depressive symptoms and two markers of cortisol, Area Under the Curve (AUC) and Morning Rise (MR)

for caregivers (N=149) of individuals with dementia (IWD) on low stress days when IWDs attended Adult Day Care (ADC) and high stress days when IWDs did not go to ADC. Data were gathered over 8 consecutive days. Many caregivers showed patterns of cortisol response of low or no MR and low AUC which is consistent with chronic stress. Using MLM, we found that higher individual mean depression over 8 days was associated with lower daily AUC and MR, and ADC use was associated with higher daily AUC and MR, but the ADC\*mean depression interactions were not significant. Findings indicate that higher depression is associated with the more blunted patterns of cortisol response, but changes on low stress days are not differentially found among caregivers with higher depression.

## SESSION 945 (SYMPOSIUM)

### DRIVING IN OLDER ADULTS WITH NEUROLOGICAL AND NEURODEGENERATIVE DISORDERS: A GROWING CONCERN

Chair: *A.M. Crizzle, Occupational Therapy, University of Florida, Gainesville, Florida*

Discussant: *R. Marottoli, Yale University, New Haven, Connecticut*

With an aging population also comes an increased prevalence of medical conditions that can compromise safe driving. This symposium will address, through five presentations, the impact of neurological and neurodegenerative disorders on driving in older adults. Presentations will focus on various age-related medical conditions, including Parkinson's disease (PD), Alzheimer's disease (AD) and stroke. The scope will be broad, covering topics of on-road driving performance, the influence of perceptions on self-regulation and rehabilitation interventions that may potentially improve driving ability in PD, AD and stroke. We will address these issues by examining the unique impairments associated with each medical condition (PD, AD and stroke) and its impact on driving. We will show the most frequently committed on-road errors that are common to drivers with PD and AD. First, in a sample of 100 PD drivers, we will (1) show the critical driving errors that are predictive of pass/fail outcomes on a road test; and (2) address errors of speed regulation in PD drivers by examining where and under what circumstance these errors occur. We will also show (3) driving errors that are predictive of failing a standardized road test in drivers with AD compared to healthy age-matched controls. In addressing stroke, we will (4) discuss how perceptions of driving ability can influence the decision to restrict driving post-stroke. Finally, we will discuss (5) driving rehabilitation interventions and the use of the simulator to improve driving performance in older drivers in general, and in PD, stroke and mild cognitive impairment.

### DRIVING ERRORS PREDICTING ON-ROAD OUTCOMES IN PEOPLE WITH PARKINSON'S DISEASE

S. Classen, D.N. Lanford, A.M. Crizzle, *Univ of Florida, Gainesville, Florida*

Preliminary data reveal that people with Parkinson's disease (PD) make different types and numbers of errors on the road when compared to healthy control drivers. However, identifying driving errors (type and number) have not been assessed through the process of employing a comprehensive driving evaluation by using the skills of a certified driving rehabilitation specialist (CDRS) in a large group (N=100) of drivers with PD. This study reports on the findings of the driving errors made by drivers with PD, during an on-road assessment. We will present our findings from a logistic regression model to indicate the main errors predictive of passing and failing an on-road test, as well as quantifying the total variance (R<sup>2</sup>) of passing/failing the on-road test. These findings hold promise for revealing the most common errors, open a plausible opportunity for studying mechanisms underlying such errors, and developing rehabilitation strategies for improved driver safety in PD.

## **DO SPEED INFRACTIONS PREDICT DRIVING PERFORMANCE IN DRIVERS WITH PARKINSON'S DISEASE?**

A.M. Crizzle, S. Classen, D.N. Lanford, *Occupational Therapy, University of Florida, Gainesville, Florida*

Persons with Parkinson's disease (PD) make more critical driving errors compared to healthy controls on simulator and road tests. One such error, speed regulation, is impaired in drivers with PD which may be a result of increased cognitive load. However, prior on-road studies have often not distinguished the types of speeding infractions drivers with PD make or have correlated speeding errors with clinical tests. Thus, in a sample of 100 PD drivers, the objectives are to (1) examine the types of speeding errors (over/ under speeding) and where they occur (left and right turns, straight driving); (2) examine the correlations between speeding errors and clinical tests; and (3) determine the ability of speeding errors to predict pass/fail outcomes on the road test, as assessed by a certified driving rehabilitation specialist. The findings may offer a framework for potential interventions to improve speed regulation in drivers with PD.

## **DRIVING ERRORS IN OLDER ADULTS WITH DEMENTIA: A QUANTITATIVE APPROACH TO SCORING THE ROAD ASSESSMENT**

P.P. Barco<sup>1</sup>, T.M. Meuser<sup>2</sup>, D.B. Carr<sup>3</sup>, *1. Program in Occupational Therapy, Washington University Medical School in St. Louis, St. Louis, Missouri, 2. University of Missouri-St. Louis, St. Louis, Missouri, 3. Washington University Medical School in St. Louis, St. Louis, Missouri*

Performance based road assessments have been the traditional gold standard for evaluating driver fitness. Errors, however, are often weighted differently in setting pass-fail criteria. This presentation will focus on a study of older adults with mild dementia (n=42) and healthy older adults similar in age/gender (n=41) who participated in a standardized clinical off-road and on-road driving assessment. Results will be discussed in relationship to driving errors that are more prevalent in those who failed the road test, as well as which tests of cognitive/motor function are associated with these errors. Preliminary analysis indicates that individuals who failed had significant difficulties with steering, visual scanning, lane usage/positioning, stopping, and not yielding to other vehicles. Findings will be contrasted with error patterns reported by highway patrol officers concerning crashes with drivers with dementia. Attendees will learn about the value of on-road testing and the strengths/difficulties of error standardization in scoring.

## **THE ROLE OF PERCEPTIONS ON DRIVING EXPOSURE IN OLDER POST-STROKE DRIVERS**

T. Stapleton, *Occupational Therapy, Trinity College Dublin, Dublin, Ireland*

The literature indicates older drivers reduce their driving exposure post-stroke. However, whether perceptions influence the decision to restrict and ultimately stop driving is not well understood in older drivers post-stroke. This study examined 35 older drivers with stroke (Median age of 65) who underwent an on-road driving assessment. The entire sample was considered safe to drive (100%), albeit with some restrictions (e.g., daytime only, radius from home). At six-month follow up, 87% of the sample was still driving; 53% reported similar exposure rates and 72% considered their driving ability comparable to pre-stroke, respectively. Those who reportedly reduced their driving exposure had significantly lower perceptions of their driving ability. This presentation will discuss the role of perceptions on self-reported driving exposure and perceived driving abilities. Proper planning for driving cessation is warranted in older post-stroke drivers who self-regulate as lower perceptions may mediate the process to driving cessation.

## **THE POTENTIAL OF SIMULATORS AS A REHABILITATION TOOL TO IMPROVE DRIVING PERFORMANCE IN OLDER DRIVERS WITH NEUROLOGICAL IMPAIRMENTS**

E.Y. Uc, *1. University of Iowa, Iowa City, Iowa, 2. Veterans Affairs Medical Center, Iowa City, Iowa*

The effects of neurological and neurodegenerative disorders can impair the ability to drive safely. Disorders such as Parkinson's disease (PD), Alzheimer's disease (AD) and stroke can impair perception, cognition and motor function. While most studies examine ways to identify unsafe drivers, few have examined methods to maintain and prolong safe driving. Driving simulators can help characterize patterns of driving errors that are challenging but safe compared to on-road testing. Additionally, there is preliminary evidence that driving simulators can be used as a rehabilitation strategy to improve driving performance. We will present the findings of various rehabilitation interventions that have improved driving performance and reduce crash risk in PD and stroke. We will also discuss how these findings can be extended to interventions targeting older drivers in general and those with mild cognitive impairment. Our findings will highlight the potential of simulators in the rehabilitation of older drivers with neurological/neurodegenerative disorders.

## **SESSION 950 (SYMPOSIUM)**

### **METHODS OF CREATIVE EXPRESSION AND ENGAGEMENT FOR PERSONS WITH DEMENTIA**

Chair: *L. Snyder, Shiley-Marcos Alzheimer's Disease Research Center, University of California, San Diego, La Jolla, California*  
Discussant: *R.G. Logsdon, University of Washington, Seattle, Washington*

This symposium addresses the role that the arts can play in enhancing, shaping, or facilitating quality of life and well-being for persons with dementia and their family members by providing meaningful activity, opportunity for expression or creative exploration, and shared normative activities. Mittelman provides findings from her pilot study on the benefits of a chorus for persons with dementia and their caregivers. Morhardt discusses an improvisational theatre experience for persons with early-stage dementia and its impact on quality of life. Ataie reports on qualitative data from her study using photovoice to explore issues of identity and coping in persons with early-stage dementia. Gwyther reports on a community collaboration of state level arts and Alzheimer's groups that aims to introduce people with dementia and their families to a series of arts events to promote social support and engagement. Snyder concludes with a discussion of survey data from docents who conduct arts and culture related tours for persons with dementia that reveals how these interactions can reduce negative stereotypes and assumptions about people with dementia. Together these studies affirm the enduring capacity of people with dementia to express themselves through creative engagement. Such engagement also benefits society at large by inspiring community collaborations and helping to reduce isolation and stigma surrounding dementia.

### **A PILOT STUDY OF A CHORUS FOR PEOPLE WITH DEMENTIA AND THEIR FAMILY CAREGIVERS**

M.S. Mittelman, C. Epstein, *Psychiatry, NYU Langone School of Medicine, New York, New York*

We recently instituted a chorus for people with dementia (pwd) together with their family members that rehearses weekly for periodic concerts. Eleven dyads enrolled and none dropped out. Pwd were in the mild to moderate stage of dementia. On pre-post measures, self-esteem, health related quality of life and social support improved for at least half the caregivers; self esteem, quality of life and communication with family improved for at least half the pwd. In focus groups and take-home questionnaires, caregivers consistently reported looking

forward to the rehearsals, enjoying the sense of community, comradery and lack of stigma, and that their relatives with dementia were singing at home. Pwd all said they enjoyed participating and talked with their relatives about the chorus afterwards. The pilot study revealed the difficulties of quantitative evaluation of this kind of intervention, despite the obvious pleasure it provides to participants, the chorus conductors and the audience.

### **THE MEMORY ENSEMBLE: AN IMPROVISATIONAL THEATRE INTERVENTION FOR PERSONS WITH EARLY STAGE DEMENTIA**

D.J. Morhardt<sup>1</sup>, M.C. O'Hara<sup>1</sup>, C.M. Dunford<sup>2</sup>, *1. Cognitive Neurology and Alzheimer's Disease Center, Northwestern University, Chicago, Illinois, 2. Lookingglass Theatre Company, Chicago, Illinois*

A National Institute on Aging Alzheimer's Disease Center and a theatre ensemble partnered to create an improvisational intervention for persons with early to moderate stage dementia. Since the 7-week pilot session (N=6), two additional eight-week sessions were conducted during 2010-2011 (N=22). Pre-post measures were administered, in addition to written evaluations and documented field notes by program staff. Field notes revealed subjects experienced feelings of success and empowerment. Subjects found the intervention mentally stimulating, were better able to accept their diagnosis and cope with cognitive changes, and felt less isolated and alone. Pre-post measures revealed trend toward improved quality of life. Results suggest this is a cognitively stimulating and emotionally supportive intervention for persons with dementia.

### **'RECLAIMING WELLBEING': A PHOTOVOICE PROJECT WITH PEOPLE WITH EARLY-STAGE DEMENTIA**

J.E. Atai, *Portland State University School of Social Work, Vashon, Washington*

This study used photovoice methodology to explore how people with early-stage dementia use their perceived strength and resources to cope with the illness. Purposive sampling was used to recruit participants. Thirteen women & seven men age 57 to 90 (mean 73.4) and MMSE scores ranging from 20 to 28 (mean 25.6) participated in the project. Participants were provided with a disposable camera and invited to take photographs relevant to their wellbeing. The photographs provided the means for participants to take the lead in dialogue sessions about their coping response. Grounded theory analysis revealed that the participants perceived the adjustment to living with early-stage dementia as a process. Initially, the illness precipitated a disruption in wellbeing but over time, the participants reclaimed wellbeing while acknowledging the inconceivable notion of losing their cognitive abilities. They reconstructed identity, rebuilt relationships, recalibrated emotions, reestablished healthy living, regained control, and restored meaning and purpose.

### **AN OVERVIEW OF TWO MODELS OF COMMUNITY ARTS-BASED COLLABORATIONS FOR PERSONS WITH DEMENTIA AND THEIR CARE PARTNERS**

L. Snyder<sup>1</sup>, L.P. Gwyther<sup>2</sup>, *1. Shiley-Marcos Alzheimer's Disease Research Center, University of California, San Diego, La Jolla, California, 2. Duke Center for Aging, Durham, North Carolina*

Community collaborations that engage persons with dementia in the arts provide meaningful activity and can challenge prevailing stereotypes about this population. We present two models of such collaborations. Arts Link North Carolina connects persons with dementia to cultural experiences through a collaboration of state arts and Alzheimer's groups. A pilot calendar of arts programs offers museum and musical/theatrical small group residencies to engage persons with dementia and care partners with artists. Evaluation strategies assess reduction of stigma, isolation, and marginalization of program participants. In San Diego, California, over 50 community-based arts and culture organi-

zations provide docent-led tours for persons with dementia through Out and About – a program of the University of California, San Diego Shiley-Marcos Alzheimer's Disease Research Center. A survey of docents reveals ways in which conducting tours for this population can change prevailing stereotypes about the abilities of persons with dementia, contribute to greater awareness, and reduce stigma.

## **SESSION 955 (SYMPOSIUM)**

### **NEW FRONTIERS IN TECHNOLOGY USE TO MONITOR, ENGAGE, AND STRENGTHEN OLDER ADULTS**

Chair: *S.L. Szanton, Johns Hopkins University, Baltimore, Maryland*  
Discussant: *L.N. Gitlin, Johns Hopkins University, Baltimore, Maryland*

Technology is increasingly penetrating through to all age groups. As technology use increases in older adults, so does the opportunity to use it to improve their lives. These possible improvements include understanding older adult technology use to improve it, using technology to monitor their physical activity, and using technology to increase their activity. This symposium will provide a range of perspectives on technology with older adults. The first presenter reports results that show the degree to which spatial problem solving relates to successful internet searches for health information among highly educated older adults controlling for health literacy, education and internet use. The second presentation reports results from a pilot trial of a modified Nintendo Wii gaming system with disabled older adults. Feasibility, acceptability, strength and balance improvements will be reported as well as its potential for use as a tele-health device which can communicate with caretakers and health care providers. The third presenter will report use of a precise tracking device to capture low-intensity activity, such as shuffling or very slow walking. Even this low level of activity was associated with less mobility difficulty and more lower-extremity strength, which are important factors for preserving mobility and daily functioning. The fourth presenter will report data on mobility profiles for 15 older adults who wore tracking devices for 5 days including time in the home, number of trips outside the home and frequent visiting of community locations. Dr. Laura Gitlin at Johns Hopkins University will discuss the implications of these four studies.

### **THE IMPORTANCE OF COGNITIVE STYLE FOR ONLINE HEALTH LITERACY: EVIDENCE FROM THE ONLINE HEALTH STUDY**

E.M. Agree, *Population, Family, and Reproductive Health, JHSPH, Baltimore, Maryland*

Despite rapid growth in internet use, older people often report difficulty using the internet to find health information. In this study, we examine the relationship of cognitive style to success using the Internet to answer health-related questions. From 2009-2010, at Johns Hopkins and Stanford Universities, 330 subjects ages 35-90 performed online searches for health information. Measures of health literacy, cognition, health status, and computer experience were collected. The sample is 56% female, highly educated (91% with a BA); and have good health literacy (mean REALM=127). The Group Embedded Figures Test (GEFT) was used to assess spatial problem solving. Results show that, controlling for education, Internet use, and health literacy, GEFT score is strongly associated with greater success, but does not eliminate the disadvantage of the oldest participants (age 70+) in successfully obtaining online health information. Findings suggest that spatial analytic skills may modify age-related difficulty in finding online health information.

## LOW INTENSITY ACTIVITY IS ASSOCIATED WITH BETTER PHYSICAL FUNCTION

V.R. Varma, E. Tan, T. Wang, Q. Xue, L.P. Fried, C.L. Seplaki, T. Seeman, M. Carlson, *Center on Aging and Health, Johns Hopkins University, Baltimore, Maryland*

Evidence suggests that recommended levels of physical activity may represent unrealistic targets for many older adults to adopt, particularly older, African American adults who may experience a lack of physical activity opportunities due to environmental and neighborhood characteristics. While the current physical activity guidelines focus on moderate to vigorous-intensity physical activity, low-intensity activity may yield health benefits. Using a sensor placed on the ankle that can directly measure intensity and frequency of activity per minute, we observed that higher levels of low-intensity activity were associated with less mobility difficulty and better lower-extremity strength. Our findings suggest that more precise measurements of low-intensity levels of physical activity, which may be very prevalent in older adults, were associated with better function in cross-section. The metrics developed to measure patterns of physical activity further suggest that increasing levels of low-intensity physical activity represents an achievable target by which to promote significant health improvements.

## ENRICHING MEASURES OF OLDER ADULTS' LIFESTYLE ACTIVITY AND DAILY INTERACTION WITH THEIR SOCIAL ENVIRONMENT

M. Carlson, V.R. Varma, G. Harris, A. Adam, A. Zhan, *Center on Aging and Health, Johns Hopkins University, Baltimore, Maryland*

We report on the results of a successful pilot study of life style activity conducted over five days in 15 neurocognitively and functionally well-characterized older, community-dwelling adults using portable devices to continuously collect GPS location in combination with accelerometry and daily diaries. We developed individual mobility profiles using the following metrics: 1) amount of time spent in and outside the home, 2) total distance travelled away from home per day, 3) number of trips outside the home, and, 4) "hot spots" of frequent activity using ArcGIS to identify community locations frequently visited, including religious centers, stores, malls, and park spaces. Our results confirm feasibility, adherence, and fidelity in obtaining real-time information about individuals' daily interaction with their social environment. This information allows us to develop a richer picture of the amounts and types of activities that are beneficially linked to cognitive and functional health and quality of life.

## SESSION 960 (SYMPOSIUM)

### NEW PERSPECTIVES ON LONELINESS

Chair: C. Victor, *Brunel University, London, United Kingdom*

Co-Chair: M. Sullivan, *Brunel University, London, United Kingdom*

Discussant: K.M. Bennett, *Liverpool University, Liverpool, United Kingdom*

There is now a significant body of work from a range of different countries examining the prevalence of loneliness amongst older people. Studies conducted in Britain, North America, Australia and Northern Europe consistently report rates of significant loneliness amongst the general population aged 65+ in the range of 5-10% with a further 20% categorised as 'sometimes' lonely. There are also a range of studies indicating that loneliness is associated with a range of negative physical and mental health outcomes including mortality and with elevated health service utilisation. Researchers have also sought to examine key socio-demographic correlates of loneliness such as age, gender and ethnicity. In this session we examine the prevalence and risk factors for 'special' populations of older people that are under-represented in our general population surveys. Thus we focus upon examining loneliness amongst relatively neglected populations of older people such as those living alone, minority populations and those living in rural areas.

## LONELINESS AND LIVING ALONE IN OLDER AGE: AN INVITATION TO STEP INTO THE MESO AND MACRO LEVEL OF ANALYSIS

E. Portacolone, *San Jose State University, Berkeley, California*

Living alone in older age is often associated with loneliness. This paper invites social gerontologists to adopt a broader perspective. The author invites social gerontologists to move from the study of the subjective-micro experience of loneliness to the analysis of meso and macro factors possibly associated with loneliness. The invitation stems from the findings of a two-year ethnography of 47 San Franciscans over 75 living alone. The adoption of a multi-focus (micro/subjective, meso/cultural institutional, and macro/political economic) lens pointed to the possible role of tangible and intangible resources in influencing someone's loneliness. Whereas the micro level is concerned with the subjective evaluation of social engagement, opening up the frame allows a reflection on the reasons behind the scarcity of some resources related to social engagement. It also allows the reflection on other facets of loneliness indirectly related to social engagement, such as being unequipped to cope with several compounding challenges.

## LONELINESS AMONGST ETHNIC MINORITY ELDERS: PRELIMINARY RESULTS OF A SURVEY IN ENGLAND AND WALES

C. Victor<sup>1</sup>, V. Burholt<sup>2</sup>, 1. *Brunel University, Uxbridge, United Kingdom*, 2. *Swansea University, Swansea, United Kingdom*

For those aged 65+ in Britain research has consistently reported the prevalence of loneliness at approximately 8-10%. There is limited evidence examining the prevalence of loneliness amongst older people from ethnic minorities. We report the prevalence of loneliness, measured using both a self-report measure and the de Jong Gierveld scale, for those aged 65+ years using data from a direct interview survey of 600 people from the key minority groups growing old in Britain (Indian, Pakistani, Bangladeshi, African Caribbean, and Chinese). We draw explicit comparisons for these groups with the prevalence of loneliness reported for the general population and with older people in their countries of origin. Preliminary analysis demonstrates an overall prevalence of 17%. The highest rate of loneliness at 22% was demonstrated by the Pakistani population with only those from those from the Indian population reporting a prevalence rate of 9% which approximately to the national norm.

## TESTING THE COGNITIVE DISCREPANCY THEORY: THE IMPACT OF RURALITY AND DEPRESSION ON LONELINESS

V. Burholt<sup>1</sup>, T. Scharf<sup>2</sup>, 1. *Centre for Innovative Ageing, Swansea University, Swansea, United Kingdom*, 2. *National University of Ireland, Galway, Galway, Ireland*

Previous research on loneliness tends to provide a posteriori explanation of analytical findings. By contrast, this paper develops an a priori conceptual model and uses individual (health and psychological), social and environmental factors to hypothesize a pathway from poor health to loneliness in later life. The conceptual moderated-mediation model is validated using a nationally representative dataset of older people living in the Republic of Ireland (n=8178) to test the cognitive discrepancy theory. Loneliness is the dependent variable. Health is the independent variable which we hypothesize impacts on achieved levels of social interaction through its influence on mobility and social resources (mediators between health and loneliness). We hypothesize that rural environments will amplify any difficulties associated with mobility or accessing social resources (i.e. moderating pathways between health and the mediators) and that depression influences the desired level of social contact and support (i.e. moderating pathways between the mediators and loneliness).

## NEW DEVELOPMENTS IN LONELINESS INTERVENTIONS: RESEARCH AND PRACTICE

N. Stevens, *Radboud University, Nijmegen, Netherlands*

A recent meta-analysis of loneliness interventions concluded that interventions aimed at influencing social cognitions were more effective than those aimed at improving social support or contact. No difference in effects of group versus individual interventions were found, technology was only effective in non-randomized studies. Also interventions worked better for males than females. Since the meta-analysis was published, new intervention studies have appeared. These include a bereavement visiting program, a telephone befriending scheme for socially isolated elders, programs providing elders opportunities for playing Wii regularly and for using video conferencing to enhance family visits with nursing home residents, and psychosocial group rehabilitation for lonely older persons. Some of interventions are in line with the meta-analysis whilst others are not; issues raised include qualitative versus quantitative measures of effects of an intervention, the importance of understanding for whom effects are positive, neutral or possibly negative, and the importance of gender

## OLDER IMMIGRANTS IN CANADA: SOCIALLY INTEGRATED OR CONFRONTED WITH FEELINGS OF LONELINESS?

J. Gierveld<sup>1,3</sup>, S. Van der Pas<sup>2</sup>, N. Keating<sup>3</sup>, J. Fast<sup>3</sup>, 1. *Netherlands Interdisciplinary Demographic Institute (NIDI), The Hague, Netherlands*, 2. *Department of Epidemiology and Biostatistics, EMGO Institute for Health and Care, VU University Medical Center, Amsterdam, Netherlands*, 3. *Department of Human Ecology, University of Alberta, Edmonton, Alberta, Canada*

Canada is one of the main migrant receiving countries. This study aimed at exploring the social integration versus loneliness of older immigrants in Canada, as compared to older adults born in the country. We used data from the Canadian General Social Survey, Cycle 22 (N older adults = 4345). Dependent variable is the 6-item De Jong Gierveld loneliness scale. Determinants of loneliness included: sex, age, educational level, subjective health, region of birth, age at arrival, the network of familial and non-familial relationships, as well as satisfaction with the communication with network members. Results showed that immigrants are significantly lonelier than older adults born in Canada. Multivariate analyses identified the most important determinants of loneliness, but at the end, the level of loneliness of older immigrant adults in Canada was still significantly higher than the level of loneliness of the non-immigrant older population.

## SESSION 965 (SYMPOSIUM)

### OUTCOMES OF AGE DIFFERENCES IN EMOTIONAL GOALS

Chair: *H. Fung, Department of Psychology, Chinese University of Hong Kong, Hong Kong, China*

Discussant: *D. Isaacowitz, Northeastern University, Boston, Massachusetts*

Socioemotional theory argues that as people age, they shift their focus from knowledge-related goals to emotionally meaningful goals. Affect Valuation Theory further postulates that the type of emotions that people seek, known as ideal affect, may differ across age and culture. Although both of these theories have received empirical support, the consequences of such age differences in emotional goals on the everyday life of older adults have not been adequately studied. To fill in this gap, this symposium reports four papers that examine the outcomes of age differences in emotional goals from different perspectives. Jiang and colleagues address this question from the perspective of ideal affect. They examine how the discrepancy between actual and ideal affect may be differentially related to subjective well-being and depression among young, middle-aged and older adults. Then, Sims and Tsai link these

age differences in ideal affect to decision making. They examine whether age differences in ideal affect predict preferences for health care options. Next, Fung and You investigate the outcomes of age differences in goals from the perspective of physiology. They examine how approach-avoidance social motives influence anger-related physiological responses under different relationship contexts among younger and older adults. Finally, Yeung and colleagues study age differences in goals in the workplace. They compare conflict styles between younger and older workers and assess their impacts on work-related outcomes and psychological well being. Our discussant, Derek Isaacowitz, will discuss the above findings in terms of the theoretical and practical significance of studying age differences in goals.

## ANGER RESPONSES IN RELATIONSHIPS: IMPACTS OF AGE AND APPROACH-AVOIDANCE MOTIVES AMONG HONG KONG CHINESE

H. Fung<sup>1</sup>, J. You<sup>2</sup>, 1. *Chinese University of Hong Kong, Hong Kong, Hong Kong*, 2. *Department of Psychology, University of Houston, Houston, Texas*

The experimental study investigated age difference in anger responses under relationship contexts and how such difference would be shaped by approach-avoidance motives among Hong Kong Chinese females. After priming approach-avoidance social motives, we asked 69 older and 102 younger females to recall the anger-eliciting events that occurred in kinship or friendship, and assessed their subjective feelings and cardiovascular reactivity. Results indicated that, when recalling anger-eliciting events in friendship, older females reported higher low-arousal positive affects and displayed longer inter-beat interval (IBI) in the approach-priming condition than in the avoidance priming condition, but such an effect was absent among younger females. When recalling anger-eliciting events in kinship, younger females showed lower heart rate (HR) in the approach-priming condition than in the avoidance-priming conditions, but no such effect was found among their older counterparts. These findings have implications for understanding the biopsychosocial mechanisms underlying the health effects of negative interpersonal events.

## AGE DIFFERENCES IN IDEAL AFFECT: DO OLDER PEOPLE VALUE THE SAME AFFECT AS YOUNGER PEOPLE?

D. Jiang<sup>1</sup>, M. Sit<sup>1</sup>, H. Fung<sup>1</sup>, J.L. Tsai<sup>2</sup>, 1. *Psychology, Chinese University of Hong Kong, Hong Kong, Hong Kong*, 2. *Stanford University, Stanford, California*

Socioemotional selectivity theory argues that people prioritize emotionally meaningful goals as they get older. Ideal affect may be considered to be the emotionally meaningful goal that people seek with age. The present study examined age differences in ideal affect among 321 Hong Kong Chinese aged 18 to 89 years. Controlling for actual affect, Hong Kong Chinese valued low arousal positive states (LAP; e.g., calm, relaxation) more than high arousal positive states (HAP; e.g., excitement, enthusiasm) across the three age groups (i.e., younger, middle-aged, and older people). Controlling for the demographics and health, the discrepancy between ideal and actual affect accounted for SWB but not depression in older people; SWB and interpersonal depression in middle-aged people; and emotional depression but not SWB in younger people. The results suggest that although ideal affect may not differ much across adulthood, it regulates SWB and depression differently among different age groups.

## DO OLDER AND YOUNGER EMPLOYEES HANDLE WORKPLACE CONFLICTS DIFFERENTLY?

D. Yeung<sup>1</sup>, H. Fung<sup>2</sup>, D. Chan<sup>2</sup>, 1. *City University of Hong Kong, Hong Kong, Hong Kong*, 2. *Chinese University of Hong Kong, Hong Kong, Hong Kong*

Socioemotional selectivity theory stresses that older adults focus more on emotionally meaningful goals when they perceive future time

as increasingly limited (Carstensen, 2006). When handling conflict with social partners, older adults' emphasis on emotional goals may motivate them to concern more for other parties, instead of personal interest. It is speculated that the way individuals handle workplace conflicts would be guided by their goal orientation. This study examined conflict styles and motivational orientation between younger and older employees and assessed their impacts on work-related outcomes. The sample consists of 300 Chinese executive employees. Preliminary analyses showed that as compared with younger counterparts, older employees were less likely to use dominating and comprising conflict strategies at work. They also exhibited stronger cooperation and less competition motivation in the conflict situations. The effects of age-related differences in conflict styles and motivations on work-related outcomes and psychological well-being would be also discussed.

#### **AGE DIFFERENCES IN CHOOSING EMOTIONALLY-FRAMED HEALTH CARE OPTIONS ACROSS CULTURES**

T. Sims<sup>1</sup>, J.L. Tsai<sup>1</sup>, M.K. Goldstein<sup>1,2</sup>, 1. *Stanford University, Stanford, California*, 2. *VA Palo Alto Health Care System, Palo Alto, California*

Evidence suggests that in an effort to enhance positive affect, older adults attend more to, prefer, and are more motivated by positively (versus negatively) framed health information compared to younger adults. Research has also shown cultural and age-related variation in the type of positive affect people want to feel (e.g., calm and excitement). In a series of studies converging these two lines of research, we examined preferences for positively framed physicians that promote feeling calm or excitement. We compared young, middle aged and older adults in two cultural contexts, European American (EA) and Chinese American (CA). We predicted that older adults would prefer the calm physician more than younger adults across cultures. Moreover, we predicted that CAs would prefer the calm physician more than EAs. Consistent with our hypothesis, older CAs were more likely to choose the calm physician than younger. Contrary to our expectation, we found no age differences in physician preference among EAs. We discuss implications for optimizing health care utilization across the life span and reducing health disparities.

#### **SESSION 970 (SYMPOSIUM)**

##### **UNDERSTANDING OLDER MEN'S PERSPECTIVES ON DEPRESSION AND SUICIDE IN PRIMARY CARE: RESULTS FROM THE MEN'S HEALTH AND AGING STUDY (MEHAS)**

Chair: *L. Hinton, University of California Davis, Sacramento, California*

Discussant: *P.A. Arean, University of California San Francisco, San Francisco, California*

Older men are less likely to be treated for depression and more likely to commit suicide compared with older women. Primary care is a critical site for treatment of depression and prevention of suicide in older adults. However, there are important gaps in our knowledge about how older men experience depression and suicidal ideation, their preferences for treatment in primary care settings and how best to assist older men with suicidal ideation. This symposium will present findings from the Men's Health and Aging Study (MeHAS) to address these gaps in our knowledge. MeHAS is a mixed-method study funded by the National Institute on Mental Health that examined barriers and facilitators of depression care among age 60 and above men white Hispanic and Mexican-origin men in primary care settings in California's Central Valley. Over 360 older men were screened and a subsample of 108 with clinical depression and/or depression treatment were identified, 77 of whom successfully completed a follow-up in-depth interview. The four presentations in the symposium include 1) an overview of the MeHAS design and methods including the complementary use of both qualitative and structured approaches in the in-depth interview, 2) a qualita-

tive analysis of men's depression attributions, 3) a qualitative analysis of what stops older men from committing suicide and 4) a quantitative analysis of older men's depression care preferences, including similarities and differences among older white Hispanic and Mexican-origin men. Each presentation will highlight practical implications of the findings for primary care based treatment of depressed older men.

##### **DESIGN, METHODS AND COMPLEMENTARY USE OF QUANTITATIVE AND QUALITATIVE APPROACHES IN THE MEN'S HEALTH AND AGING STUDY (MEHAS)**

L. Hinton, *Psychiatry and Behavioral Sciences, University of California, Sacramento, California*

Older men are more likely than older women to receive treatment for their depression and are also at increased risk for suicide. The Men's Health and Aging Study (MeHAS) is an NIMH funded study examining barriers and facilitators of depression care for older men in primary care settings. In this paper, we present the design and methods of MeHAS, highlighting the complementary use of both qualitative and quantitative methods. Quantitative methods in MeHAS included a survey and structured elicitation of treatment preferences (i.e. conjoint survey). Qualitative methods in MeHAS included in-depth qualitative interviews with older men (n=77) and with primary care physicians (n=17). To illustrate the strength of the combined use of both quantitative and qualitative methods in this study, we will present data on convergence of results from analyses of both qualitative and quantitative data around the theme of family involvement in older men's depression care.

##### **CAUSAL ATTRIBUTIONS OF DEPRESSION AMONG WHITE-NON-HISPANIC AND MEXICAN-ORIGIN OLDER MEN**

E. Apesoa-Varano, *Betty Irene Moore School of Nursing, UC Davis, Sacramento, California*

Research has examined causal attribution models in a variety of illnesses. However, we know little about what depressed older men attribute their depression to, especially Mexican-origin men (MO). By causal attributions we mean the way in which the men experiencing illness symptoms identify and describe the source/s or cause/s of their illness. The aims of this study are to a) describe the illness attributions of depressed older men, and b) compare the illness attributions of depressed White-non-Hispanic (WNH) and Mexican-origin older men. In-depth semi-structured interviews with 77 (WNH=47, MO=30) depressed older men recruited for the Men's Health and Aging study (MeHAS) were analyzed per standard qualitative techniques. We found that the most commonly identified depression attributions are 1) declining physical health, 2) economic problems, 3) lack of and/or conflictive social relationships, 4) substance use, and 5) caregiving. The cross-ethnic comparison showed that MO men did not identify substance use and caregiving as causes of their depression while WNH men did. These findings have implications for building social-behavioral models of depression attribution.

##### **OLDER MEN'S PERSPECTIVES ON WHAT HAS STOPPED THEM FROM SUICIDE AND HOW TO HELP OTHERS**

S. Vannoy<sup>1</sup>, M. Park<sup>1</sup>, J. Unutzer<sup>1</sup>, L. Hinton<sup>2</sup>, 1. *University of Washington, Seattle, Washington*, 2. *University of California, Davis, Davis, California*

Older men have the highest rates of suicide in the U.S. Little is known about how depressed older men think about suicide and what could be done to prevent suicide in their peers. Our paper fills this gap by identifying practical ways to prevent suicide behaviors. The data consisted of 76 face-to-face, in-depth interviews with depressed older men. We focused on two research questions: a) what stopped older men from completing suicide and b) what can be done to help suicidal older men. Participants were also asked if they had ever spoken to their primary care provider (PCP) about suicide and whether or not they would be

offended if their PCP inquired about suicide. We identified ten categories of what stopped older men from committing suicide and six categories for what can be done to help suicidal older men. The findings of these analyses yield useful information to guide PCPs in exploring suicide risk with their older, adult male patients.

#### **DEPRESSION TREATMENT PREFERENCES OF OLDER WHITE AND MEXICAN AMERICAN MEN**

M.D. Johnson<sup>1</sup>, E. Apesoa-Varano<sup>2</sup>, J. Hay<sup>3</sup>, J. Unutzer<sup>4</sup>, L. Hinton<sup>2</sup>, 1. *West Los Angeles VA, UCLA, Los Angeles, California*, 2. *UC Davis, Davis, California*, 3. *University of Southern California, Los Angeles, California*, 4. *University of Washington, Seattle, Washington*

To guide development of patient centered programs that would encourage depressed older men to enter and remain in treatment, we examined preferences for depression care and strategies to enhance treatment acceptance among older white and Mexican origin male primary care patients. 63 (45 white, 18 Mexican origin) older men were recruited at the time of their primary care visit. All met SCID criteria for major depression in the past year and/or were receiving depression treatment. Participants completed a conjoint analysis survey assessing preferences regarding depression treatments, providers, and treatment enhancements. White men were more likely to prefer medication over counseling, while Mexican origin men were less likely to prefer medication compared to counseling. Both white and Mexican origin men preferred treatment that included family involvement and treatment for insomnia. White men also preferred treatment by telephone. Findings could inform development of patient centered depression treatment programs for older men.

### **SESSION 975 (PAPER)**

#### **AGING AND SEXUALITY**

##### **ATTITUDES TOWARD EXTRAMARITAL SEX IN THE CONTEXT OF SPOUSAL ALZHEIMER'S DISEASE**

A.S. London<sup>1,2</sup>, J. Wilmoth<sup>1,2</sup>, 1. *Sociology, Syracuse University, Syracuse, New York*, 2. *Aging Studies Institute, Syracuse, New York*

We use data from the National Social Life, Health, and Aging Project (NSHAP), a representative sample of adults aged 57 to 85 years, to examine how attitudes toward extramarital sex when a spouse has Alzheimer's disease compare to attitudes toward extramarital sex when a spouse has a chronic illness and general attitudes about extramarital sex. Overall, favorable attitudes toward extramarital sex are more likely when a spouse has dementia or a chronic illness: 67.3% reported that extramarital sex in the context of spousal dementia was always wrong, 14.9% reported it was almost always wrong, 8.6% reported it was wrong only sometimes, and 9.2% reported it was not wrong. The comparable percentages for when a spouse has a chronic illness were 67.3%, 15.2%, 7.8%, and 9.8%, while for extramarital sex generally, they were 80.9%, 14.7%, 3.0%, and 1.8%. In ordered logistic regression analyses, the odds of having more favorable attitudes toward extramarital sex were consistently higher among those reporting: college education or more; income of \$50,000 or more; prior incarceration; and being currently divorced/separated or never married. The odds of having less favorable attitudes were consistently higher among Protestants, Catholics, and persons affiliated with "other" religions (compared to those with no religious affiliation) and among those who reported that their religious beliefs were important in their daily lives. Caregiving for a spouse was not significant. The results are discussed in relation to demographic trends, popular discourses, and implications for providers who work with persons with Alzheimer's disease and their spouses.

#### **THE IMPACT OF SEXUAL INTEREST ON HEALTH OUTCOMES IN OLDER ADULTS**

C. Sharpe, S.S. Reynolds, *USF School of Aging Studies, Tampa, Florida*

The literature on sexuality in older adults suggests that a healthy sex life is an important component of successful aging, including maintenance of physical health. In this cross-sectional study of 3800 men and women age 39-85, we use the US National Health Measurement Study to examine the effect of sexual interest on older adults' health. Health outcomes include arthritis, back pain, coronary heart disease, depression, diabetes, and sleep disorders. Independent variables include sexual interest, socio-demographics, medications and self-reported health and disability factors. Logistic regression results indicate that low sexual interest is associated with increased risk of back pain, coronary heart disease, depression, and sleep disorders, but not arthritis or diabetes. The most consistent other factors were fatigue, black race, medications, and ADL impairment. Further research on other measures of sexual desire, activity, and satisfaction are needed to fully understand the importance of sexuality for older adults' health.

#### **IN THE SHADOW OF SEXUALITY: SOCIAL SUPPORT AND HEALTH CHALLENGES IN THE LIVES OF OLDER, AFRICAN AMERICAN SEXUAL MINORITIES**

M.R. Moore<sup>1</sup>, R. Andersen<sup>2</sup>, 1. *University of California, Los Angeles, Los Angeles, California*, 2. *University of California, Los Angeles, Los Angeles, California*

This paper seeks to broaden the focus of aging research by examining the interaction of racial group membership and sexual orientation as it relates to dimensions of social support. It analyzes participant-observation, focus group and in-depth interview data from an NIH Diversity Supplement study of 40 African Americans who were born before 1955 and who self-identify as lesbian, gay, bisexual, or same-gender-loving. While past studies of aging in Caucasian lesbians and gay men have assumed that homophobia results in geographically distant relationships between gay people and their kin, findings from this work suggest that some African American sexual minority elders live in close proximity to family members and sustain closer relationships with kin than we have previously assumed. However, they also maintain a particular type of silence and discretion around their sexual orientation. This silence has the consequence of making them appear more available to family members as sources of economic and social support. Because they keep their intimate relationships private and in a separate realm of their lives, extended kin perceive them as single, stable, and particularly available to care for others. These kin may not be aware of the supports sexual minority elders in their families need. Instead of receiving social support from family, some seniors are consistently and predominantly providing resources and care to family members (i.e., taking in elderly parents or nephews and nieces when adult siblings are incapacitated). While prior research on social support has assumed this relationship operating through a one-way exchange with gay elders as the recipients of support, an examination of these systems among older African Americans suggests that we must also consider ways that social support operates as an exchange in the opposite direction, or as a multi-directional exchange. Despite sexual minority status, many older gay racial minorities report close relationships with family members but remain distant in the types of information they are willing to share about their lives. They provide substantial instrumental support to kin but may not receive sufficient emotional support to mitigate experiences of loneliness and social isolation that increase with age. These findings have important implications for how we conceptualize "open" and "hidden" expressions of gay sexuality in older cohorts, the relationships aging sexual minorities have with kin and others in their racial communities, and the development of interventions to address health inequities for this population.

## RELATIONSHIP POWER & CONTROL AMONG SINGLE HETEROSEXUAL MIDLIFE WOMEN: CORRELATES OF CONDOM USE & TRADITIONAL GENDER ROLE IDEOLOGY

P.P. Brown, 1. *Sociology and Gerontology, Miami University, Oxford, Ohio*, 2. *University of Central Missouri, Warrensburg, Missouri*

Sexual relationship power (SRP) and relationship control (RC) are thought to be related to traditional gender role ideology and are important in negotiating condom use in unmarried, heterosexual couples. Presently, there are increasing numbers of unmarried middle-aged adults who may have not had access to information about the benefits of condom use in preventing the spread of STIs. Linear regression analyses were conducted to answer the following research question: what variables contribute to the ability to predict SRP and RC for single middle-aged heterosexual women? Variables contributing to the prediction of SRP were higher decision-making dominance (DM) and higher scores on the Sex Role Egalitarianism Scale (SRES), while higher income, higher education, and consistent male condom use were weakly or not at all related to higher SRP. Variables contributing to the prediction of RC were higher SRP and SRES while higher education, consistent male condom use, and higher income were not related to higher RC. The data supported the concept that more egalitarian attitudes and higher control over DM predicts higher SRP-RC, while the data did not support previous research indicating that higher income and education is indicative of higher SRP-RC. The data also indicated that consistent male condom use is not related to SRP-RC, contradicting previous beliefs and research.

## SESSION 980 (PAPER)

### COGNITIVE INTERVENTIONS

#### A RANDOMIZED CONTROLLED TRIAL OF COGNITIVE TRAINING IN MIDDLE AGED AND OLDER ADULTS

F.D. Wolinsky, M.W. Vander Weg, M. Howren, M.P. Jones, M.M. Dotson, *College of Public Health, University of Iowa, Iowa City, Iowa*

Background: Age-related cognitive decline is common, affects multiple cognitive functions, and begins by age 45, if not sooner. These declines may result in substantial difficulties and disabilities in everyday life, making the identification of interventions that delay, prevent, or reverse cognitive decline clinical and public health priorities. Methods: We randomized 681 participants within two age strata (50-64 vs. > 65) to a four-arm controlled trial using three modes of delivering a second-generation visual speed of processing (VSP) cognitive intervention (on-site with vs. on-site without booster training vs. at-home training) compared to attention control training using a computerized cross-word puzzle program. Six neuropsychological tests were assessed at baseline and one year later. General linear models for repeated measures were used to evaluate main effects for treatment group and age strata, as well as their two-way interaction. Results: Among the 620 (91%) participants with complete data, all VSP delivery modes had statistically significant small to medium effect size improvements on the Useful Field View, Trail Making A and B, and Symbol Digit Modalities Tests of divided attention (faster completion times or more correct symbol-digit matches). Effect sizes were comparable across the three VSP delivery modes and for both age strata. Conclusion: This study demonstrated that 10 hours of well-tolerated and enjoyable VSP training delivered either on-site or on a home PC using a complex video game resulted in important improvements in cognitive function among 50-87 year olds. Wide spread implementation of this VSP training appears feasible and may reverse age-related cognitive decline.

#### OLDER ADULTS' SUBJECTIVE ENGAGEMENT WITH A HOME-BASED VIDEO GAME TRAINING PROGRAM

P. Belchior<sup>1</sup>, M. Marsiske<sup>2</sup>, 1. *McGill University, Montreal, Quebec, Canada*, 2. *University of Florida, Gainesville, Florida*

Introduction: This study examined older adults' Flow experience (or engagement with) a home-based video game training program. Flow has been defined as an optimal psychological state thought to occur when people are able to meet the challenges of a given task or activity with appropriate skills, and accordingly feel a sense of well-being, mastery, and heightened self-esteem. Methods: Thirty six participants, mean age 73 years (range = 65 to 86 years), took part in this study. Participants were randomly assigned to two different conditions: 1) computer-based training (Insight by PositScience) in visual attention or 2) video game practice (i.e., Crazy Taxi). Both training conditions were home based; participants were asked to engage for 12 weeks (minimum of 5 hours a week). The outcome measure, the Flow Questionnaire, was completed at the end of each training session, although it was only required three times a week. Participants each provided between 36 and 84 flow ratings. Results: A linear growth model revealed that both groups experienced significant increase in Flow over the period ( $p < .001$ ), but a Group X Time interaction revealed that participants in the Crazy Taxi group experienced more increase in Flow ( $p < .001$ ), "catching up" to the initially higher Insight group. Discussion: The findings are consistent with Csikszentmihalyi's Flow theory. The Insight training program provides clear feedback and is adaptively adjusted to individual's level, allowing participants to experience game mastery from the beginning. Crazy Taxi game is less structured, but with practice mastery experiences increase, leading to increases in Flow. The results are encouraging regarding older adults' continued motivation for and subjective experience with ongoing mental exercise.

#### IMPACT OF COGNITIVE TRAINING ON GAIT AND BALANCE: RESULTS FROM THE HEALTHY BRAIN, HEALTHY BODY PILOT STUDY

R. Smith-Ray, S.L. Hughes, T. Prohaska, *Univ of Illinois at Chicago, Chicago, Illinois*

Fall-related injuries are the 5th most common cause of death for older adults (Rubenstein, 2006). Risk factors for falls include impairments in gait, balance, and cognition including memory and attention (American Geriatric Society, 2001). This randomized controlled trial (RCT) tested whether cognitive training of executive functions over 10 weeks improves gait and balance in older adults. Participating residents of independent living facilities were randomly assigned to a cognitive training intervention or measurement-only control. Measurements were completed at baseline and 10 weeks. Primary outcomes included 10-meter walk test, 10-meter walk with cognitive distraction, and Timed Up and Go (TUG; proxy measure of balance). Secondary cognitive outcomes included Useful Field of View (UFOV) processing speed (UFOV-PS), divided attention (UFOV-DA), and selective attention (UFOV-SA), inhibition (California Older Adults Stroop Test), and visuospatial working memory (Corsi blocks forward and backward). Data were analyzed using one-way ANOVA models with change scores. The 51 participants were on average age 81.7, white (96%) and female (78%). Participants who completed the intervention experienced significant improvements in UFOV-PS [ $F(1,44) = 5.72, p = 0.021$ ] and UFOV-DA [ $F(1,41) = 9.55, p = 0.004$ ] and marginally significant improvements in TUG [ $F(1,36) = 3.44, p = 0.072$ ] and UFOV-SA [ $F(1,40) = 2.49, p = 0.123$ ] compared to participants who did not complete the intervention. This RCT demonstrates that cognitive training not only leads to improvements in cognitive tasks related to executive functions but also balance. Training aspects of cognition related to balance and gait may be a promising approach to falls prevention.

## THE MEMORY GAME: AN IPAD-BASED INTERACTIVE REMINISCENCE PROGRAMME TO AID THOSE WITH DEMENTIA

T.V. Wright<sup>1,2</sup>, M. Mulvenna<sup>1</sup>, 1. *Art & Design Research Institute, University of Ulster, Belfast, United Kingdom*, 2. *University of Texas Institute of Medical Humanities, Galveston, Texas*

In 2010, our pilot research project titled *The Art of Memory* (<http://trail.ulster.ac.uk/activities/art-of-memory/>), based at the University of Ulster, identified older peoples' attitudes to using photographs displayed on iPad tablets to reminisce as opposed to taking a photographic card-based approach. While the central findings of this research are discussed elsewhere (Mulvenna, Doyle, Wright et al 2011), the research provided the foundations for developing "The Memory Game": a visual media computer-based system for reminiscing. The 'game' designed to support the memories of people with dementia and has the added benefit of decreasing the caregivers' burden. When playing the game, the computer programme hyperlinks images, music, movie and news clips via a chronological timeline in the form of quiz. The overall aim is to encourage older people to engage in reminiscing in a way that is both engaging and fun. With material designed specifically for their age-group, the quiz element of the game is not so much goal-driven - taking part, recalling and discussing past events and memories are the key concerns. The paper examines central issues concerning visual images as stimulants for reminiscing and recall. It extends the narrative potential of studying the processes of reminiscence, particularly in the digital multi-media context and when the material is to be broadcast via mobile media devices.

## SESSION 985 (PAPER)

### MANAGING CHRONIC DISEASE

#### PERSONAL AND SOCIAL DETERMINANTS OF DIABETES SELF-CARE BEHAVIORS AMONG AGING MEXICAN AMERICANS IN THE TEXAS-MEXICO BORDER REGION

M.L. Smith<sup>1,2</sup>, X. Wang<sup>4</sup>, N. Mier<sup>3</sup>, G. Carrillo-Zuniga<sup>3</sup>, N. Garza<sup>3</sup>, M.G. Ory<sup>2</sup>, 1. *College of Public Health, The University of Georgia, Athens, Georgia*, 2. *Texas A&M Health Science Center School of Rural Public Health, College Station, Texas*, 3. *Texas A&M Health Science Center School of Rural Public Health, McAllen, Texas*, 4. *University of Texas - Pan American, Edinburg, Texas*

**Background.** Self-care practices are essential to disease control and positive health outcomes. Older Hispanics are disproportionately affected by diabetes, but little is known about predictors of diabetes self-care behaviors among this group. **Objectives.** The current study identifies personal characteristics, social factors, and health indicators associated with diabetes self-care behaviors (i.e., those related to diet and physical activity) among underserved, aging Mexican Americans living in the Texas-Mexico border region. **Methods.** Data were analyzed from 249 Mexican Americans with diabetes aged 60 years or older who lived in Hildago County, Texas (one of the 10 poorest counties in the United States). Two multiple linear regression models were used to evaluate independent variable effects on two self-care activities scales, measuring the frequency in which participants performed 3 diet-related and 2 physical activity-related self-care behaviors, respectively. **Results.** On average, diet-related summary scores were 3.16 points higher among Hispanic adults who received diabetes education, relative to those not receiving such education ( $B=0.20$ ,  $P=0.03$ ). Average diet-related scores were 2.90 points higher among participants who reported high family support levels, compared to those with low family support levels ( $B=0.21$ ,  $P=0.03$ ). On average physical activity-related scores were 3.31 points higher among participants with a high school diploma or more education, relative to those with less than a high school education ( $B=0.24$ ,  $P=0.01$ ). **Conclusion:** Diabetes management strategies targeting diet among Hispanic seniors at the border region should be

designed to incorporate programmatic and social-related supports. Further investigation should investigate the range of factors surrounding self-care behaviors among this population.

#### OLDER RURAL AFRICAN AMERICANS AND TYPE 2 DIABETES: A CULTURAL APPROACH

I. Canty Williams, S.W. Utz, K. Reid, R.A. Jones, I. Hinton, G. Yan, *School of Nursing, University of Virginia, Charlottesville, Virginia*

Type 2 diabetes is an increasing public health problem affecting 25.8 million Americans, with a prevalence of 26.7% for those over the age 65. Diabetes disproportionately affects African Americans who have a nation-wide prevalence of 13.3% versus 8.7% among adults. One out of every three Medicare dollars is spent on people with diabetes. The purpose of this feasibility study was to test a culturally-tailored intervention to promote effective diabetes self-management among rural African Americans. A series of eight 2-hour sessions were held in a community center for subgroups of 6-8 older adults ( $N=32$ ), using videotaped vignettes to promote problem-solving for improved self-management. Outcomes were measured at baseline, 3, 6 and 12 months post-baseline. Primary outcomes were long-term blood glucose average (HbA1c), cardiovascular risk, and general physical/mental health. Secondary outcomes were goal-achievement, and scores on problem-solving, self-efficacy and daily self-care actions. Mixed-effect models were used to analyze changes in all outcome variables over time. Results indicate trends toward clinically significant reductions in HbA1c, cardiovascular risk, and improved mental health. Physical health did not improve, likely due to multiple chronic conditions and aging. Significant secondary outcomes were goal achievement and increased knowledge about diabetes ( $p<.01$ ). Analyses also revealed a possible ceiling effect for self-efficacy, and problem-solving. Results of this research will help to inform researchers as to the kind of intervention that is effective in promoting better diabetes management to reduce complications and improve quality of life among African Americans who experience a high burden of the disease.

#### RISK AND PROTECTIVE FACTORS ASSOCIATED WITH DIABETES-RELATED DISTRESS: IMPORTANCE OF EARLY DIABETES MANAGEMENT

J. Wardian, F. Sun, *Ste 720, Arizona State University, Phoenix, Arizona*

**Background:** Diabetes is a common problem in older adults (20% vs 7.8% of the general population). Health care professionals (HCP) are tasked with providing resources to assist patients toward self-management that results in healthier outcomes. Psychosocial issues have an effect on diabetes self-care that is not fully understood by HCP. This cross-sectional study seeks to understand the effect of demographic factors, psychological orientations, social support, and diabetes management behaviors on diabetes-related distress. **Methods:** This study uses BEAD project data collected from 267 adults (Mean age = 57.9.  $SD=13.6$ ) with type 2 diabetes, diagnosed from 1 to 5 years ago. The Diabetes Distress Scale (DDS) is a validated 17-item scale that measures emotional distress, physician related distress, regimen distress, and interpersonal distress. **Results:** Hierarchical regression was conducted in four stages. The final model including demographics, psychological factors, social support, and self-care behaviors explains 49.1% of the variance in DDS [ $F(10, 201)=19.37$ ,  $p<.001$ ]. Significant factors related to lower DDS were older age, higher self-efficacy, positive thinking, higher levels of HCP support, and a healthy diet. **Discussion:** This study would help HCP to know what to focus on when trying to reduce diabetes-related distress. Diabetes-related stress may diminish as people live with it longer, but deteriorated physical or cognitive health associated with aging are potential risks for older diabetes patients. Support is significant in reducing DDS and assisting person with diabetes to engage in self-care management. Diabetes education may want to include

cognitive behavioral therapy as a means of increasing self-efficacy and reducing negative thinking.

### PERCEIVED VERSUS ACTUAL FACTORS ASSOCIATED WITH ADOPTION AND MAINTENANCE OF EVIDENCE-BASED PHYSICAL ACTIVITY PROGRAMS

C. Der Ananian<sup>2</sup>, P. Desai<sup>1</sup>, R. Smith-Ray<sup>1</sup>, R. Seymour<sup>1</sup>, S.L. Hughes<sup>1</sup>, 1. Center for Research on Health and Aging, Univ Illinois, Chicago, Illinois, 2. Arizona State University, Phoenix, Arizona

Despite the need to increase the availability of evidence-based (EB) physical activity (PA) programs for people with arthritis (Brady et al., 2009), little is known about effective ways of translating and diffusing these programs. This study used qualitative methods to examine factors related to the adoption and maintenance of EB PA programs in two states. Fit and Strong! is a PA/ health behavior change program for older adults with osteoarthritis. We conducted focus groups (n=6) with decision makers who were potential adopters of Fit and Strong! prior to their offering the program. We then conducted in-depth interviews (n=18) with key informants from organizations that adopted the program. Both sets of participants were asked to identify barriers and facilitators to the adoption and maintenance of PA programs in general and Fit and Strong!, specifically. Four perceived and five actual generic factors were identified. Both contemplators and adopters identified client interest/need as the primary factor. Cost was also reported but ranked higher for contemplators than program adopters. Participants identified four perceived vs. two actual factors as associated with program-specific adoption. Space was identified by both groups. Actual generic factors associated with adoption included client interest, safety and effectiveness, evidence, cost, and appeal to multiple user groups. Actual generic factors associated with maintenance included client interest, enrollment, instructor satisfaction, instructor retention and cost. Differences found between respondent groups indicate that EB programs should craft different marketing messages to address barriers and facilitators perceived and experienced by providers engaged in specific stages of translation.

### CHRONIC PAIN AND PARENT-CHILD RELATIONS IN LATER LIFE: DOES IT MAKE A DIFFERENCE?

C. Riffin<sup>1</sup>, K. Pillemer<sup>1</sup>, J. Suiitor<sup>2</sup>, C. Reid<sup>3</sup>, 1. Cornell University, Ithaca, New York, 2. Purdue University, West Lafayette, Indiana, 3. Weill Cornell Medical College, New York, New York

Chronic pain is a debilitating and pervasive health concern, particularly among older adults. Both researchers and clinicians acknowledge that pain conditions do not occur in isolation, but rather, exact a toll on the individual sufferer and family system at large. Surprisingly, no research has explored the effects of older parents' chronic pain symptoms on their adult children. To address this gap in the literature, this study employed a within-family design to investigate the impact of mothers' self-reported pain on parent-child relationship quality and on adult children's depressive symptoms. Data for these analyses come from the Within-Family Differences Study (WFDS), a two-wave study of mothers (aged 65-75) and their adult children. Analyses were based on 734 children of mothers who responded to the question, "In the past 30 days, on how many days did you cut down on your usual activities because of this pain?" Multilevel analyses revealed an adverse association between mothers' pain and the child-parent relationship ( $\beta = -.23$  SE = .09,  $p = .03$ ). In addition, a significant pain by frequency of contact interaction also emerged for relationship quality ( $\beta = .263$ , SE = .116,  $p = .01$ ). As hypothesized, mothers' pain predicted adult children's depressive symptoms ( $\beta = -.622$ , SE = .355,  $p = .08$ ). Results held after controlling for children's sociodemographic characteristics, the amount of help they provided their mother during an illness and their perception

of mother's functional limitations. Implications of these findings for future research on the impact of pain in later-life families are discussed.

## SESSION 990 (SYMPOSIUM)

### BUILDING A PLATFORM FOR RESEARCH: THE CANADIAN LONGITUDINAL STUDY ON AGING

Chair: S.A. Kirkland, Community Health and Epidemiology, Dalhousie University, Halifax, Nova Scotia, Canada

Discussant: A.V. Wister, Simon Fraser University, Vancouver, British Columbia, Canada

Over the next twenty years, the Canadian Longitudinal Study on Aging (CLSA) will generate a wealth of information that will contribute to the advancement of the science of aging and policy development. The study will collect information on the changing biological, medical, psychological, social, and economic aspects of people's lives in order to understand how, individually and in combination, they influence the maintenance of health and well-being, and the development of disease and disability as people age. The CLSA will be one of the most comprehensive studies of its kind undertaken to date. Its large sample, multidisciplinary focus, and longitudinal design will provide research opportunities unprecedented in Canada and internationally. In 2009 the CLSA partnered with Statistics Canada to develop the Canadian Community Health Survey (CCHS) in Healthy Aging and launch the CLSA. In 2010, recruitment of the Tracking cohort began with funding from the Canadian Institutes of Health Research. In 2011, with funding from the Canada Foundation for Innovation, the infrastructure for eleven Data Collection Sites across Canada was created to conduct participant health assessments in the Comprehensive cohort. In 2012, recruitment of the Comprehensive cohort began. The objectives of this Symposium are to: 1) Provide an update on the progress of the study and milestones achieved to date; 2) Report on key methodological aspects of recruitment and sampling, outcomes ascertainment, and biobanking of biological samples; and 3) Give researchers an understanding of the scope and potential of the CLSA as a platform for research on aging.

### SETTING THE STAGE FOR A RESEARCH PLATFORM ON AGING

S.A. Kirkland<sup>1</sup>, C. Wolfson<sup>2</sup>, P.S. Raina<sup>3</sup>, L. Griffith<sup>3</sup>, M. Oremus<sup>3</sup>, 1. Community Health and Epidemiology, Dalhousie University, Halifax, Nova Scotia, Canada, 2. McGill University, Montreal, Quebec, Canada, 3. McMaster University, Hamilton, Ontario, Canada

The Canadian Longitudinal Study on Aging is following 50,000 men and women aged 45-85, for 20 years. Data collection methods include telephone and face-to-face interviews, physical assessments, biological samples, and linkage to administrative databases. The first wave of recruitment for the Comprehensive cohort and the second wave of recruitment for the Tracking cohort are currently underway. The CLSA has engaged in a number of "firsts" in Canada, including: establishing the first known coordinated approach to the Research Ethics Board approval process for a national multi-site observational study using an online documentation process; designing web-based open-source computer software applications – Mastodon, Sabretooth and Beartooth – enabling paperless data collection and integration while protecting confidentiality and managing interactions with study participants, standardized across the 11 data collection sites and four computer-assisted telephone interview sites; and working with data stewards across all 10 provinces to facilitate linkage to administrative health data of a national scope.

**BUILDING A PLATFORM OF RESEARCH ON AGING:  
DEVELOPMENT OF CHRONIC DISEASE  
ASCERTAINMENT ALGORITHMS FOR THE CANADIAN  
LONGITUDINAL STUDY ON AGING (CLSA)**

M. Oremus<sup>1</sup>, R. Postuma<sup>2</sup>, L. Griffith<sup>1</sup>, P. Raina<sup>1</sup>, C. Wolfson<sup>3</sup>,  
S.A. Kirkland<sup>4</sup>, 1. *McMaster University, Hamilton, Ontario, Canada*,

University, Halifax, Nova Scotia, Canada*

The CLSA research platform will allow researchers to investigate the incidence and prevalence of chronic diseases. In the absence of a physician examination, the CLSA will use algorithms to combine participants' questionnaire-based, anthropometric, and clinical data to ascertain the presence of chronic diseases. For example, ruling in or ruling out diabetes mellitus will depend on whether participants report a physician diagnosis of diabetes, use diabetes medications, and have a glycosylated hemoglobin value of  $\geq 48$  mmol/mol. The CLSA's Clinical Working Group conducted a systematic review to identify existing algorithms for use in the CLSA. The working group found suitable algorithms for all except seven chronic diseases (i.e., diabetes mellitus, parkinsonism, chronic airflow obstruction, hand osteoarthritis [OA], hip OA, knee OA, and ischemic heart disease [IHD]). The CLSA developed algorithms for these diseases and recruited 176 participants to validate the algorithms. Most estimated sensitivities and specificities were  $\geq 80\%$ .

**SAMPLING AND RECRUITMENT IN THE CANADIAN  
LONGITUDINAL STUDY ON AGING**

L. Griffith<sup>1</sup>, H. Shannon<sup>1</sup>, P.S. Raina<sup>1</sup>, C. Wolfson<sup>2</sup>, S.A. Kirkland<sup>3</sup>, 1. *Clinical Epidemiology and Biostatistics, McMaster University, Hamilton, Ontario, Canada*, 2. *McGill University, Montreal, Quebec, Canada*, 3. *Dalhousie University, Halifax, Nova Scotia, Canada*

The Canadian Longitudinal Study on Aging (CLSA) is recruiting 50,000 Canadians aged between 45 and 85 for a 20-year study. Obtaining a representative sample of Canadians can be challenging. Ideally, we would take a simple or stratified sample from a list of the population, but identifying a single sampling frame that will meet all of our needs is not practicable. The CLSA researchers have considered several options for sampling including recruitment from 1) participants of a large population-based survey conducted by Statistics Canada, the Canadian Community Health Survey on Healthy Aging, 2) provincial health registries, and 3) random digit dialling (RDD). Each of these potential sampling frames has strengths and weaknesses and a unique set of challenges for operationalization. We will describe the issues associated with using each of these sampling frames and how partial samples using different selection methods will be combined to comprise the CLSA baseline cohort.

**A NOVEL SOFTWARE INFRASTRUCTURE FOR LARGE  
EPIDEMIOLOGICAL STUDIES**

P.D. Emond, D. Inglis, P.S. Raina, *Clinical Epidemiology and Biostatistics, McMaster University, Hamilton, Ontario, Canada*

Novel software infrastructure has been created to manage data collection logistics for the Canadian Longitudinal Study on Aging. The software includes: a participant relationship manager (PRM), data bank, computer-assisted telephone interviewing (CATI) software and computer-assisted personal interviewing (CAPI) software. The PRM centralizes the study's interactions with participants and is responsible for recruitment and preservation of confidentiality. It maintains identifying data and consent status while facilitating communication between software components. The CATI software coordinates the collection of telephone questionnaire responses from participants at one of four call centres. The system schedules interviews, tracks their status and reports on their progress until completion. The CAPI software coordinates the collection of questionnaire responses and physical measurements from participants at one of 11 data collection sites. It schedules in-home and

site interviews, integrates medical devices and facilitates biospecimen collection. Finally, the data bank manages and stores data collected from the CATI and CAPI systems.

**SESSION 995 (SYMPOSIUM)**

**DEVELOPING RESEARCH METHODS TO FACILITATE A  
RESEARCHER / PARTICIPANT RELATIONSHIP**

Chair: A. Kydd, *Health, Nursing and Midwifery, University of the West of Scotland, Hamilton, United Kingdom*

Discussant: H. Wilkinson, *University of Edinburgh, Edinburgh, United Kingdom*

In keeping with the conference theme, this symposium showcases qualitative research methods that have been selected and adapted with the focus on developing a trusting relationship with vulnerable groups. These individuals are those who are hard to access as participants, yet demographics clearly show that the oldest old and those with dementia make up an increasingly larger number within developed populations. In charting new frontiers the voices of these vulnerable groups need to be heard. Robson's (2002) advice that the best method is that which serves to answer to the research question is agreed, but this symposium also reminds researchers that the methods need to be those that provides a facilitative relationship with the participant. Studies such as Steeman et al (2007) state that when participants feel safe with a researcher, they are more likely to relate their experiences in a less guarded and more relaxed manner. This is of great importance when interviewing frail older people and those who have cognitive deficits as their fears of being thought incapable are high (Mac Quarrie, 2005). The papers from the UK, USA and Japan illustrate issues arising from accessing vulnerable participants; ethical directives on accessing people newly diagnosed with dementia; using story theory to provide dialogue with people on dialysis and with couples – one of whom has dementia; gaining trust through frequent visits in an observer-participant role to a care home and interviewing an Amish community. Each paper outlines the strengths and limitations of qualitative methods used.

**ENHANCING QUALITY AND INTEGRITY OF RESEARCH  
GUIDED BY STORY THEORY**

D.J. Hain, *Christine E Lynn College of Nursing, Florida Atlantic University, Boca Raton, Florida*

Story-path approach was used to encourage older adults undergoing hemodialysis to share stories of the health challenge of making lifestyle change. This paper will discuss strengths, limitations and potential strategies when using this method of inquiry. Strengths: Participants appreciated someone cared enough to listen and shared information never shared before. Story theory provided the foundation for identifying health challenges, allowing for shared dialog of possible intervention to resolve health challenges. Limitations: Some participants didn't think they had a health challenge, when the researcher thought differently; making it difficult to be open to the perceptions of the participants rather than attach my own meaning to their stories. Per participants' request data collection was changed; limiting privacy. Strategies: The researcher used reflexive thought to bring conscious awareness of self and not influence the stories. Data collection started within the first 30 minutes of dialysis and a screen was used to provide privacy.

**THE COUPLES LIFE STORY METHOD**

M. Ito<sup>1</sup>, R. Campbell<sup>2</sup>, Y. Kurokawa<sup>3</sup>, B. Ingersoll-Dayton<sup>4</sup>, B. Spencer<sup>4</sup>, 1. *Human care Research Team, Tokyo Metropolitan Institute of Gerontology, Itabashi-ku, Tokyo, Japan*, 2. *University of Tokyo, Bunkyo-ku, Tokyo, Japan*, 3. *Sophia University, Chiyoda-ku, Tokyo, Japan*, 4. *University of Michigan, Ann Arbor, Michigan*

In Japan, the co-residence rate of older people and their children is decreasing. Over 80% of older people say they prefer to receive caregiving from their spouse. Caring for a spouse with dementia can be very

stressful and increase feelings of burden. The couples life story method helps couples review their life together from the first time they met to the present using photographs to stimulate conversation. We used a life story board to conduct interviews with couples over 4-5 sessions lasting 1 to 2 hours each (n = 10 couples). Pre-and post questionnaires for each spouse were used before and after the tape-recorded sessions; a life story book was produced for each couple. We found this method is effective in reconfirming or revising their feelings for each other. We plan to adapt the couples life story method for use in professional training and in nursing homes.

#### **ISSUES CONCERNING PARTICIPANT OBSERVATION WITH FRAIL OLDER ADULTS**

A. Kydd, *Health, Nursing and Midwifery, University of the West of Scotland, Hamilton, United Kingdom*

Participant observation is a complex and potentially intrusive method of gathering data. Yet many texts on methodologies refer to participant observation without elaborating on the ethical, moral and personal dilemmas that might face the researcher. The degrees of participation and observation are not clear and it is up to the researcher to determine how to conduct this type of research. This paper outlines a twelve-month study, which involved a nurse researcher acting as an observer-participant in a hospital ward of frail older people awaiting a place in a care home. Some of the problems encountered are discussed and include; entering the field and gaining acceptance, deciding on the researcher's role and how much time each visit should take, taking sides between the staff and patients, reporting without betraying those who agreed to participate and finally deciding how and when to say goodbye.

#### **COMMUNITY BASED PARTICIPATORY RESEARCH METHODOLOGY AS A FRAMEWORK FOR COLLABORATING WITH AN AMISH COMMUNITY TO CONDUCT RESEARCH ABOUT THE CARE OF OLDER ADULTS**

H.M. Farrar, J.S. Wilson, *University of Oklahoma, Oklahoma City, Oklahoma*

Amish communities in the United States are increasingly utilizing Western healthcare resources to promote the health and well-being of their community members. Discussions between the researcher and an Elder of an Amish community in northeastern Oklahoma identified a mutual interest in research about the care of older adults. There is limited research about caring for older adults in Amish communities to inform culturally sensitive healthcare practices. The Amish community of northeastern Oklahoma has no experiences working with the research community, which in addition to cultural sequestration and minority population status increases their position as a vulnerable population. This paper will outline the Principles of Community Based Participatory Research (CBPR), which promotes a framework for collaboration in the promotion of equality during the course of the research, ensuring that the Amish community would receive an equal share of the benefits of the research without bearing a disproportionate burden.

#### **THE ETHICAL CHALLENGES OF INVOLVING PEOPLE NEWLY DIAGNOSED WITH DEMENTIA IN THE RESEARCH PROCESS**

S. Holland, A. Kydd, G. Ellis, *University of the West of Scotland, Ayr, Ayrshire, United Kingdom*

There is growing recognition of that people with dementia can provide a unique expertise in research studies. This information can be used to enhance quality of care and tailor services to meet the needs of clients. Nevertheless, research in this area of practice is limited. As a result decisions, regarding what is best practice in dementia continue to be steered by health professionals and Government drivers. The need for further research which focuses on the viewpoint people with dementia is well recognised. However, as Wilkinson (2003) and McKeowan et al. (2010)

identify, people with dementia remain "difficult to reach" within the world of research in part due to the presence of cognitive impairment but also as a result of the scrutiny of research involving people with dementia by ethics committees. This paper will discuss the ethical challenges encountered during the involvement of people newly diagnosed with dementia in the research process.

### **SESSION 1000 (SYMPOSIUM)**

#### **DISENTANGLING THREATS TO ENERGETIC EFFICIENCY AND CAPACITY IN THE BALTIMORE LONGITUDINAL STUDY OF AGING**

Chair: E.M. Simonsick, *National Institute on Aging, Baltimore, Maryland, Johns Hopkins University School of Medicine, Baltimore, Maryland*

Discussant: L. Ferrucci, *National Institute on Aging, Baltimore, Maryland*

The specific mechanisms that govern age-and disease-related slow or slowing gait are not well-understood, but emerging work suggests that both the energetic cost of walking and energetic capacity (i.e., fitness) play central roles. This symposium examines the relationship between several physiologic parameters associated with gait speed to evaluate their contribution to the energetic cost of and energetic capacity for walking using data on up to 500 men and women aged 60 years and older participating in the Baltimore Longitudinal Study of Aging (BLSA). The BLSA constitutes a continuous enrollment cohort of initially healthy well-functioning individuals evaluated every 1-4 years depending on age during a 2-3 day clinic stay. Energetic cost of walking (ml O<sub>2</sub>/kg/meter) was assessed during a 2.5 minute usual paced corridor walk using a portable metabolic analyzer (Cosmed k4b2). Energetic capacity (i.e., available energy) was determined from oxygen consumption during a 400m walk done as quickly as possible and maximal treadmill testing. Both balance and strength deficits were associated with greater energetic cost of and diminished capacity for walking. Knee pain and restricted knee range of motion when walking independent of pain were also associated with greater walking cost. Metabolic parameters including indicators of glucose and adipokine dysregulation were associated with both available and maximal energetic capacity; findings regarding walking cost were mixed. Together these findings provide good evidence that musculo-skeletal, biomechanical and metabolic impairments contribute to both greater cost of walking and reduced energy availability – double jeopardy – for aging individuals and identify several potential intervention targets.

#### **PERCEIVED AND OBSERVED BALANCE AND THE ENERGETIC COST OF AND CAPACITY FOR WALKING**

E.M. Simonsick<sup>1,2</sup>, J.A. Schrack<sup>1</sup>, A.Z. Moore<sup>1</sup>, L. Ferrucci<sup>1</sup>, *1. National Institute on Aging, Baltimore, Maryland, 2. Johns Hopkins School of Medicine, Baltimore, Maryland*

Despite the primacy of balance in functional independence, scant empirical research has examined the association between instability and the energetic cost of and capacity for walking. In over 500 men (52%) and women aged 60+, those with reported instability walking on a level surface, poor standing balance and inability to successfully execute a narrow (20cm) 6m walk exhibited: (1) higher energy consumption per meter during 2.5 minutes of normal walking of 5.4%, 11.1% and 14.5%, respectively and (2) lower fitness capacity (10.6% for all) during a 400m endurance walk test than persons without these problems (p<.01 and p<.004, respectively) in models controlled for age, race, sex and obesity. Findings indicate older persons with balance instability, especially those failing the narrow walk, experience both increased energetic cost and diminished capacity for walking – a double-pronged threat to mobility – and argue for balance evaluation and training in mobility intact older adults.

## IMPAIRED GLUCOSE METABOLISM AS AN INDICATOR OF WALKING EFFICIENCY

J.A. Schrack, E.M. Simonsick, A.Z. Moore, K.S. Gravenstein, C.W. Chia, L. Ferrucci, *National Institute on Aging, Baltimore, Maryland*

Impaired glucose metabolism is associated with reduced physical performance and mobility limitation in older adults. Poor walking efficiency is associated with slower gait speed, a predictor of disability and death in older adults. Despite these accepted associations, the relationship between glucose metabolism and walking efficiency is unknown. To examine whether impaired glucose metabolism is associated with walking efficiency, we assessed the relationship between reported diabetes medication use, fasting and two hour blood glucose, HbA1c, and energy expenditure per meter during 2.5 minutes of customary and 400 meters of peak walking (ml/kg/m) in 482 (49% female) BLSA participants aged 60 and older. Medication use predicted customary and peak walking efficiency ( $p < 0.01$ ) independent of potential confounders. Neither fasting blood glucose, nor two hour glucose, nor HbA1c predicted walking efficiency after accounting for medication use. Accordingly, these findings suggest impaired glucose metabolism may contribute to functional efficiency in older adults.

## LEPTIN AND ENERGETIC CAPACITY IN OLDER ADULTS

C.W. Chia, J.A. Schrack, K.S. Gravenstein, J.M. Egan, E.M. Simonsick, L. Ferrucci, *National Institute on Aging, Baltimore, Maryland*

Leptin, secreted by adipocytes and a marker of body fat, plays a role in the regulation of energy intake and expenditure. However, scant research has examined the relationship between leptin and energy capacity, especially in older adults. In BLSA participants aged 60 and older, fasting plasma leptin concentrations were available in 457 participants (53% men) who underwent treadmill stress test and 243 participants (57% men) who underwent 400m fast-paced corridor walk. Leptin is negatively associated with peak energetic capacity as measured by  $VO_{2max}$  during treadmill ( $\beta = -0.122$ ,  $P = 0.006$ ) and  $VO_2$  during 400m walk ( $\beta = -0.205$ ,  $P = 0.015$ ) in models controlled for age, sex and total body fat (by DEXA). These findings suggest that higher leptin is associated with reduced energetic capacity (i.e., fitness) in older individuals. Therefore, leptin may be a surrogate marker of energy capacity that is independent of body fat.

## GAIT LAB PARAMETERS, KNEE PAIN AND THE ENERGETIC COST OF NORMAL WALKING

S. Ko<sup>1</sup>, E.M. Simonsick<sup>2</sup>, J.A. Schrack<sup>2</sup>, L. Ferrucci<sup>2</sup>, *1. Mechanical Engineering, Chonnam National University, Yeosu, Republic of Korea, 2. National Institute on Aging, National Institutes of Health, Baltimore, Maryland*

Knee pain is common in older adults and is associated with altered gait characteristics; it remains unclear whether pain and/or biomechanical alterations impact walking efficiency. This study examines the energetic cost of usual walking and gait parameters ascertained in a gait lab [3D motion capture system with 10 cameras and 20 anatomical markers] in persons aged 60-96 years with ( $n=57$ ) and without knee pain ( $n=222$ ) enrolled in the BLSA. Participants with knee pain exhibited 11.5% higher energetic cost than participants without pain ( $p < 0.001$ ) controlling for age, sex and BMI. Higher energetic cost was associated with reduced knee range of motion (ROM) overall and in participants with pain ( $p < 0.001$ ) and with greater ankle ROM in participants without pain ( $p = 0.001$ ). Results indicate both knee pain and compensatory strategies contribute to increased energetic costs of walking and suggest pain management and flexibility training may improve walking efficiency.

## MUSCLE STRENGTH AND THE ENERGETIC COST OF AND CAPACITY FOR WALKING IN OLDER ADULTS

A.Z. Moore<sup>1</sup>, E.M. Simonsick<sup>2</sup>, J.A. Schrack<sup>2</sup>, E. Metter<sup>2</sup>, L. Ferrucci<sup>2</sup>, *1. Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, 2. National Institute on Aging, Baltimore, Maryland*

Muscle strength has been associated with walking speed and physical disability in older adults. Lower strength may lead to suboptimal

gait or necessitate compensation from other systems leading to higher energetic cost and decreased mobility. The cross-sectional relationship between muscle strength and energy expenditure was evaluated in 486 BLSA participants aged 60 or older (mean = 72.8 years) with data on energetics, maximum grip strength and anthropometric measurements. Grip strength was positively associated with fitness capacity, assessed as average energy expenditure per minute, during 400 meters of walking at peak speed in models adjusted for age, sex, height, weight and body composition ( $p < .05$ ). Greater strength was also associated with lower energetic cost, average energy expenditure per meter, during 2.5 minutes of customary speed walking ( $p < .01$ ). These results support the hypothesis that lower strength may contribute to functional limitations through both biomechanical and metabolic inefficiency.

## SESSION 1005 (SYMPOSIUM)

### FATIGABILITY IN OLDER ADULTS: DETERMINANTS, CONSEQUENCES AND FUTURE DIRECTIONS

Chair: *N.W. Glynn, Epidemiology, University of Pittsburgh, Pittsburgh, Pennsylvania*

Co-Chair: *K. Avlund, University of Copenhagen, Copenhagen, Denmark*

Discussant: *B. Eldadah, National Institute of Aging, Bethesda, Maryland*

Fatigue, defined as "a subjective lack of physical and/or mental energy that is perceived by the individual to interfere with usual or desired activities", is a common complaint among older adults. Fatigability, a newer concept, is a characteristic of an individual that describes how fatigued one gets in relation to defined activities. Understanding fatigability can provide insight into the extent to which fatigue may interfere in the disablement pathway. The determinants, consequences and future direction of this stimulating novel area of research will be explored in this symposium. The determinants of fatigability will be examined using Danish data with Dr. Manty evaluating the prevalence and associated health factors of indoor mobility-related fatigability among nonagenarians and Dr. Ekmann examining the impact of fatigability as a predictor of subsequent poor general health and ischemic heart disease. The consequences of fatigability will be presented by Dr. Manini who will explore the impact of performance and perceived fatigability (during a 400m walk and steady-state treadmill test at a fixed duration and speed) in older adults who self-report severe fatigue. Mr. Santanasto will also examine the consequences by evaluating the impact of fatigability versus fatigue in relation to physical performance and performance fatigability. Finally, Dr. Glynn will present the development and initial validation of a novel tool to measure fatigability in older adults. The discussion, led by Drs. Eldadah and Simonsick, will critically review current research, and focus on important issues for future directions of fatigability among older adults.

### FATIGABILITY IN NONAGENARIANS: PREVALENCE AND UNDERLYING FACTORS

M. Manty<sup>1,2</sup>, A. Ekmann<sup>1,3</sup>, M. Thinggaard<sup>3,4</sup>, K. Christensen<sup>3,4,5</sup>, K. Avlund<sup>1,2,3</sup>, *1. Section of Social Medicine, Department of Public Health, University of Copenhagen, Copenhagen, Denmark, 2. Center for Healthy Aging, University of Copenhagen, Copenhagen, Denmark, 3. Danish Aging Research Center, Universities of Odense, Aarhus and Copenhagen, Odense, Denmark, 4. Unit of Epidemiology, The Danish Twin Registry, University of Southern Denmark, Odense, Denmark, 5. Department of Clinical Genetics, Odense University Hospital, Odense, Denmark*

The aim of this study was to evaluate the prevalence and associated health factors of indoor mobility related fatigability among nonagenar-

ians. The study is based on a sample of 92-93-year old persons (n=1181) who were independent of help in indoor mobility. Fatigability was defined as a subjective feeling of fatigue when transferring or walking indoors. Other standardized assessments include self-report measures of medical history, and performance-based assessments of walking speed and maximum hand grip strength. In total, every fourth (26%) of the participants reported fatigability when transferring or walking indoors and fatigability was more common among participants living in sheltered housing as compared to those living independently (32% vs. 23%,  $p < .001$ ). Cardiovascular diseases, musculoskeletal pain, medications, walking speed and depressive symptoms were independently associated with fatigability. Fatigability in very basic everyday mobility is relatively common in non-disabled nonagenarians. The results indicate important associations between fatigability and potentially modifiable health factors.

### FATIGABILITY PREDICTS POOR GENERAL HEALTH AND IHD IN OLDER ADULTS

A. Ekman<sup>1,2</sup>, I. Petersen<sup>4</sup>, M. Manty<sup>1,3</sup>, K. Christensen<sup>4,2,5</sup>, K. Avlund<sup>1,2,3</sup>, 1. Section of Social Medicine, Department of Public Health, University of Copenhagen, Copenhagen, Denmark, 2. Danish Aging Research Centre (DARC), University of Odense, Aarhus and Copenhagen, Odense, Denmark, 3. Centre for Healthy Aging (CESA), Faculty of Health and Medical Sciences, University of Copenhagen, Copenhagen, Denmark, 4. Unit of Epidemiology, The Danish Twin Registry, University of Southern Denmark, Odense, Denmark, 5. Department of Clinical Genetics, Odense University Hospital, Odense, Denmark

The aim of this study was to investigate the predictive value of fatigability for ischemic heart disease (IHD) and poor general health in healthy individuals aged 70+. Fatigability was measured with the Mob-T Scale at intake assessments in 1995, 1997, 1999 or 2001 within a healthy cohort (n=1969). IHD incidence (first hospitalization due to IHD or death due to IHD) was traced through registers until end of 2010. Poor general health (loss to follow-up, hospitalized due to IHD, self reported IHD related diagnoses or mobility disability) was measured by questionnaires at 2- and 4-year follow-up. Individuals without fatigability had a higher chance of staying healthy at 2- and 4-year follow-up; OR=1.45 (CI95%: 1.08-1.93), OR= 1.55 (CI95%: 1.11-2.16), respectively and individuals with fatigability had a higher hazard of IHD (HR=1.47 (CI95%: 1.08-2.00)). It is suggested that fatigability in older healthy adults is an early predictor for subsequent poor general health and IHD.

### PERFORMANCE AND PERCEIVED FATIGABILITY IN OLDER ADULTS WHO SELF-REPORT SEVERE FATIGUE

T. Manini, M. Lorow, M. Lewis, A. Joseph, University of Florida, Gainesville, FL

We conducted a case-control study of older adults who had perceived severe fatigue (N=29, 71.3±4.9 yrs) and controls without fatigue (N = 33; 72.2±4.6 yrs). Participants completed a long distance rapid-paced walking test and graded exercise test on a treadmill. Fatigued participants walked at slower pace (1.14 ± 0.14 vs. 1.0 ± 0.18 m/sec,  $p = 0.01$ ) and reported slightly higher fatigability while walking (max RPE: 0.52 ± 1.3 vs. 1.67 ± 1.6), although the rating indicated a low level of exertion ("weak"). Peak oxygen consumption attained during the treadmill test was similar between groups (19.6 ± 5.5 vs. 19.2 ± 4.9 ml/kg/min). Fatigued participants reported a more rapid increase in RPE during the treadmill test ( $p = 0.04$ ), but maximal exertion was similar between groups. Self-report severe fatigue is marginally associated with worse physical performance and perceived fatigability during performance tests.

### PERCEIVED FATIGABILITY IS ASSOCIATED WITH MOBILITY AND PERFORMANCE IN OLDER ADULTS

A.J. Santanasto<sup>1</sup>, E.M. Simonsick<sup>2</sup>, L. Ferrucci<sup>2</sup>, J.A. Schrack<sup>2</sup>, R. Boudreau<sup>1</sup>, A.B. Newman<sup>1</sup>, N.W. Glynn<sup>1</sup>, 1. *Epidemiology, University of Pittsburgh, Pittsburgh, Pennsylvania*, 2. *National Institute on Aging, Bethesda, Maryland*

Fatigability (i.e., fatigue related to defined activities) rather than fatigue (i.e., low energy) may be important in the disablement pathway. A new Activity-Anchored Fatigability Survey (AAFS, higher score=higher fatigability) and past month energy level (lower score=higher fatigue) were compared in relation to physical performance and performance fatigability (Rating of Perceived Exertion (RPE) at end of 5 minute, 0.67m/s treadmill walk) in a subset of Baltimore Longitudinal Study of Aging participants age 73.7±8.5yrs, N=167. AAFS was associated with fast-paced 400m walk time ( $r=0.34$ ,  $p < 0.0001$ ), usual gait speed ( $r=-0.27$ ,  $p=0.002$ ), and 10 chair stand time ( $r=0.23$ ,  $p=0.01$ ) after age, sex, race, obesity, and smoking adjustment. Lower energy level was inversely associated with fast-paced 400m walk time ( $r=-0.17$ ,  $p=0.03$ ) only. AAFS discriminated between high (RPE≥10) vs. low performance (RPE≤9) fatigability, adjusted mean difference = 27.2±6.7,  $p < 0.0001$ . Fatigability rather than global fatigue may be more insightful when examining underlying factors in the disablement pathway.

### DEVELOPMENT OF A NOVEL SURVEY TO MEASURE PERCEIVED FATIGABILITY IN OLDER ADULTS

N.W. Glynn<sup>1</sup>, A.J. Santanasto<sup>1</sup>, R. Schulz<sup>2</sup>, S. Beach<sup>2</sup>, R. Boudreau<sup>1</sup>, E.M. Simonsick<sup>3</sup>, A.B. Newman<sup>1</sup>, 1. *University of Pittsburgh - Center for Aging and Population Health, Pittsburgh, Pennsylvania*, 2. *University of Pittsburgh - Center for Social and Urban Research, Pittsburgh, Pennsylvania*, 3. *National Institute on Aging, Bethesda, Maryland*

There is no validated tool that measures perceived fatigability in older adults. Currently published surveys often contain activities infrequently performed by older adults, do not consider a situational, standardized context, and lack a measure of intensity, which can lead to self-pacing bias. The Activity-Anchored Fatigability Survey (AAFS) was designed to address the shortcomings and based activities (both physically and mentally fatiguing tasks) on those most frequently reported in aging epidemiologic studies. The 26-item pilot survey asked responders to indicate their level of physical and mental fatigue separately on a 0-5 scale, with 0=no fatigue and 5= extreme fatigue. The survey was mailed to 2671 enrollees of two local aging research registries. Thirty-eight percent of surveys were returned (N=1012) with mean age 75.4±6.7 yrs (range 61-94), 59% female, 5% black. Initial psychometric validation and future directions for refining this novel tool to capture perceived fatigability in older adults will be presented.

## SESSION 1010 (SYMPOSIUM)

### NURSING CARE OF OLDER ADULTS INTEREST GROUP SYMPOSIUM: USE OF TECHNOLOGY TO SUPPORT HEALTHY AGING

Chair: K.A. Gretebeck, School of Nursing, University of Michigan, Ann Arbor, Michigan

Co-Chair: P. Cacchione, University of Pennsylvania, Philadelphia, Pennsylvania

Discussant: P. McNeese, University of Alabama, Birmingham, Alabama

Technology is becoming an increasingly important vehicle used to support healthy aging for older adults across settings. The development and testing of new technology and translation of these innovations into the necessary settings or markets are important for healthcare

providers, caregivers and the aging population. The purpose of this presentation is to discuss four different research programs that used technology to support healthy aging with application to nurses and health-care professionals. Specifically, the presentations will discuss: 1) use of telecommunications for remote monitoring of older adults with chronic disease; 2) technology designed to improve health outcomes through measurement of night time activity; 3) decisional support tools developed to facilitate patient discharge planning; and 4) development of a network of non-wearable motion and bed sensors to detect changes in health status. The development, testing and translation of these technologies will also be discussed. Lastly, Dr. McNees, an expert in technology innovations, will be the discussant for this session.

#### **LESSONS LEARNED FROM A DECADE OF TELEHEALTH RESEARCH IN OLDER ADULTS WITH CHRONIC ILLNESS**

B.J. Wakefield, *University of Missouri, Columbia, Missouri*

Chronic disease rates are increasing, and older adults are at higher risk for developing chronic disease. Use of telecommunications technology to provide remote monitoring for people with chronic disease is becoming increasingly accepted as a means to improve patient outcomes and reduce resource use. Data provided through this type of monitoring enable clinicians to provide close surveillance so earlier intervention may be implemented when clinical parameters are out of control or when data indicate additional health information or support is needed. Using findings from the literature and the author's six funded studies evaluating use of remote monitoring of older adults in the home setting, this presentation will focus on lessons learned about implementation of these technologies in the lives of older adults. Lessons will address technical, clinical, human factors, acceptability and satisfaction, and cost issues. The presentation will conclude with recommendations for next steps for research and clinical implementation.

#### **COMMERCIALIZING INVESTIGATOR-DEVELOPED TECHNOLOGY**

M. Rowe, *University of South Florida, Tampa, Florida*

The purpose of this paper is to describe the process of developing technology designed to improve health outcomes and taking that technology to commercialization. A night home monitoring system, CareAlert, was developed to assist in-home caregivers manage nighttime activity in a care recipient with dementia. In clinical trials of the device, there was an 86% reduction in nighttime events with the use of CareAlert over a 12-month period. There was strong caregiver satisfaction and improvement of caregiver quality of life. The next challenge was device commercialization and this is occurring through the origination of a small business and partnership with business experts. Information will be presented on intellectual property protection, articulation with Intellectual Property offices at the University, licensing, small business origination and design/manufacture of a product. This presentation will highlight the critical role nurses can play in designing technology to improve health outcomes.

#### **PUTTING NURSING DATA TO WORK: BUILDING DECISION SUPPORT FROM THE EHR**

K.H. Bowles, M. Rosenberg, S. Potashnik, M.D. Naylor, *University of Pennsylvania, Philadelphia, Pennsylvania*

The growing implementation of electronic health records (EHRs) provides an important opportunity for nurses to demonstrate value from our rich documentation. This session will demonstrate how a research team is "putting nursing data to work" to build decision support for discharge planning. De-identified data created from nursing admission assessments and nursing documentation throughout the hospital stay was used to create case studies of older adults describing their health status during the hospital stay. Interdisciplinary teams of doctors, nurses, social workers, and physical therapists evaluated the cases and determined the need for referral to home care, skilled nursing facility, inpa-

tient rehabilitation, nursing home, or hospice. The finished product will be imbedded in the EHR of two hospitals and prospectively tested for its impact on referrals, readmissions, and ED use. The team will share the lessons learned and suggest what nurses can do to advance the use of nursing data in research.

#### **HEALTH ALERT SYSTEM OF NON-WEARABLE SENSORS FOR ELDERLY**

M.J. Rantz, M. Skubik, R. Koopman, G.L. Alexander, L.J. Phillips, C.M. Galambos, *University of Missouri, Columbia, Missouri*

The University of Missouri Eldertech Research Team at TigerPlace, independent elder housing designed for aging in place, has developed a network of non-wearable motion and bed sensors that detect changes in health status (impending acute illness or exacerbation of chronic illness) before symptoms that prompt clinical evaluation are reported. We successfully used this information in a one year prospective study to alert health care providers so they could assess the situation and initiate early treatment to improve functional independence. Intervention participants (n=20) showed significant improvements (as compared to control group (n=21)) for SPPB gait speed score at quarter 3 (p=0.030), left hand grip at quarter 2 (p=0.02), right hand grip at quarter 4 (p=0.05), and functional ambulation profile of the GAITrite at quarter 2 (p=0.05). Technological methods such as these could be widely adopted in elder housing, long term care settings, and in private homes to help elders remain independent.

#### **SESSION 1015 (PAPER)**

#### **ADDRESSING THE QUALITIES AND PROPERTIES OF FRAILTY**

#### **THE PSYCHOMETRIC PROPERTIES OF THREE SELF-REPORT SCREENING INSTRUMENTS FOR IDENTIFYING COMMUNITY-DWELLING FRAIL ELDERLY**

S. Metzeltin<sup>1</sup>, R. Daniels<sup>2</sup>, E. van Rossum<sup>2,1</sup>, A. Beurskens<sup>2</sup>, W. van den Heuvel<sup>3</sup>, L. de Witte<sup>2,1</sup>, G.I. Kempen<sup>1</sup>, *1. CAPHRI School for Public Health and Primary Care, Maastricht University, Maastricht, Netherlands, 2. Zuyd University of Applied Sciences, Heerlen, Netherlands, 3. University Medical Centre Groningen, Groningen, Netherlands*

**BACKGROUND:** Valid screening instruments are needed to identify frail elderly. This study aims to evaluate the psychometric properties of three instruments: the Groningen Frailty Indicator (GFI), the Tilburg Frailty Indicator (TFI) and the Sherbrooke Postal Questionnaire (SPQ). **METHODS:** A questionnaire was sent to 687 community-dwelling elderly ( $\geq 70$  years). Internal consistency, construct validity and scalability of instruments were evaluated. After 1-year follow-up predictive validity regarding development of disabilities, hospital admission and mortality was tested. **RESULTS:** The response rate was 77%. Prevalence estimates of frailty ranged from 40% to 59%. Cronbach's alpha for the GFI, TFI and SPQ was 0.73, 0.79 and 0.26, respectively. The cumulative scalability of the three instruments was inadequate (Loevinger's H: 0.09-0.30). Scores on the three instruments correlated significantly with each other and with disability. Adjusted odds ratios showed that the risk of developing disability is more than double (GFI, 2.62; TFI, 2.00; SPQ, 2.49) for frail elderly compared to the non-frail group; those identified as frail by the TFI and SPQ had more than twice the risk of being admitted to a hospital. Sensitivity and specificity for the development of disability were 71% and 63% (GFI), 62% and 71% (TFI) and 83% and 48% (SPQ), respectively. Regarding mortality, sensitivity for all tools was about 70% and specificity between 41% and 61%. For hospital admission, SPQ had the highest sensitivity (76%). **CONCLUSIONS:** All three instruments have the potential to identify

frail elderly, but their scalability and predictive power is not yet sufficient. Further research is needed.

### USING STRUCTURAL EQUATION MODELLING TO DETECT MEASUREMENT INVARIANCE IN A MEASURE OF FRAILTY

B. King-Kallimanis, G.M. Savva, R. Kenny, *The Irish Longitudinal Study on Ageing, Trinity College Dublin, Dublin, Ireland*

The measurement of the frailty syndrome in older people is controversial. Using data from the Survey of Health, Ageing and Retirement in Europe (SHARE, N=30,555) and The Irish Longitudinal Study on Ageing (TILDA, N=5,986) we explore the measurement properties of frailty with the goal of optimising frailty assessment according to Fried's phenotype definition. We examine whether this definition can be conceptualised as a single underlying latent variable in both TILDA and SHARE, and test the assumption of measurement invariance across the 11 countries included in the first wave of SHARE. We use confirmatory factor analysis (CFA) to assess our measurement model, and multi-group CFA to assess measurement invariance in SHARE. The same measurement model satisfactorily fit both the TILDA and SHARE data. With respect to measurement bias across countries, configural invariance held, and the fit of the model was satisfactory ( $SB\chi^2(48) = 93.38$ ,  $p = 0.001$ ), suggesting that a single latent factor model for frailty is appropriate. The inclusion of equality constraints on the factor loadings and thresholds, led to significant model deterioration ( $SB\chi^2_{diff}(33) = 234.83$ ,  $p < 0.001$ ). Many equality constraints for Spain and several of those associated with Greece, and Austria were non-tenable, violating the assumption of measurement invariance. In conclusion, while a single latent variable model for the Fried frailty phenotype is tenable, the factor loadings and thresholds are not invariant across countries, suggesting that direct comparisons of the prevalence of frailty across countries may not be appropriate.

### IMPROVING THE PHENOTYPE: EFFECTS OF PHYSICAL TRAINING ON FRAILTY STATUS. A RANDOMIZED CONTROLLED TRIAL

K.A. Hauer, M. Schwenk, T. Zieschang, P. Oster, *Geriatric Research, Bethanien-Hospital at the University of Heidelberg, Heidelberg, Germany*

Background: Clinical assessments for frailty have largely been used in longitudinal ageing studies to determine predictive validity of constructs. Interventional studies have rarely targeted the modification of frailty status. Objective: To determine the effect of a standardized training program on frailty status in frail, multi-morbid geriatric patients (n=130). Methods: Frailty status and issues of Fried's phenotype of frailty were documented at baseline, after a 3-month- training and a 3-months-follow. A progressive strength and functional training (intervention) was compared to an unspecific low-intensity group training (control) in a post-ward rehabilitation program. Results: The intervention significantly increased 3 out of 5 frailty items as used by Fried compared to the control group during intervention: maximal strength (One Repetition Maximum leg press):  $p < 0.001$ ; functional performance (5-chair rise):  $p < 0.001$ , and physical activity level (physical activity questionnaire for the elderly):  $p < 0.001$ . Between group differences largely remained in the follow up period. Body mass index as well as perception of fatigue did not change in both study groups. When scored according to a modified Fried phenotype for frailty, the standardised intervention improved overall frailty status in the intervention group compared to the control group adjusted for baseline values ( $p = 0.0029$ ). Between group differences remained significant during follow up:  $p = 0.0127$ . Conclusion: Study results demonstrate that a highly intensive, standardized training program improved frailty status as defined by a modified Fried's phenotype in frail, multimorbid, geriatric patients.

### COMPARING THE FEASIBILITY, SENSITIVITY, AND SPECIFICITY OF EIGHT FRAILTY SCALES

O. Theou, T.D. Brothers, M.R. Rockwood, A.B. Mitnitski, K. Rockwood, *Geriatric Medicine, Dalhousie University, Halifax, Nova Scotia, Canada*

Introduction: Several definitions have been proposed to quantify frailty. It is not clear which is the most effective. The purpose of this study was to operationalize frailty using eight scales and compare their ability to predict all-cause mortality. Methods: Twelve countries participated in the first wave of the Survey of Health, Ageing, and Retirement in Europe. Frailty was operationalized for 30,025 participants aged 50+ years (13,700 men, 16,325 women) using eight scales: the Clinical Frailty Scale (CFS), the Edmonton Frail Scale, a 70-item Frailty Index (FI), a 44-item Frailty Index based on a Comprehensive Geriatric Assessment (FI-CGA), a frailty phenotype, the "FRAIL" scale, the Groningen Frailty Indicator, and the Tilburg Frailty Indicator. Results: Frailty was successfully operationalized for each scale in 87.2% (frailty phenotype) to 99.2% (CFS) of cases. After a mean 4.4 years, the mortality rates for FI, FI-CGA, and CFS were similar between included and excluded cases (e.g. FI-CGA 9% vs 9.8%). In the remaining scales, the mortality rate was 2-3 times higher in excluded cases than in included ones (e.g. Tilburg 8.7% vs 25.6%). Among the frailest participants, the highest mortality rates were predicted in the CFS (26.4%) and FI (24.6%) and the lowest rates in the frailty phenotype (18.3%) and Tilburg (18.9%). ROC analysis showed that the area under the curve ranged from 0.64 ("FRAIL" scale) to 0.74 (FI, Edmonton). Conclusion: CFS and FI are the most feasible (least missing data), while FI is the most sensitive and specific scale for predicting mortality.

### OBESITY AND PHYSICAL FITNESS AS LONG-TERM PREDICTORS OF FRAILTY –THE 22-YEAR MINI-FINLAND FOLLOW-UP SURVEY

S. Stenholm<sup>1</sup>, T.E. Strandberg<sup>2,3</sup>, K. Pitkälä<sup>4</sup>, P. Sainio<sup>1</sup>, M. Heliö vaara<sup>1</sup>, S. Koskinen<sup>1</sup>, 1. National Institute for Health and Welfare, Turku / Helsinki, Finland, 2. University of Helsinki, Department of Medicine, Helsinki, Finland, 3. University of Oulu, Institute of Health Sciences, Oulu, Finland, 4. University of Helsinki, Department of General Practice, Helsinki, Finland

This study examines the effect of midlife obesity on development of frailty over 22-years of follow-up. Data are from 1122 men and women aged 30 years or more at baseline participating in the population-based Min-Finland Health Examination Survey (1978–80) with follow-up measurement in 2000–01. Based on multinomial logistic regression, baseline overweight and obesity strongly predicted pre-frailty (OR 1.42, 95% CI 1.06–1.92; OR 2.23, 95% CI 1.33–3.73) and frailty (OR 2.12, 95% CI 1.05–4.31; OR 3.89, 95% CI 1.47–10.34) in comparison to not frail at the follow-up. Models were adjusted for age, sex, education, life style factors and chronic diseases. Moreover, good physical fitness at midlife was found to diminish the negative effect obesity on frailty. In conclusion, development of frailty may start as early as in midlife and obesity is one of the underlying causes.

### SESSION 1020 (PAPER)

#### OLDER ADULT HOSPITALIZATIONS & ACUTE CARE ISSUES

#### DIFFERENCES AMONG HOSPITAL STAFF IN BARRIERS TO WALKING OLDER HOSPITALIZED ADULTS

C. Bianchi, N.M. Watson, *University of Rochester, Rochester, New York*

The purpose of this study was to identify differences in barriers to walking hospitalized older adults among different types of hospital staff – providers (MDs, NPs, PAs), therapists (PTs/OTs), nursing staff (RNs/LPNs), and nursing assistants (NAs). More than half of hospitalized older adults lose function by the second day of hospitalization as

a result of decreased mobility. A survey for hospital staff was developed to identify perceived barriers to walking hospitalized older adults according to professional licensure. Strong psychometrics were established for the survey. It was administered to staff in one acute care hospital via email. Responses were anonymous. A 30% response rate was obtained (n=175). Significant differences in certain aspects of knowledge, beliefs and confidence were found between staff. Significantly more NAs thought that older patients with endurance problems should have a PT consult before getting out of bed or walking (knowledge barrier) (p=.004). Significantly more therapists believed that older patients who do not want to walk should have their walking limited (belief barrier) (p=.043). Significantly more providers than other staff lacked confidence in their ability to show families how to safely walk older patients (confidence barrier) (p=.000). Thus, the risk for hospitalized older adults to lose their independence and suffer serious complications (e.g., pressure ulcers, injury, infections, as well as premature institutionalization and/or death) appears high and warrants an interdisciplinary solution. Understanding such differences among hospital staff in terms of barriers to walking could help focus efforts to increase activity level and decrease deconditioning of this vulnerable population.

### HOSPITALIZATION AS A TURNING POINT FOR SLEEP MEDICATION USE IN OLDER ADULTS

A. Zisberg<sup>1</sup>, E. Shadmi<sup>1</sup>, G. Sinoff<sup>2,3</sup>, N. Gur-Yaish<sup>4,1</sup>, E. Srulovici<sup>1</sup>, T. Shochat<sup>1</sup>, 1. Department of Nursing, Faculty of Social Welfare & Health Sciences, Haifa University, Haifa, Israel, 2. Department of Geriatrics, Carmel Medical Center, Haifa, Israel, 3. Department of Gerontology, Faculty of Social Welfare & Health Sciences, Haifa University, Haifa, Israel, 4. Center for Research and Study of Aging, Haifa University, Haifa, Israel

Background: Use of sleep medications as a result of hospitalization among older adults is common and has been shown to result in chronic use and adverse effects. Objectives: To examine changes in pre to post hospitalization sleep medication use as a function of in-hospital use. Design: Prospective cohort study in the medical services of a large Israeli teaching hospital. Participants: 485 acute medical patients age 70 and older. Measurements: Sleep medication use was assessed by patient interviews on patterns of use prior to, during, and at one and three months after discharge. Post-discharge using patterns, given in-hospital discontinuation or initiation, were assessed. Logistic regressions were modeled separately for discontinuation and for initiation of sleep medication use at each follow-up. Results: Of those who used sleep medications prior to admission, 37 (18% of 206 prior users) discontinued use during the hospital stay. Discontinuation was associated with adjusted odds ratio (AOR) of 3.91 (95% confidence interval (CI): 1.64-9.30) for non-use at one month follow-up. Of those who did not use sleep medications prior to admission 39 (14% of 279 non-prior users) initiated use during hospitalization. Hospital initiation of sleep meds was associated with an AOR of 4.65 (95% CI: 1.95-11.09) for post-discharge use. Similar results were obtained for the three-month follow-up, reaching significance levels only for the discontinuation group. Conclusions: In-hospital discontinuation and initiation of sleep medications are related to post-discharge sleep medication use patterns. Thus, in-hospital sleep medications prescribing policies should acknowledge the potential for changes in sleep medication regimen.

### BECOMING A STEP BEHIND: ACUTE CARE OF OLDER PATIENTS WITH COGNITIVE IMPAIRMENT

A. Nilsson<sup>1</sup>, B.H. Rasmussen<sup>1</sup>, D. Edvardsson<sup>1,2</sup>, 1. Umeå University, Umeå, Sweden, 2. La Trobe University, Melbourne, Victoria, Australia

Objectives: Older patients with cognitive impairment often receive acute care not fully corresponding to their multidimensional needs. Person-centred care (PCC) has emerged as a model for high quality care of older people that holistically attends to biopsychosocial needs of peo-

ple with beneficial outcomes. However, it appears difficult to implement, deliver and sustain PCC in acute care settings. The aim of this study was therefore to explore barriers for PCC of older patients with cognitive impairment in acute care. Methods: A total of 110 hours ethnographic style observations were conducted at a cardiologic ward in Sweden. Data analysis was inspired by the principles of grounded theory and based on different types of observations and interviews. Results: Data analysis is under progress and the final results will be presented at the conference. Preliminary results show that barriers to PCC exist on several levels in acute care settings, namely; the organizational, environmental, and the individual staff and team level. Consequences of not providing person-centered care included patient suffering, family exclusion, and staff frustration. A theoretical model of barriers for PCC, its causes, and consequences will be presented. Conclusions: Providing PCC of older patients with cognitive impairment in acute care is complex and requires a well-developed structure of facilitating factors at several levels. Change processes, strategies and interventions must target underlying workplace and organizational factors as well as individual staff and their attitudes.

### A TOOL TO PREDICT RECOVERY, DEPENDENCE OR DEATH IN OLDER ADULTS WHO BECOME DISABLED DURING HOSPITALIZATION

D.E. Barnes<sup>1,2</sup>, R.M. Palmer<sup>2</sup>, R.H. Fortinsky<sup>4</sup>, J. Boscardin<sup>5,2</sup>, K. Kirby<sup>5,2</sup>, K. Mehta<sup>5,6</sup>, S.R. Counsell<sup>7</sup>, C. Landefeld<sup>5</sup>, 1. Psychiatry and Epidemiology & Biostatistics, University of California, San Francisco, San Francisco, California, 2. San Francisco Veterans Affairs Medical Center, San Francisco, California, 3. Eastern Virginia Medical School, Norfolk, Virginia, 4. University of Connecticut Health Center, Farmington, Connecticut, 5. Division of Geriatrics, University of California, San Francisco, San Francisco, California, 6. Stanford University, Stanford, California, 7. Indiana University, Indianapolis, Indiana

Background: Many older adults who are living independently become dependent in one or more activities of daily living (ADLs: dressing, bathing, transferring, toileting, eating) during hospitalization, and their prognosis is unclear. The goal of our study was to develop a tool to predict the probabilities of recovery, continued dependence or death in older adults who become ADL dependent during hospitalization. Methods: We performed a retrospective cohort study of 449 adults age  $\geq 70$  years who were fully independent two weeks prior to hospitalization and were discharged with at least 1 ADL dependency. Multinomial logistic regression was used to develop a prognostic model for simultaneously predicting the three outcomes of recovery, disability or death. Discrimination of the final model was assessed for each outcome based on the c statistic. Results: During the year following hospitalization, 36% of participants recovered, 27% remained dependent and 37% died. The final prognostic model included age, sex, number of instrumental activities of daily living (IADL) dependencies prior to hospitalization, number of ADL dependencies at discharge, dementia, cancer, number of other chronic conditions, reason for admission, and creatinine levels. Discrimination was good to excellent for all three outcomes based on the c-statistic (recovery: 0.81, dependence: 0.72, death: 0.78). Conclusions: This tool can be used to estimate the probability of recovery, dependence or death in elders who become dependent during hospitalization. This information may help guide care planning and discussions with patients and family members regarding likely prognosis. A web-based calculator is being developed.

### AVOIDABLE HOSPITALIZATIONS AND THE ARKANSAS AGING INITIATIVE

C.J. Beverly<sup>1</sup>, R.E. McAtee<sup>1</sup>, J. Wayne<sup>1</sup>, G.P. Mays<sup>2</sup>, 1. College of Nursing, University of Arkansas for Medical Sciences, Little Rock, Arkansas, 2. University of Kentucky, Lexington, Kentucky, Kentucky

The Arkansas Aging Initiative (AAI) was established in 2001 and is an infrastructure with the mission to improve health outcomes of older

Arkansans through interdisciplinary primary care and innovative education programs targeting older adults, the community and health care professionals, and influence health policy at the state and national level. This study examined the impact of the AAI on potentially avoidable hospital admissions measured by AHRQ's "Prevention Quality Indicators" (PQIs). A quasi-experimental design was employed using a pre-post design to evaluate readmissions from AAI related physicians compared to non-AAI related physicians and before-and-after implementation of the AAI. The project utilized Arkansas Hospital Discharge Data for a 10 year period ending in 2010. A total of 1,621,766 hospitalizations of patients age 65 or older who resided in the five AAI service areas were studied. Overall, the AAI had a significant ( $P < 0.0001$ ) positive impact on potentially "Avoidable Hospitalizations". Four regions had a positive impact on avoiding admissions for angina without a procedure, three regions avoided admissions for adult asthma and uncontrolled diabetes and other regions reduced admissions for COPD, hypertension, UTI, dehydration, CHF, and short-term diabetic complications. Compared to other hospitals in the service area, the hospitals affiliated with the AAI had significant improvements in a least one quality measure indicator after establishment of the AAI. Further research is needed to discern further impact of the AAI, especially one to examine the specific effects from the educational activities.

## SESSION 1025 (PAPER)

### PHYSICAL ACTIVITY & EXERCISE

#### ASSOCIATION BETWEEN LIFESTYLE AND PHYSICAL ACTIVITY LEVEL: VALIDATION OF SIMPLIFIED ACTIVITY RECORD

Y. Yamada, E. Yamagata, K. Yokoyama, Y. Okayama, M. Kimura, *Kyoto Prefectural University of Medicine, Kyoto, Japan*

**Background:** Physical activity level (PAL) is associated with all-cause mortality in the elderly. However, few studies have attempted to clarify the relationship between lifestyle and PAL in the elderly. The aim of this study was to examine the determinants of PAL in the elderly in terms of behavioral pattern and exercise intensity and validate the simplified physical activity record (sPAR). **Methods:** Thirty-two healthy, elderly individuals, aged 64-87 years, participated in the study. Doubly labeled water (DLW) and basal metabolic rate were used to measure total energy expenditure (TEEDLW) and PAL (PALDLW). Physical activity was recorded using the sPAR and tri-axial accelerometry. **Results:** PALDLW was significantly correlated with PAL estimated by sPAR ( $r = 0.588$ ,  $P < 0.001$ ). A good agreement between TEEDLW ( $1860 \pm 373$  kcal/d) and TEE estimated by sPAR ( $1854 \pm 377$  kcal/d) was observed with a mean difference of  $-6 \pm 221$  kcal/d ( $r = 0.825$ ,  $P < 0.001$ ). PALDLW was significantly and positively correlated with the duration of 1) standing housekeeping, 2) gymnastics, tai chi and stretching, and 3) swimming, hill climbing and jogging, and negatively correlated with the duration of 1) sleeping and rest, 2) daily life sedentary activities, and 3) slow walking ( $P < 0.05$ ). **Conclusions:** The results suggest that the sPAR is useful for the assessment of non-exercise activity thermogenesis such as housekeeping and sedentary activities and various sports activities. The sPAR provides valid estimates of TEE and PAL in the elderly.

#### EXERCISE TRAINING FOR OLDER ADULT QUICKNESS

C.A. Knight, M. Bellumori, *Kinesiology and Applied Physiology, University of Delaware, Newark, Delaware*

Slowing is among the most visible signs of aging but exercise recommendations do not explicitly target this impairment in mobility. We tested a novel exercise intervention that targets neural correlates of quickness and is appropriate for many older adults due to the safety of seated exercise, moderate cardiovascular demand and avoidance of high musculoskeletal loads. Fourteen adults (65-79 years) participated in a 6-

week program. Twice-weekly sessions included stationary recumbent bicycling at the lowest resistance settings. In 30 minutes of cycling at preferred cadence (PC), participants performed ten 20-second bouts of high cadence cycling (PC + 20%) with 1-minute recovery between bouts. Fast cadences progressively increased per individual progress (+38 revolutions per minute,  $p < .01$ ). The rate of force development scaling factor (RFD-SF), a measure of the neural control of quickness, improved 53% in the knee extensors ( $p < .01$ ). That this measure also improved 28% in untrained elbow extensors ( $p < .001$ ) suggests that the program stimulates central rather than localized adaptations. The timed up and go (-21%,  $p < .001$ ), 6-meter walk (-20%,  $p < .001$ ) and 9-hole peg test (-16%,  $p < .001$ ) improved. Improvements were mostly retained after four weeks and changes in control subjects were generally small and non-significant. While the improvements in mobility are promising, the improved 9-hole peg test further supports central adaptations. The activity-specific balance confidence scale (5.4%,  $p = .1$ ) and SF-36 (6.2%,  $p = .07$ ) exhibited positive trends, which were consistent with positive comments from participants. Continued work on this topic may warrant the addition of quickness training to exercise recommendations for older adults.

### PHYSICAL ACTIVITY, ALLOSTATIC LOAD, AND CANCER: RESULTS FROM THE NHANES STUDY

M. Peterson<sup>1</sup>, M.C. Morey<sup>1</sup>, C.F. Pieper<sup>2</sup>, A. Abernethy<sup>2</sup>, *1. Geriatrics, Duke/VA Medical Centers, Durham, North Carolina, 2. Duke Medical Center, Durham, North Carolina*

**PURPOSE:** Physical activity (PA) is advocated to older adults for primary and secondary prevention of cancer. Reducing allostatic load (AL) may be one beneficial mechanism. Our aim was to determine associations between meeting PA guidelines, AL, and history of cancer diagnosis in older adults. **METHODS:** Data were from 3382 male and female participants in the NHANES study (2007-10). Using previous methodology, AL was defined as positive for  $\geq$  three of nine components (systolic BP; diastolic BP; pulse; BMI; total cholesterol; HDL; hemoglobin; C-reactive protein; albumin). Meeting PA guidelines was defined as  $\geq 150$  minutes/week of moderate intensity PA by self-report. All-site, colon, skin, prostate, breast and reproductive cancer history were self-reported. Logistic models were constructed, by gender and cancer site, AL x PA interactions were entered into models. **RESULTS:** No AL x PA interactions were observed in men. Meeting moderate PA guidelines was associated with greater odds of all-site cancer history (Adj OR=1.35; 95%CI 1.03-1.80), controlling for AL, age, race, and education. In women, a significant AL x PA interaction was observed with breast cancer. Compared to no AL and low PA, meeting PA guidelines and having AL was associated with greater odds of breast cancer (Adj OR=1.35; 95%CI 1.03-1.80). **CONCLUSIONS:** Meeting PA guidelines was associated with increased odds of all-site and breast cancer history, respectively, in men and women. AL was not a deterrent to meeting PA guidelines in breast cancer. We speculate that a diagnosis of cancer, perhaps combined with multiple poor health indicators, may foster a healthier lifestyle.

### EVALUATING THE FITBIT MOTION TRACKER® IN RESIDENTIAL CARE/ASSISTED LIVING RESIDENTS

L.J. Phillips, N.E. Markis, *Nursing, Univ Missouri, Columbia, Missouri*

Slow gait patterns, common in residential care/assisted living (RC/AL) residents, compromise accurate measurement of walking behavior. This study examined the usability and concurrent validity of an economical accelerometer, the Fitbit Motion Tracker®, for measuring steps/day in RC/AL residents. Elders enrolled in an ongoing longitudinal study ( $n = 119$ ), Physical Activity and Disability in Residential Care/Assisted Living Residents, completed the Short Physical Performance Battery (SPPB) and wore the Fitbit for three days at baseline data collection. The associations between recorded steps/day and gait parameters were estimated for subjects with valid Fitbit data (at least two days of wear  $\geq 8$  hours/day). The total sample was 84% female with

a mean age of 84.8 (SD=8.2) years. For participants with valid Fitbit data (n=90), mean steps/day were 1520 (SD=1495; range 52–7613). Eighty-nine of the 90 persons with valid Fitbit data were able to complete the 4-meter (m) walk. Average gait speed was .62 m/sec (SD=.23) and stride length was 15.5 inches (SD=4.45). Steps/day were significantly correlated with gait speed ( $r=.37$ ,  $p<.001$ ) and stride length ( $r=.35$ ,  $p=.002$ ), but not with age, height, or weight. Faster gait and longer stride was associated with greater steps/day. Residents often forgot to wear the device as scheduled, but enlisting RC/AL staff to supervise Fitbit wear may improve compliance and reduce missing data. The Fitbit may be less accurate for slower walkers. A pilot study is planned to compare the accuracy of ankle versus hip Fitbit placement for step detection in elders with slow gait patterns.

#### **ASSOCIATIONS BETWEEN WALKING, NEIGHBORHOOD, AND DEPRESSION SYMPTOMS AMONG OLDER ADULTS**

D. Julien<sup>1</sup>, L. Gauvin<sup>2,3,4</sup>, L. Richard<sup>1,4,5</sup>, Y. Kestens<sup>2,3,4</sup>, H. Payette<sup>6,7</sup>. 1. *IRSPUM, Institut de recherche en santé publique de l'Université de Montréal, Montreal, Quebec, Canada*, 2. *CRCHUM, Centre de recherche du Centre hospitalier de l'Université de Montréal, Montreal, Quebec, Canada*, 3. *Département de médecine sociale et préventive, Université de Montréal, Montreal, Quebec, Canada*, 4. *Centre de recherche Léa-Roback sur les inégalités sociales de santé de Montréal, Université de Montréal, Montreal, Quebec, Canada*, 5. *Faculté des sciences infirmières, Université de Montréal, Montreal, Quebec, Canada*, 6. *Centre de recherche sur le vieillissement, Centre de santé et des services sociaux, Institut universitaire de gériatrie de Sherbrooke, Sherbrooke, Quebec, Canada*, 7. *Département des sciences de la santé communautaire, Université de Sherbrooke, Sherbrooke, Quebec, Canada*

**Background.** Neighborhood characteristics have been associated with walking for either utilitarian or recreational motives and depression. Walking has been linked with lower depression. Unfortunately, little is known about the interrelationships among this constellation of variables. **Aim.** To investigate associations between walking for utilitarian or recreational purposes, greenness, proximity to parks, and proximity to local services/amenities, and depression symptoms among older adults. **Method.** The sample consisted of participants aged 65 years or older ( $n = 377$ ). The Geriatric Depression Scale was used to assess depression symptoms. Questions pertaining to walking from the International Physical Activity Questionnaire were used to assess walking. Neighborhood variables were derived from geographic information systems. Logistic regression analyses were performed, entering walking and neighborhood variables as predictors of depression symptoms controlling for age, sex, marital status, education, income, country of birth, stressful events, number of chronic illnesses, and physical activity other than walking. The study design was cross-sectional. **Results.** More frequent episodes of utilitarian and recreational walking were significantly associated with fewer depression symptoms independent of other covariates. Surprisingly, participants living further away from parks reported fewer depression symptoms. **Discussion.** The fact that both walking for utilitarian and recreational motives were additively related to fewer depression symptoms suggests that the associations between walking and depression are driven to a greater extent by frequency of walking episodes than by purpose of walking episodes (whether utilitarian or recreational). The unforeseen associations between proximity to parks and depression could be explained by unmeasured variables such as park amenities.

#### **SESSION 1030 (SYMPOSIUM)**

##### **AGING-FRIENDLY COMMUNITIES: DO THEY PROMOTE EMPOWERMENT AND INCLUSION?**

Chair: J.G. Gonyea, Boston University, Boston, Massachusetts

Discussant: P. Stafford, Indiana University, Bloomington, Indiana

A key challenge facing policymakers is meeting the desire of the vast majority of Americans to stay in their own homes and communi-

ties as they age. This consumer preference, coupled with a growing belief among policy analysts that aging-friendly communities can be cost-effective, suggests a near-imperative that we as a nation move in this direction. WHO (2002) defines an aging-friendly city as one that “adapts its structures and services to be accessible to and inclusive of older people with varying needs and capacities.” Central to most definitions are themes of empowerment and inclusion, including the promotion of a paradigm shift from a view of elders as passive service recipients to being seen as active participants and leaders. Yet, an unanswered question is whether aging-friendly efforts actually do promote empowerment and inclusion. Because to date many of these communities have been supported largely through resident, neighborhood and private sector resources, a particular challenge to the model lies in its ability to take root in low income communities and communities of color. Being able to do so would establish the model’s empowerment potential and speak to the core policy criterion of social inclusion. In this symposium, presenters explore these issues through analyses of: 1) the consumer-directed “Village Model” trend, 2) the New York City “Aging Improvement Districts” model, 3) a Boston Elder Nutrition, Food and Income Security Neighborhood-based Program,” and 4) a broader policy discussion of public and private sector roles in promoting aging-friendly communities and the growing divide between affluent and poor localities.

##### **THE POLITICS OF AGING-FRIENDLY COMMUNITIES IN THE US: NARROWING OR WIDENING THE DIVIDE?**

J.G. Gonyea<sup>1</sup>, R. Hudson<sup>2</sup>. 1. *Social Work, Boston Univ, Boston, Massachusetts*, 2. *Boston University, Boston, Massachusetts*

Despite near universal agreement that there is a demographic imperative for our nation’s cities and towns to become more “aging friendly,” surveys consistently reveal that the majority of U.S. municipalities have not yet started to plan for their future aging populations. Moreover, the recent economic downturn has slowed or stalled many communities’ efforts. The reality is that the implementation of “aging-friendly community” initiatives has occurred largely in affluent communities, places in which seniors typically possess greater human and social capital. A policy concern is whether this will result in a greater divide between wealthier and poorer communities (and seniors) or can we assume there will be a “ripple effect” in which these models will spread to less affluent communities (seniors)? In this presentation, we explore this question as well as policy actions and tools states might use to promote the expansion of aging-friendly communities, including raising the issue’s visibility and fostering multisectorial partnerships.

##### **THE “VILLAGE” MODEL: DOES IT PROMOTE SOCIAL INCLUSION OR SOCIAL EXCLUSION?**

A.E. Scharlach<sup>1</sup>, J.K. Davitt<sup>2</sup>. 1. *Social Welfare, University of California, Berkeley, California*, 2. *University of Pennsylvania, Philadelphia, Pennsylvania*

This presentation describes findings from two national surveys of “Village” programs –membership organizations designed to enhance older adults’ service access, social connections, and ability to age in place. Survey results indicate that Villages typically engage members in a variety of empowerment roles, including organizational development (83%), governance (77%), and peer support (47%). Village membership underrepresents community diversity, with fewer than 10% of Village members non-White or Hispanic. Although 60% of Villages offer discounted memberships, efforts to attract a socio-economically diverse membership have met with limited success. Findings suggest that existing Villages may promote empowerment and inclusion among members, many of whom already are relatively socially-advantaged, while most Villages do relatively little to enhance the well-being of less-resourced older individuals and communities. Implications for modifying the Village model to better serve a broader range of older adults will be discussed, along with recommendations for future research.

## AGING IMPROVEMENT DISTRICTS: EMPOWERMENT THROUGH INCLUSION

R. Finkelstein, S. Roher, *The New York Academy of Medicine, New York, New York*

Aging Improvements Districts are designed to enable older adults to publicly identify local issues of concern and work effectively with a broad coalition of public and private stakeholders to make desired changes. The model, developed by Age-friendly NYC, has been piloted in three diverse neighborhoods: a predominantly African-American community undergoing gentrification; a low income community with a majority of Latino residents; and an upscale, primarily white neighborhood which includes thousands of poor older adults. A comparison of these three Aging Improvement Districts offers insights about various strategies utilized to promote inclusion, broaden social networks, and leverage social capital to further the agenda of older neighborhood residents. Objective: After attending this activity, participants will be able 1. To discuss how race, ethnicity, and income profiles influenced strategies in three Aging improvement Districts; 2. To analyze how 'inclusion' was operationalized in different neighborhoods.

## REDUCING FOOD AND ECONOMIC INSECURITY AMONG ELDERLY: ASSESSING COMMUNITY-BASED MODELS FOR CHANGE

A. Bookman, W. Leutz, L.E. Bercaw, *Heller School for Social Policy and Management, Brandeis University, Waltham, Massachusetts*

This presentation is based on data from a university-community partnership project in three low-income neighborhoods in Boston. The project centers on delivery of a training curriculum to low-income elders who are meet certain indicators of food insecurity. The curriculum, called "Food Dollars" is designed not only to advance healthy eating, but also to empower elders by giving them the tools and information they need to improve their access to publicly funded benefits which will help them afford to shop, cook and eat healthy food. Data from the evaluation of the project will critically look at the impact of this curriculum on enrollees, and assess the effectiveness of this model of elder empowerment and improved nutrition actually reduces hunger and food insecurity. It will also examine whether the issue of food insecurity has been adequately addressed in various efforts at creating aging-friendly communities in low-income neighborhoods.

## SESSION 1035 (SYMPOSIUM)

### ECONOMICS OF CAREGIVING: PAYING FOR AN INVALUABLE RESOURCE

Chair: *C.E. Bishop, Heller School for Social Policy and Management, Brandeis University, Waltham, Massachusetts*

Discussant: *S.C. Reinhard, AARP Public Policy Institute, Washington, District of Columbia* Discussant: *C.E. Bishop, Heller School for Social Policy and Management, Brandeis University, Waltham, Massachusetts*

With a sixth of older adults in need of hands-on or supervisory care from another person, the work of caregiving has never been more important. Analysis of the Health and Retirement Survey (HRS) data reveals that adult children providing care and/or financial assistance to aging parents, estimated at a quarter of this population, endure substantial lost wages and Social Security benefits. Seeking causal patterns, a cross-lagged panel model using HRS data investigates differential impacts for men and women of labor-force participation on caregiving and of caregiving on labor-force participation. Older adults receiving long-term services and supports from paid direct care workers may experience poor quality when workers turn over; an analysis of the relationship between unemployment rates and turnover highlights the impact of wages and local labor market factors for these workers. Discussants will outline public policies that can address issues for care providers and recipients.

## A RECIPROCAL RELATIONSHIP BETWEEN CAREGIVING AND LABOR FORCE PARTICIPATION OF FAMILY CAREGIVERS: A LONGITUDINAL CROSS-LAGGED PANEL ANALYSIS

Y. Lee, K. Kim, *University of Pittsburgh, Pittsburgh, Pennsylvania*

Since most previous research on the consequences of caregiving and labor force participation used cross-sectional designs, the direction of the relationship between caregiving and labor force participation remains ambiguous. It is unclear whether caregivers leave the labor force due to care demands, or whether unemployment predates the initiation of caregiving, and thus, unemployed individuals assume caregiving roles. To explore the reciprocal relationship between caregiving and labor force participation, we conducted a cross-lagged panel model using 3 waves of Health and Retirement Study and structural equation modeling. Caregiving had negative impact on labor force participation for females; whereas labor force participation had negative impact on caregiving for males. The direction of the relationship between caregiving and labor force participation was different between males and females. Findings have implications that while females leave the labor force due to care demands, males assume care responsibilities when they are not in the labor force.

## THE EFFECT OF CUTTING WAGES FOR PERSONAL CARE AIDES DURING A RECESSION

C. Howes, *Economics, Connecticut, New London, Connecticut*

Personal care aides (PCAs) are currently the fastest growing occupation in the United States. Various estimates put their annual national turnover rate at 40 to 60 percent. Turnover of California's consumer-directed PCA workforce is about 30 percent. As states consider strategies to reduce Medicaid costs during the recession, the question arises of whether it is possible to cut wages during periods of high unemployment without increasing turnover and harming consumers. In prior research using cross-sectional data I have found little effect of local unemployment rates, controlling for other co-determinants of turnover (Howes 2004). Using monthly individual level data for March 2001 through December 2009 from a California administrative database, I measure the interactive effect of unemployment and compensation on turnover. After attending this session participants will be able to discuss methods of measurement and the effect on turnover of cutting wages for personal care aides during a recession.

## CAREGIVING COSTS TO WORKING CAREGIVERS: DOUBLE JEOPARDY FOR BABY BOOMERS CARING FOR THEIR PARENTS

J. Migliaccio, *MetLife Mature Market Institute, Westport, Connecticut*

The MetLife Study of Caregiving Costs to Working Caregivers: Double Jeopardy for Baby Boomers Caring for Their Parents analyzes data from the 2008 panel of the National Health and Retirement Study (HRS) combined with estimates to determine the extent to which older adult children provide care to their parents, the roles gender and work play in that caregiving, and the potential cost to the caregiver in lost wages and future retirement income as a result of their support. Nearly 10 million adult children over the age of 50 care for their aging parents. These family caregivers are themselves aging as well as providing care at a time when they also need to be planning and saving for their own retirement. Estimates for total cost impact of caregiving on the individual female and male caregiver of lost wages and Social Security benefits are provided.

## SESSION 1040 (SYMPOSIUM)

### HOW TO LIVE ON WHEN CONTROL FAILS

Chair: *J. Baars, University of Humanistic Studies, Haarlem, Netherlands*

Most work in gerontology has to do with trying to identify problems more clearly, solving them or improving problematic situations so that

the quality of the lives of aging persons will be improved. Modern accomplishments regarding medical treatment, hygiene, care facilities or pensions have indeed led to better lives for many aging persons in Western societies. The basic orientation of such work is to find, improve and impose control. When control fails, the usual answer is to try to expand it: more research, more effective therapies, more surveillance or better policies. To a certain degree this all remains important. Yet, instead of focusing on how aging can be transformed, influenced, improved, it might also be that there is something to learn from aging experiences. The confrontation with realities that cannot be controlled has been at the core of aging experiences and at the core of the wisdom traditions. This symposium presents some reflections about the profundity of the inevitable encounter with what cannot be controlled and how we still might live on in a meaningful way. Tom Cole will reflect on the challenges to the identities of old men in the face of fading control. Harry Moody will discuss the modernist ideal of individual control-autonomy. Andrew Achenbaum will contrast the historical perspectives on the future with demographical forecasts and Jan Baars will approach aging as a process of living in time, between the vulnerability and creativity of life on one side and the desire for control on the other.

### **AGING AS LIVING BETWEEN VULNERABILITY AND CONTROL**

J. Baars, *University of Humanistic Studies, Haarlem, Netherlands*

Aging can be seen as a process of living in time, between the vulnerability and creativity of life on one side and the desire for control on the other. The experience of change and its uprooting effects have led to the most dominant concept of time: chronometric time. Modern science and the many forms of technology have improved living conditions for many people in Western societies. Yet, it appears that we have neglected to develop ways to confront the uncontrollable in a meaningful way, although this is one of the fundamental conditions of human life which may intensify in aging. This leads us back to the wisdom traditions which developed in situations where control over nature outside and within humans was hardly developed.

### **GETTING BY WITH A LITTLE HELP FROM MY FRIENDS**

H. Moody, *AARP, Washington, District of Columbia*

I will argue that the ideal of individual autonomy, as represented in practices such as advance directives, is misguided. Priority for personal autonomy reflects, from a developmental viewpoint, the experience of midlife and locus of control, while from a philosophical viewpoint, it represents the hegemony of individual consciousness, inaugurated by Descartes and reaching fruition in Locke, Kant and Adam Smith. This modernist ideal systemically ignores the wider social context, as demonstrated by the global financial crisis of 2008. This concept of individual autonomy has been attacked by postmodern critics of "Foundationalism" (Heidegger, Foucault, Rorty, etc.) and, more recently, it has been much discredited by the empirical findings of behavioral economics. The experience of old age dependency represents an experiential erosion of the autonomy ideal, creating perplexity for bioethics. But instead of linking "dignity" with "autonomy," I argue for shifting our analysis to social networks and support systems. Consent remains important, but, given the lived experience of dependency, it will inevitably be negotiated consent. In the words of the Beatles: "I get by with a little help from my friends."

### **FRAILTY: A CHALLENGE TO MANHOOD IN OLD AGE**

T. Cole, *McGovern Center, University of Texas Houston School of Medicine, Houston, Texas*

Gerontology has been slow to study old men as men. This paper poses the question of how frailty affects old (over 70) men's identity as men, that is, their perceptions of their own masculinity. Using selected memoirs, essays and autobiographies from the last 50 years, the paper

explores men's reactions to and perceptions of declining strength, sexual potency, ability to function independently, etc..... Do they tell stories of decline? Of love? Of spiritual growth? Has the issue of gender identity faded in importance? Or, are they interested in proving that they are men? Is so, what does manhood mean to them?

## **SESSION 1045 (SYMPOSIUM)**

### **POLICIES TO SUPPORT THE HEALTH OF VULNERABLE OLDER ADULTS: ANALYSIS AND CONTROVERSIES**

Chair: *D. Alley, University of Maryland, Baltimore, Maryland*

Discussant: *W.F. Benson, Andersen Benson Consulting Services, LLC, Silver Spring, Maryland*

Eliminating health disparities and improving the health of all older adults are key policy goals. However, policymakers face a variety of challenges in implementing policies to improve health and achieve health equity, including designing policies that address the needs of an increasingly diverse older population and finding ways to reach vulnerable older adults. The Health & Aging Policy Fellowship program, funded by The Atlantic Philanthropies, is a 9-12 month opportunity for professionals in health and aging to participate directly in the policy arena. This symposium features presentations from a multidisciplinary group of current and former fellows with experience in both the legislative and executive branches and at both local and federal levels. Dr. Herrera will discuss an analysis of the reach of Older Americans Act caregiver services into racial and ethnic minority communities and identify opportunities for greater engagement. Dr. Perez will describe a project that takes into account the cultural needs of community residents and partners in a predominantly Hispanic community, to help guide local environmental policy change that promotes healthy aging. Dr. Dong will describe the Elder Justice Act and highlight opportunities to leverage the principles of community-based participatory research to address elder abuse in minority populations. Finally, Dr. Miles will discuss Medicaid's role in reducing health disparities across the lifespan, highlighting controversies about Medicaid expansion under the Affordable Care Act. Each of these fellows brings a unique research, policy, and practice perspective to addressing the needs of vulnerable older adults.

### **HEALTH POLICY AND COMMUNITY ADVOCACY: PUSHING THE ISSUES OF ELDER ABUSE**

X. Dong, M.A. Simon, *Rush University, Chicago, Illinois*

Elder abuse is a pervasive public health issue, and estimates suggest that 10% of US older adults experience some form of abuse, neglect or exploitation. Despite National Research Council and 2010 NIA-NAS State-of-the-Science recommendations, vast gaps exist in our current understanding of elder abuse. Unified national policy could be an important approach to advance the field of elder abuse and to provide much needed momentum to propel scientific knowledge, practice and policy. In this session, we will highlight the epidemiology of elder abuse and describe the current Elder Justice Act. This discussion will emphasize the complexities of elder abuse at the community level, especially given the rapidly increasing diversity of the aging population. We will provide examples of community advocacy to bring elder abuse awareness in a Chicago Chinese population and to leverage the principles of community-based participatory research methodology to advance the issues of elder abuse.

### **MEDICAID AND THE AFFORDABLE CARE ACT (ACA): ACCESS TO HEALTHCARE ACROSS THE LIFE SPAN**

T. Miles, *University of Georgia-Athens, Athens, Georgia*

Given the polarizing rhetoric surrounding the ACA, its provisions to strengthen Medicaid support for all ages have received less attention. Understanding the Medicaid's inter-generational value is essential for gerontologists. Medicaid not only supports institutional and community-based services, but also provides more than 50 percent of U.S.

maternity care. In March 2012, we await the Supreme Court ruling on two critical provisions in the ACA. Almost everyone is familiar with the Individual Mandate, which requires all citizens to obtain health insurance. The other critical provision is the Medicaid Expansion in 2014, which opens eligibility to a broad group of US citizens. In the period before the expansion, states are required to maintain an eligibility standard for the next two years. This requirement poses a challenge to cash-strapped states. If the Supreme Court rules this provision unconstitutional, the entire structure of Medicaid may destabilize – limiting access to care across the life span.

### **EFFECTIVENESS AND REACH OF OLDER AMERICANS ACT CAREGIVER SERVICES TO LATINO AND AFRICAN AMERICANS**

A.P. Herrera<sup>1</sup>, R. George<sup>2</sup>, J. Angel<sup>2,3</sup>, K. Markides<sup>4</sup>, F. Torres-Gil<sup>5</sup>, *1. University of Maryland, Baltimore County, Health Administration and Health Policy, Department of Sociology and Anthropology, Baltimore, Maryland, 2. University of Texas, Austin, School of Public Affairs, Austin, Texas, 3. University of Texas, Austin, Department of Sociology, Austin, Texas, 4. University of Texas, Medical Branch, Galveston, Texas, 5. University of California, Los Angeles, School of Public Affairs, Los Angeles, California*

Home- and community-based services are cost-effective alternatives to institutionalization, but underused by minority seniors despite greater disability. We studied 1,749 Hispanic, African-American and White Older Americans Act Title III caregiver service users in 2009. We examined racial/ethnic variation in the effectiveness of services, unmet needs, and reach to the most vulnerable. Compared to White care recipients, Hispanics and African-Americans were more likely to be disabled, poor, reside in urban areas, and have Medicaid. Hispanics had the highest percentage of unmet care needs, while caregiver services were less effective at helping African-Americans remain living at home independently. Minorities utilizing OAA caregiving services sought instrumental caregiver support through community agencies and were drastically more educated than demographically similar national cohorts. Greater efforts to reach less educated, limited-English proficient, and disabled minority seniors in urban areas and community agencies may reduce unmet needs and increase effectiveness of caregiver services in maintaining independent living.

### **THE IMPORTANCE OF CULTURE IN ENVIRONMENTAL POLICY CHANGE STRATEGIES TO PROMOTE HEALTHY AGING**

A. Perez, *Arizona State University College of Nursing & Health Innovation, Phoenix, Arizona*

In Arizona (2001 – 2010), the population of individuals ≥ 65 years old grew at a rate of 82%, the fastest growth of any age group; older Hispanics account for 59% of this growth. By 2030, older adults are expected to represent almost 12% of the U.S. population; older Hispanics represent a large segment of this group. Not all older adults are benefiting equally from scientific advances. In particular, a growing body of research documents the importance of age-friendly built environment policies. Emerging information emphasizes how to design and implement such strategies in culturally diverse neighborhoods. This project, funded through a Health and Aging Policy Fellowship supported by Atlantic Philanthropies in partnership with the Healthy Aging Program at the CDC, describes community-based participatory methods working with residents and community partners to identify, and adopt strategies to guide local environmental policy change promoting healthy and vital aging while attending to the community's cultural needs.

## **SESSION 1050 (SYMPOSIUM)**

### **THEORETICAL INNOVATION IN ENVIRONMENTAL GERONTOLOGY: SOCIAL CONSTRUCTION, THE LIFE COURSE AND THE NEGOTIATION OF PLACE**

Chair: *K. Diaz Moore, Architecture, University of Kansas, Lawrence, Kansas*

Discussant: *R. Rubinstein, University of Maryland, Baltimore, Maryland*

The passing of M. Powell Lawton a decade ago triggered a renewed focus on theoretical development within environmental gerontology. These four presentations each reflect advancement at different levels of theory. Diaz Moore and Geboy will present the Ecological Model of Place for the Aging (EMPA), an accommodative heuristic designed to produce both hypotheses and propositions as well as guide action-taking. The EMPA makes lateral connections between Weisman's Model of Place and a core environmental psychology theory entitled the Theory of Place. Wahl's presentation examines how our understanding of aging-environments interactions may be enhanced by considering inter-linkages between: Bronfenbrenner's ecology of human development; Baltes & Baltes' model of selective optimization and compensation; and Carstensen's socio-emotional selectivity theory. Oswald and colleagues will present a new four domain model of perceived housing and suggest new, salient theoretical constructs for further consideration. Golant's presentation will focus on the new theory of Residential Normalcy which enhances the understanding of person-environment fit through careful consideration of the coping mechanisms selected to be employed to maintain comfort, competence and a sense of control. After attending this session, participants will be able to explain the main trajectories of theoretical development within environmental gerontology and formulate possible policy/program implications that stem from them.

### **THE ECOLOGICAL MODEL OF PLACE FOR THE AGING: PURPOSE, ACTIVITY AND THE NEGOTIATION OF PLACE EXPERIENCE**

*K. Diaz Moore<sup>1</sup>, L. Geboy<sup>2</sup>, 1. Architecture, University of Kansas, Lawrence, Kansas, 2. Architectural and Organizational Change Advisor, Milwaukee, Wisconsin*

This presentation presents the Ecological Model of Place for the Aging (EMPA), an integrative and accommodative heuristic model which draws upon Lawton's Ecological Model of Aging, Weisman's Integrative Model of Place, Wahl and Lang's Socio-Physical Place Over Time (SPOT) theory, and connecting it with Canter's Theory of Place, a core theory within environmental psychology. The core construct is place defined as a socio-physical milieu circumscribed by a Physical Setting to which an implicit Program of shared expectation is tied in relation to which People enact their chosen Activities for a given purpose(s). The potential utility of the EMPA is both in its ability to inform meaningful multi-level hypotheses as well as inspire systemic action-taking. Attendees will be able to describe and define the Ecological Model of Place for the Aging and its use as a heuristic to inform research and action-taking.

### **COPING STRATEGIES BY OLDER PERSONS TO ACHIEVE RESIDENTIAL NORMALCY**

*S. Golant, Geography, University of Florida, Gainesville, Florida*

A major focus of environmental gerontology is to optimize the fit or congruence between aging persons and their physical and social environments. The most cited model of environmental congruence continues to be Lawton's ecological theory of aging. Although it recognizes the importance of adaptive behaviors, it leaves unspecified the coping mechanisms by which older persons respond to adverse or stressful environmental conditions. This is an important omission given that human development and life-span theorists consistently argue that older persons who age successfully or optimally are those who have the resilience

to manage, change, or eliminate the threats or assaults to their well-being. We propose an emotion-based theoretical model of environmental congruence specifying how older persons initiate accommodative (emotion-focused, secondary control) and assimilative (problem-focused, primary control) coping strategies to achieve residential normalcy, that is, to occupy a residential environment in which they feel comfortable, competent, and in control.

#### **ON CONCEPTS AND MEASURES OF PERCEIVED HOUSING IN OLD AGE**

F. Oswald<sup>1</sup>, R. Kaspar<sup>1</sup>, H. Wahl<sup>2</sup>, *1. Interdisciplinary Ageing Research, Goethe University Frankfurt, Frankfurt, Germany, 2. Heidelberg University, Heidelberg, Germany*

The aim of this presentation is to address concepts of experiential facets of person-environment (P-E) exchange in later life, as well as related quantitative measures emphasizing particular perceived housing. First, a four-domain model of perceived housing based on data from a European research project (ENABLE-AGE) is introduced. Each of the domains brings a unique perspective to the understanding of perceived housing, i.e. housing satisfaction, usability in the home, meaning of home and housing-related control beliefs. Second, we want to reconsider existing concepts for two of the four domains, i.e. control beliefs and meaning of home. Pilot data from factor analyses with 232 participants give support for alternative concepts, such as “daily independence”, “neighborhood belonging”, or “continuity and remaining in place”. The findings show the complexity of P-E experience in later life and the value of different complementary concepts, as well as the need for further theory and instrument development.

#### **AGING IN PHYSICAL-SPATIAL-TECHNICAL CONTEXTS: TOWARD A BETTER LIAISON WITH LIFESPAN DEVELOPMENTAL MODELS**

H. Wahl, *Heidelberg University, Heidelberg, Germany*

Contextual and co-constructive lifespan developmental models have been at the heart of developmental science since the 1970's. However, such a meta-perspective still has been spelled out for gerontology only in a rather unsystematic way. In this paper, I will make an attempt to link co-constructive reasoning in developmental science with aging in context, while putting the focus on the physical-spatial-technical (P-S-T) environments. To do so, I will introduce a general model of person-environment relations in aging as spelled out in Wahl, Iwarsson, & Oswald (2012; *The Gerontologist*) and create bridges with three lifespan models which build on the meta-perspective of co-construction: (1) Bronfenbrenner's ecology of human development; (2) Baltes & Baltes' model of selective optimization with compensation; and (3) Carstensen's socio-emotional selectivity theory. I will also ask for research and practice implications for forthcoming cohorts of older adults at the high as well as low end of functioning and competence.

#### **SESSION 1055 (PAPER)**

#### **MENTAL HEALTH SERVICES, WELLBEING, AND CROSS-CULTURAL PERSPECTIVES**

##### **FACTORS AFFECTING DEPRESSION AMONG ELDERLY RESIDENTS OF RESIDENTIAL CARE HOMES: A NATIONAL SURVEY IN CHINA**

Z. Ouyang<sup>1,2,3</sup>, S. Liu<sup>1,3</sup>, A.M. Chong<sup>1,3</sup>, *1. City University of Hong Kong, Hong Kong, China, 2. China Research Center on Aging, Beijing, China, 3. Centre for Behavioural and Social Research, Hong Kong, China*

Aim: China has become an aging society since 1999. About 1.16% of older Chinese aging 60 and above are now living in aged care homes. This paper examines the association between a number of personal factors and depression among older adults living in residential care

homes through a national survey. Methods: A total of 1,700 residents of residential care homes were recruited using a multistage random sampling method across China. Among them, 1,636 were successfully interviewed by trained interviewers with the use of a structured questionnaire from March to May in 2010. Findings: Nearly half (44.7%) of the respondents showed significant depressive symptoms (with a cut-off value  $\geq 5$ ) in the Chinese version of GDS-15. A hierarchical regression analysis found functional disabilities and leisure activities predicted depression and explained 18.2% of the variance of depression after controlling gender, age, marital status, educated level and income. Moreover, the relationship between functional disabilities and depression was significantly moderated by residential satisfaction. Conclusion: The study found the depression rate of residents in residential care homes in China was high, and was even higher than some findings from American studies (Kerber, Dyck, Culp, & Buckwalter, 2005; Abas et al., 1998). This study has important findings, namely leisure activities, which is seldom studied in China, would reduce depression; and that resident satisfaction could help alleviate depression associated with functional disabilities. Residential care homes in China are recommended to organize more leisure activities and programs that would promote resident satisfaction in order to enhance the residents' well-being.

#### **ASIAN NEIGHBORHOODS AND THE MENTAL HEALTH OF OLDER ASIAN AMERICANS**

D. Nguyen<sup>1</sup>, S. Park<sup>2</sup>, *1. New York University, New York, New York, 2. Kyonggi University, Suwon, Republic of Korea*

Study Aim: Applications of social capital theories with Asian Americans show social connections can improve health and mental health outcomes. Little research has extended the theories to older Asian Americans, who have many health, mental health, and social vulnerabilities. This study examines the relationship between social capital and perceived social discrimination on the depressive symptoms of community-dwelling older Asian Americans. Methods: Community-based participatory research methods were used to survey Chinese, Korean, and South Asian adults over the age of 60 living or receiving services in a large multi-Asian enclave. The study was administered as a randomized phone interview, and individually with senior-center attendees. These procedures yielded 120 completed surveys. In order to account for missing values, multiple imputation was used to test a multiple regression model that examined scores on the Patient Health Questionnaire – 9. Results: The results reveal the separate and unique contributions of two dimensions of neighborhood relationships. Elders living in Asian neighborhoods endorsed fewer depression symptoms. Meanwhile, higher levels of social capital were associated with lower levels of depression. The deleterious effects of discrimination are tempered by the benefits of neighborhood social connections. Conclusion: The social environment, role of aging in place and naturally occurring retirement communities (NORC) are vitally important for elders, irrespective of the demographic composition of the surrounding neighborhood. Implications for social capital theories and mental health promotion will be discussed.

#### **THE “LONE RANGER”: A MOTIF FOR OLDER MEN WITH SMALL SOCIAL NETWORKS**

D. Cloutier-Fisher, K. Kobayashi, *Geography and Centre on Aging, Univ of Victoria, Victoria, British Columbia, Canada*

In the gerontological literature, larger support networks are associated with better health and well-being, while having few people to rely upon during times of need or to talk with about private matters is associated with vulnerability to health declines or increased service use. This qualitative research study uses a life course perspective. In-depth, face to face interviews were conducted with 12 older men, aged 69-92 years (average age 80), who had been screened and identified as being at-risk for social isolation. Using an inductive coding framework, the thematic analysis for this study examined: (1) patterns of socialization over

the life course; (2) the meaning of kin and non-kin ties; and (3) the role of weak peripheral ties or ties to social organizations as influences on the well-being of these older men. A portrait of the myriad ways in which older men with small support systems can be characterized as both resilient and vulnerable is reflected in the motif of the "Lone Ranger." In this context, it is insufficient to argue then that small social networks increase the health risk of older males, without also seeking a more nuanced understanding of how older men themselves interpret the nature and meaning of these relationships.

#### **USE OF COMPLEMENTARY AND ALTERNATIVE MEDICINE FOR MENTAL DISORDERS AMONG BABY BOOMERS AND OLDER ADULTS**

S. Groden, A.T. Woodward, *School of Social Work, Michigan State University, East Lansing, Michigan*

This study uses data from the Collaborative Psychiatric Epidemiology Surveys to compare the use of Complementary and Alternative Medicine (CAM) for mental health problems between baby boomers and older adults. CAM refers to medical and health care systems and practices that are not part of conventional medicine (NCCAM website, 2012). One category of CAM, common within the mental health professional practice is Mind-Body, which includes guided imagery, relaxation, meditation and hypnotherapy techniques. Twenty-three percent of the respondents (n=2,263) indicated that they used some type of CAM during the last 12 months. A significantly higher percentage of baby boomers (27.9%) used CAM versus older adults (16.7%) even after controlling for sociodemographic and mental disorder variables. Among those who reported using CAM, a higher proportion of baby boomers reported using most types of CAM, including Mind-Body techniques, except for prayer or other spiritual practices (68.9% of older adults vs. 61.6% of baby boomers). Social workers, psychologists, psychiatrists and other mental health professionals who work with older adults need to be aware of CAM use amongst both cohorts for both assessment and treatment options. Other factors influencing use of CAM for each cohort will be discussed.

#### **RE-ENGAGEMENT INTO MENTAL HEALTH-CARE AMONG OLDER ADULTS: ROLE OF TREATMENT SATISFACTION ON SERVICE USE FOR RECURRENT EPISODES OF DEPRESSION**

M. Hansen, *School of Social Work, U.S.C., Los Angeles, California*

**Objective:** The study examined patient and system level factors on mental health service use for recurrent depressive episodes among middle to older aged adults. Given high rates of relapse for individuals who experience depression and related health complications with untreated mental health needs in late life, understanding factors associated with the persistent low use of mental health services by older adults is vital. **Method:** Study used 1-year and 5-year follow-up data from the Partners in Care Project (PIC), pooling a sample of adults 50 years and older, minorities and non-Hispanic Whites (n=416). Using logistic regression, analysis examined direct and moderating effects of reported treatment satisfaction with depression care and its impact on later service use for experienced mental health need. **Results:** Service use at 5-year follow-up was significant for younger segments of the sample, those who reported increased satisfaction with care after active treatment at 1-year, and high mental health need at 5-year follow-up. Though no direct effect with minority status and service use existed, treatment satisfaction positively moderated the relationship between minority status and later service use, increasing odds of use by double. **Conclusion:** Findings inform and extend the understanding of treatment satisfaction as relevant in predicting service use to manage recurrent depressive episodes in adults as they age. Profiling risk factors for under-use among minority populations such as low treatment satisfaction assists practitioners in improving methods to actively engage patients in care

to increase service use in preventing and managing depression in late life.

### **SESSION 1060 (SYMPOSIUM)**

#### **EXERCISE - CELLULAR AND MOLECULAR MECHANISMS: CAN EXERCISE ALTER AGING OR AGE-RELATED DISEASE?**

Chair: *L. Ferrucci, National Institute on Aging, Baltimore, Maryland*

Co-Chair: *L. Ferrucci, National Institute on Aging, Baltimore, Maryland*

Co-Chair: *T.N. Burks, Johns Hopkins University, Baltimore, Maryland*

Exercise is an intervention that has been shown to delay aging and age-related disease. There is intense interest at both the basic science and clinical levels related to the cellular and molecular mechanisms through which exercise has beneficial actions. This symposium will be targeted toward understanding the mechanisms for skeletal muscle decline with age and the importance of exercise as an intervention for aging.

#### **NEW INSIGHT INTO THE ROLE OF RESIDENT STEM CELLS IN ADULT SKELETAL MUSCLE HYPERTROPHY**

C.A. Peterson, *University of Kentucky, Lexington, Kentucky*

Satellite cells are the primary stem cell of skeletal muscle and are required for post-natal growth. The role of satellite cells in adult muscle fiber hypertrophy in response to resistance training remains equivocal. To address this issue, a novel mouse strain was created that enables ablation of satellite cells. Following mechanical overload, satellite cell-depleted muscle showed the same robust increase in muscle mass as observed in the control group. Unlike fiber hypertrophy, new muscle fiber formation was significantly blunted with satellite cell depletion, indicating that fiber hypertrophy and hyperplasia have different satellite cell requirements. The typical increase in myonuclei with hypertrophy was absent in satellite cell-depleted muscle, suggesting that compensatory mechanisms enable effective adult muscle fiber growth independent of satellite cells. The ability of aged muscle to activate these compensatory mechanisms in response to overload will be discussed.

#### **NON-CLASSICAL ROLE OF TROPONIN T IN SKELETAL MUSCLE**

T. Zhang, A. Birbrair, Z. Wang, J. Taylor, M.L. Messi, O. Delbono, *Gerontology and Geriatric Medicine, Wake Forest University School of Medicine, Winston-Salem, North Carolina*

In aging humans and rodents, decreased muscle mass does not fully account for the decrease in strength, indicating that atrophy only partially explains muscle weakness. Publications from our laboratory and others support the concept that aging impairs muscle activation-contraction efficiency. Troponin T (TnT) is known to mediate the interaction between Tn complex and tropomyosin (Tm), which is essential for calcium-activated striated muscle contraction. This regulatory function takes place in the myoplasm, where TnT binds Tm. However, recent findings imply other roles for the Tn-Tm complex. We propose that TnT plays a non-classical role through nuclear translocation. A pool of fast TnT3 is localized in the nuclear fraction of mouse skeletal muscle as either an intact or fragmented protein. TnT3 fragments are closely related to nucleolus and RNA polymerase activity. TnT3 fragmentation is highly regulated by aging, thus creating a possible link between the deleterious effects of TnT3 fragments and sarcopenia.

#### **INFLUENCE OF EXERCISE ON MITOCHONDRIAL FUNCTION IN OLDER ADULTS AND MICE**

M. Tarnopolsky, *Mark Tarnopolsky, Mark Tarnopolsky, Hamilton, Ontario, Canada*

Skeletal muscle in older adults show; mitochondrial DNA deletions, lower mitochondrial electron transport chain enzyme activity, and higher

oxidative stress. We have found an increase in electron transport chain enzyme activity, fewer mitochondrial DNA deletions, lower oxidative stress and higher anti-oxidant enzyme capacity in older adults following a resistance exercise training program. The potent effect of endurance exercise as a countermeasure for aging was demonstrated using the polymerase gamma mutator mouse model (POLG1 mutator) where five months of exercise training conferred nearly 100% phenotypic protection in the POLG1 animals that normally demonstrate phenotypic features seen in older adults (hair loss, muscle atrophy, cardiac hypertrophy, anemia, gonadal atrophy). Data the POLG1 model in combination with human studies has allowed us to identify several serum factors (myokines) that are involved in the overlapping and multi-systemic benefits conferred by endurance exercise that mitigate some of the effects of aging. Supported by CIHR Canada.

## SESSION 1065 (SYMPOSIUM)

### THE IL-10<sup>-/-</sup> FRAIL MOUSE AS A MODEL FOR AGE-RELATED DISEASE STATES

Chair: J.D. Walston, *Medicine/Geriatrics, Johns Hopkins University, Baltimore, Maryland*

Discussant: L.L. Dugan, *University of California, San Diego, San Diego, California*

Inflammatory pathway activation has long thought to be important in the development of multiple aging-related chronic disease states, functional decline, and frailty. The IL-10<sup>-/-</sup> mouse does not produce the anti-inflammatory cytokine IL-10 and develops a low grade inflammatory state by mid-life that influences multiple organ systems and the aging process. This mouse has been proposed as a model for frailty because of its age-related acceleration in decline in muscle strength, mild elevation in inflammatory mediators, endocrine changes, and early mortality when compared to a age and gender background strain non-frail mouse. Because of the similarities observed to human frailty, investigators have attempted to further characterize the age-related changes that might parallel those seen in human frailty and age-related disease states as well as the underlying biology that influences those changes. In this symposium, data will be presented that describes cognitive and behavioral changes and the biology that underlies that change in this mouse strain. Data that characterizes the vascular stiffness and myocardial function identified in the frail mouse and will also be described. Finally, in a finding that may help to explain accelerated loss of muscle strength in the frail mouse, data will be presented that shows significant declines in mitochondrial induced energy generation in the skeletal muscle of frail older mice compared to non-frail mouse. Taken together, these findings provide further support for the use of this mouse strain for the study of the influence of chronic inflammation on frailty and multiple age-related chronic diseases.

### BEHAVIORAL ASSESSMENT OF THE IL-10<sup>-/-</sup> MOUSE MODEL OF FRAILITY SUGGESTS IMPAIRMENTS IN EMOTIONAL LEARNING AND ANXIETY RESPONSE TO ENVIRONMENT

W. Nguyen<sup>1</sup>, E. Inui<sup>1</sup>, V. Nagarajan<sup>1</sup>, D. Lui<sup>1</sup>, G. Shekhtman<sup>1</sup>, A.J. Roberts<sup>2</sup>, J.D. Walston<sup>3</sup>, L.L. Dugan<sup>1</sup>, *1. UCSD, La Jolla, California, 2. Scripps Research Institute, La Jolla, California, 3. Johns Hopkins University, Baltimore, Maryland*

IL-10<sup>-/-</sup> mice have been proposed as model of the frailty syndrome, but a systematic assessment of neurocognitive status of these mice has not been previously performed. Here we carried out a sequence of behavioral studies aimed at assessing working memory, anxiety- and depression-like phenotypes, emotional learning, and executive function. IL-10<sup>-/-</sup> mice demonstrated significant impairment in emotional learning (an amygdala-based process) in a fear-conditioning task, enhanced anxiety (freezing) in response to a novel environment, and an inappropriate increase in time spent in an aversive environment (time-in-center on

open field testing). IL-10<sup>-/-</sup> mice also had impaired performance on the Barne's maze, which assesses the time and strategy used by the mouse to escape to a dark, safe location. Taken together, these data suggest that the IL-10<sup>-/-</sup> mice have increased anxiety, impaired processing of environmental information and deficits in executive function, features which may parallel deficits in many frail older adults.

### IL10<sup>-/-</sup> FRAIL MICE DEVELOP CARDIAC AND VASCULAR DYSFUNCTION WITH INCREASED AGE

G. Sikka<sup>1</sup>, K. Miller<sup>1</sup>, S. Jung<sup>4</sup>, C.D. Fraser III<sup>3</sup>, D. Bedja<sup>1</sup>, J.D. Walston<sup>1,2</sup>, D.E. Berkowitz<sup>1</sup>, L.A. Barouch<sup>1</sup>, *1. Johns Hopkins University, Baltimore, Maryland, 2. Johns Hopkins Bayview Medical Center, Baltimore, Maryland, 3. University of Texas Health Science Center, Houston, Texas, 4. Yeungnam University, Daegu, Democratic People's Republic of Korea*

Frailty in humans is associated with activation of inflammatory pathways, skeletal muscle decline, and cardiovascular dysfunction. Older IL10<sup>-/-</sup> mice display many characteristics of human frailty and have been proposed as a model to study the biology that underlies frailty. We hypothesized that the frail mouse would also have similar cardiovascular dysfunction to that observed in frail humans. To test this, we recorded in-vivo echocardiography, pulse wave velocity, blood pressure and conducted ex-vivo vascular force-tension myography in IL10<sup>-/-</sup> and control mice. Left-ventricular (LV) End Systolic Diameter, LV mass, and iso-volumic relaxation time were increased, while ejection fraction was reduced in old IL10<sup>-/-</sup> mice compared to control mice. Stimulation with acetylcholine in endothelial-intact aortic rings from old mice demonstrated vasoconstriction, which was reversed by COX1, COX2 and ThromboxaneA2 blockers in old IL10<sup>-/-</sup> mice but absent in young and old WT and young IL10<sup>-/-</sup> aortic rings.

### PROGRESSIVE INCREASES IN BRAIN INFLAMMATORY SUPEROXIDE PREDICT REGION-SPECIFIC DEFICITS IN CRITICAL INHIBITORY INTERNEURONS IN IL-10<sup>-/-</sup> MICE

Q. Tang, W. Nguyen, E. Inui, V. Nagarajan, D. Lui, G. Shekhtman, A. Habas, L.L. Dugan, *Medicine & Neurosciences, UCSD, LaJolla, California*

L-10<sup>-/-</sup> exhibit behavior changes associated with several brain regions; here we attempted to identify molecular and anatomic pathways which underlie these changes. Previous studies in non-frail, aged mice have shown inflammatory signaling through IL-6 produces injury to PV-positive GABAergic inhibitory interneurons critical for memory formation and recall, attentional shift, and information encoding. We now show that IL-10<sup>-/-</sup> mice have a significantly greater increase in inflammatory superoxide production than age-matched controls, accompanied by loss of PV-interneurons first in the amygdala (at 14 mos.), then hippocampus and cortex (21 mos.) These region-specific changes in inhibitory interneuron integrity would be predicted to impair executive function and attentional shift (pre-frontal cortex), emotional learning (amgdala), and spatial information processing (hippocampus), all behavioral deficits observed in aging IL-10<sup>-/-</sup> mice. Current studies are aimed at identifying the specific molecular source of superoxide and the physiological implications of PV-interneuron loss, and how these relate to the observed behavioral changes.

### SKELETAL MUSCLE CREATINE KINASE ATP KINETICS ARE IMPAIRED IN FRAIL MICE

A. Akki, A. Gupta, V.P. Chacko, H. Yang, J.D. Walston, R.G. Weiss, *Medicine, Cardiology, Johns Hopkins Medical Institution, Baltimore, Maryland*

The interleukin-10 knockout mouse (IL-10) has been proposed as a model for human frailty, a geriatric syndrome characterized by muscle weakness, because it develops an age-related increase in muscle weakness compared to control (C57BL/6J) mice. The creatine kinase (CK) reaction is the primary energy reserve in skeletal muscle (SM) providing ATP during periods of increased demand. It is not clear whether

SM CK energy metabolism is altered in frailty. We used a combination of in vivo <sup>31</sup>P nuclear magnetic resonance experiments and biochemical assays to measure the rate of CK-ATP synthesis in hind-limb SM of 23-month-old control (n=7) and IL-10 (n=6) mice. SM Phosphocreatine (20.2±0.8 vs. 16.8±0.9, μmol/g, control vs. IL-10, p<0.05) and CK-ATP flux (5.0±0.3 vs. 3.1±0.5, μmol/g/s, p<0.01) were significantly lower in IL-10 than in control mice with no difference in [ATP]. These observations demonstrate that in vivo SM ATP kinetics are depressed in a murine model of frailty.

## **SESSION 1070 (SYMPOSIUM)**

---

### **A PRIMER ON THE WISCONSIN LONGITUDINAL STUDY: OVER 50 YEARS OF SOCIAL DATA AND NEWLY AVAILABLE GENETIC DATA**

Chair: *C. Roan, Sociology, University of Wisconsin, Madison, Wisconsin*

Co-Chair: *P. Herd, Sociology, University of Wisconsin, Madison, Wisconsin*

The Wisconsin Longitudinal Study is an important data source for researchers interested in examining aging in the context of the life course. The study is a sample of one in three Wisconsin high school graduates, and a selected sibling, from the class of 1957. WLS is unique among major social scientific resources for the length with which it has followed a large population-based cohort sample and that it includes siblings. Recently available DNA data can be merged with fifty years of social data. The addition of genetic data allows new analyses linking genotypic, biomedical, psychosocial, and life course outcomes in novel ways. The data cover nearly every aspect of the participants' lives from early life socioeconomic background, schooling, family and work to health, social participation, civic engagement, well-being, and cognition. The study also has a wealth of unique data including examples such as administrative IQ scores from high school, information collected from high school yearbooks that include measures of attractiveness, proxy measures for obesity, and complete lists of student activities for all respondents. Examples of administrative data include Medicare records, Social Security records, and resource data on primary and secondary schools attended by participants. This session will introduce the study to researchers who are not familiar with the data by providing an overview of the study as well as practical information on the structure of the data. Attendees will be provided with a CD containing documentation and the data.

### **HOW TO ACCESS AND USE DATA FROM THE WISCONSIN LONGITUDINAL STUDY**

*C. Roan, Sociology, University of Wisconsin, Madison, Wisconsin*

With over 15,000 analysis variables covering more than 50 years of data, new users of the WLS data may find themselves overwhelmed when looking for the measures they need to answer their research questions. I will give detailed instructions on how to use the tools and reference materials developed by WLS staff. Attendees will learn how to search for analysis variables, where to find copies of the survey instruments online, and how to download the public data. I will also explain the organizational structure of the data, variable naming conventions, and offer recommendations on how to break the data into smaller pieces if your computing resources are limited. Participants in this symposium will also learn about the differences between publically available data and data available only by application. Finally I will explain how to apply to use the genetic data and other non-public data.

### **A PRIMER ON GENETIC DATA AVAILABLE IN THE WISCONSIN LONGITUDINAL STUDY**

*C.S. Atwood, N.S. Roetker, J.A. Yonker, V. Chang, P. Herd, T. Hauser, R.M. Hauser, University of Wisconsin, Madison, Wisconsin*

The Wisconsin Longitudinal Study (WLS) is unique among major social scientific resources for the length with which it has followed a large population-based cohort sample and that it includes siblings. WLS is a premier resource for studies of social, economic, psychological, and health outcomes in the United States, and its design and findings have had world-wide influence. The addition of genetic data allows new analyses linking genotypic, biomedical, psychosocial, and life course outcomes in novel ways. WLS will be a unique resource available to all qualified researchers that is well suited for replication of findings from existing studies in a population-based sibling-design sample, investigations exploring the genotypic contribution to observed associations among phenotypic measures across domains, gene x gene interaction studies, and gene x environment interaction studies. To investigate gene x gene and gene x environment interactions using this wealth of data we have been investigating a number of sophisticated modeling techniques (e.g. recursive partitioning, random jungle, multi-factor dimensionality reduction) to examine the etiology of complex diseases and conditions.

### **WHAT'S IN THE WISCONSIN LONGITUDINAL STUDY: AN OVERVIEW OF EXISTING AND NEWLY COLLECTED 2011 DATA**

*P. Herd, UW-Madison, Madison, Wisconsin*

This presentation will provide an overview of the WLS data. Survey years include 1957, 1964, 1975, 1993, 2004 and a new data collection effort is currently in the field. The content of the WLS has changed to reflect the life course of participants: education inspired the initial data collection, familial and career outcomes focused data collection in midlife, and later rounds have shifted attention to respondent's health, cognitive status, psychological and other dimensions of well-being, non-work activities, and caregiving and social support. Some examples of non-survey derived measures include: parent earnings from state tax records (1957-60), high school IQ scores; characteristics of high schools and colleges, employers, industries, and communities of residence; archival data on high school and elementary school resources; information on social participation, facial obesity, and attractiveness from yearbooks; matches to the National Death Index and the Wisconsin State Tumor Registry; and Medicare claims data for older siblings.

## **SESSION 1075 (SYMPOSIUM)**

---

### **CHARTING REACH TRANSLATIONS: LESSONS, INSIGHTS, & FINDINGS**

Chair: *D.W. Coon, Arizona State University, Phoenix, Arizona*

Co-Chair: *C. Lee, University of Miami Miller School of Medicine, Miami, Florida*

Discussant: *D. Gallagher-Thompson, Stanford University School of Medicine, Stanford, California*

A number of evidence based treatments for family caregiver distress have emerged in the last two decades; however, investigation into the effective translation and ongoing support of these interventions into community based settings is still in its infancy. Supported through competitive ADSSP grants from the U.S. Administration on Aging, this symposium focuses on the translation of REACH (Resources for Enhancing Alzheimer's Caregiver Health) and REACH II interventions from the original trials into communities across five U.S. States (Arizona, Florida, Georgia, Nevada, and North Carolina). These projects are designed to accomplish their goals through partnerships among various entities including the state units on aging, health and community-based organizations like the local Alzheimer's Association and the Area Agencies on Aging, and research institutions. This symposium also

describes how these projects incorporated aspects of the RE-AIM framework and its related tools to facilitate translation into the community as outlined in the CDC's Assuring Healthy Caregivers, A Public Health Approach to Translating Research into Practice: The RE-AIM Framework (2008). Notably, leadership implemented adaptations to foster adoption and maintenance of the interventions while also ensuring fidelity to the core elements of the original REACH or REACH II intervention. In addition to the discussion of successful outcomes, the symposium will present challenges in the translation process including: staff turnover requiring ongoing training and supervision, competing staff roles and divergent skill levels, streamlining of materials, and outreach and delivery barriers in resource rich versus resource poor environments and the need to customize recruitment messages.

### **RCI REACH: A MODEL FOR COMMUNITY AGENCY IMPLEMENTATION**

G. Alston, L. Easom, *Rosalynn Carter Institute for Caregiving, Americus, Georgia*

Resources for Enhancing Alzheimer's Caregiver Health II (REACH II) is an evidence based caregiver intervention proven to significantly reduce stress and depression. The Rosalynn Carter Institute for Caregiving translated the REACH-VA model of REACH II through their Caregiver Support Center beginning in 2009. The translation successfully decreased caregiver depression (11.7 to 9.8,  $p \leq .05$ ) and burden (18.9 to 15.7,  $p \leq .05$ ). From the lessons learned in this translation, RCI-REACH was developed. In 2010, RCI provided technical assistance for the replication of their model through the aging services network. Embedding RCI-REACH into the Coastal Georgia Area Agency on Aging has led to development of new tools (web-based data collection) and procedures (staffing models) that have improved client recruitment, data collection, and adoption. This presentation will share outcomes results from the RCI-REACH translation project as well as an overview of the model developed for implementation through the AAA.

### **COMMUNITY REACH II: MIAMI**

C. Lee<sup>1</sup>, S. Czaja<sup>1</sup>, D.M. Perdomo<sup>1</sup>, V. Stubbs<sup>2</sup>, E. Ellsworth<sup>2</sup>, G. Rodriguez<sup>2</sup>, *1. Center on Aging, University of Miami Miller School of Medicine, Miami, Florida, 2. United HomeCare Services, Miami, Florida*

There are over 50,000 cases of elders with Alzheimer's Disease (AD) in South Florida and the majority of these patients live at home and are cared for by family members. Effective interventions to reduce caregiver distress and delay nursing home placement that can be successfully implemented in community settings are warranted. This paper describes a collaborative demonstration project, Community REACH II, for caregivers of persons with AD. Community REACH II is based on the multi-component evidenced-based REACH II program. To date, 72 dyads of caregivers and care recipients have successfully completed the program. The presentation will provide an overview of the processes and challenges involved with the adaptation, implementation and sustainability of Community REACH II (e.g., session structure, staff training). Preliminary data on characteristics of the participants and reactions to the intervention by both the caregivers and United Homecare Personnel involved in the program will also be discussed.

### **CONDUCTING A MID-COURSE ASSESSMENT OF THE NORTH CAROLINA REACH INTERVENTION: LESSONS LEARNED**

M. Altpeter<sup>3</sup>, L.P. Gwyther<sup>4</sup>, S. Kennedy<sup>1</sup>, K. Derence<sup>5</sup>, T. Patterson<sup>2,1</sup>, *1. Department of Health and Human Services, NC DHHS Division of Aging and Adult Services, Raleigh, North Carolina, 2. North Carolina State University, Raleigh, North Carolina, 3. University of North Carolina at Chapel Hill, Chapel Hill, North Carolina, 4. Duke University, Durham, North Carolina, 5. NC DHHS Division of Public Health, Raleigh, North Carolina*

This presentation will describe the results and "Lessons Learned" from the mid-course assessment of the REACH II community transla-

tion project in North Carolina. Specifically, we will introduce the methods of the mid-course assessment, which was guided by the RE-AIM framework, where adaptations were made to enhance the feasibility of adoption and maintenance while at the same time assuring fidelity to program core elements. The two-stage assessment involved both quantitative (survey) and qualitative (discussion group) components used with the program interventionists. Results revealed a need to focus on tailoring training to the experience level of trainees, streamlining and clarifying the use of materials, customizing recruitment messages for specific circumstances, addressing workload and program length, and clarifying whether flexibilities could be exercised in terms of content addressed and materials used. The nature of the mixed-method process allowed the interventionists to thoroughly assess program satisfaction and areas of concern.

### **CAREPRO (CARE PARTNERS REACHING OUT): AN EBT COMMUNITY PARTNERSHIP IN ARIZONA & NEVADA**

D.W. Coon<sup>1</sup>, T. Walker<sup>1</sup>, S. Hirsch<sup>3</sup>, S. Alloway<sup>2</sup>, J.S. Doucet<sup>2</sup>, D.A. Besst<sup>4</sup>, *1. Arizona State University, Phoenix, Arizona, 2. Aging and Disability Services Division, Las Vegas, Nevada, 3. Cleveland Clinic Lou Ruvo Center for Brain Health, Las Vegas, Nevada, 4. Arizona Department of Economic Security, Phoenix, Arizona*

Using the RE-AIM framework, local chapters of the Alzheimer's Association, state units on aging, and area agencies on aging partnered to translate CarePRO (an initial REACH based intervention) across Arizona and Nevada. Over 300 family caregivers of people with dementia have participated with 100% of those completing evaluations reporting overall benefit (85% benefited "a great deal"). Caregivers also reported they benefited ("some" benefit combined with "a great deal") with regard to: understanding memory loss and its impact (97%); more confidence in dealing with memory problems (98%); made their lives easier (97%); enhanced their ability to provide care (97%); and, improved the patient's life (95%). Embedding CarePRO into the community brought forth both challenges and opportunities yielding key lessons learned: frequent staff turnover requiring re-training and supervision; staff differences regarding theoretical underpinnings, past training, and interest in behavior change skills; recruitment and referral struggles across partners; and, increasingly complex caregiving situations.

## **SESSION 1080 (SYMPOSIUM)**

### **COLLABORATIVE INTERVENTIONS: THE FRONTIER OF LATE LIFE ISSUES FOR ADULTS WITH DISABILITIES**

Chair: *K.L. Culler, Psychology, Institute of Life-Span Development and Gerontology, The University of Akron, Austintown, Ohio*  
Co-Chair: *Y. Shirai, University of Arizona, Tucson, Arizona*  
Discussant: *E.F. Ansello, Virginia Commonwealth University, Richmond, Virginia*

The life expectancy of individuals with disabilities and developmental disabilities (DD) is no longer lagging behind the trends of the general population. Now aging individuals with disabilities and DD are facing late life issues such as: care giving for a parent, adjusting to the loss of a parent, addressing concerns for overall health and wellness in later life and transitioning into nursing home care in comparison to their peers. The symposium begins with a discussion of a training intervention designed to increase overall wellness for adults with cerebral palsy from Project ACT NOW and an innovative intervention (creative aerial-movement) offered in a grieving support group for adults with DD. The last intervention in this symposium describes the design and effectiveness of an organizational/educational intervention on group home support of aging adults with DD among 76 group homes, 103 group home staff and 106 residents aging with DD. Adults with disabilities may simultaneously be a care giver and care receiver. The next two papers in this symposium address this phenomenon from interviews (N=15) from sibling caregivers and interviews (N=18) from bereave-

ment counselors. Overall these interviews further emphasize the necessary involvement of caregivers in interventions tailored for future and late life planning among adults with DD. Additionally, a lack of supports for sibling caregivers of adults with DD, as well as, adults with DD care giving for others is noted within the DD and aging communities. This symposium addresses pivotal late life issues for adults with disabilities from current interventions and research.

### **GROUP HOME TO NURSING HOME: PREVENTING PREMATURE RELOCATION**

B. Bowers<sup>1</sup>, R. Webber<sup>2</sup>, C. Bigby<sup>3</sup>, 1. *Nursing, University of Wisconsin-Madison, Madison, Wisconsin*, 2. *Australian Catholic University, Melbourne, Victoria, Australia*, 3. *LaTrobe University, Melbourne, Victoria, Australia*

As life expectancy of people with intellectual disability has increased, many more people with ID are reaching old age and experiencing age related health problems. Research from several countries has documented that people with ID tend to be prematurely relocated to nursing homes, many coming from group homes. This paper describes an intervention study designed to test the effectiveness of an organizational/educational intervention on group home support of people aging with an intellectual disability. The sample includes 76 group homes, 103 group home staff, and 106 residents aging with an intellectual disability. Data were collected on group home staff knowledge about and confidence in caring for people who were aging with ID, their views on who should be moved from group homes to nursing homes, their awareness and use of health related resources in the community and on organizational policies related to support for aging residents.

### **SIBLING CAREGIVERS OF AGING ADULTS WITH INTELLECTUAL DISABILITIES**

C. Coyle<sup>1</sup>, J. Kramer<sup>2</sup>, J.E. Mutchler<sup>1</sup>, 1. *Univ Mass Boston, Boston, Massachusetts*, 2. *Institute for Community Inclusion, Boston, Massachusetts*

The increased longevity of persons with Intellectual and Developmental Disabilities (IDD) prompts a rethinking of how support will be provided in later life. Current cohorts of adults with IDD are the first to experience the frailty and death of their own parents—their original and often primary supports. In this qualitative study, 15 in-depth interviews were conducted with middle-aged and older adults who are caretakers of a sibling with IDD. Major areas of questioning included: service utilization; experiences with the transition to sibling caregiver; the role of aging; and future planning. Results of this study suggest that there is a need for education targeting family caregivers of people with IDD around aging issues, particularly in respect to planning for the future. More specialized support is needed for sibling caregivers as they age together with their sibling with IDD. Also, stronger infrastructure is needed among aging and disability specialty services providers.

### **RECIPROCITY AT END OF LIFE: WHAT IS KNOWN ABOUT ADULTS WITH DISABILITIES PROVIDING CARE TO ELDERLY PARENTS?**

M. Clute, *Social Work, Eastern Washington University, Cheney, Washington*

In 2011, at the special interest group discussion on adults with ID/DD, members began discussion of the phenomenon of care giving by adults with ID/DD for elderly parents. The discussion prompted this researcher to review her 2007 data from bereavement counselors about grieving adults with ID. Without specifically asking about this phenomenon, four clear examples of reciprocity of care of parents, grandparents, and foster parents were present in interviews of 18 participants. This finding prompted the researcher to look deeper into the literature on caregiving, examining what is documented about bi-directional caregiving for adults with ID. This issue was found to be addressed sparsely in the literature for adults with disabilities including history of mental illness.

The presenter will address the implications for health teaching and grief/death education for caregivers with disabilities; needs for tailored caregiver support for these informal providers; and an agenda for research.

### **GRIEVING SUPPORT GROUP WITH CREATIVE-AERIAL MOVEMENT FOR ADULTS WITH DEVELOPMENTAL DISABILITIES**

Y. Shirai, S.S. Koerner, L. Tomasa, *University of Arizona, Tucson, Arizona*

As the life expectancy of adults with developmental disabilities (DD) now approaches that of the general population, they often experience loss of caregivers (e.g., death of elderly parents). However, their communication challenges, due to the limited cognitive/behavioral abilities of this population, restrict their opportunities to grieve through traditional means (e.g., counseling, talking with friends). This lack of grieving opportunities could result in severe consequences (e.g., isolation, depression). Based on work from two independent research fields, sensory-integration from occupational therapy and creative expression from expressive-art therapy, this pilot-case study (n=3) introduces an innovative intervention—a five-month weekly group grieving workshop: (a) utilizing creative aerial-movement (with a one-point trapeze like swing as the main communication tool) to give adults with DD opportunities to explore, express, and process their abstract and complicated thoughts/feelings resulting from their significant loss, and (b) developing memorial rituals in their daily environment to afford closure to this group.

### **ADULTS WITH CEREBRAL PALSY TRAINING TO INCREASE OVERALL WELLNESS: PROJECT ACT NOW**

D.E. Thorpe<sup>1</sup>, R.G. McMurray<sup>2</sup>, M. Turk<sup>3</sup>, R.C. Henderson<sup>4</sup>, 1. *The University of North Carolina at Chapel Hill, Division of Physical Therapy, Chapel Hill, North Carolina*, 2. *The University of North Carolina at Chapel Hill, Department of Exercise and Sports Sciences, Chapel Hill, North Carolina*, 3. *SUNY Upstate Medical University, Department of Physical Medicine and Rehabilitation, Syracuse, New York*, 4. *The University of North Carolina at Chapel Hill, Department of Pediatric Orthopedics, Chapel Hill, North Carolina*

**Objectives:** 1) Participants will be able to identify common secondary conditions experienced by adults with CP. 2) Participants will be able to recognize appropriate forms of exercise for adults with CP in order to improve or maintain fitness goals. **Purpose:** A randomized prospective cohort of adults with cerebral palsy (CP) was investigated to determine the effects of an aquatic resistive exercise intervention on function and fitness. **Participants and Setting:** Thirty adults with CP aged 21-65 years (M =34.7) and of GMFCS Levels I-IV completed a 12-week aquatic exercise program, exercising at target heart rates. Seventeen adults with CP ages 21-45 years (M = 29.2) comprised a comparison group. **Materials/Methods:** Gross motor function, body composition, leg strength, physical activity (PA) and health-related quality of life (HRQOL) were assessed over a 9-month time period. **Results:** The sample was 55% female; 83% Caucasian, 6% Black, 9% Asian and 2% Hispanic with 38% GMFCS Level I, 30% GMFCS Level II, 19% GMFCS Level III and 13% GMFCS Level IV. PA levels were in the low category. The physical component of the HRQOL score was lower than age-matched peers. Subjects showed 100% compliance with the aquatic intervention. There were no differences between groups for BMD, LMM, composite leg strength, PA, or HRQL. Within the aquatic group, leg strength increased 53%, gross motor function increased significantly and there was a positive trend  $f(1,44) = 2.77, p = .10$  for increases in BMD. **Conclusions/Significance:** Cerebral palsy is not a

static condition. Adults with CP of varying GMFCS levels, develop secondary impairments and conditions. Aquatic exercise, at high intensities, is a feasible and effective intervention to improve gross motor function and has the potential to improve bone mineral density.

## SESSION 1085 (SYMPOSIUM)

### DESIGNING AND IMPLEMENTING AN INTERVENTION FOR OLDER ADULTS: THE PRISM FIELD TRIAL

Chair: *S.J. Czaja, Psychiatry and Behavioral Sciences, University of Miami Miller School of Medicine, Miami, Florida*

Discussant: *J. King, National Institute on Aging, Bethesda, Maryland*

The Center for Research on Aging and Technology Enhancement (CREATE) is conducting a large scale, multi-site randomized clinical trial that is evaluating the efficacy of a computer-based personal reminder, information, and social management (PRISM) system designed to support socialization and communication, memory for everyday events and improve overall quality of life of older people (aged 65+) at risk for social isolation. The computer-based system is being compared to a manual version of PRISM. This symposium will discuss the planning and design process for the intervention and challenges with the implementation of the trial. S. Czaja will present an overview of the study design and the user-centered design approach that was used for the development of the intervention. N. Charness will then present findings from focus groups and a questionnaire study that were used to gather information about technology needs and preferences and to guide the initial development of the PRISM system. W. Boot will describe two new measures of computer proficiency and user acceptance developed for the trial and present data regarding the psychometric properties of these measures. W. Rogers will discuss the Human Factors Engineering tools used in the development of PRISM and the results of the heuristic and piloting testing of the system. Finally, S. Czaja will provide data regarding the participants' perception of PRISM and discuss challenges associated with the implementation of the trial. J. King will lead a discussion of these topics and highlight some of the challenges and opportunities associated with the PRISM trial.

### AN OVERVIEW OF THE PRISM TRIAL AND DESIGN APPROACH

*S.J. Czaja<sup>1</sup>, J. Sharit<sup>2</sup>, C. Lee<sup>2</sup>, S.N. Nair<sup>2</sup>, M.A. Hernandez<sup>2</sup>, S. Fu<sup>2</sup>, 1. Psychiatry and Behavioral Sciences, University of Miami Miller School of Medicine, Miami, Florida, 2. university of miami Miller School of Medicine, miami, Florida*

The Center for Research on Aging and Technology Enhancement (CREATE) is conducting a large scale, multi-site randomized clinical trial that is evaluating the efficacy of a computer-based personal reminder, information, and social management (PRISM) system designed to support socialization and communication, memory for everyday events and improve quality of life of older people (aged 65+) at risk for isolation. The computer-based system is being compared to a manual version of PRISM. The intervention was developed using a user-centered design approach. This overview presentation will present the goals of the trial, the trial design and the design approach. The process was iterative and involved input from representative samples of older adults throughout the design cycle. The presentation will demonstrate how this type of approach can be used to guide the development of an intervention for older adults. In addition, strategies for insuring treatment adherence across the sites will be discussed.

### THE FINAL DESIGN OF PRISM, TRIAL CHALLENGES AND PARTICIPANT FEEDBACK

*S.J. Czaja<sup>1</sup>, J. Sharit<sup>2</sup>, C. Lee<sup>2</sup>, S.N. Nair<sup>2</sup>, M.A. Hernandez<sup>2</sup>, S. Fu<sup>2</sup>, 1. Psychiatry and Behavioral Sciences, University of Miami Miller School of Medicine, Miami, Florida, 2. university of miami Miller School of Medicine, miami, Florida*

The PRISM system was designed using a user-centered iterative design approach and incorporated feedback from samples of older adults. This presentation will focus on the features of the final design of the computer-based version of PRISM and will describe the instructional and technical help support systems and the comprehensive system for data management. In addition, data will be presented on the characteristics of the sample, who ranged in age from 65-98 years, and their perceptions of the system. This will include case examples of the impact of use on everyday activities such as communication and social connectivity. In addition, challenges associated with the implementation of the intervention such as recruitment, training and technical issues will be discussed. Overall, despite these challenges, the participants' reactions are highly positive and indicate that use of the system helped them remain connected and improved their access to resources in the community.

### PRISM: THE FOCUS GROUP AND QUESTIONNAIRE PREQUEL

*N. Charness<sup>1</sup>, K. Dijkstra<sup>2</sup>, R. Best<sup>1</sup>, D. Souders<sup>1</sup>, 1. Florida State University, Tallahassee, Florida, 2. Erasmus University, Rotterdam, Netherlands*

We report on a focus group study conducted in Atlanta, Tallahassee, and Miami (n=113; split by low and high education levels) and a questionnaire conducted in Atlanta and Tallahassee (n=321) concerning the technology that older adults used, liked, and disliked to determine the components and design features for the PRISM clinical trial. People in the focus groups reported a range of technologies from 3-32 items/group, with 19 for home, 13 for work and 7 for health. Technologies that were liked supported activities, were convenient to use, and had useful features. Technologies that were disliked proved inconvenient, had too many features, raised safety concerns, and proved unreliable. The communications section of the questionnaire showed that for older adult computer users rated e-mail and e-mailing photos more highly than messaging, chat, and videoconferencing. These findings guided the development and inclusion of features for PRISM, such as e-mail, search, calendaring, and classroom topics.

### USING HUMAN FACTORS TOOLS TO PREPARE FOR A FIELD TRIAL WITH OLDER ADULTS

*W.A. Rogers, T.L. Mitzner, School of Psychology, Georgia Institute of Technolog, Atlanta, Georgia*

The PRISM field trial was designed to assess the relative benefits of a computer system versus a paper-based system containing comparable information. To evaluate the differential effects, we had to ensure that both systems were usable by and useful for the target users (i.e., older adults at risk for social isolation). In addition, the instructions for use and the training had to be clear and effective. To that end, we employed a human factors approach. Human factors practitioners investigate capabilities and limitations of people and demands placed upon them when interacting with a system. Our approach was multifaceted: (1) heuristic evaluation by experts; (2) user testing of all experimental materials; and (3) development of detailed instruction and support system. We will present these data to illustrate how the assessment tools provided valuable insights for design of the field trial, a necessary first step to ensure reliable and valid behavioral assessments.

## THE PRISM FIELD TRIAL: DEVELOPMENT OF NEW MEASURES

W.R. Boot, N. Charness, K. Arredondo, J. Bartley, A. Saperstein,  
*Psychology, Florida State University, Tallahassee, Florida*

The PRISM trial's focus of a computer-based intervention to improve well-being and social connectedness, in addition to its target population of non-computer using older adults, required the development of new measures of computer proficiency and user acceptance. We present factors that influenced the development of these measures (including the popularization of new technologies and shifts in usage patterns over time) and an assessment of their psychometric properties derived from baseline data collected from PRISM participants and from computer proficient adults across the three sites of the PRISM trial. Pilot testing of a new questionnaire revealed that a brief Computer Proficiency Questionnaire (CPQ) targeting six computer-related skill domains could reliably capture computer proficiency (Cronbach's alpha = .94). Although developed for the PRISM trial, we discuss the utility of brief but well-characterized and validated measures of computer proficiency and acceptance in facilitating the training of technologies related to E-health and other applications.

## SESSION 1090 (SYMPOSIUM)

### DOES 'WHERE' HAVE AN IMPACT ON 'HOW' PEOPLE AGE? THE ROLE OF CONTEXT IN SUCCESSFUL AGING

Chair: *M. Wiest, German Centre of Gerontology, Berlin, Germany*  
Co-Chair: *N.J. Webster, Life Course Development Program, Institute for Social Research, University of Michigan, Ann Arbor, Michigan*  
Discussant: *C. Phillipson, Keele University, Keele, United Kingdom*

It is understood that aging does not occur in a vacuum, but rather people grow older within multiple layered environmental contexts, from countries to neighborhoods. However, the extent to which structural characteristics of these environments influence how people age are rarely examined. This symposium addresses the role of context in shaping later life mastery, health and well-being within four countries and varying levels of the environment. Using data from the INK study from South Africa (N=1008), Deeg and colleagues found that the negative association between depression and mastery was greatest in the context of more affluent living conditions. Park and Kim, using data from the Korean Longitudinal Study of Ageing (N=3500) found that functional limitations were negatively associated with life satisfaction in urban areas, and this relationship was further buffered by social network type. Using data from the Social Relations, Aging and Health Study from the mid-western United States (N=293), Webster and Antonucci found that in more affluent neighborhoods positive support was related to less depression, while in poorer neighborhoods functional impairments had a weaker relationship with depression. With data from the German Ageing Survey (N=1735), Wiest and colleagues found that positive emotions and county-level density of general practitioners had a positive impact on health. Together, these studies demonstrate that contextual factors need to be considered on multiple levels and structural characteristics of the environment affect mastery, health and well-being differently across countries. To better understand successful aging we need to situate individuals within the places in which they live.

### THE INFLUENCE OF POVERTY ON THE ASSOCIATION BETWEEN HEALTH AND MASTERY

D.J. Deeg, D. Verver, S. Van der Pas, B. Cassim, *LASA, VU University Medical Centre, Amsterdam, Netherlands*

Poor health has been shown to be associated with a poor sense of mastery. The strength of this association may differ across living conditions. It was examined if the association of health (disability and depression) with mastery varies across three townships outside Durban, South Africa, as part of the Inanda-KwaMashu-Ntuzuma (INK) study. The townships differed in average income, KwaMashu having the low-

est. Using multiple stage clustering, a sample of 1008 individuals aged 60+ was recruited, with a 100% response rate. Pearlin's sense of mastery scale (5-item version) showed better scores in Inanda, followed by KwaMashu and Ntuzuma. The Center for Epidemiologic Studies Depression scale (10-item version) showed the reversed pattern. Disability was lowest in KwaMashu. Both disability and depression were inversely associated with mastery. An interaction effect township\*depression indicated that the depression-mastery association was weakest in KwaMashu, suggesting that depression affects mastery only in relatively favorable living conditions.

### HEALTH, SOCIAL NETWORK, AND LIFE SATISFACTION AMONG KOREAN OLDER ADULTS: DOES URBAN RESIDENCE MATTER?

S. Park, B. Kim, *University of Michigan, Ann Arbor, Michigan*

This study investigated the association between functional limitations and life satisfaction among older Koreans, and explored how social network type and urban residence moderate this association. Data came from the 2006 and 2008 waves of the Korean Longitudinal Study of Ageing on respondents aged 65 years or older (N=3,500). Five network types were derived by Ward hierarchical and k-means cluster analysis based on network structural characteristics, including 1) restricted, 2) coresidential family-focused 3) child-focused, 4) friends-focused, and 5) diverse. Separate analysis was conducted among urban and rural residents. Functional limitations were negatively associated with life satisfaction among those living urban areas, and coresidential family-focused and diverse types of social network buffered the effect of functional limitation on life satisfaction. Among older adults in rural areas, functional limitations exerted no significant effects on life satisfaction. These results extend previous findings on health, social networks, and well-being in later life.

### SOCIAL SUPPORT AND WELL-BEING IN LATER LIFE: THE ROLE OF NEIGHBORHOODS

N.J. Webster, T.C. Antonucci, *Life Course Development Program, Institute for Social Research, University of Michigan, Ann Arbor, Michigan*

Many studies have documented the detrimental effects of poverty on health and well-being. Less is understood about how environment enhances or hinders the buffering effect of social relationships on the stress-health link. This study explores how neighborhood-level income moderates the effects of functional limitations and positive child relationship quality on depression. Data include respondents age 65 and older (N=293) from the Social Relations, Aging and Health Study (2005) a regionally representative sample from the mid-western United States. A significant interaction between neighborhood income and positive child relationship quality indicates that more positive support is related to less depression among those living in more affluent neighborhoods. Among respondents living in less affluent neighborhoods, functional impairments had a weaker relationship with depression. Findings highlight the importance of environmental context in shaping later life vulnerabilities and suggest that interventions need to be tailored to the structural characteristics of where people live.

### THE EFFECT OF POSITIVE EMOTIONS ON FUNCTIONAL HEALTH: DOES CONTEXT MAKE A DIFFERENCE?

M. Wiest, J.K. Wolff, O. Huxhold, *German Centre of Gerontology, Berlin, Germany*

Positive emotions (PE) and health care service predict health outcomes. We examine if they interact in the prediction of functional health (FH) in old age. Using cross-sectional data from the German Ageing Survey (age range: 65-91, N= 1.735), multilevel models were estimated to examine the direct and interaction effects of PE and health care service on FH in old age. Number of general practitioners per inhabitant (GPs) was considered as an indicator of health care service on the county

level (N=206). Preliminary results show that PE ( $B = .26$ ;  $p < .01$ ) and GPs ( $B = -.31$ ;  $p < .05$ ) were related to FH, however, there was no support for a cross-level interaction between PE and GPs ( $B = .01$ ;  $p = .24$ ). Findings suggest that personal and context resources independently affect health outcomes in old age. Feeling good and GPs in the area are important for maintaining FH in old age.

## SESSION 1095 (SYMPOSIUM)

### FROM RCT TO COMMUNITY-BASED TRANSLATION: SYSTEMATIC EXPANSION OF THE SEATTLE PROTOCOLS:

Chair: L. Teri, U. Washington — School of Nursing, Seattle, Washington

Recent years have seen a slow but steady rise in both (1) the number of randomized controlled trials indicating behavioral and psychosocial strategies are effective in teaching caregivers how to reduce affective and behavioral disturbances common in persons with Alzheimer's disease (AD) and (2) the funding of translational efforts to move these findings into 'real world' community settings. This symposium will present three such translational efforts which have been conducted systematically taking caregiver and care-recipient needs into account, addressing provider and agency priorities, allowing flexibility and fidelity to the original protocols, and evolving across five states. Each presenter will discuss a different protocol and translation project, focusing on the issues arising from implementation and translation as well as providing new data on the success (or failure) of these approaches in community settings.

### DISCUSSANT

L. Anderson, CDC, Atlanta, Georgia

Perspectives on translating research into practice

### REDUCING DISABILITY IN ALZHEIMER DISEASE: OHIO'S TRANSLATION INTO COMMUNITY PRACTICE

H.L. Menne<sup>1</sup>, J.D. Johnson<sup>1</sup>, D.M. Bass<sup>1</sup>, S. Bollin<sup>2</sup>, L. Teri<sup>3</sup>, 1. Margaret Blenkner Research Institute, Benjamin Rose Institute on Aging, Cleveland, Ohio, 2. Alzheimer's Association, Northwest Ohio Chapter, Toledo, Ohio, 3. School of Nursing, University of Washington, Seattle, Washington

Alzheimer's Association Chapters serving Ohio replicated the evidence-based program "Reducing Disability in Alzheimer Disease" (RDAD). RDAD participants are trained in three exercise areas (i.e., flexibility, strength, and balance), and caregivers learn techniques to manage dementia-related behaviors. Preliminary analyses focus on 3 month physical health outcomes for persons with dementia (PWDs) in relation to usage of RDAD program components (i.e., exercises and behavior management). For the 282 PWDs completing 12 RDAD sessions, the results are mixed. A beneficial relationship exists for PWDs who have a history of falls before enrollment, where usage of the RDAD exercise component is associated with significantly fewer falls. Conversely, for PWDs who have more disability before the program, usage of the RDAD exercise component is associated with a significant increase in disability. The use of RDAD components has no relationship with PWD walking speed and functional reach. Findings inform sample eligibility recommendations for future RDAD implementations.

### ADAPTING AND IMPLEMENTING STAR FOR VA MENTAL HEALTH PROVIDERS: FEASIBILITY AND FINDINGS FROM A NATIONAL PILOT PROJECT

B. Karlin<sup>1</sup>, S. Visnic<sup>2</sup>, L. Teri<sup>3</sup>, 1. Office of Mental Health Services, Department of Veterans Affairs Central Office, Washington, District of Columbia, 2. VA Serious Mental Illness Treatment Research and Evaluation Center, Ann Arbor, Michigan, 3. University of Washington, Seattle, Washington

The U.S. Department Veterans Affairs (VA) health care system has developed and piloted an adapted psychosocial intervention for managing challenging dementia-related behaviors of residents in VA nursing homes [now known as "Community Living Centers" (CLCs)], called STAR-VA. STAR-VA is a multi-component behavioral intervention for managing challenging dementia behaviors, adapted from Teri and colleagues' (2005) STAR intervention. Following development of the protocol, interventionist manual, and training of CLC mental health providers, STAR-VA was implemented in selected CLCs throughout the VA health care system as part of pilot initiative. STAR-VA is a collaborative, interdisciplinary intervention that is guided by the behavioral expertise of a doctoral level mental health provider. This presentation will describe the adapted intervention and feasibility of implementation in a complex, interdisciplinary environment with nursing home residents. Initial resident and staff outcomes from the pilot will be reviewed as they relate to the feasibility and impact of implementing the intervention.

### STAR EXPANSION: LEARNING WHAT PROVIDERS WANT AND CHANGING PLANS ACCORDINGLY

D.M. La Fazia<sup>1</sup>, G. McKenzie<sup>2</sup>, G. Marshall<sup>1</sup>, K.C. Pike<sup>1</sup>, C.A. Coulter<sup>1</sup>, L. Teri<sup>1</sup>, 1. University of Washington, Seattle, Washington, 2. Oregon Health Sciences, Ashland, Oregon

STAR, Staff Training in Assisted-living Residences, is an interactive, dynamic program held onsite (2 group workshops and 4 individual sessions) with direct care staff and leadership. It is effective in reducing depression, anxiety, and behavioral problems among residents with dementia and improving staff satisfaction and skill. We were interested in learning whether ALR supervisors would be interested in teaching STAR and if so, what program characteristics were most appealing, which needed modifications, and what their ideas were for sustainability. To answer these questions, leadership from 10 ALRs participated in a series of informal information gathering sessions and structured focus groups designed to begin shaping STAR-II. Participants were interested in becoming certified STAR trainers and provided helpful suggestions for STAR implementation and sustainability. Data from these discussions will be presented along with preliminary plans to move STAR into an in-house trainer based model.

### STAR-C MOVING FROM RCT TO TRANSLATION – INITIAL FINDINGS FROM OREGON AND BEYOND

S.M. McCurry<sup>1</sup>, L. Teri<sup>1</sup>, R.G. Logsdon<sup>1</sup>, D.M. La Fazia<sup>1</sup>, J. Mead<sup>2</sup>, L.A. Stevens<sup>3</sup>, L. Korte<sup>4</sup>, 1. University of Washington, Seattle, Washington, 2. State Unit on Aging, Salem, Oregon, 3. Multnomah County Aging & Disability Services, Portland, Oregon, 4. Aging and Disability Services Administration, Department of Social and Health Services, Olympia, Washington

This paper describes an ongoing 3-year Administration on Aging-funded grant partnership between the State of Oregon and University of Washington designed to translate and sustain the evidence-based STAR-C program in Oregon. Two Area Agencies on Aging (AAAs) offered STAR-C to caregivers in three rural and urban counties. To evaluate outcomes, the RE-AIM (Reach, Effectiveness, Adoption, Implementation, Maintenance) framework was applied. To date, 142 caregiver/care-recipient dyads have been enrolled (mean caregiver age=68.4 years; 78% female). Thirteen STAR-C consultants completed training (nine AAA case managers, two private geriatric case managers, and two

regional coordinators). Participant outcomes indicate significant ( $p < .05$ ) reductions in caregiver depression, burden, and care-recipient behavioral disturbances. Plans for sustainability of STAR-C in the Oregon portfolio of caregiver services will be described, along with recent experiences introducing STAR-C as a pilot training and service implementation program in Washington State.

## SESSION 1100 (SYMPOSIUM)

---

### MEASURING ALZHEIMER'S/DEMENTIA KNOWLEDGE IN DIVERSE POPULATIONS

Chair: *M. Hurwicz, Anth, Soc & Lang, UMSL, St. Louis, Missouri*

Co-Chair: *B.D. Carpenter, Washington University, St. Louis, Missouri*

Discussant: *M. Gatz, University of Southern California, Los Angeles, California*

Given the increasing prevalence of Alzheimer's disease (AD), it is essential for the public to have accurate knowledge about AD and for scientists and organizations to have well-validated tools to measure public knowledge. This symposium brings together papers by 3 researchers who have used a variety of quantitative and qualitative methods to understand knowledge about Alzheimer's disease/dementia in diverse populations. In the first paper, Carpenter conducted a cross-national study to confirm the psychometric properties of the Alzheimer's Disease Knowledge Scale (ADKS) in a variety of languages and assessment settings. He identified national differences in knowledge regarding risk factors, assessment and diagnosis, symptoms, course, life impact, caregiving, and treatment and management. In the second, Rodriguez conducted focus groups with community-dwelling Latinos in Los Angeles. He identified common themes in their knowledge and perceptions of dementia by asking questions about the idioms, behavioral signs, etiology, risk and protective factors, help-seeking, and available treatments for dementia. In the final paper, Hurwicz developed lay-generated questions based on in-depth interviews about the explanatory models of African American and European American caregivers and non-caregivers in St. Louis. These questions were administered to a large random sample to identify shared cultural knowledge about symptoms, causes/risk factors, home and physician treatments and prevention of AD in several subpopulations using the Cultural Consensus Model. The results of these studies could provide the substantive basis for the development and targeting of health education materials for specific countries and groups defined by culture.

### AN INTERNATIONAL PERSPECTIVE ON KNOWLEDGE ABOUT ALZHEIMER'S DISEASE

*B.D. Carpenter, Washington University, St. Louis, Missouri*

Many countries around the globe are facing the public health crisis prompted by the growing prevalence of Alzheimer's disease (AD). The purpose of this presentation is to review data collected using the Alzheimer's Disease Knowledge Scale (ADKS) in several countries, including Australia, Brazil, Israel, Iceland, India, and the United Kingdom. Psychometric characteristics of the scale appear to be consistent across translations and assessment settings. Knowledge about AD is variable across content domains and across countries, with notable differences in knowledge regarding risk factors, assessment and diagnosis, symptoms, course, life impact, caregiving, and treatment and management. Patterns of misinformation suggest a potential focus for future educational efforts. Accurate knowledge about AD in the general public (and a way to measure it) will be essential to future public health initiatives.

### KNOWLEDGE AND PERCEPTIONS OF DEMENTIA AMONG LATINOS

*C. Rodriguez, Psychology, University of Southern California, Los Angeles, California*

The current study examined knowledge and perceptions of dementia among a convenience sample of 40 community-dwelling adult Latinos in Los Angeles using focus group interviews asking questions regarding the idioms, behavioral signs, etiology, risk and protective factors, help-seeking, and available treatments for dementia. Common themes included: the belief that dementia is a normal part of aging, a lack of knowledge of specific treatments despite a recognition that seeking a medical diagnosis leads to the best treatment, overestimation of reported risk and protective factors of dementia, and little knowledge of the earliest signs of dementia. Participants commonly described dementia as a loss of memories, and placed a high value on the family participating in dementia care. Results suggest priorities in dementia literacy to target in public health communications among subpopulations of Latinos.

### SHARED CULTURAL KNOWLEDGE OF ALZHEIMER'S DISEASE IN A LARGE RANDOM SAMPLE

*M. Hurwicz, Anth, Soc & Lang, UMSL, St. Louis, Missouri*

Agree/Disagree data for 44 Alzheimer's knowledge items covering symptoms, causes/risk factors, home and physician treatments and prevention of AD, developed using in-depth Explanatory Model (EM) interviews with African American and European American caregivers and non-caregivers in St. Louis, Missouri, were collected from a Random Digit Dialing (RDD) sample ( $N=692$ ) in the St. Louis SMSA. Consensus Analysis (CA) was performed for the total sample, and for subsamples defined by gender, race/ethnicity, education and caregiver status. Although the "culturally correct" answer to some items in some subgroups did not match the total sample consensus for those items, the "culturally correct" answers to most of the items were shared by all groups. The content of these items and suggestions for designing and targeting health education and outreach materials for specific cultural groups are discussed.

## SESSION 1105 (SYMPOSIUM)

---

### NEW INVESTIGATIONS OF AGING WITH DISABILITY: RESULTS AND IMPLICATIONS FOR DATA, POLICY AND PRACTICE

Chair: *M. Campbell, U.S. Department of Education, National Institute on Disability and Rehabilitation Research, Washington, District of Columbia*

Discussant: *M. Campbell, U.S. Department of Education, National Institute on Disability and Rehabilitation Research, Washington, District of Columbia*

This symposium will feature four presentations on aging with and aging into disability by distinguished scholars from gerontology and rehabilitation. The purpose of this symposium is to advance knowledge about the health and well-being of individuals aging with long-term disabilities acquired at different stages of the life course, and identify implications for program development and public policy. The symposium will also examine how best practices in health interventions in the fields of gerontology and disability can be used to inform each other to better meet the needs of the expanding population of individuals aging with disabilities, regardless of age of onset. Gaps in data sources and evidence will also be discussed. Implications focus on how these findings inform federal, state, and local level policies and practices as well as international efforts to bridge the fields of aging and disability research. The first two presenters focus on documenting secondary/chronic health conditions experienced by individuals aging with long-term disabilities acquired earlier in life, and outlining the results

of reviews of best practices for health promotion interventions to synthesize “what works” for middle-aged and older adults aging with physical and developmental disabilities. The third presenter utilizes data from The National Health and Aging Trends Study (NHATS) to examine implications of disability onset before late life for supportive services. The fourth presenter places these trends within a larger context of initiatives on healthy aging and highlights how they inform national and international work on bridging aging and disability research, policy, and practice.

#### **IMPLICATIONS OF KNOWLEDGE TRANSFER BETWEEN AGING AND DISABILITY FOR PUBLIC POLICY AND ADVANCING BRIDGING ACTIVITY**

M. Putnam, *School of Social Work, Simmons College, Boston, Massachusetts*

This presentation places the results of the environmental data scans on aging with physical disabilities and aging with intellectual disabilities within the context of healthy aging initiatives including the World Health Organization’s Active Aging Framework and Healthy People 2020. It discusses how findings from the data scans inform current national strategies to bridge aging and disability service systems and reduce poor outcomes for older adults with chronic conditions in need of long-term supports and services through mechanisms such as Aging and Disability Resource Centers and initiatives that support community living. It concludes by discussing how the environmental data scans contribute to the empirical argument for creating a national agenda for bridging research between the fields of aging and disability and formalizing mechanisms of knowledge transfer that support larger national goals for health population aging.

#### **IMPLICATIONS OF DISABILITY ONSET BEFORE LATE LIFE FOR SUPPORTIVE SERVICES**

B. Spillman, *Urban Institute, Washington, DC, Maryland*

Relatively little is known about the number and characteristics of persons who enter retirement ages already experiencing disabilities, although there is widespread belief that improved medical treatments and survival may be contributing to a higher proportion of older persons who have longstanding disabilities that began in midlife or earlier. The National Health and Aging Trends Study (NHATS) provides an enhanced ability to identify this group through a combination of survey reports and administrative data and to examine whether and how they differ from persons with disability onset in later life. In this presentation, we exploit this opportunity to more carefully characterize the population with early onset disability and profile how their demographic and socioeconomic characteristics, and social and family support networks; assistive technology, environmental, and informal support accommodations; and use of other supportive services compare with those for older persons with later-onset disabilities.

#### **PREVALENCE AND IMPACT OF SECONDARY HEALTH CONDITIONS IN INDIVIDUALS AGING WITH, AND AGING INTO, DISABILITY**

I. Molton, M.P. Jensen, *Rehabilitation Medicine, University of Washington, Seattle, Washington*

Individuals aging with long-standing disabilities as well as those aging into disability are at increased risk of developing chronic health conditions. These conditions, often described as “secondary” to the original disability, make a significant impact on quality of life. This presentation will have two main goals: 1) to share key findings from a series of scoping literature reviews examining the frequency, course, and impact of chronic health conditions in older persons aging with and into physical disability; and (2) to outline the results of a review of best practices for health promotion in these individuals. Key findings from these reviews highlight gaps in the knowledge base for particular conditions, describe a need for more standardized terminology defining “secondary

health conditions,” and call for better translation of effective health and wellness interventions to the older, disabled population.

### **SESSION 1110 (SYMPOSIUM)**

#### **PAIN ASSESSMENT AND MANAGEMENT IN OLDER ADULTS. CURRENT DEVELOPMENTS IN THE US, CANADA AND EUROPE**

Chair: *S.M. Zwakhalen, CAPHRI School for Public Health and Primary Care, Maastricht University, Maastricht, Netherlands*

Discussant: *A. Horgas, College of Nursing at the University of Florida, Florida, Florida*

Assessment and management of pain in older adults has been a topic of discussion during the last decade. Research focused on the development of tools to assess pain in older adults at first and more recently attention has been given to innovative ways to treat pain. In this area of pain research there is particular emphasis on residents who have dementia. During this symposium cross country developments and initiatives undertaken on pain research in older adults will be highlighted and discussed. To start with, tools available to measure pain in older adults with and without dementia will be discussed in this symposium. In Europe there is an aim towards the development of a comprehensive and internationally useful toolkit for older adults targeting the various subtypes of dementia and various aspects of pain. In the US there is a priority on addressing pharmacologic treatment of pain in older adults. The challenges of pharmacological treatment and research directions will be highlighted. In Ontario Canada, the development and implementation of provincial governmental regulations specific to pain management has recently occurred, which has created an imminent need for LTC homes to develop or improve their programs. In partnership with Health Quality Ontario a Change Package for pain management has been developed which will be discussed in detail in this presentation.

#### **CHALLENGES IN PHARMACOLOGIC MANAGEMENT OF PAIN IN OLDER ADULTS: RESEARCH DIRECTIONS**

K. Herr, *Nursing Science, The University of Iowa, Iowa City, Iowa*

Considerable interest has been voiced recently regarding chronic pain management in older adults. With the growing proportion of those over 65 globally, an urgency to address challenges of providing safe and effective pain care to older persons has surfaced. In particular, concerns regarding safe use of pharmacological agents as a strategy for pain management in this population are impacting practice and stimulating the research agenda. The FDA, NIA, and NIH Pain Consortium, as well as other groups with commitment to quality pain care, have addressed this problem with panel meetings leading to recommendations and action. This session will highlight the challenges facing the care of older persons with pain, recommendations for research and current activities in USA to move the agenda forward.

#### **INNOVATIVE HEALTH SERVICES AND POLICY FOR PAIN MANAGEMENT IN LONG TERM CARE: CREATING MOMENTUM FOR CHANGE**

S. Kaasalainen, *McMaster University, Hamilton, Ontario, Canada*

In Ontario, Canada, new long term care (LTC) regulations have recently been developed with a particular focus on improving pain management. These regulations mean that LTC homes are faced with meeting new inspection processes without much support or time to do so. As a result, a partnership with Health Quality Ontario has spawned the development of a Pain Change Package that can assist LTC homes to meet these new inspection processes. A Pain Advisory board was assembled that included 24 pain/LTC experts with representation from pharmacy, medicine, nursing, personal support workers, LTC administration, and provincial organizations. Using a Delphi consensus method that included three sequential rounds of data gathering interspersed with controlled feedback, a list of priority areas for change that aligned with

the new regulations was developed. This presentation will discuss the activities involved with this partnership and the Change Package that resulted.

#### **THE ASSESSMENT OF PAIN IN LONG TERM CARE PATIENTS WITH DEMENTIA**

S. Zwakhalen, J. Hamers, *HSR, University Maastricht, Maastricht, Netherlands*

Pain research in Europe predominantly focused on the development and evaluation of observational tools in long term care dementia patients, with a recent shift towards the uptake of strategies to assess and manage pain in daily clinical practice. We investigated which pain assessment tools are currently available and in use to assess pain in this patient population and what the psychometric qualities of these tools are. In addition the clinical usefulness were evaluated and common barriers and facilitators to use these pain tools discussed. We reviewed publications based on an extensive search strategy and evaluated the tools using quality judgement criteria. Findings show that currently, a large number of tools (>20) are available with varying degree of psychometric properties. Closer examination of the tools reveal that content and format vary extensively. In recent years more tools have become available to assess specific pain conditions (like for example osteoarthritis). Initiatives undertaken in Europe during last decade focused on developing innovative ways to both assess pain with a particular emphasis on residents who have dementia. This resulted in a large number of tools. We should avoid the development of new scales. A consensus on what to use in Europe in assessing pain in long term care residents could contribute to this proliferation.

### **SESSION 1115 (SYMPOSIUM)**

#### **SUCCESSFUL AGING – FROM INDIVIDUAL DIFFERENCES TO PERSONALIZED INTERVENTIONS?**

Chair: *B. Godde, Jacobs Center on Lifelong Learning, Jacobs University, Bremen, Germany*

Co-Chair: *M.M. Lorist, University of Groningen - Department of Experimental Psychology, Groningen, Netherlands*

With aging populations in most industrialized societies the question of how older adults can maintain or even improve their cognitive functioning and independent living has gained increasing importance. Decades of training research have demonstrated cognitive plasticity but also that training gains are highly specific. This Symposium aims to shed light on the role of specific alterations in brain function and connectivity for aging outcomes. Moreover, we will provide latest evidence on different types of training and their effects on cognitive functioning in both healthy and cognitively impaired older adults and discuss the specificity and generality of such effects. For this purpose, we will get together researchers using different methods, e.g. neuropsychological testing, EEG, fMRI, genetics, and different study samples – healthy and demented older adults. Thus, the symposium will contribute to answering the question what successful and sustainable interventions should look like. Monique Lorist will address changes in functional brain networks and compensation strategies related to specific aging outcomes. The following two presentations will report data from a one-year intervention study with older adults trained in physical fitness or motor coordination. Claudia Voelcker-Rehage will discuss the role of genetic polymorphisms on the relationship between physical activity and cognition. Ben Godde will present how cognitive resources can be freed-up by physical interventions. Finally, Marieke van Heuvelen will address effects of combined strength and aerobic exercise interventions on cognition in older adults with dementia. The session will end with a discussion of the presented findings in respect to the topic of the symposium.

#### **COGNITIVE RESOURCES NECESSARY FOR MOTOR CONTROL IN OLDER ADULTS ARE FREED UP AFTER ONE YEAR OF PHYSICAL EXERCISE TRAINING**

B. Godde, C. Voelcker-Rehage, *Jacobs Center on Lifelong Learning, Jacobs University, Bremen, Germany*

With advanced age, motor tasks are increasingly in need of cognitive control. Moreover, in older adults low fitness corresponds with less automation and more cognitive supervision. To study the effect of physical exercise on cognitive control of complex motor tasks, 44 healthy older adults (62-79 years of age) participated in a one-year intervention study. They trained either walking or motor coordination or did relaxation and stretching as active control group. Brain activation during motor imagery of forward and backward walking was assessed with functional MRI. BOLD responses in selected brain regions modulated by fitness levels under control conditions were analysed. Both training interventions led to significantly reduced activation in the dorsolateral prefrontal cortex during motor imagery. There was no such effect for the control group. Therefore our results reveal that one year of physical exercise is sufficient to free up frontal brain resources otherwise spent to the cognitive control of motor tasks.

#### **COMT POLYMORPHISMS INFLUENCE THE ASSOCIATION BETWEEN PHYSICAL AND COGNITIVE FITNESS IN OLDER ADULTS**

C. Voelcker-Rehage<sup>1</sup>, A. Jeltsch<sup>1,2</sup>, B. Godde<sup>1</sup>, U.M. Staudinger<sup>1</sup>, *1. Jacobs Center on Lifelong Learning and Institutional Development, Jacobs University Bremen, Bremen, Germany, 2. University Stuttgart, Stuttgart, Germany*

Physical fitness is positively related to cognitive functioning in older adults. Further, it is well known that genetic predispositions might influence cognitive performance. One gene related to dopamine metabolism and executive functioning is the COMT gene with met/met carriers outperforming val/val carriers in cognitive tasks. The aim was to analyze the association of the COMT gene polymorphisms with the relationship between fitness and cognition. Sixty-eight healthy older adults (62-79 years of age) were analyzed. DNA was extracted from capillary blood samples. As indicator for executive control a modified version of the Flanker Task, as indicator for fitness a battery of motor tests was used. Hierarchical regression analyses revealed a positive influence of fitness and of the interaction between fitness and COMT polymorphisms on accuracy in the Flanker task. Val/val carriers revealed the strongest association between fitness and cognition. Thus, exercise might particularly help val/val carriers to improve their cognitive functioning.

#### **EFFECTS OF COMBINED STRENGTH AND AEROBIC TRAINING IN OLDER PEOPLE WITH DEMENTIA**

M.V. Heuvelen, *Center for Human Movement Sciences, University Medical Center Groningen / University of Groningen, Groningen, Netherlands*

There is ample evidence that physical exercise enhances cognition in healthy older people. In this population, a combination of strength and aerobic exercise appeared to be most effective. In older people with dementia, the effects of physical exercise on cognition are less clear and the combination of strength and aerobic exercise was not studied before. Therefore, the effects of combined strength and aerobic exercise on cognitive functioning, physical functioning and ADLs in older people with dementia were investigated. A randomized clinical trial was performed. Persons recruited in nursing homes/homes for the elderly with moderate to moderate/severe dementia were included (MMSE 10-20). The participants were randomized over three interventions: combined strength/aerobic training, aerobic training, and control (social visits). Sessions lasted 30 minutes, 4 times/week, during 8 weeks. The effects were measured with performance-based tests for executive functioning, memory, physical fitness and ADLs. Preliminary results of 75 participants will be presented.

## FUNCTIONAL CONNECTIVITY AND COGNITIVE PERFORMANCE IN THE AGING BRAIN

M.M. Lorist<sup>1,2</sup>, L. Geerligs<sup>1,2</sup>, 1. *Department of Experimental Psychology, University of Groningen, Groningen, Netherlands*, 2. *BCN-Neuroimaging Center, University of Groningen, Groningen, Netherlands*

In different projects we examined whether age-related changes in brain structure and neuronal activity affects functional connectivity and cognitive performance. First, a data-driven method was used to analyse fMRI data of older and younger participants who performed a visual oddball task. Results showed a widespread decrease in the specificity of functional networks in older compared to younger participants, reflected in decreased connectivity between areas belonging to the same functional network and increased connectivity between areas belonging to different networks. In an EEG study we tested whether changes in connectivity were related to performance changes. Phase locking analyses in the alpha band revealed that increased phase locking between frontal and occipito-parietal regions in the pre-stimulus interval led to better performance in both age groups. Phase locking in the beta band was related to better suppression of irrelevant information in the elderly group only, which may reflect compensation mechanisms employed by high performing elderly.

## SESSION 1120 (SYMPOSIUM)

### SYMPOSIUM ON REDUCING DISTRESS IN DEMENTIA CAREGIVERS: THE NUMBER NEEDED TO TREAT (NNT)

Chair: R.C. Moore, *Psychiatry, University of California, San Diego, La Jolla, California*

Co-Chair: B. Mausbach, *Psychiatry, University of California, San Diego, La Jolla, California*

Discussant: R.C. Moore, *Psychiatry, University of California, San Diego, La Jolla, California*

This symposium's primary objectives are to showcase a new method for evaluating clinical effectiveness of EBTs: the Number Needed to Treat (NNT), and to introduce two novel interventions for dementia caregivers. The symposium will be of interest to mental health providers. Caregivers are at risk for significant health problems, including increased stress, major depression, generalized anxiety, and sleep problems, and interventions to improve caregiver health and emotional wellbeing have greatly evolved over the past decade. We will begin with an overview of NNT, which is a way for clinicians to discuss the strength of an intervention in terms of how many clients need to receive the treatment before one client will show clinical improvement. Knowing the NNT can help clients and clinicians weigh the costs and benefits of specific treatment modalities. Following the NNT overview, the NNTs of the largest existing dementia caregiver intervention and two novel interventions will be presented. The first presentation will discuss the NNTs on several aspects of caregiver wellbeing (e.g., depression, burden, self-care) from the multicomponent Resources for Enhancing Alzheimer's Caregiver Health 2 (REACH2) program. Next, we will introduce a new EBT for reducing depression and distress in dementia caregivers: the Pleasant Events Program (PEP). In the PEP randomized, controlled trial, several biomarkers associated with cardiovascular disease risk were measured, and the impact of PEP on these biomarkers will be discussed. The final presentation will be a comparison between the efficacy of Acceptance and Commitment Therapy and Cognitive Behavioral Therapy for reducing caregiver distress.

### ACCEPTANCE AND COMMITMENT THERAPY VS. COGNITIVE BEHAVIOURAL THERAPY FOR DEMENTIA FAMILY CAREGIVERS: OUTCOMES OF A RANDOMIZED INDIVIDUAL TREATMENT STUDY

A. Losada<sup>1</sup>, M. Marquez-Gonzalez<sup>2</sup>, R. Romero-Moreno<sup>1</sup>, J. Lopez<sup>3</sup>, V. Fernandez-Fernandez<sup>1</sup>, C. Nogales-Gonzalez<sup>1</sup>, 1. *Universidad Rey Juan Carlos, Psychology Department, Madrid, Spain*, 2. *Universidad Autonoma de Madrid, Biological and Health Psychology Department, Madrid, Spain*, 3. *Universidad San Pablo Ceu, Department of Psychology, Madrid, Spain*

Preliminary data analyzing the differential efficacy of Acceptance and Commitment Therapy (ACT), Cognitive Behavioural Therapy (CBT) and a minimal support control group (MSG) for reducing depression in dementia caregivers is described (N=44). While 78.6% of caregivers in the ACT program showed CES-D scores lower than 16 at post-intervention (d= 1.39; NNT for obtaining a 50% improvement = 2.04), a 58.8% and 23.1% change was found for CBT (d = 1.35; NNT for a 50% improvement = 2.66) and MSG (d = -0.12) groups. Regarding anxiety, an effect size of 1.29 was found for ACT, and 0.79 and 0.04 for CBT and MSG, respectively. The NNT for a 50% improvement in anxiety in ACT and CBT is 4.6. The NNT for obtaining a greater improvement in experiential avoidance is lower for ACT than for CBT, while a lower NNT is found in CBT for change in dysfunctional thoughts compared with ACT.

### NUMBER NEEDED TO TREAT VS. TRADITIONAL EFFECT SIZES: EXPLORATION OF THE REACH II RANDOMIZED, CONTROLLED TRIAL

R.C. Moore<sup>1</sup>, J. Ceglowski<sup>1</sup>, E. Chattillion<sup>1,2</sup>, B. Mausbach<sup>1</sup>, 1. *Psychiatry, University of California, San Diego, La Jolla, California*, 2. *San Diego State University/University of California, San Diego, Joint Doctoral Program in Clinical Psychology, San Diego, California*

Number Needed to Treat (NNT) was calculated based on the published results of the structured multicomponent REACH II intervention for reducing depression in caregivers (Belle et al., 2006). In a sample of 642 Hispanic (N=212), Caucasian (N=219), and African-American (N=211) caregivers, NNT for improvements in burden, depression, problem behaviors, self-care and social support were calculated. This intervention yielded positive results for decreasing depression in Hispanics (NNT = 4), yet was not as successful in the Caucasian (NNT=20) or African-American (NNT=12.66) groups. NNT for overall improvement across all domains was 2.59 for Hispanic, 5.92 for Caucasian, and 8.4 for African-American. Additionally, NNTs for changes in clinical depression and institutional placement of care recipients at 6-months post-intervention were calculated in each group and the whole sample. Overall, the NNTs were much more robust than the effect sizes, and are encouraging for clinicians and agencies who are interested in implementing this intervention.

### HOW EFFECTIVE IS YOUR TREATMENT? EVALUATING TREATMENT EFFECTS USING THE NUMBER NEEDED TO TREAT (NNT) EFFECT SIZE

D.E. Jimenez<sup>1</sup>, R.C. Moore<sup>2</sup>, V. Cardenas<sup>2</sup>, B. Mausbach<sup>2</sup>, 1. *Dartmouth University, Hanover, New Hampshire*, 2. *Psychiatry, University of California San Diego, La Jolla, California*

The American Psychological Association (APA) Task Force on Statistical Inference has stated that scientists should "always provide some effect size estimate when reporting a p value." In intervention research, effect sizes provide a meaningful way to evaluate the strength of a treatment's effect on a given outcome. The most commonly reported effect size for treatment research is Cohen's d, although the clinical meaning of this metric is not always intuitive. For example, patients may not grasp the meaning of improving 0.8 standard deviations in depressive symptoms over the course of treatment. When comparing treatments, the Number Needed to Treat (NNT) effect size represents the number

of individuals who must receive treatment A to generate one more success than would have resulted had all persons been given treatment B. We will present information on the clinical meaning of NNT, methods for its calculation, and provide examples from the empirical literature.

### **BEHAVIORAL ACTIVATION THERAPY FOR DEPRESSIVE SYMPTOMS AND CVD RISK IN CAREGIVERS: A CONTROLLED TRIAL**

B. Mausbach<sup>1</sup>, E. Chattillion<sup>1</sup>, R.C. Moore<sup>1</sup>, T.L. Patterson<sup>1</sup>, R. von Känel<sup>2</sup>, I. Grant<sup>1</sup>, 1. *Psychiatry, University of California San Diego, La Jolla, California*, 2. *Bern University Hospital, Bern, Switzerland*

We describe results of a randomized trial comparing a brief (6-week) Behavioral Activation (BA) intervention to an information support (IS) intervention for reducing depression, Interleukin (IL-) 6, and D-dimer in 80 dementia caregivers (CG). We compared BA and IS on change from pre- to post-treatment and calculated the number-needed-to-treat (NNT) for 50% reduction in each outcome. The BA condition showed greater improvement in depressive symptoms ( $p = .049$ ). 39% of CG in the BA condition showed 50% improvement compared to 12.8% in the IS condition (NNT = 3.82). BA participants also showed greater reduction in IL-6 ( $p = .048$ ), with 41.4% of CG showing 50% reduction compared to 20% of IS participants (NNT = 4.67). Group differences were not observed in D-dimer change ( $p = .699$ ). However, a main effect for time was evident ( $p = .039$ ), with the sample-wide mean  $\pm$  SE decrease of  $103.0 \pm 49.3$  pg/ml.

## **SESSION 1125 (SYMPOSIUM)**

### **WHAT'S TIME GOT TO DO WITH IT?: EXPLORING CHANGING CONCEPTS, PRACTICES AND EXPERIENCES RELATED TO AGING**

Chair: *R.L. Beard, Department of Sociology & Anthropology, College of the Holy Cross, Worcester, Massachusetts*

Discussant: *T. Calasanti, Virginia Tech, Blacksburg, Virginia*

This panel will examine the salience and changing role of time in aging theory, research, practice and experiences. By exploring the different concepts, images and metaphors of time related to aging, and how these have changed historically, we aim to open up the dialogue to a richer, multi-layered temporal perspective on aging. Conceptually, a more complete understanding of human aging requires an appreciation of numerous images and metaphors of time and temporality beyond chronological age, physical appearance and functional performance. Practically, outcome-based interventions, especially for individuals with dementia, fall short of adequately measuring “in-the-moment” benefits of various arts therapies. Experientially, frank discussion about how the very meaning of time and aging changes across the life course offers a broader definition of subjective experiences of self aging. Given the ever-evolving nature of the theory, concepts, practices and experiences of time, temporality has everything to do with aging.

### **OUT OF TIME OR IN-THE-MOMENT? BEYOND OUTCOME-BASED ARTS THERAPY INTERVENTIONS FOR DEMENTIA**

*R.L. Beard, Department of Sociology & Anthropology, College of the Holy Cross, Worcester, Massachusetts*

Research on arts based therapies (AT) has long been accused of trying to impose a basic science model of evaluation on what is an inherently idiosyncratic process and subjective experience. Especially with persons who have dementia, the value of understanding the meaning of AT “in-the-moment” for those participating in such programs cannot be overstated. Efforts to evaluate these programs based on such narrow scientific measures as quantifiable outcomes risks overlooking the meaning for participants while they are participating. In contrast, various programs focused on subjective well-being and/or enrichment will be discussed. Based on an extensive literature review of AT over the past

two decades, reflections on the state-of-the-science and art will be made. In contrast to biomedical models privileging the management of so-called behavioral problems, the pros and cons of refocusing evaluation on subjective well-being and enrichment will be discussed, as will implications for AT practice.

### **THE CHANGING MEANINGS OF “TIME” TO AN AGING GERONTOLOGIST**

*W. Achenbaum, University of Houston, Houston, Texas*

As a gerontologist for over four decades, I will recollect my thoughts about my aging self at 25, 40, 55, and 65. As a historian of aging, in this presentation I will locate my changing perspective within the salient cultural trends and popular gerontological frameworks of the epochs relevant to my aging self concept and experience. Engaging policy making related to, images of, and issues regarding spirituality in aging, I will both reflect on my past self as well as speculate about my future aging self and the projects I hope to complete before exiting the stage.

### **THE RICHNESS OF TIMES IN AGING**

*J. Baars, University of Humanistic Studies, Haarlem, Netherlands*

Human aging is basically living in a time perspective. In a more specific meaning it refers to human life after somebody has crossed the threshold of being called ‘aged’ or ‘old’. Usually such thresholds are connected with a certain chronological age, although this age may vary across cultures and societies. Other dimensions of ascribing the status of being or becoming ‘aged’ are physical appearance or functional performance, which however do not change according to calendar age and introduce other temporal perspectives. A further inspection reveals several different concepts and metaphors of time and temporality which are important to distinguish and acknowledge if we want to attain a fuller understanding of human aging.

## **SESSION 1130 (PAPER)**

### **DISCOVERY EXCHANGE: EARLY ORIGINS OF ADULT WELL-BEING**

#### **EARLY LIFE NUTRITIONAL ENVIRONMENTS, INFECTIOUS DISEASE AND OLDER ADULT HEALTH: CONTRASTING CROSS NATIONAL MORBIDITY PATTERNS**

*M. McEniry, University of Michigan, Ann Arbor, Michigan*

The dramatic improvement in life expectancy during the 20th century (1930s-1960s) was primarily due to reductions in infant and child mortality as a result of massive public health interventions and medical technology but in some instances occurred largely in the absence of improvements in standard of living. Using comprehensive historical and survey data on nearly 144,000 older adults (50 years and older) in 20 low, middle and high income countries, the paper demonstrates that these circumstances produced a larger pool of survivors of poor early life conditions (i.e., poor nutrition, infectious diseases, and poor socioeconomic conditions) in the “tip of the iceberg” unique cohorts of the 1930s-1960s that is more susceptible to their effects later in life, specifically in the case of adult diabetes. The results suggest the importance of early life nutritional environment and infectious disease and a critical period in utero, early infancy or childhood with consequences for adult functionality and mortality. In contrast and surprisingly the paper provides evidence that in the case of adult heart disease the composition of early life diet is important with poor early life nutritional environment and infectious disease playing a competing role in the “tip of the iceberg” cohorts. Evidence for increased susceptibility to the effects of poor early life conditions for the “tip of the iceberg” unique cohorts is thus mixed but may become more apparent when individuals from later cohorts born in low and middle income countries reach older ages.

## CHILD MALTREATMENT AND ADULT HEALTH: DO FAVORABLE RECOLLECTIONS OF THE OFFENDING PARENT SOFTEN THE BLOW?

M.H. Schafer<sup>1</sup>, P. Morton<sup>2</sup>, K.F. Ferraro<sup>2</sup>, 1. *Sociology, University of Toronto, Toronto, Ontario, Canada*, 2. *Purdue University, West Lafayette, Indiana*

**Objectives:** This study considers the long-term health consequences of childhood maltreatment on health. Distinct from previous research, we examine the maltreatment in the context of more general parental evaluations. Our main hypothesis is that adults who experienced maltreatment but view the overall relationship with the offending parent in a positive light will report better health than adults with more negative recollections of their offending parent. **Methods:** Analyses used retrospective and current data from the Midlife Development in the United States (MIDUS) study. We employed negative binomial regression to predict the count of chronic conditions experienced in middle- and older-aged men and women; ordinary least squares regression was used to understand the association between maltreatment, parental evaluations, and physical symptom complaints. **Results:** A considerable proportion of middle- and older-age adults who experienced frequent maltreatment nevertheless evaluated the relationship with their offending parent as “excellent”, “very good”, or “good” (e.g., 64% for physical abuse by mothers). Adults who experienced child maltreatment reported a greater number of chronic medical conditions and physical symptoms, but the effect was much smaller when they evaluated the relationship with the offending parent as a generally positive one. **Discussion:** Findings highlight a common and seemingly paradoxical pattern among MIDUS participants: the co-presence of harsh parental behavior and positive recollections of parental relationships during childhood. Moreover, these surprising patterns of retrospective interpretation predict very different experiences of adult health, suggesting that favorable recollections of parents in spite of maltreatment may be a compensatory mechanism of resilience.

## CHILDHOOD POVERTY AND DEPRESSIVE SYMPTOMS FOR OLDER ADULTS IN MEXICO: A LIFE-COURSE ANALYSIS

J. Torres, *Community Health Sciences, UCLA, Los Angeles, California*

Recent health research has turned its focus to childhood circumstances in order to explain later-life outcomes. However, less work has been done in the developing country context, and particularly on mental health outcomes. This study applies life-course theories of latent (direct), pathway (indirect) and conditional effects in an analysis of childhood poverty on later-life depressive symptoms among older adults in Mexico. Data are from the 2001 Mexican Health and Aging Study (MHAS), a nationally representative sample of older adults born before 1951 ( $n=8697$ ). Respondents had a mean of 3.6 past-week depressive symptoms (9-item CES-D scale) and 71% had no household sanitation facilities before age 10, indicating poverty. Childhood poverty is significantly related to scores on the 9-item CES-D scale in the full model ( $b=0.20$ ,  $p<0.01$ ). This effect is partially mediated by four adult socioeconomic status measures, although decomposition analysis reveals the mediation effect to be primarily driven by education, and minimally by occupation, wealth or income. Results for conditional effects of childhood poverty and education on CES-D scores are negative. The negative results instead suggest that material deprivation during childhood has a consistently adverse impact on depressive symptoms later on regardless of years of education, although education has important implications for health outcomes generally. These findings have important implications for Mexico's rapidly aging population as well as efforts for childhood poverty reduction.

## THE EFFECTS OF CHILDHOOD SOCIAL CONDITIONS ON MENTAL AND PHYSICAL HEALTH OF SOUTH KOREAN OLDER ADULTS

H. Jun<sup>1</sup>, J.I. Wassel<sup>2</sup>, K. Cho<sup>1</sup>, H. Chai<sup>1</sup>, 1. *Yonsei University, Seoul, Republic of Korea*, 2. *The University of North Carolina Greensboro, Greensboro, North Carolina*

Historically, researchers have tended to focus on the low social conditions in the adulthood when examining social inequalities related to health issues. Only recently has the link between childhood factors and the health status in older adulthood is only recently gained attention. Current South Korea older adults faced great adversity as children during and after the Korean War however no formal study has examined the effect of this hardship on later life. Using the South Korea Welfare Panel data, we examined the association between the physical/mental health of the older South Korean adults (aged 60+ in 2006,  $N=4,579$ ) and childhood social conditions, including economic adversity and parental loss. Four health indicators (depression level, self-esteem, health satisfaction, and self-perceived health status) were measured yearly from 2006 to 2009. Using Latent Growth Curve Models, the result suggest that childhood parental loss was significantly associated with the initial levels of all four health measures in 2006. Older Koreans who experienced childhood parental loss marked significantly high on the initial 2006 level of depression measured and significantly low on self-esteem, health satisfaction, and self-perceived health status and were sustained for all times measured. Experiencing economic adversity during childhood was significantly associated with the four health variables. However its effect was positive for health status, suggesting that the economic adversity during childhood tended to decrease over time. These results suggest that experiencing parental loss during childhood is more likely to trigger negative long-term effects in the older ages compared to experiencing economic adversity during childhood.

## EDUCATIONAL TRAJECTORIES AND WELLBEING: A LIFECOURSE PERSPECTIVE

A. Jenkins, R.D. Wiggins, *Quantitative Social Science, Institute of Education, University of London, London, United Kingdom*

This project presents new quantitative evidence for contemporary ‘third age’ individuals on the relationship between their individual histories of learning and subsequent well-being. In the European Union there is a mounting policy interest, in the influence of learning on a range of outcomes, notably health and wellbeing. However, much of the research to date has tended to focus on younger adults and the immediate benefits of participating in courses. The longer term outcomes, such as the potential of accumulated learning experience for enriching later life, have been neglected. Our research therefore adopts a lifecourse approach to participation in learning and the potential benefits of learning. We will present typologies of participation in learning through the lifecourse into early old age, and then to relate these differing learning ‘trajectories’ to wellbeing at age 50. We use data from the UK's National Child Development Study (NCDS). This is a large-scale survey which contains information on all those born in Britain in one week in 1958. Follow-up data collection has taken place at various points in childhood and adulthood, most recently at age 50. Wellbeing at 50 is analysed as an outcome in path analyses and structural equation models. Our results will show, firstly, the extent to which engagement in learning has an impact on wellbeing at 50 after allowing for other factors and, secondly, whether the various learning trajectories have differential effects on wellbeing.

## ADOLESCENT HEALTH AND EDUCATIONAL ATTAINMENT: AN EXAMINATION OF REVERSE CAUSALITY

A. Zajacova<sup>1</sup>, K.M. Walsemann<sup>2</sup>, 1. *University of Wyoming, Laramie, Wyoming*, 2. *University of South Carolina, Columbia, South Carolina*

Educational attainment is a key predictor of health in adulthood and old age. A critical question, however, is whether early health problems can depress educational attainment, creating a spurious

association in studies of the education- health relationship. We analyzed the impact of adolescent health limitations on educational attainment. Our study is unique in that it accounts for major correlates of educational attainment identified in the educational and psychological literatures, including factors like parental background and educational aspirations. We used data from the National Longitudinal Survey of Youth (NLSY79), a nationally representative sample of 12,686 respondents ages 14-21 at baseline who were followed through 2008 when they were ages 42-50. Regression and fixed-effects models estimated the relationships between adolescent health and education, net of family background, academic performance, school-level information, and personality characteristics. Adolescent health limitations had no significant effect on educational attainment net of family background and other covariates. In bivariate sibling fixed-effects models, there was also no association between limitations and attainment. At the same time, the limitations strongly predicted adult health outcomes, indicating that the measure had good criterion and predictive validity. We found little evidence that adolescent health limitations influenced educational attainment. The results have implications for research on educational inequalities in adult health, providing additional support that schooling's effects are likely causal.

## **SESSION 1135 (SYMPOSIUM)**

### **DEVELOPING GERIATRIC NURSE LEADERS TO ADVANCE INTERPROFESSIONAL PRACTICE**

Chair: *D. Cleeter, Sawgrass Leadership Institute, Ponte Vedra Beach, Florida*

Discussant: *B. Resnick, University of Maryland School of Nursing, Baltimore, Maryland*

Many reports have recently called for the development of skilled and committed leaders as we intentionally transform healthcare in the United States. A clearly identified need for the immediate future is to lead practice advancements in the care of older adults across settings. Twenty eight Fellows of the national Geriatric Nursing Leadership Academy (GNLA) have completed the 18 month experience in which leadership of an inter-professional team project serves as the medium for individual leadership development. Of these interprofessional team projects 11 were conducted within acute care settings, 5 within community health agencies, and 12 occurred within long term care organizations including nursing homes and assisted living facilities. From Alaska to Maine, in rural and urban locations, and among a variety of patient populations, these projects have resulted in significant outcomes regarding practice improvements at the individual and family level, system and organizational changes including impact on market share, cost reduction, workforce development through education of geriatric resource nurses (GRN) and other health professionals caring for older adults, leadership of national professional organizations, and involvement within regional and national policy arenas. Using evidence from the GNLA Fellows evaluations and reports, the presentations will address practice advancements, individual leadership development, expanded scope of involvement within professional organizations, career progression, policy activities, and national impact. In addition, in-depth reports from two Fellows regarding the outcomes of their inter-professional projects will be included in the symposium.

### **GERIATRIC NURSE LEADERSHIP OF INTERPROFESSIONAL TEAMS: HEALTHCARE IMPROVEMENTS AND OUTCOMES**

*J.F. Wyman<sup>1</sup>, D. Cleeter<sup>2</sup>, C.J. Beverly<sup>3</sup>, 1. School of Nursing, University of Minnesota, Minneapolis, Minnesota, 2. Sawgrass Leadership Institute, Ponte Vedra Beach, Florida, 3. Arkansas Medical Sciences University, Little Rock, Arkansas*

Developing nurses who can effectively lead interprofessional teams that improve care quality to older adults is a major goal of

the Geriatric Nursing Leadership Academy (GNLA). This presentation will summarize the 28 interprofessional projects conducted by the GNLA Fellows and describe their impact on patient, family, and organizational outcomes. Outcomes associated with the Fellows' professional development will also be described. Practice changes included implementation of new guidelines, culture change programs, the NICHE program across settings, workforce development programs, and development of a telehealth program. Project outcomes included reduced use of psychotropic medications, falls, and readmission rates; improved function; decreased length of stay; improved patient/family satisfaction; increased Press-Ganey scores; increased geriatric knowledge among nursing staff; and reduced staff turnover and increased retention. As a result of their GNLA experience, Fellows have enrolled in advanced degree programs, with a majority assuming new leadership positions and receiving state and national awards.

### **IT'S MY HEALTH: A NURSING MODEL COMBINING PATIENT-CENTERED CARE AND TRANSITIONAL CARE**

*K. Wright<sup>1,2,3</sup>, C. Holder<sup>1</sup>, K. Hausch<sup>1</sup>, B. Lyn<sup>1</sup>, S. Hazelett<sup>1</sup>, M.H. Ward<sup>1</sup>, K. Blake<sup>1</sup>, C. Natale<sup>1</sup>, 1. Summa Health System, Akron, Ohio, 2. The University of Utah College of Nursing John A. Hartford Center of Geriatric Nursing Excellence, Salt Lake City, Utah, 3. John A. Hartford Building Academic Geriatric Nursing Capacity Scholar and Substance Abuse and Mental Health Services Administration MFP Fellow at ANA, New York, New York*

Fifty percent of Medicare patients returning to the hospital did not follow-up with a doctor after discharge. "It's My Health (IMH) is a nurse driven model of care designed to activate patients/families and improve the discharge care experience. In a pilot study, nurses provided the IMH folder and collaborative goal-setting. Patients were encouraged to keep discharge instructions in the folder and take the IMH folder to each medical appointment. N=504 patients were discharged; nurses completed a 2-3 day post-discharge phone call with a 62% completion rate. Seventy-six percent of patients made follow-up appointments and 78% filled prescriptions. Press Ganey Satisfaction with discharge planning scores increased to the 80-95%tile range. IMH was awarded "Best New Innovation" at 2011 Magnet Conference and Summa Health System created a centralized Post-Discharge Phone Call program as part of the Service Excellence Department to assure a standardized process that coach's patients around their IMH goals.

### **INTEGRATING NICHE ACROSS SETTINGS: A GERIATRIC NURSE LEADERSHIP CAPSTONE PROJECT**

*C. Roscoe-Herbert, P. DeGolia, Geriatrics, UH Hospitals, Cleveland, Ohio*

Frail older adults across healthcare settings often receive care from healthcare providers, including nurses, having repeatedly failed to recognize acute health status changes precipitated by certain medications, infection, and dehydration related issues such as constipation. The specific aim for the Geriatric Nursing Leadership Academy (GNLA) Fellowship Project was to institute a comprehensive Leadership Plan to improve senior care across healthcare settings and concurrently integrate a large health system with model senior care programming. The Fellow led integration efforts yielded an 83% NICHE designation for acute facilities. Other project outcomes and innovations include, development and implementation of the Teach Me Tuesday NICHE GRN Training Program<sup>®</sup>, and extending NICHE into the community to nursing homes (n=22) and one home care agency. More than two hundred (n=219) nurse recruits registered for Cohorts I – IV with near 82% (n=180) GRN(s) completing the training as skilled champions to improve senior care across the healthcare continuum.

## PREPARING GERIATRIC NURSES TO TRANSFORM HEALTH CARE ACROSS CARE SETTINGS

C.J. Beverly, *College of Nursing, University of Arkansas for Medical Sciences, Little Rock, Arkansas*

The Geriatric Nurse Leadership Academy (GNLA) serves as a mechanism for Fellows to increase knowledge about the health care delivery system and leadership in the policy arena at local, state and national levels. The Academy provides policy related learning opportunities by providing opportunities to increase knowledge and role of key agencies in the health care delivery system. Inter-professional opportunities engage other disciplines in the policy dialogue are examined through multiple strategies that include online discussions and inviting key policy stakeholders to site visits. Activities will be presented describing the experiences of all Fellows aimed at transforming health care within the context of the Patient Protection and Affordable Care Act and the work of the Fellows in Cohort II related to one or more of the recommendations from the Institute of Medicine's Future of Nursing report.

## SESSION 1140 (SYMPOSIUM)

### FIRST FRUITS FROM THE LIFESTYLE INTERVENTIONS AND INDEPENDENCE FOR ELDERLY (LIFE) STUDY

Chair: *S.B. Kritchevsky, Sticht Center on Aging, Wake Forest School of Medicine, Winston-Salem, North Carolina*

Co-Chair: *M. Pahor, University of Florida, Gainesville, Florida*

Discussant: *J.M. Guralnik, University of Maryland, Baltimore, Maryland*

The growing older population makes the identification of strategies to maintain functional independence a major public health priority. Physical inactivity is one of the strongest predictors of physical disability in elders, and substantial evidence from observational studies and small scale randomized trials targeting intermediate endpoints suggests that moderate-intensity physical activity can prevent mobility disability. However, there have yet to be trials confirming the efficacy of exercise for the prevention of clinical disability endpoints. To remediate this gap, several academic institutions with support from the National Institute on Aging and National Heart, Lung, and Blood Institute have fielded the LIFE Study, a Phase 3 multicenter randomized controlled trial comparing the effect of a supervised moderate-intensity physical activity program to a health education program in 1,635 sedentary older adults. Participants (age range 70-89; mean 78.9 yr; 33% male; and 25.8% non-white) were recruited by 8 field centers over a 21 month period. At baseline they were sedentary, at high risk for mobility disability (Short Physical Performance Battery score < 10) but able walk 400 m within 15 minutes without sitting, leaning, using a walker or the help of another person. This symposium will be the first presentation of LIFE data and will include its unique context (Pahor); recruitment strategies (Marsh); and baseline relationships between physical function and cognition (Espeland); peripheral vascular disease (McDermott) and sleep (Fragoso). LIFE is supported by a NIA grant U01 AG22376 and a supplement from the NHLBI. Additional support comes from the Pepper Centers grants.

### DESIGN AND RATIONALE FOR A LONG-TERM STUDY OF PHYSICAL ACTIVITY IN OLDER ADULTS

M. Pahor<sup>1</sup>, R. Fielding<sup>2</sup>, T. Church<sup>3</sup>, J. Williamson<sup>4</sup>, T. Manini<sup>5</sup>, S. Blair<sup>6</sup>, *1. University of Florida, Gainesville, Florida, 2. Tufts University, Boston, Massachusetts, 3. Pennington Biomedical Research Center, Baton Rouge, Louisiana, 4. University of Florida, Gainesville, Florida, 5. Wake Forest University, Winston Salem, North Carolina, 6. University of South Carolina, Columbia, South Carolina*

LIFE is a Phase 3, multicenter randomized controlled trial which compares a physical activity (PA) with a successful aging (SA) program in 1635 sedentary older persons over approximately 3 years. The primary outcome is major mobility disability (inability to walk 400m).

Secondary outcomes include cognitive function (Digit Symbol Substitution Test, Hopkins Verbal Learning Test); serious fall injuries; persistent mobility disability; major mobility disability or death; disability in activities of daily living; and cost-effectiveness. Tertiary outcomes include mild cognitive impairment or dementia, cognitive assessments, sleep disturbances, pulmonary function and events, and cardiovascular events. PA consists of walking at moderate intensity, resistance exercises, balance, stretching and behavioral counseling. SA consists of health education seminars regarding health-related matters and upper extremity stretching exercises. LIFE will provide definitive evidence regarding the efficacy of PA for preventing major mobility disability, and will yield valuable information concerning the efficacy of PA across several health outcomes.

### PERFORMANCE OF A COMPUTER-BASED ASSESSMENT OF COGNITIVE FUNCTION IN TWO COHORTS OF SENIORS

M.A. Espeland<sup>1</sup>, C.M. Castro<sup>2</sup>, J.M. Jennings<sup>3</sup>, J.A. Katula<sup>3</sup>, D.R. Kerwin<sup>4</sup>, A. Kramer<sup>5</sup>, J. Rushing<sup>1</sup>, *1. Wake Forest School of Medicine, Winston-Salem, North Carolina, 2. Stanford Prevention Research Center, Palo Alto, California, 3. Wake Forest University, Winston-Salem, North Carolina, 4. Northwestern University Feinberg School of Medicine, Chicago, Illinois, 5. University of Illinois at Urbana-Champaign, Urbana, Illinois*

Computer-based cognitive assessment tools are increasingly being incorporated in clinical trials and multicenter cohort studies because they may provide better standardization of test administration; richer data on performance measures such as response times, latency, and variability; and opportunities for greater efficiency and improved quality control for data management. We describe a battery developed in the Senior's Health and Activity Research Program pilot study (N=73) and implemented in LIFE (N=1635), a major multicenter clinical trial examining whether physical activity may reduce the risk of mobility disability and cognitive decline. Tasks to assess working memory, response inhibition, and attentional flexibility were administered; data were uploaded to a web-based data management system. Across both cohorts, computer-administered cognitive function scores were consistently related to risk factors for cognitive dysfunction, objective measures of physical function, and interviewer-administered assessments of cognitive function. They had stronger associations with 400 m walk gait than interviewer-administered test scores.

### THE ANKLE-BRACHIAL INDEX (ABI), LEG SYMPTOMS, AND PHYSICAL PERFORMANCE IN THE LIFE STUDY

M.M. McDermott<sup>1</sup>, L. Lovato<sup>4</sup>, J. Guralnik<sup>3</sup>, A.B. Newman<sup>2</sup>, *1. Northwestern University Feinberg School of Medicine, Chicago, Illinois, 2. University of Pittsburgh Aging Institute, Pittsburgh, Pennsylvania, 3. National Institute on Aging, Bethesda, Maryland, 4. Wake Forest School of Medicine, Salem, North Carolina*

Among 1527 LIFE participants with an ABI < 1.30, 219 (14%) had an ABI < 0.90, consistent with peripheral arterial disease (PAD). Exertional leg symptoms were reported by 35% with PAD vs. 25% without (P=0.001). Prevalences of intermittent claudication symptoms were 5.5% and 1.2% among those with vs. without PAD, respectively (P<0.0001). Lower ABI values were associated with older age, male gender, being African-American (all p-values < 0.001) and a history of current or former smoking, but not diabetes mellitus. Adjusting for age, sex, race, body mass index, smoking, and comorbidities, lower ABI values were associated with lower SPPB scores (p=0.02) and a trend toward slower 400-meter walk time (P trend=0.06). In LIFE, PAD is common and frequently asymptomatic. Lower ABI values were not significantly associated with walking endurance, perhaps because of the higher prevalence of frailty among LIFE participants as compared to community dwelling older men and women.

## SLEEP-WAKE COMPLAINTS AND SLEEP-APNEA RISK AMONG OLDER PERSONS WITH FUNCTIONAL LIMITATIONS (LIFE STUDY)

C. Frago<sup>1</sup>, M.E. Miller<sup>2</sup>, Y. Endeshaw<sup>3</sup>, T.B. Rice<sup>4</sup>, A. King<sup>5</sup>, S.B. Kritchevsky<sup>2</sup>, T.M. Gill<sup>1</sup>, *1. Yale University, New Haven, Connecticut, 2. Wake Forest University, Winston-Salem, North Carolina, 3. University of Florida, Gainesville, Florida, 4. University of Pittsburgh, Pittsburgh, Pennsylvania, 5. Stanford University, Palo Alto, California*

Among LIFE participants (N=1635), we evaluated the prevalence of sleep-wake complaints (Pittsburgh Sleep Quality Index [PSQI], Insomnia Severity Index [ISI], and Epworth Sleepiness Scale [ESS]), as well as the prevalence of high sleep-apnea risk (Berlin Questionnaire [BQ]). We also evaluated the association of objectively measured mobility (400-meter gait-speed and short physical performance battery score), with sleep-wake complaints and sleep-apnea risk—which has been studied rarely. The prevalence of poor sleep quality (PSQI>5), insomnia-diagnosis (ISI>=8), and daytime-drowsiness (ESS>=10) was 51.6%, 33.6%, and 17.6%, respectively; 32.9% had a high sleep-apnea risk (BQ>=2 positive categories). Using continuous measures, a significant association was found only between slower gait-speed and higher sleep-apnea risk—adjusted R-squared value of 0.41% (p=0.009). These results suggest that, among older persons with functional limitations, sleep-wake complaints and high sleep-apnea risk are highly prevalent. However, reduced mobility was not associated with sleep-wake complaints, and only minimally associated with sleep-apnea risk.

## RECRUITMENT STRATEGIES AND BASELINE CHARACTERISTICS OF OLDER ADULTS RECRUITED INTO THE LIFE STUDY

A. Marsh<sup>1</sup>, K. Kennedy<sup>2</sup>, L. Lovato<sup>2</sup>, E.J. Groessl<sup>3</sup>, M. Pahor<sup>4</sup>, J.M. Guralnik<sup>5</sup>, *1. Health and Exercise Science, Wake Forest University, Winston Salem, North Carolina, 2. Wake Forest Health Sciences, Winston Salem, North Carolina, 3. University of California San Diego, San Diego, California, 4. University of Florida, Gainesville, Florida, 5. University of Maryland, Baltimore, Maryland*

Recruitment of functionally limited older persons into behavioral/lifestyle long-term randomized controlled trials is a significant challenge. In the LIFE Study we used a diverse array of recruitment strategies at eight study sites including print, TV, radio, and events. Over 21-months we completed 14,811 telephone screens and randomized 1,635 (11.0%) participants (67.2% women, 21.0% minorities, 44.7% with SPPB ≤ 7) at an average cost/participant of \$838. Of the 6,318 persons who received physical performance assessments, 42% were excluded because they scored above the SPPB cutoff of 9. Of the 3,669 remaining eligible, 4.9% (174/3547) were too active, 10.0% (198/1980) could not complete the 400-m walk, and 5.6% (109/1945) had medical exclusions. The LIFE Study achieved all recruitment goals. Direct mailing was the most productive recruitment strategy (58.0% of all randomized participants) and an efficient method for recruiting high-risk community-dwelling older persons, including minorities, in diverse geographic areas.

## SESSION 1145 (SYMPOSIUM)

### IDENTIFICATION AND TREATMENT OF COMMUNITY-DWELLING FRAIL OLDER PEOPLE: AN INTERNATIONAL PERSPECTIVE

Chair: *E. van Rossum, Zuyd University of Applied Sciences, Heerlen, Netherlands, CAPHRI School for Public Health and Primary Care, Maastricht University, Maastricht, Netherlands*

Co-Chair: *G.I. Kempen, CAPHRI School for Public Health and Primary Care, Maastricht University, Maastricht, Netherlands*

Discussant: *L. Rubenstein, University of Oklahoma, Oklahoma, Oklahoma*

Frail older people often suffer from multimorbidity and functional impairments, which may lead to disability and long-term care. Regarding the increasing number of older people, it is a public health priority for Western countries to support frail older people in staying at home as long as possible. They have to be identified in time and their problems have to be addressed adequately. Various initiatives have been set up to improve community-based care for frail older people. This symposium aims to provide an international perspective on community-based strategies in five different countries (Denmark, The Netherlands, Switzerland, Japan and USA). Five presenters discuss their experiences with and results of various strategies. The first presenter reports about the effects of different home visiting models in Denmark, which support frail older people after discharge from hospital. The second presentation is about an interdisciplinary primary care approach in the Netherlands. The experiences of frail older people and healthcare professionals were investigated in a comprehensive process evaluation. The third presenter reports on the effects of a preventive home visits in Japan, and the implications of their findings for local public health strategies. The fourth presentation is about a study on a Swiss telephone-based reinforcement approach combined with computer-based feedback reports on health risks and recommendations by primary care practitioners. The fifth presenter reports on a bio-behavioural-environmental program in the USA and its effects on healthcare outcomes and costs. The findings of these five studies will be discussed by Dr Laurence Rubenstein from the University of Oklahoma.

### GERIATRIC FOLLOW-UP OF FRAIL ELDERLY AFTER DISCHARGE FROM HOSPITAL: EVIDENCE FROM FOUR INTERVENTION SCHEMES

F. Rønholt, *Medical dept. O, University Hospital of Copenhagen - Herlev, Herlev, Denmark*

Over the last years, different models were tested in four RCTs in Denmark to support frail elderly after discharge from hospital 1) One home visit by a home nurse the day after discharge and one home visit by a GP 2 weeks after discharge. 2) Four home visits over 4 months (week 1, 3, 8 and 16) by a geriatric team after discharge from a geriatric ward. 3) One home visit by a GP and a home nurse 1 week after discharge plus 2 contacts further at week 3 and 8. 4) "Follow home" on the day of discharge by a member of a geriatric team. Conclusion: Geriatric follow-up reduces the risk of readmissions, has financial benefits, initiate medical adjustment but seems not to influence functional capacity or allocated social care. But we still need to know how to target the right patients for the right type of follow-up.

### DISABILITY PREVENTION IN FRAIL OLDER PEOPLE: AN INTERDISCIPLINARY PRIMARY CARE APPROACH

S. Metzelthin<sup>1</sup>, E. van Rossum<sup>2,1</sup>, R. Daniels<sup>2</sup>, K. Cox<sup>1</sup>, H. Habets<sup>2,1</sup>, L. de Witte<sup>2,1</sup>, G.I. Kempen<sup>1</sup>, *1. CAPHRI School for Public Health and Primary Care, Maastricht University, Maastricht, Netherlands, 2. Zuyd University of Applied Sciences, Heerlen, Netherlands*

A powerful multidisciplinary primary care approach is needed to identify frail older people, to address their needs and to prevent a loss of function and early long-term care. Such an approach is evaluated in

six general practitioner (GP) practices in the south of the Netherlands in the framework of the National Care for the Elderly Program (2008-2012), an initiative of the Dutch Ministry of Health, Welfare and Sport. The approach starts with a postal screening of community-dwelling older people ( $\geq 70$  years,  $n=1,825$ ) using a 15-item screening questionnaire (Groningen Frailty Indicator). Consequently, frail older people receive a multidimensional assessment and a tailor-made treatment executed by a primary care team. Frail older people ( $n=194$ ) and health-care professionals ( $n=45$ ) are very satisfied with the approach. The approach is considered to be feasible by both healthcare professionals and frail older people. However given its complexity the implementation is challenging and requires special attention.

#### **PREVENTIVE HOME VISIT APPROACH IN FRAIL ELDERLY UNDER THE JAPANESE PUBLIC LONG-TERM CARE SYSTEM**

A. Kono<sup>1</sup>, Y. Kanaya<sup>1</sup>, C. Tsumura<sup>2</sup>, L. Rubenstein<sup>3</sup>, 1. School of Nursing, Osaka City University, Osaka, Japan, 2. Konan Women's University, Kobe, Japan, 3. the University of Oklahoma, Oklahoma, Oklahoma

Japan faces a "super-aging" society, where elders comprise over 23%, and preventing their functional decline has become a high priority. Japan has a unique mandatory public long-term care insurance (LTCI) system that divides elders into several categories according to their care needs. We performed a randomized trial on the effects of preventive home visits (PHVs) for those elders not using long-term care service even though they qualify for it ( $N=323$ ). The PHVs were provided by nurses or care managers on municipal community-based comprehensive care centers. Results from subgroup analysis suggest PHVs prevent functional decline including ADLs or IADLs for those with ADL dependency. Moreover, PHVs could facilitate earlier use of long-term care service, avoiding monthly hospital costs with more than 500,000 JPY ( $\approx 5,000$ USD) per person on average. We feel that our preventive care system needs to be connected to primary care and further multidisciplinary public health programs.

#### **FEASIBILITY OF HEALTH RISK APPRAISAL FOR OLDER PERSONS WITH TELEPHONE REINFORCEMENT IN FOUR SWISS COMMUNITIES**

A.E. Stuck<sup>1</sup>, J. Wagner<sup>1</sup>, A. Moser<sup>2</sup>, S. Born<sup>1</sup>, P. Frey<sup>3</sup>, 1. Geriatrics University of Bern, Bern, Switzerland, 2. Institute of Social and Preventive Medicine, Bern, Switzerland, 3. Institute of Primary Care, Bern, Switzerland

A promising approach for prevention of disability is based on Health Risk Appraisal for Older Persons (HRA-O). A randomised controlled study in Switzerland demonstrated favourable effects on health behaviour and preventive care uptake of older persons if a self-administered HRA-O questionnaire was combined with preventive home visits. However, only 514 (59%) of 874 persons allocated to the intervention group accepted to receive preventive home visits. We therefore developed a telephone-based reinforcement approach combined with mailing of individualized computer-generated HRA-O feedback reports and selection of appropriate recommendations by primary care practitioners on a computer-generated prescription form. This telephone-based system was successfully implemented in a group of 129 older persons. Participation rate was 95%, and overall cost was USD 27 per person. In a next step this promising low-cost approach is implemented and compared to the more costly home visitation approach in a larger population.

#### **FISCAL AND POLICY IMPLICATIONS FOR IMPROVING FUNCTIONAL ABILITY IN THE U.S.: THE CAPABLE PROGRAM**

S.L. Szanton<sup>1</sup>, R. Thorpe<sup>1</sup>, B. Left<sup>1</sup>, E. Tanner<sup>1</sup>, J.M. Guralnik<sup>2</sup>, L. Gitlin<sup>1</sup>, 1. Johns Hopkins University, Baltimore, Maryland, 2. University of Maryland, Baltimore, Maryland

In the United States, there is substantial race and income disparity in functional status in middle to late life. Although Medicare is univer-

sal for those over 65, many cannot afford to make changes to their living environment that can keep them safe and mobile at home. This leads to costly, preventable, nursing home placement much of which is paid for by tax-payers. We performed a randomized pilot trial on the effects of a bio-behavioral-environmental program called Community Aging in Place, Advancing Better Living for Elders ( $N=41$ ) which demonstrated decreased limitation in functional ability and increased quality of life for the intervention group relative to the control group. Nursing home care in the United States costs \$75,000 per person per year. If each participant is delayed from nursing home admission only by 2 weeks, the CAPABLE program will save substantial health care costs.

#### **SESSION 1150 (SYMPOSIUM)**

#### **OCCUPATIONAL GERONTOLOGY: EFFECTS OF WORK AND RETIREMENT ON HEALTH AND FUNCTIONING IN OLD AGE**

Chair: S. Stenholm, National Institute for Health and Welfare, Turku, Finland

Co-Chair: T. Rantanen, University of Jyväskylä, Jyväskylä, Finland

Discussant: W. Satariano, University of California at Berkeley, Berkeley, California

Several work-related factors have been identified as determinants of adverse health events. However, few studies have the long-term data needed to examine the consequences of work and retirement on health and functioning in old age. The presentations in this symposium are based on two unique cohorts from Finland: The Finnish Longitudinal Study of Municipal Employees (FLAME) is a 28-year follow-up study of public sector employees aged 44 to 58 years at baseline ( $n=6257$ ) in 1981 and 3092 returned the follow-up questionnaire in 2009. The Mini-Finland Health Examination Survey enrolled a nationally representative sample of 8000 Finnish persons aged 30 or over in 1978-1980 and 1278 of them living in the 9 municipalities were re-examined 22 years later. This symposium will describe the associations of work-related physical stress on handgrip strength in midlife and handgrip strength decline through 22 years of follow-up (Dr. S Stenholm). Findings from the FLAME will include the role of work-related mental stress symptoms in midlife as risk factors for old age disability (Dr. J Kulmala) and the effects of midlife physical activity during leisure and at work on later life mobility limitations (Prof. T Rantanen). Moreover, based on linkage from several medical records in the FLAME study data, the long-term effect of physical and mental job strain on hospital admissions (Dr. MB von Bonsdorff) and the relationship between type of pension and mortality (Dr. ME von Bonsdorff) will be highlighted. Taken together, these studies demonstrate the importance of working life on health and functioning in old age.

#### **PHYSICAL ACTIVITY DURING LEISURE VS. WORK: DIFFERENT EFFECTS ON PROGRESSION OF MOBILITY LIMITATION**

T. Rantanen<sup>1</sup>, M. von Bonsdorff<sup>1</sup>, T.M. Tormakangas<sup>1</sup>, C. Nygård<sup>2</sup>, J. Seitsamo<sup>3</sup>, J. Ilmarinen<sup>3</sup>, 1. Gerontology Research Center, University of Jyväskylä, University of Jyväskylä, Finland, 2. University of Tampere, Tampere, Finland, 3. Finnish Institute of Occupational Health, Helsinki, Finland

We studied the effects of midlife physical activity during leisure and at work on mobility limitations assessed 28 years later. The participants were 2899 municipal employees aged 44 to 58 years (63% women) at baseline in 1981. In follow-up in 2009, 30% reported difficulty walking 500 meters. Higher leisure time physical activity protected from mobility limitation while higher work physical activity increased the risk of mobility limitation 28 years later. After adjusting for age, body dimensions and occupational status, the risk of mobility limitation was highest among those with low leisure and high work physical activity, and lowest among those with high leisure and low work physical activ-

ity. High work physical activity accelerates progression of mobility decline probably through degenerative diseases. In contrast, leisure physical activity protects from mobility limitation through improved fitness.

### PHYSICAL AND MENTAL JOB STRAIN IN MIDLIFE AND USE OF HOSPITAL RESOURCES: A 27-YEAR PROSPECTIVE FOLLOW-UP

M. von Bonsdorff<sup>1</sup>, M.E. von Bonsdorff<sup>1</sup>, J. Kulmala<sup>1</sup>, T. Törmäkangas<sup>1</sup>, J. Seitsamo<sup>2</sup>, C. Nygård<sup>3</sup>, J. Ilmarinen<sup>2</sup>, T. Rantanen<sup>1</sup>, 1. *Gerontology Research Center and Health Sciences, University of Jyväskylä, University of Jyväskylä, Finland*, 2. *Finnish Institute of Occupational Health, Helsinki, Finland*, 3. *University of Tampere, Tampere, Finland*

We investigated the long-term effect of physical and mental job strain on hospital admissions during a 27-year follow-up. 5485 middle-aged public sector employees had data on physical and mental job strain in 1981. Hospital admissions between January 1981 and December 2008 were extracted from the National Hospital Discharge Register. Analyses were performed with recurrent event models and adjusted for age, gender, occupational group, smoking and main chronic diseases. Mortality was considered as a competing risk. Those with higher physical and mental job strain in midlife had a higher rate of hospital admissions during the follow-up (Likelihood ratio test  $p < 0.001$ ). The competing risks –recurrent events model indicated that higher mental and physical job strain was associated with a higher risk for recurrent hospital admissions during the long follow-up. Higher mental and physical job strain in midlife predicted more frequent hospital admissions spanning from midlife to old age.

### WORK-RELATED PHYSICAL STRESS AS PREDICTOR OF MUSCLE STRENGTH DECLINE OVER TWO DECADES

S. Stenholm<sup>1</sup>, T. Rantanen<sup>2</sup>, P. Sainio<sup>1</sup>, M. Heliövaara<sup>1</sup>, S. Koskinen<sup>1</sup>, 1. *National Institute for Health and Welfare, Turku, Finland*, 2. *University of Jyväskylä, Jyväskylä, Finland*

This study examines the associations of work-related physical stress on handgrip strength in midlife and handgrip strength decline through 22 years of follow-up. Data are from 892 men and women aged 30 to 73 years at baseline participating in the population-based Mini-Finland Health Examination Survey (1978–80) and living in 9 municipalities in which the handgrip strength measurement was repeated in 2000–01. At baseline, no difference in handgrip strength was observed in men with different work-related physical stress but women who engaged with heavy physical work had significantly higher handgrip strength compared to those with light work ( $p = 0.04$ ). Both men ( $p = 0.05$ ) and women ( $p = 0.04$ ) with heavy physical work experienced greater handgrip strength decline over 22 years than those with light work. Especially vibration from hand-held tools and repetitive work predicted higher handgrip strength decline. In conclusion, physically demanding work exposes to accelerated muscle strength decline, possible via upper extremity musculoskeletal disorders.

### PSYCHOSOCIAL STRESS IN WORK AND DISABILITY 30 YEARS LATER

J. Kulmala<sup>1</sup>, M. von Bonsdorff<sup>1</sup>, S. Stenholm<sup>2</sup>, M.E. von Bonsdorff<sup>1,3</sup>, C. Nygård<sup>4</sup>, J. Seitsamo<sup>5</sup>, J. Ilmarinen<sup>5</sup>, T. Rantanen<sup>1</sup>, 1. *Department of Health Sciences, Gerontology Research Center, University of Jyväskylä, FI-40014 University of Jyväskylä, Finland*, 2. *National Institute for Health and Welfare (THL), Department of Health, Functional Capacity and Welfare, Turku, Finland*, 3. *Aalto University, School of Economics, Department of Management and International Business, Helsinki, Finland*, 4. *Gerontology Research Centre, School of Health Sciences, University of Tampere, Tampere, Finland*, 5. *Finnish Institute of Occupational Health, Helsinki, Finland*

The aim of this study was to examine work-related psychosocial stress symptoms in midlife as risk factors for old age disability. Study

includes 2994 persons aged 44–58 years at baseline, whose self-reported stress symptoms were assessed in 1981 and 1985 and who responded to disability questionnaire in 2009. Four midlife stress profiles were identified: avoidance of work and lack of energy; perceived decrease in cognition; sleep disturbances; and somatic stress symptoms. The results showed that the proportion reporting high level of work-related stress in midlife varied between 14–23%. The adjusted logistic regression models showed that those with disability in old age had reported constant work-related stress symptoms two to three times more often in midlife than those without disability in old age. Work-related stress symptoms may be the first signs of decompensation of individual functioning relative to environmental demands, which may later manifest in disabilities.

### TYPE OF PENSION AS A PREDICTOR OF MORTALITY - A 28-YEAR FOLLOW-UP STUDY

M.E. von Bonsdorff<sup>1,2</sup>, M. von Bonsdorff<sup>1</sup>, M. Wang<sup>3</sup>, J. Kulmala<sup>1</sup>, J. Seitsamo<sup>4</sup>, J. Ilmarinen<sup>4</sup>, T. Rantanen<sup>1</sup>, 1. *Health Sciences, University of Jyväskylä, Jyväskylä, Finland*, 2. *Aalto University, Helsinki, Finland*, 3. *University of Florida, Gainesville, Florida*, 4. *Finnish Institute of Occupational Health, Helsinki, Finland*

We investigated the relationship between type of pension and mortality. Data come from 5764 public sector employees from the Finnish Longitudinal Study on Municipal Employees (FLAME), aged 44 to 58 at baseline. Mortality data was retrieved from national registers. Register-based data on type of pension was classified into old age, disability, and early individual pension. Cox Regression analyses were adjusted for age, gender, occupational group, main chronic diseases, and lifestyle factors. 1753 participants died during the follow-up from 1981 to 2009. Compared to those who retired due to old age, those who retired due to disability had an increased risk of mortality among men and women. Adjusting for main chronic illnesses and lifestyle factors did not attenuate the associations. The risk of mortality differed according to type of pension. Disability pension was an independent predictor of mortality. Lifestyle and health factors changed little the association.

## SESSION 1155 (SYMPOSIUM)

### VOLUNTEERING AMONG THE OLD-OLD: NEW WAYS TO THINK ABOUT AGING

Chair: *B. Resnick, University of Maryland, Baltimore, Maryland*  
Discussant: *A. Cohen-Callow, University of Maryland, Baltimore, Maryland*

There is increasing evidence that volunteering among older adults benefits the individual and society at large. Numerous studies have documented that individuals who volunteer have lower morbidity and longer survival than those who do not volunteer. More importantly, a meta-analysis of 37 studies demonstrated that older volunteers report a higher overall quality of life than those who do not volunteer. Moreover, a growing number of longitudinal studies provide some support for causation and suggest that volunteering is beneficial to older individuals overtime. Specifically, longitudinal studies have shown a causal relationship between volunteering and lower rates of mortality, better quality of life, more time spent in physical activity and better mental health as demonstrated by fewer depressive symptoms and less anxiety. Given the many benefits of volunteering consideration should be given to ways to increase the number of older individuals who volunteer. An important first step in this process is to explore volunteer activities among older individuals, their preferences for volunteering and barriers to engaging in volunteer activities. This symposium provides outcomes from a sample of 127 older adults living in a continuing care retirement community, the majority of whom were greater than 85 years of age. In addition, we explored personality factors and tested the hypothesis that mutations in selected candidate genes can explain individual differences in resilience in older adults and this directly and indirectly

influences volunteer activity. Findings from this research can be used to guide future work focused on increasing volunteerism among older adults.

### **VOLUNTEER ACTIVITIES, PREFERENCES AND BARRIERS**

B. Resnick, J. Klinedinst, *University of Maryland, Baltimore, Maryland*

The purpose of this study was to explore the preferences for volunteer activities among residents of a continuing care retirement community (CCRC). The majority of the participants were female (78%) and white (98%) with an average age of 88.0 (SD=6.5) years. Just under half of the residents were doing some volunteer work (47%). Engagement in volunteer activities ranged from 0 to 7 activities with a mean of 1.31 (SD=1.62). The majority of the 60 individuals who volunteered did so within the facility [n=52 (87%)]. Reasons for volunteering included: engaging in an interesting activity, mental stimulation, health and social benefit, to learn new skills, and engagement in a meaningful activity. Of those who did not volunteer, 13% reported that they were interested and willing to volunteer either within or outside the facility. We propose using a community/kibbutz approach to increase volunteer opportunities and behaviors among these older individuals.

### **INFLUENCE OF VOLUNTEERING AND DEPRESSIVE SYMPTOMS AMONG RESIDENTS OF A CCRC**

N. Klinedinst, B. Resnick, *University of Maryland, Baltimore, Maryland*

The purpose of this study was to explore the impact of volunteerism on depressive symptoms among residents in a CCRC. All participants completed a one-time survey. Depressive symptoms were measured by the PHQ-2. Controlling for age and number of comorbidities a stepwise regression model was used. Participants were 88.0±6.5 years old, and the majority were female and Caucasian and on average were not depressed ( $X=.63\pm 1.1$ ). Pain ( $\beta=.0$ ,  $p<.001$ ), fear of falling ( $\beta=.29$ ,  $p<.001$ ) and exercise ( $\beta=-.16$ ,  $p=.04$ ) explained 27% of the variability in depressive symptoms. Volunteerism did not enter the model. Among older individuals living in a CCRC setting, there was no indication that volunteering is associated with depressive symptoms. Interventions aimed at reducing pain and fear of falling and increasing exercise among CCRC residents may be useful in reducing depressive symptoms.

### **THE DIRECT AND INDIRECT RELATIONSHIP OF GENETIC FACTORS ON RESILIENCE AND VOLUNTEERISM IN OLDER ADULTS**

S.G. Dorsey, B. Resnick, *University of Maryland, Baltimore, Maryland*

The most commonly studied gene related to resilience is variation in the human serotonin transporter gene (5-HTTLPR). The short allele of 5-HTTLPR is associated with decreased serotonin transporter availability and lower reuptake of serotonin from synaptic clefts. Another polymorphism that is relevant to resilience is found in the gene catechol-O-methyltransferase (COMTVal258Met). Individuals with low functioning have the VAL258Met allele, resulting in higher circulating levels of dopamine and noradrenaline and are more anxious and less resilient. With regard to BDNF, in animal models resilience to chronic stress can be mediated via BDNF expression. We proposed that the same process occurs in humans. In this study of 127 older individuals living in a continuing care retirement, we explored the relationship between resilience and volunteerism and considered whether or not the individual's genes interacted with environmental factors to shape neural circuitry and neurochemical function to influence resilience and directly and indirectly influence volunteerism.

## **SESSION 1160 (SYMPOSIUM)**

### **GETTING SQUEEZED: THE AARP MIDDLE CLASS SECURITY PROJECT**

Chair: *S.C. Reinhard, Public Policy Institute, AARP, Washington, District of Columbia*

Co-Chair: *D.L. Redfoot, Public Policy Institute, AARP, Washington, District of Columbia*

Discussant: *R. Deutsch, Public Policy Institute, AARP, Washington, District of Columbia*

This symposium will report findings from the "Middle Class Security Project," a ground-breaking look at factors that have squeezed middle class households over the past several decades and how those factors will impact the retirement security of current and future retirees. Specifically, the symposium will feature: 1) recent trends measured by a middle class security index, 2) findings from commissioned research in specific areas of security, and 3) videos and focus group results illustrating how these trends are experienced by individuals in their daily lives. Many families have faced growing financial insecurity for a generation. Wages have not kept pace with rising costs for middle class basics: housing, health care, and education. Income growth has not offset increasing family burdens associated with caring for children or aging parents. Unemployment, threats of layoffs, and the loss of housing values and wealth have contributed to the sense of insecurity during the recent recession. A recent AARP survey of Americans over 50 found that one in six is unemployed. One in three said their homes had lost value during the recession; one in four said they had exhausted all their savings. In these challenging times, Medicare, Medicaid and Social Security have become increasingly important for middle class security in retirement. If these benefits are cut—as many political leaders propose—the impact may force millions of older Americans out of the middle class. The symposium will discuss these trends and potential policy options for addressing middle class insecurity across the life span.

### **TRENDS IN MIDDLE CLASS SECURITY: THE MIDDLE CLASS SECURITY INDEX**

*S.C. Reinhard, Public Policy Institute, AARP, Washington, District of Columbia*

Susan Reinhard will describe the AARP Middle Class Security Project – the motivation for a major research focus in this area, the types of issues facing middle class Americans, and the importance of these issues for AARP's public policies. This presentation will describe how security is built over the working years in ways that affect security in retirement. This presentation will also examine the degree to which the recent recession disrupted the security of many middle class families and retirees. Finally, this presentation will describe the findings of a Middle Class Security Index developed in partnership with Brandeis University that measures trends in a number of dimensions – including asset security, housing security, budget security, and health security – among working age middle class households between 2004 and 2010. Trends in security on these dimensions as well as overall security are compared by age, race/ethnicity, and family status.

### **DOCUMENTING THE DECLINE: RESEARCH FROM THE AARP MIDDLE CLASS SECURITY PROJECT**

*D.L. Redfoot, Public Policy Institute, AARP, Washington, District of Columbia*

Don Redfoot will report the findings of various research initiatives that were commissioned as part of the Middle Class Security Project, including: Trends in family income The affordability of healthcare in retirement The performance of various classes of assets and investments and the increased risks associated with those assets for many in the middle class Strategies for decumulation of assets and the risks faced by middle class retirees in light of the lack of consensus about optimal strategies among financial experts Projections of the retirement secu-

city of future cohorts of middle class retirees This presentation will look at the growing risks in various areas that affect middle class security – income, asset accumulation, healthcare, housing, and family structure. The theme of the presentation is to describe the cumulative effects of these risks and the impact that they have on individuals through the life course.

### **INDIVIDUAL LIVES IN PERIL: THE AARP MIDDLE CLASS SECURITY PROJECT IN PERSPECTIVE**

R. Deutsch, *Public Policy Institute, AARP, Washington, District of Columbia*

Rick Deutsch's presentation will show how the cumulative risks and stresses from the social and economic trends described in the previous sections impact the lives of individuals. Individuals do not compartmentalize the stresses that are the basis of the analytical work that researchers, including those in this project, tend to do. Financial, healthcare, and family crises are often interrelated in complex ways at various stages in the life course of those in the middle class. This presentation will explore these individual experiences in two ways: Presenting mini-ethnographies of the lives of select participants in focus groups conducted in Tampa, Philadelphia, and Milwaukee Showing video ethnographies of middle class individuals in these three cities who are struggling with the loss of income, declining home values, and healthcare issues that affect their security and the security of their families

## **SESSION 1165 (SYMPOSIUM)**

### **INNOVATIONS IN GERIATRIC EDUCATION: CONSIDERING CROSS-DISCIPLINARY APPLICATIONS OF THE HPPAE MODEL**

Chair: *E.C. Barker, Social Work Leadership Institute, New York Academy of Medicine, New York, New York*

Co-Chair: *P.J. Volland, Social Work Leadership Institute, New York Academy of Medicine, New York, New York*

Discussant: *J. Damron-Rodriguez, University of California, Los Angeles, Los Angeles, California*

The Hartford Partnership in Aging Education (HPPAE) has been implemented in 69 US graduate schools of social work over a 12 year period. The rigorous evaluation of institutional and student outcomes and a 3 stage national dissemination strategy provide evidence of success and considerations for other health professional education programs. Six essential elements were identified by 11 demonstration sites and then adopted and adapted at 58 other schools. Dissemination continues through a normalization phase of implementation in additional schools. The elements include: 1) university-community partnership, 2) competency-driven education, 3) integrated field education across multiple programs, populations, interventions, and disciplines through rotations, 4) expanded field instructor role, 5) focused recruitment of students and 6) leadership. The IOM Report, *Re-tooling for an Aging America*, recommends competency-based education in aging for all providers in order to enact new EB models of care in the community. This paper will present findings of the evaluation of the HPPAE model and implications for other health professionals that are considering implementing a geriatric curriculum. Implications derived from the HPPAE evaluation support the following educational approaches. 1) Articulation of a rotational model that provides diverse learning experiences with particular attention to transitions and continuity of care. 2) Geriatric competencies are shown to provide a curricula for agency based field education. 3) The teaching of contemporary geriatric practice requires the need for collaborative models of education with strong university agency partnerships exemplified in the HPPAE model. Moreover cross -disciplinary and interdisciplinary new applications of the model will be explored.

### **HARTFORD PARTNERSHIP PROGRAM FOR AGING EDUCATION (HPPAE) OVERVIEW**

E.C. Barker, P.J. Volland, *Social Work Leadership Institute, New York Academy of Medicine, New York, New York*

The Partnership Program for Aging Education (HPPAE) is a national initiative funded with support from the John A. Hartford Foundation and the MetLife Foundation; developed and administered by the Social Work Leadership Institute at The New York Academy of Medicine. The program responds to several interconnected concerns, including the increasing numbers of older adults, difficulties attracting social work students to aging specializations, and lack of aging focused programs in schools of social work. It offers an innovative field approach that exposes students to a broad spectrum of settings and diverse older populations. It integrates classroom learning and internships, so that graduates are prepared for practice in the current dynamic delivery system. HPPAE differs from traditional MSW education models. Based on collaborative partnerships between universities and community-based agencies, the HPPAE provides select groups of students with wide-ranging, hands-on experience in older adult practice.

### **COLLABORATIVE MODEL OF SOCIAL WORK EDUCATION WITH STRONG UNIVERSITY-AGENCY PARTNERSHIPS**

E.C. Barker<sup>1</sup>, M. Patchner<sup>2</sup>, *1. Social Work Leadership Institute, New York Academy of Medicine, New York, New York, 2. Indiana University, Indianapolis, Indiana*

A key element of the HPPAE Model is the focus on agency-university partnerships to further social work education for geriatric practice. Though social work education has traditionally required linkages with community agencies, the HPPAE program established collaborative relationships of mutual benefit for the partners, students, and clients. Having collaborative relationships with agencies resulted in agency personnel informing curriculum development, which required rotations among community programs and developing competencies for student learning. The majority of HPPAE programs reported having formal university–community partnerships with between 5 and 25 agencies. Most of these schools had regular advisory board meetings with participating agencies, field instructors, and faculty members. HPPAE schools markedly increased the number of aging agencies designated as field sites and the number of students in aging placements. The HPPAE model has implications for the development of agency relationships for other disciplines.

### **THE ROTATIONAL MODEL PROVIDES DIVERSE LEARNING EXPERIENCES WITH ATTENTION TO TRANSITIONS, CONTINUITY OF CARE AND PROVIDING SERVICES FOR HARD TO REACH POPULATIONS**

E.C. Barker<sup>1</sup>, K. Bullock<sup>2</sup>, *1. Social Work Leadership Institute, New York Academy of Medicine, New York, New York, 2. North Carolina State University, Raleigh, North Carolina*

An essential component of the HPPAE model is rotational field education. This innovative approach to training and educating social workers to provide care for older adults, gives particular attention to transitions and continuity of care. Furthermore, it is an effective strategy for creating diverse learning opportunities in diverse practice settings. As demonstrated by comprehensive data collected from HPPAE programs, the field rotation model is a successful mechanism, which builds upon the university-community partnership and augments the capacity for aging agencies to serve “hard-to-reach” populations. This success is achieved through the recruitment and training of faculty and field instructors, recruitment and orientation of students; implementation and monitoring of the rotation process, customizing rotations to meet the students' learning objectives and participation in an evaluation of the model, which is used to make programmatic and curriculum changes and updates as needed.

## GERIATRIC COMPETENCIES PROVIDE A CURRICULUM FOR AND EVALUATION OF FIELD EDUCATION

E.C. Barker<sup>1</sup>, J. Damron-Rodriguez<sup>2</sup>, 1. *Social Work Leadership Institute, New York Academy of Medicine, New York, New York*, 2. *University of California, Los Angeles, Los Angeles, California*

According to accrediting bodies, Competency-based Education and Evaluation (CBE) is increasingly the foundation for professional education. The Geriatric Social Work (GSW) Competencies have been aligned with the Council on Social Work Education Educational Policy for Accreditation Standards. Within the HPPAE model, training of over 2,600 graduate students, the competencies actively structure the field education process in the following ways: training of field instructors, early assessment of student skills, to setting yearlong learning goals and on to continued student self-assessment as well as assessment by the field instructor. The types of field practice experiences are guided by the competency goals. Using the GSW Competency Scale II significant ( $p=.001$ ) improvement were found for 50 skills in 5 domains of practice. This evaluation of outcome allows for programs to continuously improve their training based on student outcomes. The implications of using other disciplinary competencies to guide internships and residencies will be discussed.

## SESSION 1170 (SYMPOSIUM)

### RELOCATION OF OLDER ADULTS AND TRANSITIONS

Chair: *N. Castle, University of Pittsburgh, Pittsburgh, Pennsylvania*

Discussant: *K. Thomas, Brown University, Providence, Rhode Island*

Relocation of older adults and transitions between places of care has been a consistent concern of practitioners and policy-makers for several years. Transitions have potential negative outcomes which include mortality and physiological and psychological decline, but may have positive outcomes as older adults move to less restrictive settings. The focus of this symposia is on the transitions of care between and among settings within the long-term care continuum, between the long-term care continuum and acute-care settings, and between the long-term care continuum and the community. The main objective is to gain an understanding of the mechanisms driving transitions, issues surrounding transition, and strategies to ensure successful transition in an effort to improve the quality of care delivered to patients in long-term care settings. Speakers will discuss transitional care, discharge planning, care coordination, case management, continuity of care, referrals, post-discharge follow-up, patient assessment, patient needs, interventions, and evaluation.

### APPLYING CRUCIAL CONVERSATIONAL SKILLS TO CARE TRANSITIONS

J.S. Hahn, *Center for Gerontology, Western Michigan University, Kalamazoo, Michigan*

This session addresses the importance of effective dialogue in care transitions. Conversations about care transitions are key to decision-making and often occur in rushed, high-stress situations. These conditions lead to poor communication and negative results for patients. Increasingly, regulations reward effective care transitions that reduce re-hospitalization and health care waste. However, none of the developing care transition models work well if patients, families and providers do not use effective communication skills. Based on work of Patterson, Grenny, McMillan and Switzler, "crucial conversation" skills will be mapped as applied to care transitions and guidance will be given on additional resources to support effective care communication through these skills. Participants will apply effective dialogue techniques to numerous cases and discuss ways to measure the effectiveness of dialogue. The presenter led survey process design at the Joint Commission, studied nursing home decision-making and culture

change, and led a care transition improvement team at a large health system.

### USE OF HEALTH INFORMATION TECHNOLOGY DURING CARE TRANSITIONS

W.W. Hung<sup>1,2</sup>, B. Morano<sup>1,2</sup>, K. Boockvar<sup>1,2</sup>, 1. *James J Peters VA Medical Center, Bronx, New York*, 2. *Geriatrics, Mount Sinai School of Medicine, New York, New York*

Older patients who transition from acute care are at risk for adverse outcomes. The Bronx RHIO, a regional electronic health information network, provides an opportunity to improve coordination among sites. We piloted a project to deliver a care transitions intervention (CTI) after acute care discharges. Program Information: CTIs were delivered via home visits and telephone calls by a CTI coach, and contained components of education, self-management and empowerment. After discharge from acute care, and for patients discharged to skilled nursing facility for short term rehabilitation, the coach continued to follow the patient until discharge to home to deliver home visits. Use of RHIO included notification for acute events and discharge, and delivery of clinical information. Conclusion: Health information technology has the potential to be used during care transitions across care spectrum. It requires linkage of facilities to the health information network and timely delivery of relevant clinical information.

### RELOCATION OF OLDER ADULTS AND TRANSITIONS

M.S. Anderson<sup>1,2</sup>, D.M. Gentry<sup>2</sup>, 1. *Nursing, Jefferson College of Health Sciences, Roanoke, Virginia*, 2. *Carilion Clinic, Roanoke, Virginia*

The largest health care system in southwestern Va. started a care transitions team after detailed interviews from stakeholders addressing issues of concern with long term care. Based on data addressing some of the details of discharges and readmissions from long term care, several initiatives are ongoing- including revamping the care transitions team, and expansion and growth of our geriatrics team. Educational programs in long term care involving nurse practitioners have grown. The NPs are part of the geriatrics team and are placed in LTC. The manager of the case management department at the hospital participates in the care transition team and has recently worked with the Quality Director to test a tool for readmission risk assessment. Progression of the team's work with outcomes will be shared.

### EASING THE TRANSITION TO SPECIALIZED DEMENTIA CARE: THE LAKEVIEW RANCH BUDDY PROGRAM

J. Berry<sup>1</sup>, R.J. Karasik<sup>2</sup>, 1. *The Dementia Care Foundation, Darwin, Minnesota*, 2. *St. Cloud State University, St. Cloud, Minnesota*

Transitions for persons with dementia are particularly challenging due to diminished cognitive and coping abilities. Ironically, transitional "behaviors" can often lead to additional transitions. To counter this, the Lakeview Ranch Model of Specialized Dementia Care™ developed a resident buddy program which assigns short term 1:1 staffing to each transitioning resident using a consistent, extensively trained staff person. Focusing on the resident's emotional needs and providing a single familiar face for the resident's waking hours during the first 4-10 days helps reduce the resident's fears and allows the creation of a trusting & safe relationship with a familiar person who may also learn more quickly about the resident's likes, dislikes, and needs. The staff buddy also helps promote positive interactions with other residents. Since committing resources to the new resident buddy program 5 years ago, Lakeview Ranch has significantly reduced the new resident transition period from 2-3 months to 7-10 days.

## SESSION 1175 (SYMPOSIUM)

### SYSTEMS ISSUES IN NURSING HOMES: EXPLORING LINKS AMONG NURSE STAFFING, CARE DELIVERY, AND OUTCOMES

Chair: *T.J. Roberts, School of Nursing, University of Wisconsin - Madison, Madison, Wisconsin*

Discussant: *K.S. McGilton, Toronto Rehabilitation Institute, Toronto, Ontario, Canada*

Nursing homes face a number of organizational barriers to providing high quality care. One of the most challenging is setting appropriate staffing levels and implementing evidence-based practices to ensure that the needs of residents are adequately addressed in spite of fiscal constraints. Research has shown inconsistent links between nurse staffing practices and outcomes. Understanding the nature of the relationships between nurse staffing and outcomes and systematic approaches to nurse staffing that may promote high quality is imperative. The presentations in this session will focus on the influence of nurse staffing patterns and practices on care delivery and outcomes in nursing homes. The studies address all levels of nursing staff (nursing assistants, licensed nurses, and nursing management) and their associations with care delivery or staff and resident outcomes. The first presentation reports on a study of consistent assignments for nursing assistants. Results show wide variation in understanding and implementation of the practice, highlighting the need for more rigorous research on the implementation of this practice and its relationship to positive clinical outcomes. The second presentation focuses on a particular clinical condition – development of pressure ulcers – and how nurse staffing practices may present barriers or facilitators to its prevention. The third presentation demonstrates how the ratio of RNs to LPNs influences care assessment and planning processes. The final presentation focuses on staffing practices from the perspective of the Director of Nursing, highlighting the administrative, budgetary, and policy-level complexities associated with ensuring adequate nurse staffing.

### UNDERSTANDING BARRIERS TO SYSTEMATIC IMPLEMENTATION OF CONSISTENT ASSIGNMENTS IN NURSING HOMES

*T.J. Roberts, K. Nolet, B. Bowers, School of Nursing, University of Wisconsin - Madison, Madison, Wisconsin*

The nursing home culture change movement has embraced consistent assignment (CA) of certified nursing assistants to residents, as it is generally believed to increase familiarity between staff and residents, fostering individualized care for residents and enhancing quality of life. While commonly promoted as improving resident outcomes, research on outcomes of CA is inconsistent, hindering systematic implementation of the practice. The purpose of this study was to determine the state of the science on CA, focusing on how CA has been defined and implemented across studies. Additionally, nursing assistant staffing data were collected from 20 nursing homes using CA and analyzed to compare how CA was implemented within and across homes. The literature review and data collection demonstrate wide variation in CA implementation. Results have implications for future research on the impact of CA on resident and staff outcomes.

### THE DIRECTOR OF NURSING AND STAFFING IN NURSING HOMES

*E.O. Siegel<sup>1</sup>, V. Santillan<sup>1</sup>, H.M. Young<sup>1</sup>, M. Leo<sup>2</sup>, 1. Betty Irene Moore School of Nursing at UC Davis, Sacramento, California, 2. Kaiser Permanente – Center for Health Research, Portland, Oregon*

The purpose of this paper is to examine the Director of Nursing's (DON) roles and responsibilities associated with staffing in nursing homes. Data were collected through in-depth, semi-structured telephone interviews with a convenience sample of DONs and other nursing home leaders throughout the U.S. that had knowledge and expertise about

the DON position (n=29). Data were analyzed using microanalysis coding and thematic analysis. The findings highlight the DON's broad scope of roles and responsibilities for staffing and the administrative, budgetary, and policy-level complexities associated with adequately managing staffing resources. DONs respond to staffing challenges in a variety of ways, with some DONs focused on personally covering for staff shortfalls and others focused on enhancing human resource management practices or "making the case" to the executive team for more staffing resources. Policy, practice, and education implications of the findings will be discussed.

### NURSE STAFFING AND PRACTICE PATTERNS IN NURSING HOMES

*C. Mueller<sup>1</sup>, K. Corazzini<sup>2</sup>, R.A. Anderson<sup>2</sup>, 1. Nursing, Univ of MN-School of Nursing, Minneapolis, Minnesota, 2. Duke University, Durham, North Carolina*

While numerous staffing studies have related higher ratios of RNs to nursing staff in nursing homes to improved quality of care, such studies are predominately quantitative studies that do not elucidate the causal mechanisms of the relationships between staffing ratios and outcomes. This study draws upon comparative case study data of Directors of Nursing from 48 nursing homes in North Carolina and Minnesota to describe how higher ratios of RNs to nursing staff affects patterns of nursing practice in nursing homes, specifically how assessment and care planning occur. Results indicate that adequate ratios of RNs provide a critical threshold without which professional nursing assessment and care planning cannot occur. Ultimately, staff mix restricts or enhances access of vulnerable nursing home residents to comprehensive nursing assessment and care planning.

### FACILITATORS AND BARRIERS TO PRESSURE ULCER PREVENTION IN 2 VA COMMUNITY LIVING CENTERS (CLCS)

*M.E. Dellefield<sup>1</sup>, J.L. Magnabosco<sup>2</sup>, A. Kelly<sup>1</sup>, 1. VASDHS, San Diego, California, 2. Center for Implementation Practice and Research Support VAGLAHS, Los Angeles, California*

Prevention of pressure ulcers (PUs) is an important quality indicator. Implementation of preventive practices is difficult to sustain. Purpose of mixed methods study is to describe nursing assistant, licensed vocational nurse, and registered nurse attitudes, beliefs, knowledge, values, and work practices perceived as facilitators/barriers to PU prevention care. 16 nurses were interviewed. 45-60 minute individual interviews with an embedded questionnaire were audio-recorded. Qualitative data analyzed with micro-coding; quantitative data analyzed with descriptive statistics. Findings: quality of human and technical resources impact staff's ability to perform preventive care. Facilitators: wound team structure at facility and unit level; consistent staffing and work practices that promote team work; surveillance/ early detection practices; individual intrinsic staff motivation/belief in preventability of PUs. Barriers: limited supervisory feedback and under-utilization of medical record data. Findings indicate that further study of impact of attitudes, beliefs, knowledge, values and work practices on delivery of PU preventive care is warranted.

## SESSION 1180 (SYMPOSIUM)

### THE ECONOMIC COSTS OF CARE: THE CANADIAN CASE

Chair: *J. Fast, Department of Human Ecology, University of Alberta, Edmonton, Alberta, Canada*

In this symposium we explore the economic consequences that caregivers experience when they care for family members and friends with long term health problems or disabilities. Findings will be framed by two taxonomies of the economic costs of care, one for caregiver costs and one for employer costs, developed by symposium presenters. Duncan et al will describe the sources, magnitude and main predictors of

care-related out-of-pocket expenses and their relationship to other (economic and non-economic) consequences of care. Fast and colleagues will explore the relationship between the incidence, timing and duration of care responsibilities across the life course for caregivers' employment. Lero et al will describe how Canadian employers are responding to a rising number of employees with care responsibilities in their workplaces. Taken together these presentations provide a holistic picture of the threats to the economic security of Canadian caregivers, and their employers, and measures that may act to mitigate these threats.

#### **CAREGIVING ACROSS THE LIFE COURSE AND EMPLOYMENT PROSPECTS OF CANADIAN CAREGIVERS**

J. Fast<sup>1</sup>, D. Dosman<sup>3,1</sup>, D. Lero<sup>2</sup>, 1. *Department of Human Ecology, University of Alberta, Edmonton, Alberta, Canada*, 2. *University of Guelph, Guelph, Ontario, Canada*, 3. *Statistics Canada, Ottawa, Ontario, Canada*

This paper Statistics Canada General Social Survey (2007) data to explore the implications of the incidence, timing and duration of episodes of caregiving across the life course for the labour force behavior of Canadian caregivers. We find that 62% of women and 51% of men reported having provided care to a family member or friend with a long term health problem or disability at some time since they were 15 years of age, averaging 2 such episodes. More episodes of care, caring for more years in total, and providing more hours of care during the past 12 months, all significantly increased the odds that current caregivers would experience employment consequences in the present, including reducing hours of work, missing full days of work, and being out of the work force entirely. These effects were more likely to be experienced by women than men. Policy and practice implications are discussed.

#### **THE AVAILABILITY OF WORKPLACE PROGRAMS, POLICIES & PRACTICES TO SUPPORT EMPLOYED CAREGIVERS IN CANADA**

D. Lero<sup>1</sup>, N. Spinks<sup>2</sup>, J. Fast<sup>3</sup>, J. de Guzman<sup>1</sup>, 1. *Centre for Families, Work and Well-Being, University of Guelph, Guelph, Ontario, Canada*, 2. *Vanier Institute of the Family, Ottawa, Ontario, Canada*, 3. *University of Alberta, Edmonton, Alberta, Canada*

A growing proportion of employees are providing care to a family member with a long-term health condition or physical limitation. Results are presented from a comprehensive on-line survey of 280 Canadian workplaces designed to assess the extent to which employers currently have formal programs, policies or practices and/or informal supports to enable employed caregivers to better manage their work and caregiving responsibilities and reduce avoidable costs to employers. We find that many workplaces offer flexible work schedules and periods of unpaid leave to employees, but most have not consciously considered the unique issues faced by employed caregivers, their needs for information and support, or the importance of training managers to respond effectively. Comparisons are drawn across workplaces varying by sector, firm size and unionization status, and between supports provided to parents of young children and employed caregivers.

#### **CARE-RELATED OUT-OF-POCKET SPENDING: PREVALENCE AND CONSEQUENCES FOR CANADIAN CAREGIVERS**

K.A. Duncan<sup>1</sup>, S. Shoostari<sup>1</sup>, K. Roger<sup>1</sup>, J. Fast<sup>2</sup>, 1. *Family Social Sciences, University of Manitoba, Winnipeg, Manitoba, Canada*, 2. *University of Alberta, Edmonton, Alberta, Canada*

Although care-related out-of-pocket spending is an important aspect of caregiving, it is not well understood in the Canadian context. We use data from Statistics Canada's 2007 General Social Survey to examine the prevalence, correlates and social and economic consequences of out-of-pocket expenses for caregivers as the result of unpaid caregiving to family members and friends. We find that 35% of family/friend caregivers aged 45 and older reported out-of-pocket expenses. The major-

ity of these caregivers spent \$6,000 or less per year, but 3% reported spending more than \$24,000 per year out-of-pocket. Significant predictors of these expenditures include characteristics of the caregiver, the care receiver, the care dyad and other factors. We conclude with a discussion of the implications of the results, including the social inclusion/exclusion of caregivers and care receivers.

### **SESSION 1185 (PAPER)**

#### **ASSISTED LIVING QUALITY OF CARE RESIDENT SATISFACTION AND ALZHEIMERS CARE OPTIONS**

#### **AN INTERNATIONAL COMPARISON OF THE OHIO DEPARTMENT OF AGING – RESIDENT SATISFACTION SURVEY: APPLICABILITY IN A U.S. AND CANADIAN SAMPLE**

H.A. Cooke<sup>1</sup>, T. Yamashita<sup>2</sup>, J. Brown<sup>2</sup>, J. Straker<sup>2</sup>, S. Baiton-Wilkinson<sup>3</sup>, 1. *University of Victoria, Victoria, British Columbia, Canada*, 2. *Miami University, Oxford, Ohio*, 3. *Fraser Health Authority, Vancouver, British Columbia, Canada*

The assessment of resident satisfaction within long-term care is an integral measure of care quality that ensures the reflection of residents' voice within the quality improvement process and the appropriateness and adequacy of care and services provided. To date, the majority of resident satisfaction surveys available for use in assisted living settings have been developed in the U.S. Testing and reporting of their psychometric properties remains limited and sporadic. The Ohio Department of Aging – Resident Satisfaction Survey (ODA-RSS), which consists of 42 items across 10 domains (e.g., Care and Services, Meals and Dining, Employee Relations), has been in use in Ohio since 2007. However, its applicability for use in assisted living settings outside of the U.S. is unknown. Drawing on data collected in 2009 from 9,739 residential care facility (RCF) residents in Ohio, and in 2010 from 938 assisted-living residents in British Columbia (B.C.) Canada, confirmatory factor analyses were conducted to assess the instrument's psychometric properties within the two samples. While the ODA-RSS appears well-suited for assessing resident satisfaction in Ohio RCFs, it is less so in B.C. assisted living settings. Adequate reliability and validity was observed for all eight measurable instrument domains in the Ohio sample; however, such was the case for only four domains (Care and Services, Employee Relations, Employee Responsiveness and Communications) in the B.C. sample. Instrument applicability is discussed in the context of the long-term care milieu (e.g., policy implementation, resident characteristics, facility infrastructure) in each study location.

#### **COMPARATIVE ANALYSIS OF ALZHEIMER'S CARE OPTIONS: SYSTEMS AND HEALTH POLICIES WITHIN THE UNITED STATES AND SPAIN**

B. Kite, S. Anantha, *School of Public Health, UT Health Science Center at Houston, Houston, Texas*

Alzheimer's prevalence within the United States and Spain is increasing due to technological advances in diagnostic techniques and an overall increase in life expectancy. This rise in prevalence necessitates an overhaul of patient care facilities as well as private and governmental support concerning long-term care. Through a comparative analysis of available Alzheimer's long-term care within the US and Spain, we will identify specific private and public options available and the influence that current relevant policies have upon their healthcare systems. Analyzing the various determinants of Alzheimer's long term care such as: the role of universal and private healthcare, the powers and responsibilities of the national and local forms of government, the involvement of NGOs and private companies will reveal what further developments in health policy could help close gaps of access and service. Evaluation of specific facility options such as day care, palliative care, respite care, hospice care, independent living, government and NGO centers which

are available for patients with differing stages of Alzheimer's will contribute to formulating health policies aimed towards improved efficacy. Although both the US and Spain are classified as industrialized nations, their health care policies and standards are very different. Examining which solution systems prove effective when provided for the aging population afflicted with Alzheimer's in each respective country and observing their responses to the challenges will help strengthen the health system structure and functional differences.

### **USING ORAL HISTORY METHODS TO PROMOTE PERSON-CENTERED CARE IN ASSISTED LIVING**

D. Gammonley, C. Lester, L. Duran, D. Fleishman, G. Cravero, *School of Social Work, University of Central Florida, Orlando, Florida*

Purpose: A demonstration project evaluated impacts on staff of an oral history project using service learning in an assisted-living facility. Results identified factors contributing to resident and staff engagement, staff knowledge and use of person-centered care, and strategies for gathering oral histories with student service-learning teams. Design and Methods: Fifty staff completed a pre-test survey assessing perceived knowledge of residents and use of person-centered care practices using two standardized instruments: (1) the IC-KNOW scale (Chappell, Reid & Gish, 2007) assesses perceptions of how well they know the residents they care for and; (2) the Person-Centered Care Assessment Tool (Edvardsson, Fetherstonhaugh, Nay & Gibson, 2009) assesses the extent of personalizing care. Following the oral history project, staff was invited to view and discuss an edited 15 minute compilation video at a convenient time during their workday. Nonparametric analyses were used to evaluate impacts. Results: Staff from across the spectrum of service providers within this long established not-for-profit facility participated. At baseline they reported high levels of knowledge and person-centered care, 56% expressed enthusiasm for viewing a video. Among staff completing the post-test (N=37) 73% viewed the video. Staff members identified benefits for providing person-centered care and indicated it enhanced their knowledge of residents. Implications: Individualizing care using videotaped oral histories is a promising strategy to know each person and promote staff-resident relationships. Staff members are willing to take the time to view oral history videos and see potential benefits for their ability to deliver care. Future research should consider impacts on residents.

### **THE INFLUENCE OF FUNCTIONAL INDEPENDENCE ON SATISFACTION AMONG ASSISTED LIVING RESIDENTS**

K. Abrahamson<sup>1</sup>, K. Morgan<sup>2</sup>, B.R. Fulton<sup>2</sup>, 1. *Western Kentucky University, Bowling Green, Kentucky*, 2. *Press Ganey Associates, South Bend, Indiana*

Assisted living is a prevalent and expanding form of long term care delivery. In comparison to nursing homes the assisted living marketplace remains relatively unregulated and includes a wide variety of services, options, and caregiver skill levels. Admission criteria regarding resident level of function varies between facilities and states. The purpose of our analysis was to assess the influence of functional ability in terms of ADLs (bathing, dressing, eating, toileting, mobility) and IADLs (house cleaning, shopping, meal preparation, medication management, transportation, and financial assistance) on satisfaction with the available activities, caregivers, facility management, and overall facility satisfaction among a large, national sample of assisted living residents. We hypothesized that more functionally independent residents would express higher levels of satisfaction. Data came from the 2008 Press Ganey Assisted Living Survey (n=1246) and were analyzed through structural equation modeling. We found that satisfaction with caregivers, activities, and self-rated health increased satisfaction with management and the facility overall; longer length of stay predicted lower overall satisfaction. Unexpectedly, IADL independence directly predicted lower levels of satisfaction with activities, caregivers, and the facility overall. Independence with ADLs directly predicted higher facility satisfaction,

but had no significant influence on satisfaction with activities, caregivers, or management. Results indicated that the relationship between functional independence and resident satisfaction with assisted living is complex, that there is a differing influence of IADL versus ADL assistance on the resident experience, and that improved service offerings specifically aimed toward instrumental needs may positively influence satisfaction scores within assisted living facilities.

### **AN EXAMINATION OF RESIDENT TRANSITIONS TO ASSISTED LIVING USING THE THEORY OF SELECTIVE OPTIMIZATION WITH COMPENSATION**

N.L. Fields, *The Ohio State University, Columbus, Ohio*

Assisted living (AL) is a rapidly growing industry for providing care and support to older adults and their caregivers. The transition to AL is of growing interest as research suggests that residential relocation is an increasingly common experience among older adults. Based on the results of a written survey administered to a state wide, geographically representative purposive sample of Medicaid Assisted Living Waiver providers (N = 28), this paper provides an analysis using the theory of Selective Optimization with Compensation (SOC). Through the theoretical lens of SOC, the findings of this pilot study suggest that pre-admission education may contribute to resident adjustment to AL. Study findings also suggest that there is a clear disconnect between what AL providers believe is important for resident transitions and what is actually happening in their facilities. Pre-admission education allows prospective AL residents to learn about what the AL does and does not provide. Furthermore, pre-admission education may provide opportunities for AL residents to better utilize selective strategies (e.g. choice of social activities) to compensate for changes in independence as well as optimize supportive services (e.g. assistance with ADLs) that are provided in AL. Potential directions for improving resident transitions to AL are presented through an examination of the perspective of AL administrators and the role of pre-admission resident education in AL. The application of SOC within the context of resident transitions may also have implications for AL regulation as well as policies related to the admission and discharge of AL residents.

### **SESSION 1190 (PAPER)**

#### **TRANSPORTATION AND MOBILITY; AVOIDING WITHDRAWAL AND ISOLATION**

##### **INDIVIDUAL READINESS AND UTILIZATION OF A COMMUNITY MOBILITY RESOURCE**

M. Berg-Weger<sup>1</sup>, T.M. Meuser<sup>2</sup>, 1. *School of Social Work, Saint Louis University, St. Louis, Missouri*, 2. *University of Missouri-St. Louis, St. Louis, Missouri*

As our society strives to better serve those members who are living longer and/or living with a progressive disability, practitioners and researchers need assessment tools and practice strategies to support optimal independence and quality of life. Mobility is a key factor in the individual's ability to maintain autonomy and well-being. While tools exist to evaluate functional and instrumental aspects of mobility in older adults, most existing measures are less effective for understanding the emotional and motivational factors on an individual, personal level or the preparation for mobility loss and change. This presentation describes a community-based, clinical application of a new person-centered measurement tool, the Assessment of Readiness for Mobility Transition (ARMT) (Meuser, Berg-Weger, Chibnall, Harmon, King and Yakimo, 2011). Three objectives were pursued in partnership with an affiliate office of ITNAmerica: (1) Quantify readiness via the ARMT in new ITN members and track prospective service utilization; (2) Determine how ARMT scores may predict service utilization patterns; and (3) Examine qualitative indicators of the readiness construct and service utilization on a case level. Face-to-face and telephone interviews were

conducted with 50 new ITN members, ages 60-90. ARMT scores for one third (33%) of respondents were in the low readiness/high risk range. Preliminary utilization data indicated a more haphazard pattern of adoption and utilization of ITN services for low readiness participants (i.e., in comparison to higher readiness respondents). Detailed findings will be presented and discussed with respect to mobility transition assessment and counseling interventions.

### **AN EVALUATION OF OREGON'S WHEELCHAIR USER ONLY HANDICAP PARKING PROGRAM**

J. Lottes, *Portland State University, Portland, Oregon*

Many seniors and people with mobility impairments depend on the availability of handicap parking. Over the past decades, the number of handicap parking permits has far outgrown the number of dedicated parking spots, and many qualified individuals report having trouble finding parking. In the State of Oregon, 6% of drivers have obtained handicap parking placards, but only 1.8% of parking spots are designated as handicap parking. This mismatch between demand and supply is of grave concern to persons whose mobility impairments are severe enough to confine them to wheelchairs; these individuals cannot resort to a regular parking spot when all handicap parking spots are taken. To improve access to handicap parking for the most severely disabled, in 2010 Oregon began reserving some specifically designated handicap parking spots for wheelchair users only. This study evaluates these changes, which represent the first "tiered" handicap parking system in the nation. The study includes analysis of DMV data on placard issuance (regular and wheelchair) and parking violations, surveys of holders of both wheelchair user and regular placards, and observations of parking behavior. Results show that the wheelchair user parking system holds promise in prioritizing parking for the most severely disabled, but there are issues with implementation, including poor signage and driver education. In addition, the program does little to curb handicap parking abuse, and holders of regular permits, including many seniors, who do not use a wheelchair fear being deprived from parking privileges. Policy implications and recommendations for practice are discussed.

### **INFORMAL CAREGIVERS OF OLDER ADULTS: PREDICTORS OF CHANGES IN LIFE, HEALTH, AND FINANCES**

J.M. Vivoda<sup>1,2</sup>, D.W. Eby<sup>2</sup>, L.J. Molnar<sup>2</sup>, L. Kostyniuk<sup>2</sup>, 1. *Health Behavior and Health Education, University of Michigan, Ann Arbor, Michigan*, 2. *University of Michigan Transportation Research Institute, Ann Arbor, Michigan*

The functional limitations associated with chronic illnesses often require the aid of an informal caregiver. Previous research has found that caregiving is associated with increased isolation, physical and emotional stress, and financial hardship. The purpose of this study was to examine the predictors of overall changes in life, health, and finances, among informal caregivers of older adults. People who had provided transportation or other unpaid care to at least one older adult during the past 12 months were interviewed (N=300). Providing transportation was identified as one of the most common tasks performed by informal caregivers. Changes in life related to caregiving (both positive and negative) were assessed using questions covering a range of possible areas (including financial, emotional, and relational factors); caregiver health was also self-reported. Significant factors associated with an overall change in life related to caregiving included the number of ADLs with which one assists, frequency of providing assistance, number of people one cares for, recipient's driving status, and several caregiver demographic variables. Caregiver health was associated with number of ADLs, frequency of providing assistance, work status, and demographic variables. Finally, financial changes were associated with number of ADLs, frequency of providing assistance, providing transportation, recipient's driving status, proximity of the recipient, and caregiver demographics. Several other transportation-related variables were examined,

but were not statistically significant. Identifying transportation assistance as a key caregiving activity, and understanding how transportation variables impact these outcomes, has implications for policy and practice in both the transportation and health fields.

### **IMPACT OF LIMITATIONS IN DRIVING AND FUNCTIONAL STATUS ON DEPRESSIVE SYMPTOMS IN OLDER ADULTS**

A.C. Harmon, *University of Michigan School of Public Health, Ann Arbor, Michigan*

**PURPOSE:** Driving represents a unique aspect of older adults' ability to live independently. We examined the effects of driving limitations on older adults' depressive symptomatology, above and beyond that of Instrumental Activities of Daily Living (IADL) limitations. The interaction between these two predictors was also studied. Results will help professionals identify critical intervention points to improve older adults' mental health outcomes as challenges to independence occur. **METHODS:** Data from the 2008 Health and Retirement Study (HRS) were analyzed to assess how self-reported limitations in driving (0-4; 0=no limitations; 1=driver with geographic limitations; 2=driver has not driven in past 30 days; 3=driver with no access to car; 4=non-driver) and difficulties with IADLs (0=none, 1=any) affect older adults' (65+) depressive symptoms, as measured by the Center for Epidemiological Studies Depression Scale (CES-D). CES-D scores were regressed on driving and IADL limitations. Interactions between five levels of driving limitations and IADL functioning were also examined to identify groups at risk for more depressive symptoms. **RESULTS:** Individuals with any IADL limitations had significantly more depressive symptoms than their counterparts with no IADL limitations ( $b=1.412$ ,  $p<0.001$ ). Driving limitations also directly affected symptoms, with moderation by IADL status. Older adults with no driving or IADL limitations had significantly lower CES-D scores ( $p\leq 0.050$ ) than all other combinations. Significant interactions were also found by driving limitations within and between IADL (none/any) groups. **IMPLICATIONS:** Findings direct attention to the need to include driving limitations in addition to, and in conjunction with, IADL limitations when assessing older adults' mental health.

### **A LIVABILITY INDEX FOR AGE-FRIENDLY COMMUNITIES**

J. Lynott, R. Harrell, *AARP Public Policy Institute, Washington, District of Columbia*

This session will share a framework for measuring localized community-livability that is sensitive to the needs of older adults. This framework for developing a livability index integrates personal preferences (what people want as reported in surveys and focus groups), objective measures (what the community looks like as measured through national datasets), and policy interventions (efforts underway to improve the community). This index will be a web-based tool that allows the user to type in a zip code to obtain a livability score for the community. The score measures the degree to which one's community offers a high quality of life and fosters continued independence among older residents based on a set of metrics that represent the critical attributes of a livable community. Attributes were identified by merging the common variables of 19 surveys conducted by AARP between 2003 and 2012 into a single dataset of more than 15,000 respondents. Attributes include safe and secure environments, proximity and access to health care, housing variety (affordability and type), proximity to retail, reliable public transportation, walkability, and recreational opportunities. This tool is being designed with a simple user interface but with a robust theoretical foundation. As such, it is intended to draw national attention to livability issues specific to the wants and needs of older adults. Planners and policy makers will better understand how they can address the needs of older adults through more informed infrastructure and service planning. It will also serve to educate more casual users.

## VASCULATURE, CNS AND AGING MECHANISMS

## CNS CHANGES IN INFLAMMATION AND ER STRESS AFTER MILD HEAD INJURY IN YOUNG AND OLD MICE

K. Glenn<sup>1,2</sup>, G. Dankle<sup>1</sup>, H. Wen<sup>1</sup>, N. Bode<sup>1</sup>, A. Chan<sup>1</sup>, R. Jorge<sup>1,2</sup>, P. Gonzalez-Alegre<sup>1</sup>, 1. *Internal Medicine, University of Iowa, Iowa City, Iowa*, 2. *VA Medical Center, Iowa City, Iowa*

Traumatic brain injury (TBI) is a leading cause of morbidity and mortality in the US. Among TBI patients, older age is an independent predictor of worse outcome, and trauma, including TBI, is the 7th leading cause of death in those over 65 years of age. In these elderly TBI patients, a simple fall from a standing position is the method of injury in 40% of the cases. Though there are many factors responsible for the profound differences in outcome to simple falls in young and elderly patients, we sought to characterize differences at the cellular level. To do this, we developed a model of mild TBI using fluid percussion or sham injury in young and old female mice. To examine possible age-related differences to neuronal injury we examined markers of inflammation, apoptosis, and ER stress in protein samples from mouse cerebellum, cortex, and hippocampus. As expected, we found a vigorous inflammatory response to injury in both young and old mice. Additionally, we found elevation in some ER stress markers such as Protein Disulfide Isomerase, and Binding Immunoglobulin Protein after injury. Interestingly, while injury resulted in a dramatic increase in a marker of apoptosis, C/EBP Homologous Protein, the pattern of increase was significantly different between the young and old animals. In conclusion, we have found significant neuronal responses to mild TBI, and the first clues of some age-related differences, suggesting that further refinement of this model will allow us to explore the age-related differences in outcome to mild TBI.

## PTX3-A NOVEL REGULATOR IN EFFEROCYTOSIS IN ADVANCED ATHEROSCLEROSIS

B. Cheng, T. Guo, *Department of Geriatrics, Union Hospital, Tongji Medical College, Huazhong University of Science and Technology, Wuhan, China*

Apoptotic Cells Are Removed by Neighboring Phagocytes (Efferocytosis), Which Is An Important Event In Advanced Atherosclerosis. Recent Reports Have Elucidated Some Key Molecular Regulators In Efferocytosis Including Complement C1q, MFGE8, and MERTK. The Long Pentraxin 3 (PTX3) Is An Important Molecule Involved In Apoptotic Cell Clearance In the Immune Response. The Papers Associated With PTX3 In Atherosclerosis Were Published Explosively In This Years. Immunohistochemical Study of Human Atherosclerotic Lesions Indicated That PTX3 Is Expressed In Advanced Atherosclerotic Lesions (Macrophages, Mainly Foam Cells). PTX3 Is Likely More Specific Than HsCRP as An Indicator of Coronary Plaque Vulnerability. Therefore, We Expect PTX3 to Be A New Molecule for Efferocytosis In Advanced Atherosclerosis. Recently We Modeled Efferocytosis In Advanced Plaques. We Observed That PTX3 Was Mainly Located at the Membrane of Late Apoptotic Macrophages. The Anti-PTX3 Monoclonal Ab Inhibited the Engulfment of Late Apoptotic Macrophages by Phagocytes In A Dose-Dependent Manner. These Results Suggest That PTX3 Located at the Membrane of Late Apoptotic Macrophages Mediates Their Phagocytosis by Phagocytes In A Cell Model of Advanced Atherosclerosis. But It Is Unclear the Effect of PTX3 In An Animal Model of Advanced Atherosclerosis. Therefore, Designing An Atherosclerotic Animal Model and Observing the Effect of PTX3 On Coronary Plaque Vulnerability Require Further Investigation

## NICORANDIL REGULATING TRX AND TXNIP INFLUENCED EXPRESSION OF VCAM-1 AND NOS

B. Qi, *Department of Geriatrics, Union Hospital, Tongji Medical College, Huazhong University of Science and Technology, Wuhan, China*

Background: Thioredoxin (Trx) Is A 12-KDa Protein With Redox-Active Dithiol In the Active Site Cys-Gly-Pro-Cys- And Constitutes A Major Thiol Reducing System, And It Is Widely Conserved In Almost All Species From Bacteria To Higher Eukaryotes. Thioredoxin Interacting Protein, the Endogenous Inhibitor of Thioredoxin, Inhibits Thioredoxin Antioxidative Function By Binding To Its Redox-active Cysteine Residues. We Investigated the Hypothesis That Treated With KATP Sensitive Potassium Channel Opener Nicorandil Causes Regulating of Trx And Txnip, And Then Influence Expression of Inflammatory Markers VCAM-1 And NOS. Methods: SD Rats With Intraperitoneal Injection of Streptozotocin (STZ) Induced Diabetes. Rats With Fasting Blood Glucose 16.7mmol/L After 10 Days of STZ Injection Were Divided Into Two Groups, Controlling With normal SD Rats Without STZ Injection. One Group Was Used As The Diabetic Control And Another Treated By Gavage Feeding With Nicorandil 3mg/kg.d. After 6 Weeks, Detecting Trx Protein Expression In Carotid artery By Immunohistochemistry, And Trx mRNA Levels By Reverse Transcriptionpolymerase Chain reaction (RT-PCR). Assay Expression Levels of Txnip mRNA, VCAM-1 mRNA And NOS mRNA By Reverse Transcriptionpolymerase Chain Reaction (RT-PCR) Too. Results: Trx Protein Expression In Three Group Carotid Artery. Controlling With Diabetic Control Group, Nicorandil Can Upregulated the Expression of Trx mRNA And Then Down-regulated Expression of Txnip mRNA. But Controlling With Normal Group, the Expression of Trx mRNA In Other Two Groups Are Decreased. The Levels of VCAM-1 mRNA Decreased In Nicorandil Treated Group, Levels of NOS mRNA Increased In Nicorandil Treated Group, Controlling With Diabetic Group. Conclusion: The Expression of Trx Is Decreased In STZ-Induced Diabetic Rats And Txnip Expression Is Increased In STZ-Induced Diabetic Rats. Nicorandil Could Upregulated Trx Expression And Down-Regulated Txnip Expression In STZ-Induced Diabetes Rats. Then Decrease Levels of VCAM-1 And Increase Levels of NOS. Thus Protect Early Vascular Disease In Diabetes.

## THE RECEPTOR FOR ADVANCED GLYCATION ENDPRODUCTS (RAGE) REGULATES ATHEROSCLEROSIS IN AGING

G. Daffu, X. Shen, R. Rosario, R. Ramasamy, A. Schmidt, *Medicine, New York University, New York, New York*

Atherosclerosis is a leading cause of morbidity and mortality in the Western world. With advanced age, the incidence of atherosclerosis is higher and severity is more pronounced. Advanced glycation end-products (AGEs), the nonenzymatic modification of proteins by glucose, have been shown to accumulate in aging tissues. AGEs elicit a wide range of cell-mediated responses leading to vascular dysfunction. Studies have demonstrated that mice with a deletion of the Receptor for Advanced Glycation Endproducts (RAGE) demonstrate significantly reduced atherosclerosis in the non-diabetic and diabetic states. Here, we demonstrate that aging significantly decreases cholesterol efflux to ApoA1 and HDL in WT C57BL/6 mice. We show that young and old RAGE null mice have significantly higher cholesterol efflux to HDL compared to young and old WT mice respectively, with young RAGE null mice demonstrating superior cholesterol efflux. mRNA expression levels for cholesterol transporters ABCA1 and ABCG1 in mouse bone marrow-derived macrophages (BMDMs) correspond with efflux findings. Both ABCA1 and ABCG1 mRNA levels in BMDMs are higher in young RAGE null when compared to young WT or old RAGE null mice. These expression levels are also significantly higher in old RAGE null when compared to old WT. Furthermore, ABCA1 protein levels are higher in young WT mouse BMDMs, whereas, ABCG1 protein levels are not impacted by aging in mouse BMDMs. Taken together, these

findings suggest that deletion of RAGE facilitates cholesterol efflux and that RAGE-blocking therapeutics may alleviate atherosclerosis development in aging.

**EFFECTS OF AGING AND DIABETES ON ENDOTHELIAL SENEESCENCE: THE ROLE OF NITRIC OXIDE SYNTHASE**  
S.C. Rogers<sup>1</sup>, X. Zhang<sup>1,2</sup>, G. Azhar<sup>1,2</sup>, S. Luo<sup>1,2</sup>, J.Y. Wei<sup>1,2</sup>, *1. Geriatrics, University of Arkansas for Medical Sciences, Little Rock, Arkansas, 2. Central Arkansas Veterans Healthcare System, Little Rock, Arkansas*

**Introduction:** Aging and diabetes are known risk factors for cardiovascular disease. Hyperglycemia causes pathophysiology resembling accelerated aging, but mechanisms linking diabetes and aging to cardiovascular disease are incomplete. Cellular senescence occurs with advancing age and may contribute to loss of endothelial integrity and vascular complications. Nitric oxide (NO) produced by nitric oxide synthase (NOS) supports vascular function and may slow endothelial senescence. However, loss of NO bioavailability is implicated in cardiovascular pathologies and senescence-associated alterations in NOS expression may enhance vascular complications. **Methods/Results:** We used a HUVEC in-vitro model to investigate effects of hyperglycemia on endothelial cell senescence. Cells at passage 2 (population doubling 6) and passage 15 (population doubling 35) were used as “early” and “late” cells, respectively. We also analyzed potential regulatory effects of miRNA and transcription factors on NOS associated with hyperglycemia in cellular senescence. After 48-hour hyperglycemia exposure, early passage HUVECs showed slightly increased cell senescence compared to that of normal glucose control. High glucose exposure in late passage cells resulted in significantly greater cell senescence compared to both early and late passage controls. **Discussion:** The results indicate that early passage endothelial cells respond better to hyperglycemic stress, presumably through more efficient NO function, as compared to late passage HUVECs. The reduction in NO bioavailability may, in part, be attributed to altered regulation of NOS genes by SRF and/or miRNAs -21, -33a or -199a. These observations will help identify new targets for preventive therapy in elderly with insulin resistance, peripheral vascular disease, and/or diabetes.

### **SUBCLINICAL THYROID DYSFUNCTION AND COGNITIVE DECLINE IN OLD AGE: RESULTS FROM THE PROSPER STUDY**

L. Wijsman<sup>1</sup>, A.J. de Craen<sup>1</sup>, S. Trompet<sup>1</sup>, J. Gussekloo<sup>1</sup>, D.J. Stott<sup>4</sup>, N. Rodondi<sup>2</sup>, R. Westendorp<sup>1</sup>, S. Mooijaart<sup>1,3</sup>, *1. Gerontology & Geriatrics, Leiden University Medical Center, Leiden, Netherlands, 2. University of Bern, Bern, Switzerland, 3. Institute for Evidence-Based Medicine in Old Age, Leiden, Netherlands, 4. University of Glasgow, Glasgow, United Kingdom*

**Background:** Subclinical thyroid dysfunction has been implicated as a risk factor for cognitive decline in old age, but results are inconsistent. We investigated the association between subclinical thyroid dysfunction and cognitive decline in the PROspective Study of Pravastatin in the Elderly at Risk (PROSPER). **Methods:** Prospective longitudinal study of men and women aged 70-82 years with pre-existing vascular disease or more than one risk factor to develop this condition (N=5,494). Participants taking antithyroid medications and/or amiodarone were excluded. Thyroid function was measured at baseline: subclinical hyper- and hypothyroidism were defined as thyroid stimulating hormones (TSH) <0.45 mU/L or > 4.50 mU/L respectively. Cognitive performance was tested at baseline and at four subsequent time points during a mean follow-up of 3 years, using five neuropsychological performance tests. **Results:** Subclinical hyperthyroidism and hypothyroidism were found in 119 (2.2%) and 427 (7.8%) participants, respectively. We found no consistent association of subclinical hyper- or hypothyroidism with altered cognitive performance compared to euthyroid participants on the individual cognitive tests. Similarly, there

was no association with rate of cognitive decline during follow-up. **Conclusion:** We found no consistent evidence that subclinical hyper- or hypothyroidism contribute to cognitive impairment or decline in old age.

### **AGE-ASSOCIATED PRO-INFLAMMATORY SECRETORY PHENOTYPE IN VASCULAR SMOOTH MUSCLE CELLS FROM THE NON-HUMAN PRIMATE M. MULATTA: REVERSAL BY RESVERATROL TREATMENT**

A. Csiszar<sup>1</sup>, D. Sosnowska<sup>1</sup>, E.G. Lakatta<sup>2</sup>, W.E. Sonntag<sup>1</sup>, Z. Ungvari<sup>1</sup>, M. Wang<sup>2</sup>, *1. Reynolds Oklahoma Center on Aging, Department of Geriatric Medicine, University of Oklahoma Health Sciences Center, Oklahoma City, Oklahoma, 2. Laboratory of Cardiovascular Science, Gerontology Research Center, NIA, NIH, Baltimore, Maryland*

There is increasing evidence that age-associated chronic low-grade inflammation promotes the development of both large vessel disease (myocardial infarction, stroke, peripheral arterial disease) and small vessel pathologies (including vascular cognitive impairment) in older persons. However, the source of age-related chronic vascular inflammation remains unclear. To test the hypothesis that cell-autonomous mechanisms contribute to the pro-inflammatory changes in vascular phenotype that accompanies advancing age, we analyzed the cytokine secretion profile of primary vascular smooth muscle cells (VSMCs) derived from young (~13 year old) and aged (~21 year old) Macaca mulatta. Aged VSMCs cultured in the absence of systemic factors exhibited significantly increased secretion of IL-1 $\alpha$ , MCP-1 and TNF $\alpha$  compared to young control cells. Secretion of IL-6 also tended to increase in aged VSMCs. This age-associated pro-inflammatory shift in the cellular secretory phenotype was associated with an increased mitochondrial O<sub>2</sub>- production and NF- $\kappa$ B activation. Treatment of aged VSMCs with a physiologically relevant concentration of resveratrol (1  $\mu$ M) exerted significant anti-inflammatory effects, reversing aging-induced alterations in the cellular cytokine secretion profile and inhibiting NF- $\kappa$ B. Resveratrol also attenuated mitochondrial O<sub>2</sub>- production and up-regulated the transcriptional activity of Nrf2 in aged VSMCs. Thus, in non-human primates cell-autonomous activation of NF- $\kappa$ B and expression of an inflammatory secretome likely contribute to vascular inflammation in aging. Resveratrol treatment prevents the pro-inflammatory properties of the aged VSMC secretome, an effect that likely contributes to the demonstrated vasoprotective action of resveratrol in animal models of aging.

### **CIRCULATING FACTORS INDUCED BY CALORIC RESTRICTION IN THE NON-HUMAN PRIMATE MACACA MULATTA ACTIVATE ANGIOGENIC PROCESSES IN ENDOTHELIAL CELLS**

A. Csiszar<sup>1</sup>, D. Sosnowska<sup>1</sup>, Z. Tucek<sup>1</sup>, P. Toth<sup>1</sup>, R. Colman<sup>2</sup>, R. Weindruch<sup>3,4</sup>, R. Anderson<sup>3,4</sup>, Z. Ungvari<sup>1</sup>, *1. Reynolds Oklahoma Center on Aging, Department of Geriatric Medicine, University of Oklahoma Health Sciences Center, Oklahoma City, Oklahoma, 2. Wisconsin National Primate Research Center, University of Wisconsin, Madison, Wisconsin, 3. Department of Medicine, School of Medicine and Public Health, University of Wisconsin, Madison, Wisconsin, 4. Geriatric Research, Education and Clinical Center, William S. Middleton Memorial Veterans Hospital, University of Wisconsin, Madison, Wisconsin*

Moderate caloric restriction (CR) without malnutrition increases healthspan in virtually every species studied, including nonhuman primates. In mice, CR exerts significant microvascular protective effects increasing microvascular density in the heart and the brain, which likely contribute to increased tolerance to ischemia, improved cardiac performance and cognitive function. Yet, the underlying mechanisms by which CR confer microvascular protection remain elusive. To test the hypothesis that circulating factors triggered by CR regulate endothelial angiogenic capacity, we treated cultured human endothelial cells with

sera derived from *Macaca mulatta* on long-term (x years) CR. Cells treated with sera derived from ad libitum fed control monkeys served as controls. We found that factors present in CR sera increase endothelial NO production, up-regulate VEGF signaling and stimulate angiogenic processes, including endothelial cell proliferation and formation of capillary-like structures. Treatment with CR sera also tended to increase cellular migration (measured by a wound-healing assay using electric cell-substrate impedance sensing [ECIS] technology) and adhesion to collagen. Collectively, we find that circulating factors induced by CR promote endothelial angiogenic processes, suggesting that increased angiogenesis may be a potential mechanism by which CR improves cardiac function and prevents vascular cognitive impairment.

#### **FUNCTIONAL GENOMICS ANALYSIS OF THE HIPPOCAMPAL TRANSCRIPTOME PROVIDES INSIGHT INTO MECHANISMS OF CNS AGING AND COGNITIVE DECLINE**

W.M. Freeman<sup>1</sup>, H. VanGuilder Starkey<sup>1</sup>, G. Bixler<sup>1</sup>, J.A. Farley<sup>2</sup>, W.E. Sonntag<sup>2</sup>, *1. Pharmacology, Penn State College of Medicine, Hershey, Pennsylvania, 2. Reynolds Oklahoma Center on Aging, University of Oklahoma Health Sciences Center, Oklahoma City, Oklahoma*

In both humans and animal model organisms, advanced aging is accompanied by a variety of CNS changes including synapse loss, glial activation, and metabolic dysfunction. Deficits of hippocampal spatial learning and memory are also evident in a subset (~50%) of subjects, including both human and animal models. The goal of our current work is to comprehensively characterize and compare age-related and cognitive decline-specific molecular changes that occur in the hippocampus. Whole-genome gene expression analysis was performed on hippocampal synaptic preparations, subregion dissections (CA1, CA3, DG), and unfractionated hippocampus from adult and aged F344xBN rats. Rats were assessed for spatial learning and memory performance by Morris water maze testing before sacrifice. Meta-analysis of the resultant data clearly demonstrates that molecular markers (MHCII) of glial activation are induced across hippocampal subregions with aging and do not correlate to deficits in spatial learning and memory. Markers of complement activation and STAT3 signaling are induced with aging in pyramidal cell-containing regions (CA1 and CA3) to a greater extent than in the granule cell-containing dentate gyrus (DG). Distal (synaptosome) mRNA changes associated with advanced age included down-regulation of neurotransmission-related genes and antigen presentation, whereas whole hippocampal changes recapitulated the neuroimmune activation evident in subregion analyses. Smaller numbers of gene expression changes were associated specifically with cognitive deficits, and age-related changes in gene expression were not exacerbated with poor cognitive performance. In summary, these studies indicate a potentially additive process of age-related neuroimmune activation and impaired neurotransmission that combine with cognitive impairment-specific inhibition of synaptic plasticity.

#### **GROWTH HORMONE AND IGF-1 DEFICIENCY EXACERBATE HIGH FAT DIET-INDUCED ENDOTHELIAL IMPAIRMENT IN OBESE LEWIS DWARF RATS: IMPLICATIONS FOR VASCULAR AGING**

L. Bailey-Downs<sup>1,2</sup>, D. Sosnowska<sup>1</sup>, P. Toth<sup>1</sup>, M. Mitschelen<sup>1</sup>, J.A. Farley<sup>1</sup>, W.E. Sonntag<sup>1</sup>, A. Csiszar<sup>1</sup>, Z. Ungvari<sup>1</sup>, *1. Reynolds Oklahoma Center on Aging, Donald W. Reynolds Department of Geriatric Medicine, University of Oklahoma Health Sciences Center, Oklahoma City, Oklahoma, 2. Department of Physiology, University of Oklahoma Health Sciences Center, Oklahoma City, Oklahoma*

Previous studies suggest that the age-related decline in circulating growth hormone (GH) and IGF-1 levels significantly contribute to vascular dysfunction in aging by impairing cellular oxidative stress resistance pathways. Obesity in the elderly is increasing at alarming rates and

there is evidence suggesting that elderly individuals are more vulnerable to the deleterious cardiovascular effects of obesity than younger individuals. However, the specific mechanisms through which aging, GH/IGF-1 deficiency and obesity interact to promote the development of cardiovascular disease remain unclear. To test the hypothesis that low circulating GH/IGF-1 levels exacerbate the pro-oxidant and pro-inflammatory vascular effects of obesity, GH/IGF-1 deficient Lewis dwarf rats and heterozygous control rats were fed either a standard diet (SD) or a high fat diet (HFD) for 7 months. Feeding a HFD resulted in similar relative weight gains and increases in body fat content in Lewis dwarf rats and control rats. HFD-fed Lewis dwarf rats exhibited a relative increase in blood glucose levels, lower insulin and impaired glucose tolerance as compared to HFD-fed control rats. Analysis of serum cytokine expression signatures indicated that chronic GH/IGF-1 deficiency exacerbates HFD-induced inflammation. GH/IGF-1 deficiency also exacerbated HFD-induced endothelial dysfunction, oxidative stress and expression of inflammatory markers (TNF-alpha, ICAM-1) in aortas of Lewis dwarf rats. Overall, our results are consistent with the available clinical and experimental evidence suggesting that GH/IGF-1 deficiency renders the cardiovascular system more vulnerable to the deleterious effects of obesity.

#### **AGE AND CAVEOLIN-3 KNOCKDOWN ARE INVOLVED IN ALTERING CHOLESTEROL HOMEOSTASIS IN CARDIAC MYOCYTES**

J.M. Schilling<sup>1,2</sup>, H.N. Fridolfsson<sup>1,2</sup>, M. Paneerselvam<sup>1,2</sup>, I. Niesman<sup>1,2</sup>, B.P. Head<sup>1,2</sup>, D.M. Roth<sup>1,2</sup>, H.H. Patel<sup>1,2</sup>, *1. UCSD, San Diego, California, 2. VASDHS, San Diego, California*

Cardiovascular disease (CVD) is a leading cause of mortality in the United States with >50% of mortality attributed to coronary artery disease. 80% of deaths caused by CVD occur in patients 65 years of age and older. The percentage of people over the age of 65 years is increasing dramatically and by 2050 the elderly will account for >2 billion people worldwide. Caveolae are membrane micro-domains enriched in cholesterol, glycosphingolipids, sphingomyelin, and the protein caveolin and are critical to ischemic tolerance. The function and structure of caveolae is dependent on caveolin-3 and cholesterol. Although caveolins have been studied in cardiac protective responses, the physiological consequence of membrane cholesterol depletion in cardiac myocytes is unclear. We hypothesized, that cellular cholesterol homeostasis is altered in Cav-3 knock out (KO) and aged wild type (WT) mice. Our data show that 1) the number of caveolae and tolerance to ischemia is reduced in aged hearts, 2) genes involved in cholesterol biosynthesis, transport/processing, and transcriptional regulation show altered expression on gene arrays with Cav-3 knockdown and age, and 3) cholesterol is reduced in membrane homogenates in hearts of Cav-3 KO and aged mice. Membrane cholesterol in combination with Cav-3 could therefore play a key role in the response to ischemic stress. Altering these components may lead to better ischemic tolerance in the aged heart.

#### **DISRUPTION OF NRF2 SIGNALING IMPAIRS ANGIOGENIC CAPACITY OF ENDOTHELIAL CELLS: IMPLICATIONS FOR MICROVASCULAR AGING**

M.N. Valcarcel-Ares<sup>1,2</sup>, T. Gautam<sup>1</sup>, L. Bailey-Downs<sup>1</sup>, D. Sosnowska<sup>1</sup>, R. De Cabo<sup>3</sup>, W.E. Sonntag<sup>1</sup>, Z. Ungvari<sup>1</sup>, A. Csiszar<sup>1</sup>, *1. Reynolds Oklahoma Center on Aging, Department of Geriatric Medicine, University of Oklahoma Health Sciences Center, Oklahoma City, Oklahoma, 2. Aging and Inflammation Research Lab, INIBIC - CHU A Coruña, Coruña, Spain, 3. Laboratory of Experimental Gerontology, National Institute on Aging, Baltimore, Maryland*

Age-related impairment of angiogenesis and the resulting microvascular rarefaction and decline in tissue blood supply play a significant role in the development of vascular cognitive impairment and heart failure in elderly patients. However, the mechanisms underlying age-related

impairment of angiogenesis remain unknown. The redox-sensitive transcription factor Nrf2 plays a key role in preserving a healthy endothelial phenotype and maintaining the functional integrity of the young vasculature. Recently we demonstrated that aging is associated with Nrf2 dysfunction in endothelial cells, which alters redox signaling and likely promotes the development of large vessel disease. Much less is known about the consequences of Nrf2 dysfunction at the level of the microcirculation. To test the hypothesis that Nrf2 regulates angiogenic capacity of endothelial cells, we determined whether disruption of Nrf2 signaling (by siRNA knockdown of Nrf2 and over-expression of Keap-1, the cytosolic repressor of Nrf2) impairs angiogenic processes in cultured human endothelial cells (ECs) stimulated with VEGF and IGF-1. In the absence of functional Nrf2 ECs exhibited impaired proliferation and adhesion to vitronectin and collagen. Disruption of Nrf2 signaling also reduced cellular migration (measured by a wound-healing assay using electric cell-substrate impedance sensing [ECIS] technology) and impaired the ability of ECs to form capillary-like structures. Collectively, we find that Nrf2 is essential for normal endothelial angiogenic processes, suggesting that Nrf2 dysfunction may be a potential mechanism underlying impaired angiogenesis and microvascular rarefaction in aging.

### FROM THE CONGO TO THE MGH: REDISCOVERING CNS AMYLOID ANGIOPATHY AS A CAUSE OF ICH IN THE SILVER GENERATION

A.Z. Hashmi, *Geriatric Medicine, Massachusetts General Hospital, Boston, Massachusetts*

Case Description: 75 year old lady Ms.M.K from the Congo admitted, June 2012 with Status Epilepticus. PMH: HTN, DM, Dementia, h/o DVT (on Coumadin), Family History unknown, no substance abuse. Admission BP 158/104 HR: 91, GCS 3/15 Respiratory failure: Intubated, admitted to MICU. Loaded with Phenytoin, then on 4 AED's. Labs: CBC, BMP normal, PT 17.4 INR 1.5. Imaging: CT Brain: 3.8 x 3.7cm ICH within Left parietal lobe; Interval MRI: Micro-hemorrhages in posterior lobes. Radiology interpretation: pattern consistent with Amyloid Angiopathy. Exam: quadriplegic, non-verbal, minimal response to painful stimuli, s/p tracheostomy s/p PEG placement. Subsequently transferred to STR/SNF after 6 weeks. Passed away 6 months later post repeat ICH. Family decline autopsy. Discussion: First described in 1854, we currently know amyloid fibrils as insoluble fibers derived from amyloid precursor protein undergoing conformational change to form antiparallel beta pleated sheets. Multi-organ deposition: cardiac, hepatic, renal, tongue. Cerebral Amyloid Angiopathy (C.A.A): Specific to CNS. Prevalence: Age 65-74:2-3% > 75 years: 84.8%. CAA induces ICH. Pathophysiology: Amyloid deposits (Abeta1-40 different from Abeta 1-42 in plaques) replace smooth muscle in walls of small to medium sized arteries. Increased arterial wall fragility, necrosis and subsequent rupture. Clinical Features: None pathognomonic. CAA Neuroimaging hallmarks: Sparing of regions characteristic for hypertensive ICH: basal ganglia, thalamus, pons; posterior lobe predilection;"micro-hemorrhages: Diagnostic Gold Standard: Biopsy but rarely available and "patchy" distribution may cause false negatives. Treatment: No definitive treatment – conservative treatment as for any ICH- Role of statins and ACE Inhibitors being studied for the future.

### HIGH FAT DIET-INDUCED OBESITY PROMOTES CEREBROVASCULAR AUTOREGULATORY DYSFUNCTION IN AGED MICE

P. Toth, Z. Tucek, L. Bailey-Downs, D. Sosnowska, T. Gautam, W.E. Sonntag, Z. Ungvari, A. Csiszar, *University of Oklahoma Health Sciences Center, Oklahoma City, Oklahoma*

Diet-induced obesity in the elderly promotes the development of vascular cognitive impairment, which develops in the absence of Alzheimer-type senile plaques as a result of decreased cerebral blood flow due to vascular alterations. To test the hypothesis that obesity in

aging impairs local vasoregulatory mechanisms in cerebral arteries, young (3 mo) and aged (24 mo) C57BL/6 mice were fed a high fat diet (HFD) or a standard diet (SD) for 6 months. In middle cerebral arteries (MCA) isolated from obese aged mice stepwise increases in transmural pressure (from 10 to 160 mmHg) elicited impaired steady-state myogenic constriction as compared to responses obtained in vessels of young SD- and HFD-fed and aged SD-fed mice. MCAs from aged obese mice also exhibited impaired dynamic myogenic responses and flow-induced constriction. Furthermore, obesity impaired metabolic vasodilation in response to adenosine in young mice, whereas its effect was exacerbated in aged mice. Collectively, aging exacerbates obesity-induced cerebrovascular autoregulatory dysfunction, which likely promotes microvascular damage contributing to the development of vascular cognitive impairment in aged obese individuals.

### AGING EXACERBATES MICROVASCULAR ENDOTHELIAL DAMAGE INDUCED BY INFLAMMATORY FACTORS PRESENT IN THE CIRCULATION DURING SEPSIS

Z. Tucek<sup>1</sup>, T. Gautam<sup>1</sup>, W.E. Sonntag<sup>1</sup>, P. Toth<sup>1</sup>, A. Csiszar<sup>1</sup>, H. Saito<sup>2</sup>, C. Szabo<sup>3</sup>, Z. Ungvari<sup>1</sup>, *1. Reynolds Oklahoma Center on Aging University of Oklahoma Health Sciences Center, Oklahoma City, Oklahoma, 2. University of Kentucky, Lexington, Kentucky, 3. University of Texas Medical Branch, Galveston, Texas*

The elderly show a significantly elevated mortality rate during sepsis than younger patients, due to their higher propensity to microvascular dysfunction and consequential multi-organ failure. We tested whether aging renders vascular endothelial cells more susceptible to damage induced by inflammatory factors present in the circulation during sepsis. Primary microvascular endothelial cells derived from young (3 m.o.) and aged (24 m.o.) F344xBN rats were treated with sera obtained from sepsis patients and healthy controls. Apoptotic cell death (caspase 3 and caspase 8 activities) induced by treatment with septic sera was exacerbated in aged endothelial cells as compared to responses obtained in young cells. In aged endothelial cells, compared to young cells, DAF fluorescence, indicating NO production, was decreased both under basal conditions and after treatment with septic sera. Treatment with septic sera elicited greater increases in mitochondrial production of reactive oxygen species (MitoSox fluorescence) and NF-kappaB activation (reporter gene assay) in aged endothelial cells, as compared to young cells. Collectively, aging increases sensitivity of microvascular endothelial cells to oxidative stress and cellular damage induced by inflammatory factors present in the circulation, which likely contributes to the increased vulnerability of elderly patients to sepsis. (Funding: AHA, AFAR, NIH).

### RESVERATROL REVERSES INCREASED HYPOTHALAMIC NADPH OXIDASE ACTIVITY AND VASCULAR DYSFUNCTION WITH AGE

N. Tumer<sup>1,2</sup>, S. Gomez<sup>3</sup>, N. Kirichenko<sup>1,2</sup>, B. Erdos<sup>1</sup>, Y. Sakarya<sup>1,2</sup>, P.J. Scarpace<sup>1</sup>, M.A. Whidden<sup>4</sup>, *1. Pharmacology, University of Florida, Gainesville, Florida, 2. VA Medical Center, Gainesville, Florida, 3. Namik Kemal University, Tekirdag, Turkey, 4. West Chester University, West Chester, Pennsylvania*

Resveratrol is a natural phytoalexin which possesses anti-aging and vasoprotective effects. We examined resveratrol treatment on hypothalamic NADPH oxidase activity (NOX), aortic TNF $\alpha$ , and vascular function in mesenteric arteries in 6 mo and 24 mo old male F-344xBN rats. Resveratrol (15 mg/kg) was provided in drinking water for 14 days. Hypothalamic NOX was elevated with age and decreased with resveratrol such that resveratrol reversed the age-related increase. There were parallel changes in p47 and p67 regulatory subunits of NADPH. Resveratrol also decreased aortic TNF $\alpha$  in young and old. Concentration response curves to resveratrol and acetylcholine (ACh) were evaluated in pressurized isolated mesenteric arteries. Resveratrol reversed the age-

related decrease in Ach-induced vasodilation. Ach responses in young and old control groups were also tested after 20 min pre-incubation of isolated mesenteric arteries with 20  $\mu$ M of resveratrol. This in vitro pre-treatment with resveratrol restored the Ach-induced vasodilatation to young level. Our data indicate that age-related dysfunction in endothelium-dependent vasodilation in mesenteric arteries is reversed by oral resveratrol or in vitro resveratrol incubation. The underlying mechanism may involve decreases in aortic TNF $\alpha$  or hypothalamic NOX. Supported by Department of Veteran Affairs Rehabilitation R&D, GRECC, NIA, and American Heart Association.

#### **EFFECT OF KLOTHO POLYMORPHISMS ON EFFICACY OF SSRIS IN LATE-LIFE MAJOR DEPRESSIVE DISORDER PATIENTS**

G. Paroni<sup>1</sup>, G. D'Onofrio<sup>1</sup>, D. Seripa<sup>1</sup>, M. Urbano<sup>1</sup>, C. Gravina<sup>1</sup>, F. Ciccone<sup>1</sup>, F. Panza<sup>1</sup>, A. Pilotto<sup>1,2</sup>, *1. Geriatrics, I.R.C.C.S. Casa Sollievo della Sofferenza, San Giovanni Rotondo, Italy, 2. Azienda ULSS 16 Padova, S. Antonio Hospital, Padova, Italy*

Klotho protein, encoded by the KL gene at locus 13q12, is an anti-aging hormone-like protein playing a pivotal role in longevity and age-related diseases. No data are available regarding its role in Major Depressive Disorders (MDD) of the elderly. We evaluated the KL SNPs rs564481 and rs9536314 in 103 elderly patients (28 males and 75 females, mean age 77.46 $\pm$ 6.64) with a clinical diagnosis of MDD according to DSM-IV criteria, treated with SSRI for 6-months. Patients were evaluated with the Hamilton Rating Scale for Depression 21-items (HDRS-21) at baseline and after 6-months of treatment. According to the NICE criteria, a reduction  $\geq$ 10% in HDRS-21 score was considered a response to therapy, whereas a reduction  $<$ 10% as non-response to therapy. At six-months, 87 patients (84.5%) responded and 16 patients (58.1%) did not respond to SSRI treatment. A significant higher frequency of T/T genotype of rs564481 was found in responders than in non-responders ( $p=0.015$ ). Conversely a significantly higher frequency of G/G genotype of rs9536314 was found in non-responders than in responders ( $p=0.007$ ). These results suggest that the SNPs rs564481 and rs9536314 of the KLOTHO gene may influence the clinical efficacy of SSRIs in patients with MDD.

#### **INCREASED DEPRESSIVE SYMPTOMS ARE ASSOCIATED WITH LARGER GRAY AND WHITE MATTER REGIONAL VOLUME**

M. Mortby<sup>1,4</sup>, A.L. Janke<sup>2,4</sup>, P. Sachdev<sup>3</sup>, K.J. Anstey<sup>1,4</sup>, N. Cherbuin<sup>1,4</sup>, *1. Centre for Research on Ageing, Health and Wellbeing, Australian National University, Canberra, Australian Capital Territory, Australia, 2. Centre for Advanced Imaging, University of Queensland, Brisbane, Queensland, Australia, 3. Neuropsychiatric Institute, University of New South Wales, Sydney, New South Wales, Australia, 4. Dementia Collaborative Research Centres, Canberra, Australian Capital Territory, Australia*

Background: Depression is a known risk factor for cognitive decline and dementia, but the evidence on associations between brain structure and depressive symptomatology is mixed. This study investigates the association of depressive symptoms with regional gray/white matter volumes in a large cohort of cognitively healthy, older, community-dwelling individuals (68-73 years) from the PATH Through Life project at wave 3 (N=244). Method: Pre-processing and voxelwise analysis of regional gray/white matter volumes of T1-weighted images was conducted in SPM8. Individuals on antidepressant medication were excluded from these analyses (n=19). Results: Voxelwise analyses controlling for age, sex, anxiety, MMSE, BMI, diabetes and hypertension showed a positive association between increased depressive symptoms and greater regional gray matter volumes in the parietal, temporal and occipital lobes, and white matter volumes in the temporal and limbic cortex ( $\alpha=0.001$ ). No negative association was found. Conclusion: While these findings contrast with the growing evidence of pre-frontal and

orbitofrontal cortex degeneration in depression, they complement other findings suggesting increased gray matter volumes in the cingulate gyrus as a marker of early neuronal pathology. Possible explanations for the current findings include that increased regional gray/white matter volumes may reflect neuronal overgrowth, deficits in the pruning process of neurogenesis, neural maturation following antidepressant treatment or the impact of early inflammatory processes in depression. Future research should consider i) increased regional volumes as a marker for early neurodegenerative processes and ii) the role that inflammatory processes play in the association between increased regional volumes, depressive symptoms and cognitive decline.

#### **HISTORICAL BLOOD PRESSURE MEASUREMENTS IN OLDER ADULTS INDICATE UNDERLYING SMALL VESSEL DISEASE IN THE LEFT HEMISPHERE. (CNS)**

C. Rosano<sup>1</sup>, K.Z. Abebe<sup>1</sup>, H. Aizenstein<sup>1</sup>, T.B. Harris<sup>2</sup>, K. Yaffe<sup>3</sup>, S. Satterfield<sup>4</sup>, A.B. Newman<sup>1</sup>, *1. University of Pittsburgh, Pittsburgh, Pennsylvania, 2. National Institute on Aging, Bethesda, Maryland, 3. University of California, San Francisco, San Francisco, California, 4. University of Tennessee Health Science Center, Memphis, Tennessee*

BACKGROUND: Higher systolic blood pressure (SBP) is a known risk factor for stroke and small vessel disease (SVD). However, single SBP measures alone do not necessarily capture historical patterns of SBP. OBJECTIVE: Compare the prevalence of SVD in older adults with historical fluctuating SBP patterns and in those with stable or declining historical patterns. METHODS: Group-based trajectory models (GBTM) identified subjects based on SBP patterns from baseline in 1997-98 to time of neuroimaging in 2006-08 in 315 adults (73 years old, 60% women, 45% black). SVD was computed for commissural, association and projection fibers. RESULTS: In 2006-08, 18.8% of the participants had normal SBP ( $<$  120 mmHg), 55.1% had moderate SBP (120-140mmHg) and 26.1% had high SBP (140-160mmHg). The normal SBP group had a stable historical pattern, while the groups exhibiting moderate and high SBP in 2006-08 was further divided into those with historical stable SBP and historical fluctuating SBP patterns. Compared with those with normal SBP, there was an increasing gradient of probability of having SVD in the anterior commissural and left hemisphere for those with moderate-stable, moderate-fluctuating, high-stable, and high-fluctuating SBP (odds ratios, [95% CI]: 1.88 [1.00, 3.51], 2.85 [0.89, 9.15]; 2.81 [1.36, 5.84]; 3.42 [1.01, 11.58], respectively,  $p=0.048$ ). Results were similar after exclusion of participants with stroke and after adjustment for antihypertensive medication use, age, education, cognition, history of hypertension or impaired glucose. DISCUSSION: In addition to current SBP values, prior history of fluctuating SBP should be considered in assessing prevalence of SVD in community-dwelling older adults.

#### **BRAIN ANATOMICAL CORRELATES OF GAIT VARIABILITY IN HIGH FUNCTIONING OLDER ADULTS: REPEATABILITY ACROSS TWO INDEPENDENT STUDIES. (CNS)**

C. Rosano<sup>1</sup>, M.J. Olson Hunt<sup>1</sup>, J. Brach<sup>1</sup>, A.B. Newman<sup>1</sup>, S. Studenski<sup>1</sup>, J. Verghese<sup>2</sup>, L. Weissfeld<sup>1</sup>, *1. University of Pittsburgh, Pittsburgh, Pennsylvania, 2. Albert Einstein College of Medicine, New York, New York*

Background: Step length variability (SLV) is associated with falls. Initial studies in Parkinson's disease patients indicate that SLV is potentially amenable to intervention. Purpose: To identify the neural substrates of SLV in two cohorts of community-dwelling dementia-free elderly. Methods: Gray matter volumes and coefficient of variation of step length were obtained in participants of the Cardiovascular Health Study (n=220, 78.1 yrs old, 63% women, 78% white) and the Healthy Brain Project (n=293, 82.7 yrs old, 57% women, 60% white). Gray matter volumes were computed for: basal ganglia (caudate, putamen, pallidum,

thalamus), pre- and post-central gyri, supplementary motor cortex; middle frontal gyrus, cingulate cortex, posterior parietal cortex (medial, superior lateral, inferior lateral), medial temporal lobe (hippocampus, parahippocampus, entorhinal cortex, amygdale). Sparse partial least square methods examined volumetric data with age, sex, obesity, race and total gray matter volume to address collinearity, multiple comparisons and over-fitting. Variables were ranked based on the percentage of times they were selected (had non-zero parameter estimates) across models obtained using all possible combinations of tuning parameters. Variables selected > 90% of the times are reported. Results: Anterior and posterior cingulate, superior parietal, thalamus and total parenchyma were selected in both datasets. The frontal middle gyrus, hippocampus and motor-related regions (pre- and post-central gyri; supplementary motor cortex, inferior parietal, putamen, pallidum) were selected in the Cardiovascular Health Study only. Conclusion: Volume of cingulum, superior parietal and thalamus are related to SLV. Future studies should assess whether these regions may exhibit neuroplasticity in response to interventions improving SLV.

## SESSION 1200 (POSTER)

### AGING AND COGNITION

#### INCREASED DURATION OF DAILY MENTAL STIMULATING ACTIVITY REDUCES NUMBER OF DAILY STRESSORS IN OLDER ADULTS

A. Trujillo<sup>1</sup>, J.C. Allaire<sup>1</sup>, A.C. McLaughlin<sup>1</sup>, S. Neupert<sup>1</sup>, M. Gandy<sup>2</sup>, I. North Carolina State University, Raleigh, North Carolina, 2. Georgia Institute of Technology, Atlanta, Georgia

Excessive stress can result in reduced memory capacity, as well as detrimental effects on cognitive performance (McEwen & Sapolsky, 1995; Neupert, Almeida, Mroczek, & Spiro, 2006; Sapolsky, 2000). The current study investigated the extent to which engagement in mentally stimulating daily activities (e.g. reading, puzzles, video games) is related to daily stress. It was hypothesized that on days when older adults engaged in more cognitively challenging daily activities they would experience less stress. The sample consists of 113 community-dwelling elders with a mean age of 78 years (range = 63 – 96; SD = 7.32). Participants completed 15 daily packets over a three-week period, providing a total of 1172 observations. The daily packet consisted of questions on frequency and duration of mental activities, and number of daily stressors was assessed through the Daily Inventory for Stressful Events (Almeida, Wethington, & Kessler, 2002). Using multi-level modeling, analyses revealed that there was significant within- (56%) and between-person (44%) variability for overall mean daily stressors. Analyses revealed that on days participants spent more time on cognitively demanding activities they also reported fewer daily stressors. This relationship was stronger in participants who lived alone, compared to those who did not live alone. Discussion will focus on how undertaking challenging mental tasks may remove attention from some of the causes of stress.

#### INTENSIVE COGNITIVE PRACTICE IN OLDER ADULTS: GAINS, STRUCTURE, PREDICTORS, AND TRANSFER

J.M. Dzierzewski<sup>1</sup>, M. Marsiske<sup>1</sup>, M.P. Buman<sup>2</sup>, A. Aiken Morgan<sup>3</sup>, P.R. Giacobbi<sup>4</sup>, B.L. Roberts<sup>5</sup>, C.S. McCrae<sup>1</sup>, 1. *Clinical & Health Psychology, University of Florida, Gainesville, Florida*, 2. *Arizona State University, Phoenix, Arizona*, 3. *Duke University Medical Center, Durham, North Carolina*, 4. *University of Arizona, Tucson, Arizona*, 5. *University of Florida, Gainesville, Florida*

Introduction: Practice with cognitive stimuli is a major part of any cognitive intervention. The current study examined 18 weeks of broad computer-administered cognitive practice in middle aged and older adults and investigated (a) gains across different measures were correlated, (b) what factors predicted the magnitude of practice-related gain,

and (c) whether gains in practiced measures transferred to unpracticed measures. Methods: Participants included 88 adults aged 50-87 years (Mean=63.56) who completed 18 consecutive weeks of cognitive practice (processing speed and executive processing), pre and post cognitive practice neuropsychological assessment (used as transfer variables), and baseline demographic questionnaires (assessing common individual difference variables: age, education, estimated IQ, and psychiatric symptoms). Results: Latent growth curve models revealed substantial growth in practiced cognitive tasks across the 18-week study period. Curve-of-factors analyses indicated: (1) Sizeable higher-order gain across all measures (linear estimate,  $p < .01$ ; quadratic estimate,  $p < .01$ ), (2) Higher educational attainment was associated with more constant gain in general learning ( $p < .05$ ) and more state-anxiety symptoms was related to deceleration in general learning ( $p < .05$ ), and (3) Overall gain in practiced measures was correlated with pre-post improvements in 1-Back ( $p < .01$ ) and 2-Back RT ( $p < .05$ ). Conclusion: The cognitive gains associated with practice (i.e., 0.48-1.40 standard score increase) were comparable to or larger than those associated with tutor-guided interventions. Such findings are consistent with the notion that practice may be a viable alternative to structured cognitive interventions in late-life. Additionally, the presence of a general learning factor may suggest the possibility of classifying older adults as cognitive gainers versus non-gainers.

#### KNOWLEDGE DIFFERENTIALLY SUPPORTS ACCURACY OF FOOD LABEL USE FOR OLDER RELATIVE TO YOUNGER ADULTS

L.S. Miller<sup>1</sup>, T.N. Gibson<sup>1</sup>, D.T. Thach<sup>2</sup>, 1. *University of California, Davis, California*, 2. *Western University of Health Sciences, Pomona, California*

Nutrition fact panels (NFPs) contain a wide variety of nutrition information which could be used to support healthy food choices, yet some evidence suggests that NFPs are difficult to use, particularly for older adults. Older adults have been shown to benefit from their prior knowledge when performing nutrition comprehension tasks (Miller et al., 2011). We investigated age and knowledge effects on NFP accuracy to determine whether knowledge mitigates accuracy declines in later life. Forty-one younger and 27 older adults performed three tasks: locating information on an NFP, determining healthfulness of an NFP, and identifying the type of food represented by an NFP. Participants viewed NFPs on a computer screen at their own pace and selected answers using a response box. Knowledge groups were created by taking a median split, within age group, on a multiple-choice task that assessed a variety of areas of nutrition knowledge. Accuracy data were analyzed in a mixed ANOVA with age and knowledge as between-subjects variables and task as the repeated measure. Results showed a main effect of Knowledge,  $F(1,64) = 4.2$ ,  $p < .05$ ,  $\eta^2 = .06$ , such that the high-knowledge group (HK) had higher scores than the low-knowledge group (LK). There was a nonsignificant effect of Age,  $F < 1$ , which was qualified by a significant Age x Knowledge interaction,  $F(1,64) = 6.3$ ,  $p < .05$ ,  $\eta^2 = .09$ . There were significant age declines in the LK group that were not evidence in the HK group. These data show that knowledge differentially supports accuracy of older adults' use of NFPs.

#### AGE-RELATED DIFFERENCES BETWEEN INTENTION-BASED AND STIMULUS-BASED ACTIONS: AN ERP STUDY

Y. Niu, J. Li, *Institute of Psychology, Chinese Academy of Sciences, Beijing, China*

We recorded Event-Related Potentials (ERPs) during an adapted Acquisition-Test task to investigate the differences of motor cognition between young and older adults under intention-based and stimulus-based conditions. For Acquisition phase, the temporal bisection task was used in which case participants were asked to make left or right key presses at the midpoint between isochronous pacing letters successively presented in the center of the computer screen, either by their own will

to generate a random sequence of letters (for intention-based situation), or according to the letter previously presented (for stimulus-based situation). For Test phase, each group was divided into two subgroups to complete consistent task or inconsistent task, respectively. During Acquisition phase, previous evidence that readiness potentials (RP), reflecting action preparation, was strongest in the intention-based condition, whereas P3, reflecting stimulus evaluation, was most pronounced in the stimulus-based condition was found for both age groups. However, the amplitude of RP, P3 and the differential wave subtracted between action conditions differed between two age groups, suggesting that motor cognition declined with aging in a way of two kinds of action decreasing unequally. Contingent negative variation (CNV) was compared between consistent and inconsistent tasks during Test phase, with more pronounced difference under intention-base condition for both age groups, providing electrophysiological evidence directly for the action-effect binding and stimulus-response binding. Again, CNV was more negative in amplitude for older adults, indicating less efficiency in motor preparation and more effort demanded to make a response. Keywords motor cognition, aging, RP, P3, CNV

### AGING AND NEW WORD UNDERSTANDING

S. Hindin, E. Zelinski, *Gerontology, Univ Southern California, Los Angeles, CA, California*

New word understanding is important for aging adults because it contributes to function in the social and business world. A loss in new word understanding in old age may exist because other cognitive abilities can limit the ability to learn new words. A multiple choice measure testing understanding of new words in the context of short passages was used in a longitudinal design and both cross-sectional and longitudinal analyses were conducted. Participants in the Long Beach Longitudinal Study were tested on new word understanding items at every other testing wave, around every 6 years. Three possible testing times are available for the first panel, two testing points for the second panel. 1641 participants ages 29-100 ( $M=68.9$ ,  $SD=13.8$ ) with a majority over 55, 53.6% female, with a mean education of 14.4 years ( $SD=2.8$ ) were tested. New vocabulary items were Rasch scaled for accurate comparison of differing items. New vocabulary was modeled linearly for latent change with age as the base including missing data and a significant mean latent slope of  $-.24$  was found. The latent slope and intercept level are highly correlated (.67) showing those who did better the first time, showed less decline. New vocabulary is nonlinear throughout adulthood; those under age 59 show no change. A mean latent slope of  $-.38$  was found for those over 59, however cognitive abilities may mediate this. Cross-sectional analyses revealed similar results.

### COGNITIVE FUNCTIONING IN THE CONTEXT OF INCIDENTAL WHITE MATTER HYPERINTENSITIES

K. Thompson<sup>1</sup>, N.A. Pachana<sup>1</sup>, G. Byrne<sup>2</sup>, B. Miloyan<sup>1</sup>, 1. *University of Queensland, St Lucia, Queensland, Australia*, 2. *Royal Brisbane & Women's Hospital, Herston, Queensland, Australia*

The purpose of this study was to detect differences in neuropsychological test performance between middle-aged (48-65) and older (65-85) female adults who presented with varying degrees of White Matter Hyperintensities (WMH). MRI and neuropsychological testing were administered to a sample of 166 neurologically healthy participants ( $age=65.1\pm 10.8$ ) further classified into one of three WMH categories (normal, mild WMH, significant WMH) by an experienced neuroradiologist. A series of MANCOVAs were performed to explore age- and WMH-group differences on cognitive test performance. After controlling for premorbid intelligence (National Adult Reading Test [NART]), results revealed only a main effect of age  $F(4, 156) = 20.175$ ,  $p < 0.0001$  on overall cognitive function. Significant differences were identified between middle-aged and older adults on measures of processing speed  $F(1, 159) = 57.942$ ,  $p < .0001$ ; verbal memory  $F(1, 159) = 18.488$ ,  $p < .0001$ ; problem solving,  $F(1, 159) = 10.786$ ,  $p = 0.001$ ; and

inhibitory control  $F(1, 159) = 30.541$ ,  $p < 0.0001$ , suggesting that middle-aged adults outperformed older adults in these cognitive domains. A subsequent set of ANCOVAs evaluating age- and WMH-group differences on subjective measures of cognitive function revealed no significant group or interaction effects. These results do not lend support to the notion that a combination of advancing age and severity of WMH burden promote greater cognitive dysfunction.

### SOCIAL RELATIONSHIPS WITH FAMILY, FRIEND AND SPOUSE: WHICH ARE ASSOCIATED WITH COGNITIVE PERFORMANCE?

C. Coyle<sup>1</sup>, S. Agrigoroaei<sup>2</sup>, 1. *Univ Mass Boston, Boston, Massachusetts*, 2. *Brandeis University, Waltham, Massachusetts*

Studies of social networks have found positive relationships between social support and cognitive performance. However much less work has focused on the role of the sources of social support (family, friends, spouse) and considered both the levels of social support and social strain as indicators of the quality of social interactions. This study aims to examine the quality of relationships from three different sources (family, friend and spouse) and cognitive performance for young, middle-aged, and older adults. Participants ( $N = 3,084$ ) who were married or partnered and ages 28-84 years were included from the national Midlife in the U.S. (MIDUS) study. Two cognitive factors, episodic memory and executive functioning were measured using the Brief Test of Adult Cognition by Telephone (BTACT). Multiple regression analyses, controlling for age, sex, race, education, and physical health conditions, revealed that the overall quality of the relationship has a significant relationship with cognitive performance and that this association changed as a function of source and age group, but that the sources of these interactions differ among young, middle-age, and older adults. For example, the interaction between age and friendship quality was significantly related to poorer executive function ( $p < .05$ ). Results from these analyses indicate that the sources of social relationships (both social strain and social support) have varying degrees of impact on cognitive function within each age group.

### THE ASSOCIATION BETWEEN RACIAL PREFERENCE AND COGNITIVE PERFORMANCE IN MID AND LATE LIFE

M.S. Yang<sup>1</sup>, S. Agrigoroaei<sup>2</sup>, P. Huffman-Oh<sup>1</sup>, E. Dugan<sup>1</sup>, 1. *Gerontology, UMass Boston, Boston, Massachusetts*, 2. *University of Brandeis, Waltham, Massachusetts*

Past studies have found that discrimination had a negative association with cognitive performance. However, there is less evidence for the relationship between a more subtle measure, race preference, and cognitive performance. The purpose of this study was to explore how race preference is associated with executive functioning and episodic memory tasks. We analyze data from wave two of the Midlife in the United States (MIDUS) national longitudinal study (2004-2006). The analytic sample size was  $N=3,616$ . Age of subjects ranged from 28-85 years old (mean age 55.80,  $SD 12.31$ ), 90% were non-Hispanic Whites, 94% had at least a high school degree, 67% were married and 55% were female. To measure the level of race preference, the respondents were asked "How much do you preferred to be with other people who are the same race as yourself?"; and, "How important do you think it is for people who are in your racial group to marry other people who are the same race?" Episodic memory and executive functioning were measured using the Brief Test of Adult Cognition by Telephone (BTACT) Descriptive and multiple regression statistics were conducted. Individuals who had higher level of race preference performed poorer on executive functioning, while controlling for age, gender, education, race, physical health, and openness. Future research will focus on understanding the mechanisms of the association between race preference and cognitive performance.

## CROSS CULTURAL/CROSS NATIONAL STUDIES

**THE ROLE OF AGE AND WORKPLACE TRAINING AND DEVELOPMENT ON WORK OUTCOMES: A JAPAN-US COMPARISON**J. Lee, M. Pitt-Catsoupes, *Boston College, Brighton, Massachusetts*

A major line of research has examined the effect of workplace T&D on employee outcomes, such as higher organizational commitment. However, much less attention has been paid to whether the effects of workplace T&D differ according to the employee's age and cultural contexts. Based on theories about labor market institutions and cross-cultural differences, in this paper we investigate the effect of age on the perceived importance of/use of/satisfaction with T&D, and whether the positive relationships between T&D and organizational commitment differ by culture. Using a sample of 2,760 employees working at four multi-national corporations with work sites in both Japan and the U.S., we found that respondents working in Japan viewed workplace T&D as less important, and reported less use of those opportunities than their counterparts in the US. However, respondents working in Japan are more satisfied with their workplace T&D. In addition, younger workers viewed workplace T&D as more important, reported more use of those opportunities than older workers, regardless of country. Lastly, the positive relationships between access to/satisfaction with T&D opportunity and organizational commitment were stronger for respondents working in Japan than for those in the U.S. while the positive relationships between the use of T&D opportunity and organizational commitment was weaker for respondents working in Japan than for their counterparts in the U.S.. This study focuses attention on the importance of considering age and cultural contexts when designing, implementing, and evaluating workplace training and development initiatives.

**FAMILY AVAILABILITY, NATIONAL HEALTHCARE INFRASTRUCTURE, AND SUPPORT PREFERENCES FOR OLDER ADULTS WITH CHRONIC DISEASE IN EUROPE**C.A. Mair<sup>1</sup>, A.R. Quinones<sup>2</sup>, *1. Dept. of Sociology and Anthropology, University of Maryland, Baltimore County, Baltimore, Maryland, 2. Oregon Health & Science University, Portland Veteran Affairs Medical Center, Portland, Oregon*

Support for older adults with chronic illness is largely dependent on informal and formal care resources, such as family availability and national healthcare infrastructure. In addition, older adults' preferences for family versus state-based care are important to consider when designing health programs for aging populations. Cross-national variation in elderly rates of chronic diseases, family availability, healthcare infrastructure, and support preferences reveals international differences in health support for aging populations. A more thorough understanding of this cross-national variation will provide insight for health care policy-makers to explore new options for national and local policies aimed at promoting older adults' health. In this paper, we explore these factors across 14 countries of Europe. This study analyzes individual-data on health status, family structure, and preferences for support from the Survey of Health, Ageing, and Retirement in Europe (SHARE) in combination with detailed nation-level data on European healthcare infrastructure from the Organisation for Economic Cooperation and Development (OECD). We use multilevel modeling to investigate to what extent chronic disease prevalence, family availability, and formal infrastructural resources are associated with older adults' preferences for care. Results indicate that individual-level health limitations and family support availability combine with nation-level resource options to shape older adults' preferences for care. We interpret these findings in light of cross-national differences in order to offer policy and program suggestions that consider variation in physical health, family availabil-

ity, national healthcare infrastructure, as well as older adults' preferences for their own care.

**STRUCTURAL FACTORS ASSOCIATED WITH CAREGIVER'S BURDEN IN ALZHEIMER'S DISEASE IN EL SALVADOR**E. Valdivieso, *Psychology, Universidad Centroamericana UCA, San Salvador, San Salvador, El Salvador*

The present study attempted to explore the structural conditions within the family of an individual with Alzheimer's disease, in El Salvador. Present literature emphasize mostly on factors within the person: personality traits, coping strategies, and previous physical health conditions. But little is known about structural conditions outside an individual. This study was conducted at the Alzheimer's Disease Caregivers Association in San Salvador. Twenty-two participants were interviewed. Participants were asked about their current condition on care giving and the factors they perceived are responsible of the burden they experience. Caregivers reported that being a woman is an important risk factor for burden, given that society expects from them to be a 24 hour caregiver, continue working on their jobs, and take care of their children. They reported to feel pressured by other family members to fulfill in a satisfactory manner all these multiple roles. All participants reported that there is an insufficient and inadequate health service for their family member with AD. Most cases mentioned that the diagnoses are based on a single 30-minute interview, without further exploration (neuropsychological assessment, neuroimaging tests). This leads them to hesitate on the diagnosis. The great immigration of young adults to the US and other developed countries was recognized as an important influence on the burden. Siblings, cousins and other family members have migrate, leaving them as solely caregivers. A caregiver's burden in Alzheimer's disease is possibly more pronounced in developing countries, like ES. Economic factors and the consequent gender inequity are deepening this burden.

**THE RELATION BETWEEN SELF-ASSESSED AND OBJECTIVE COGNITIVE AND PHYSICAL HEALTH AMONG THE 50+**D. Weber<sup>1,2</sup>, V. Skirbekk<sup>1,2</sup>, *1. World Population Program, International Institute for Applied Systems Analysis (IIASA), Laxenburg, Austria, 2. Wittgenstein Centre for Demography and Global Human Capital, Vienna, Austria*

The recent availability of nationally representative samples using standardized questionnaires from WHO Study on global AGEing and adult health (SAGE) allow one to compare health levels across nations. These data are used to compare objective and subjective health (both cognitive and physical) for Ghana, India, Mexico and Russia. Here, those aged 50 and above were asked about self-reported physical and mental health. The objective cognitive health measures we study are immediate and delayed recall. In the memory test ten words of basic difficulty are read out in the local language and asked to be repeated immediately and after approximately ten minutes. Additionally, each interviewee was visited by health personnel, who measured grip strength, lung function and blood pressure as well as BMI and the waist-hip-ratio. Our self-assessed cognitive and physical questions include: "How would you best describe your memory at present?" and "In general, how would you rate your health today?". The purpose of the study is to evaluate the validity of self-reported data by comparison with mental health and to see to which extent it differs by country, age group and gender. Applying a multilevel regression approach we assess the relation of cognitive and physical health measures to the self-assessed health. We control for socio-economic factors, housing, marital status and other respondent characteristics.

## RIGHTS-BASED ADVOCACY WORK AND WITCHCRAFT ACCUSATIONS IN GHANA

A. Crampton, *Social and Cultural Sciences, Marquette University, Milwaukee, Wisconsin*

Witchcraft accusation against older adults, particularly women, has become part of elder advocacy work in Sub-Saharan Africa. HelpAge International and affiliated organizations publish articles, conduct educational campaigns, and work to protect the legal rights of the accused. These interventions, however, do not draw significantly from available research on witchcraft as integral to cultural values and local social realities. Instead, witchcraft accusations are constructed in rights-based advocacy discourse as elder abuse without empirical data on intervention outcomes. In this study, the cultural context of witchcraft beliefs and the impact of rights based intervention were examined as part of a ten-month study on elder advocacy. Data were collected between 2004 and 2005, and included participant observation, semi-structured interviews, and document examination. Participant observation was conducted in three 'witches camps,' and four villages and cities selected by an elder advocacy organization for a rights-based campaign. Interviews were conducted with older women accused of witchcraft, accusers, and professionals who intervene. Relevant documents included advocacy materials, radio and news print campaigns, and news reports. Results help explain past intervention failure as a failure to address the underlying causes of witchcraft accusations, and to engage with spiritual belief systems counter to those of advocates. Review of more recent advocacy work through document examination indicates these problems persist. Work by Mary Douglass provides a theoretical framework for understanding these failures as the result of imposing moral categories that are rejected in local contexts. Study implications include practical application to culturally sensitive elder advocacy work.

## SESSION 1210 (POSTER)

### DELIRIUM

#### DELIRIUM AND BEHAVIORAL SYMPTOMS OF DEMENTIA

P. Landreville<sup>1,3</sup>, P. Voyer<sup>2,3</sup>, P. Carmichael<sup>3</sup>, 1. *School of psychology, Université Laval, Québec, Quebec, Canada*, 2. *Faculty of Nursing, Université Laval, Québec, Quebec, Canada*, 3. *Axe Vieillessement, Centre de recherche FRSQ du Centre hospitalier affilié universitaire de Québec, Québec, Quebec, Canada*

Although delirium and behavioral symptoms are common in persons with dementia, the relation between them has received little attention. The purpose of this study was to explore the relation between delirium and behavioral symptoms of dementia (BSD). Participants were 155 persons with a diagnosis of dementia, 109 (70.3%) of whom were found delirious according to the Confusion Assessment Method (CAM). BSD were assessed using the Nursing Home Behavior Problem Scale. Results show that participants with delirium presented significantly more BSD than participants without delirium. More specifically, they presented more aggressive/uncooperative behavior, wandering/trying to leave, sleep problems, irrational behavior, and agitation. Delirium was still associated with wandering/trying to leave, sleep problems and irrational behavior after controlling for cognitive problems and use of antipsychotics and benzodiazepines. Some of the relationships between participant characteristics and BSD differed according to the presence or absence of delirium. BSD were not related to antipsychotics use over time in participants with delirium. These findings are consistent with recent studies showing an association between delirium and neuropsychiatric symptoms in persons with dementia. They may have practical implications for the detection of delirium superimposed on dementia and caregiver burden.

## INTERVENTIONS FOR DELUSIONS IN NURSING HOME RESIDENTS WITH DEMENTIA

J. Cohen-Mansfield<sup>1,2</sup>, H. Golander<sup>1,3</sup>, G. Arnheim<sup>4</sup>, R. Cohen<sup>1</sup>, 1. *Herczeg institute on aging, Tel Aviv University, Tel Aviv, Israel*, 2. *Department of Health Promotion, School of Public Health, Sackler Faculty of Medicine, Tel Aviv University, Tel Aviv, Israel*, 3. *Department of Nursing, Faculty of Medicine, Tel Aviv University, Tel Aviv, Israel*, 4. *Sanatorium "Gan Shalva" Ltd., Hod-Hasharon, Israel*

This is a qualitative and quantitative study examining institutional staff members' responses to delusions experienced by nursing home residents. Participants were 38 nursing home residents aged 65 and over, diagnosed with dementia, from 8 nursing homes in Israel. Data collection took place between June 2007 and January 2009. Assessments included: BEHAVE-AD, NPI-NH, EAPSID, ADL, and MMSE. A wide variety of interventions for dealing with dementia-related symptoms was found. This included general approaches for a variety of symptoms, as well as symptom-specific interventions. Caregivers are not always aware that multiple approaches are available to them when dealing with dementia, and the most effective approaches may be those tailored to the individual. Combining interventions may increase overall effectiveness. Caregiver's experience and institutional culture may affect choice of intervention used, either positively or negatively.

## SESSION 1215 (POSTER)

### DEPRESSION

#### VASCULAR BURDEN, DEPRESSION, AND COGNITIVE DECLINE AMONG AFRICAN-AMERICAN OLDER ADULTS

J.S. Carmasin<sup>1</sup>, B.T. Mast<sup>1</sup>, J.C. Allaire<sup>2</sup>, K.E. Whitfield<sup>3</sup>, 1. *University of Louisville, Louisville, Kentucky*, 2. *North Carolina State University, Raleigh, North Carolina*, 3. *Duke University, Durham, North Carolina*

The current study examined the extent to which vascular burden was associated with depression and cognitive decline in 434 African-American older adults from the Baltimore Study of Black Aging (BSBA). We performed logistic regression analysis to determine the effect of vascular burden on time-2 depression (measured approximately 2.5 years after baseline assessment). We controlled for age, gender, education, baseline depression, activities of daily living (ADLS), and independent activities of daily living (IADLS). The model was significantly better at predicting the presence of time-2 depression than a constant only model,  $\chi^2(7) = 96.53$ ,  $p < .001$ . The model explained approximately 20% of the variability in time-2 depression,  $r\text{-sq}_{cs} = .20$ . Vascular burden was a significant independent predictor of the presence of time-2 depression, Wald  $\chi^2(1) = 6.90$ ,  $p = .01$ . Age, gender, and baseline depression were also significant predictors of time-2 depression. Path analysis revealed that vascular burden was associated with worsening of depression ( $\beta = .106$ ,  $p = .02$ ) and cognitive decline ( $\beta = -.064$ ,  $p = .05$ ). These results suggest that vascular burden is a useful predictor of future depression and cognitive decline in this population.

#### AGE AS A MODERATOR OF THE EFFECT OF DEPRESSIVE SYMPTOMS ON IMMEDIATE RECALL MEMORY

K.R. Thomas<sup>1</sup>, M. Marsiske<sup>1</sup>, P. Belchior<sup>2</sup>, A. Yam<sup>1</sup>, 1. *Clinical and Health Psychology, University of Florida, Gainesville, Florida*, 2. *McGill University, Montreal, Quebec, Canada*

Both age and depression are related to memory performance. This study examined the joint and interactive effects to determine whether very old individuals with more depressive symptoms might evince disproportionately poorer memory performance. Ninety-four healthy older adults were administered neurocognitive, experimental, and mood measures. Participants ranged in age from 65 to 90 years (mean=73.55 years), were 62% female, and, on average, had completed a Bachelor's degree. Participants were cognitively intact and generally not depressed (mean

MMSE=28.26, SD=1.74; mean Geriatric Depression Scale [GDS]=4.39, SD=3.70). Participants were classified as young-old (65-74, n=56) or old-old (75+, n=38). Using OLS regression, the dependent variables were the Hopkins Verbal Learning Test (HVLT) immediate and delayed recall performances. Gender ( $\beta=-.220$ ,  $p<.05$ ), age category ( $\beta=-.212$ ,  $p<.05$ ), and the age by GDS interaction ( $\beta=-.312$ ,  $p<.01$ ) were significant predictors of HVLT immediate recall,  $R^2=0.25$ . When controlling for immediate recall, gender ( $\beta=-.169$ ,  $p<.01$ ) and immediate recall ( $\beta=.830$ ,  $p<.01$ ) were the only significant predictors of delayed recall,  $R^2=0.72$ . Results indicate that very old adults, particularly those with higher levels of depressive symptoms, were at greatest risk for immediate recall problems. Previous work has suggested that attention/working memory is sensitive to the effects of age and depressive symptoms. Immediate recall, which reflects initial learning and encoding of word lists, has been shown to have an attentional component. Thus, future research should examine whether disproportionate reductions of attention/working memory due to depression and aging help to explain this observed "double jeopardy" in immediate recall.

#### **FACTORS ASSOCIATED WITH DEPRESSIVE SYMPTOMS AMONG THE SOON-TO-BE-OLD, THE YOUNG-OLD, AND THE OLD-OLD**

R.K. Akashi<sup>1</sup>, A. Mui<sup>2</sup>, 1. Faculty of Sociology and Social Work, Meiji Gakuin University, Tokyo, Japan, 2. Columbia University School of Social Work, New York, New York

The fact that depression stands as the most prevalent psychopathology among the older generation indicates the importance of studying later-life depression (Bouhuys & Ormel, 2003). This research aims to investigate depressive symptoms among the soon-to-be-old, the young-old, and the old-old and their associated factors. A review of gerontology literature found that factors predicting depressive symptoms among older adults are diverse. Based on Lazarus and Folkman's stress and coping model (1984), this research categorized a variety of factors into 1) socio-demographic factors, 2) the respondents' previous level of psychological well-being; 3) stress factors; and 4) coping resources. In this secondary data analysis, using a dataset of the Aging, Status, and Sense of Control study (2001) (N=1,441), separate hierarchical regression models found that out of 21 variables in the four categories tested, no factor was common to all the three groups, and 10 factors varied among them. For the soon-to-be-old, the significant factors were: less than high school education, happiness in 1995, depressive symptoms in 1995, perceived health, and perceived social support. For the young-old, the significant factors were: gender, marital status, less than high school education, anxiety in 1995, and perceived health. For the old-old, the significant factors were: depressive symptoms in 1995, anxiety in 1995, functional limitations, perceived social support, and social contact. The finding that the significant factors of depressive symptoms are mostly unique to each age group suggests the necessity for age-group specific policy, program, and practice as the overarching interventions are not suitable for diverse older population.

#### **DEPRESSION PREVALENCE RATES AND AGES OF ONSET IN THE LONG LIFE FAMILY STUDY (LLFS) AND THE NEW ENGLAND CENTENARIAN STUDY (NECS) COHORTS**

J.D. Gass<sup>1</sup>, P. Sebastiani<sup>2</sup>, S.L. Andersen<sup>1</sup>, T.T. Perls<sup>1</sup>, 1. Medicine/Geriatrics, Boston University School of Medicine, Boston, Massachusetts, 2. Boston University School of Public Health, Boston, Massachusetts

Objective: To evaluate the prevalence and age of onset of depression in a cohort selected for familial longevity. Methods: We examined the depression-free survival of 1493 probands and their siblings and 192 spouses in the Long Life Family Study (LLFS) based on self or proxy report. There were two comparison groups: 1,797 centenarians from the New England Centenarian Study (NECS), and 436 NECS controls. Because prevalence rates can be misleading due to censoring (living

subjects who may develop depression later in life), we analyzed disease-free survival with Kaplan Meyer curves using the last age of contact for censoring. We also conducted a Bayesian analysis of disease-free survival using Weibull regression (proportional hazards and accelerated failure) and included random effects for relatedness. Finally, we estimated the mean age at which 25% of each cohort reported depression. Results: Survival curves demonstrate the NECS centenarians reporting the longest depression-free survival, followed by LLFS probands and siblings, LLFS controls, and NECS controls. When we looked at the ages at which each group reached a 25% prevalence of depression, we again found that NECS centenarians have the oldest age of onset, followed by LLFS proband generation participants and controls. Conclusions: These results indicate that centenarians and those with familial longevity are more likely to delay the onset of depression than referent cohorts. Differences between the two referent cohorts could be due to the older ages of the LLFS control sample.

#### **PERCEIVED CRITICISM, DEPRESSIVE SYMPTOM SEVERITY, AND PSYCHOLOGICAL WELL-BEING IN OLDER ADULT OUTPATIENTS: A PROSPECTIVE EXAMINATION**

P. Bamonti<sup>1</sup>, P. Duberstein<sup>2</sup>, D. King<sup>2</sup>, A. Fiske<sup>1</sup>, 1. West Virginia University, Morgantown, West Virginia, 2. University of Rochester Medical Center, Rochester, New York

Among treatment-seeking older adults, positive social ties are related to depression outcomes prospectively. Less is known regarding the role of negative social ties in relation to depression and well-being outcomes among patients in treatment. The current study adds to this literature through the cross-sectional and prospective examination of patients' appraisal of family members perceived criticism in relation to self-reported depressive symptom severity and psychological well-being. Participants were 114 adults (age M = 69.8, SD = 8.5 years, range 59-97) receiving mental health treatment. Participants completed measures within one month of their intake (time 1) and again six months later (time 2). Cross-sectional examination revealed that individuals who reported higher perceived criticism also reported greater depression symptom severity ( $B = .38$ ,  $SE = .12$ ,  $p < .01$ ). The prospective relation between perceived criticism and depression symptom severity at time 2 was non-significant after controlling for depression symptom severity at time 1 ( $B = .18$ ,  $SE = .11$ ,  $p > .05$ ). Cross-sectional examination of the relation between perceived criticism and psychological well-being revealed an inverse association ( $B = -2.00$ ,  $SE = .42$ ,  $p < .001$ ). Prospective examination revealed that individuals with higher perceived criticism reported lower levels of psychological well-being, even after controlling for psychological well-being at time 1 ( $B = -1.19$ ,  $SE = .49$ ,  $p < .05$ ). These findings suggest that perceived family criticism is prospectively associated with dampened psychological well-being. Additional research is needed to examine how perceived criticism and family functioning are related to treatment outcomes in older adults.

#### **HOW DOES CHANGE IN DEPRESSIVE SYMPTOMATOLOGY INFLUENCE TRAJECTORIES IN WEIGHT, COGNITIVE FUNCTION AND BEHAVIORS IN PATIENTS WITH DIABETES?**

C. Chiu<sup>1</sup>, F. Lu<sup>1,2</sup>, L.A. Wray<sup>4</sup>, E.A. Beverly<sup>3</sup>, 1. Institute of Gerontology, College of Medicine, National Cheng Kung University, Tainan, Taiwan, 2. Department of Family Medicine, College of Medicine, National Cheng Kung University, Tainan, Taiwan, 3. Joslin Diabetes Medical Center, Harvard Medical School, Boston, Massachusetts, 4. Department of Biobehavioral Health, Pennsylvania State University, University Park, Pennsylvania

The overall purpose of this study was to investigate associations between longitudinal changes in depressive symptoms and trajectories in weight, cognitive function and health behaviors. Data on 581 patients with diabetes (mean age 67, SD=8.3) who were interviewed face-to-

face in 1996 and followed up in the 1999, 2003, and 2007 waves of the Taiwan Longitudinal Study on Aging was used. Mixed effect regression analyses compared a) patients with persistently low depressive symptoms with those whose depressive symptoms increased (at least 5 points on CES-D) over 7 years from 1996 to 2003 and b) patients with persistently high depressive symptoms with those whose symptoms decreased (at least 5 points on CES-D) from 1996 to 2003 on their weight, cognitive and behavioral change during 1999, 2003 and 2007. Compared to those with persistently low depressive symptoms, those whose depressive symptoms increased did not differ in their patterns of cognitive function, but they had a significantly faster increase in BMI and decrease in amount of exercise they participated in. Although the groups had almost identical cognitive function at baseline, those whose depressive symptoms decreased had a significantly lower rate of decline in cognitive function compared to those with persistently high depressive symptoms. We concluded that weight management and maintain of healthy behaviors may be jeopardized by increment in depressive symptoms even for those with low depressive symptoms at baseline. In persons with diabetes who have high score of depressive symptoms, improvement in depressive symptomatology may reserve cognitive function.

### DEPRESSION, PAIN, AND POLYPHARMACY IN NURSING HOMES

S. Meeks<sup>1</sup>, I. Kostiva<sup>1</sup>, D. Antimisaris<sup>2</sup>, 1. *Dept. of Psychological & Brain Sciences, Univ Louisville, Louisville, Kentucky*, 2. *University of Louisville, Louisville, Kentucky*

Nursing home residents have high rates of polypharmacy and high risk for adverse drug events from the “prescribing cascade” of medication use leading to iatrogenic symptoms leading to more medication. Mood disorders may lead to expressions of distress that result in additional treatment; we hypothesized that depression would be a significant risk for polypharmacy. We analyzed data from two studies of nursing home residents: a review of 203 charts from 10 different facilities, and self-report and chart data from 110 residents of 12 facilities. We examined the inter-relationships among depressive symptoms, psychopharmacological agents, medical conditions, and pain in predicting polypharmacy. Both depression diagnosis and symptoms were related to the number of medications in both samples ( $r=.17-.25$ ). Diagnosis of depression was correlated with the use of antidepressants, and antidepressant use was significantly correlated with polypharmacy ( $r=.36$ ,  $p<.001$ ). Being on an antidepressant also predicted being on anxiolytics and hypnotics. With significant racial differences and total number of non-mental health diagnoses controlled, pain was a significant predictor of polypharmacy but depression was not. Anxiolytic and antidepressant use predicted polypharmacy, and pain mediated the anxiolytic effect on polypharmacy but not the antidepressant effect. That is, pain may increase the likelihood that anxiolytics are prescribed, and also increases other types of medication prescribing. Pain does not necessarily increase the number of antidepressants, which are independently related to polypharmacy. These findings may point to the role of emotion and pain, both of which can be treated non-pharmacologically, in managing chronic illness.

### RELATIONSHIP BETWEEN HOMEBOUND STATUS AND DEPRESSION TENDENCY IN COMMUNITY-DWELLING ELDERLY

K. Fujita, Y. Kaneko, Y. Motohashi, *Department of Public Health, Akita University Graduate School Of Medicine, Akita, Japan*

OBJECT: We aimed to verify the relationship between being homebound and depression, i.e. a ‘downward spiral’, among community-dwelling elderly. METHODS: We conducted a population-based cohort study with self-administered questionnaires in rural Akita, Japan (population aging rate: 35.2%). All residents age 30 and over were baseline surveyed in October, 2008, and follow-up surveyed in July, 2010. Replies

to follow-up surveys were obtained from 944 (75.8%) of 1,245 persons replying to baseline surveys of those 65-89 years old. Depression was assessed using Kessler’s 6-Item Psychological Distress Scale (K6), score range 0-24, and depression was defined as  $K6 \geq 9$ . Homebound status was estimated by frequency of going outdoors. Logistic regression analysis examined correlations between depression and homebound status, independently of potential confounders. RESULTS: Excluding 433 subjects with incomplete data, 511 were analyzed. Of 445 subjects without depression at baseline, 30 (6.7%) were assessed as having depression at follow-up. Of 371 subjects whose frequency of going out was “ $\geq$ once a day” at baseline, 83 (22.4%) went out “ $\leq$ once every 2-3 days” at follow-up. On multiple logistic regression analysis, the odds ratio for depression, comparing “ $\geq$ once a day” and “once every 2-3 days” was 3.02 (1.28-7.14), while that for “ $\leq$ once per week” was 0.75 (0.18-3.06). The odds ratio for reduced frequency of going out, versus “ $K6 \leq 3$ ”/“ $K6 > 3$ ” was 1.73 (1.05-2.85). Conclusion: Our results suggest a downward spiral relationship between “homebound status” and depression.

### PAIN VARIABILITY AND ITS PREDICTORS: DEPRESSION, AFFECT, COGNITION, FUNCTIONALITY, AND HEALTH

K. Zakoscielna<sup>1</sup>, P.A. Parmelee<sup>1,2</sup>, 1. *University of Alabama, Tuscaloosa, Alabama*, 2. *Center for Mental Health and Aging, Tuscaloosa, Alabama*

A strong correlation has been found between pain and variables such as depression, affect, cognition, functionality, and health. Pain variability, however, has neither been concisely studied, nor has its relationship with the previously mentioned variables. The purpose of this secondary data analysis is to determine whether depression, affect, cognition, functional status, and health are predictors of day-to-day pain variability in older adults in long-term care settings. Drawn from a sample of older long-term care residents, 56 adults aged 68 years and older were included in the multiple linear regression analyses. Pain variability was measured over 30 days of self-reported pain levels. The Geriatric Depression Scale (GDS), Philadelphia Geriatric Center Positive and Negative Affect Scales, Memory-Information-Concentration test, Physical Self-Maintenance Scale (PSMS), and perceived health were used as predictors. Results show a significantly positive association between total GDS score and pain variability ( $p<.05$ ,  $\beta=.468$ ). Results also showed that there is a positive correlation between pain variability, positive affect variability and negative affect variability ( $p<.05$ ,  $r=.246$ ;  $p<.05$ ,  $r=.301$  respectively). Additionally, a negative correlation was found between pain variability, mean negative affect, and perceived health ( $p<.05$ ,  $r=-.332$ ;  $p<.05$ ,  $r=-.430$  respectively). These results indicate that with increased pain variability, daily affect variability (both positive and negative) increases, while perceived health and overall negative affect decrease. Understanding the relationships that affect pain variability may potentially alleviate changeability of pain, as well as improve affect and decrease depressive symptoms in older adults.

### THOUGHT SUPPRESSION AND SELF-BLAME MEDIATE THE RELATIONSHIP BETWEEN EVENTS AND DEPRESSIVE SYMPTOMS

S. Scott, M. Sliwinski, J. Smyth, *Penn State, University Park, Pennsylvania*

Recurrent, negative thoughts often follow stressful experiences. The way individuals manage these thoughts may help to explain the relationship between life events and depression symptoms. Attempting to suppress unwanted thoughts can actually make them more intrusive and frequent. The strategy of blaming oneself for these thoughts has also been related to emotional vulnerability. Participants ( $n=322$ , age range=19-83) completed surveys of recent life events, depressive symptoms, thought suppression, and self-blame. Thought suppression and self-blame were positively correlated with life events and depressive symptoms. Although the direct path between events and symptoms

remained significant, the tendency to engage in maladaptive thinking – both thought suppression and blame – partially mediated this relationship, suggesting that part of the relationship between stressors and depressive thinking is through maladaptive strategies for managing negative thoughts. These account for unique variance and may be components of a broader set of ineffective strategies for coping with stress.

### THE GERIATRIC DEPRESSION SCALE: CORRELATION BETWEEN TELEPHONE AND IN-PERSON ADMINISTRATIONS

K.B. Dassel<sup>1</sup>, H. Ewen<sup>2</sup>, 1. *Western Kentucky University, Bowling Green, Kentucky*, 2. *Miami University, Oxford, Ohio*

The Geriatric Depression Scale (GDS) is a brief 30-item questionnaire used to screen for cognitive, somatic, and affective symptoms of depression within the older adult population. The purpose of this pilot study was to explore the association between telephone (GDS-T) and in-person (GDS-P) administrations of the GDS in a group of spousal caregivers (N = 40) of persons with cognitively impairment. Caregivers were administered the GDS-T first and then completed the GDS-P within a two week follow-up period (mean = 13.8 days; S.D. = 12.4). The caregivers averaged 75.6 (S.D. = 6.1) years of age with 14.9 (S.D. = 2.7) years of education. The caregiver sample was 60% female, cognitively intact (Mini Mental State Exam scores = 29.1; S.D. = 0.8), and rated their health between good and excellent. The relationship between the mean total scores two administration versions of the GDS was assessed using a paired-samples t-test and a Pearson correlation coefficient. The mean scores for the GDS-T was 3.1 points (S.D. = 2.4) and 3.4 points (S.D. = 2.2) for the GDS-P. Results of the paired-samples t-test revealed no significant differences between the two test administrations ( $t(1, 39) = -.70$ ;  $p = 0.49$ ). Results of the Pearson correlation between the two administration formats was found to have a moderate level of association ( $r = 0.60$ ;  $p < .001$ ). In conclusion, results of this pilot study suggest that the GDS-T is a valid administration format that can be used with older adult caregivers.

### CROSS-LAGGED EXAMINATION OF TOTAL CHOLESTEROL AND DEPRESSIVE SYMPTOMS: FINDINGS FROM THE NAS

J. Proulx<sup>1</sup>, R. Nath<sup>1</sup>, H. Igarashi<sup>1</sup>, Y. Jeong<sup>1</sup>, C.M. Aldwin<sup>1</sup>, A. Spiro<sup>2</sup>, 1. *Oregon State University, Corvallis, Oregon*, 2. *VA Boston Health Care System and Boston University School of Public Health, Boston, Massachusetts*

Clinicians often recommend changes in medications and lifestyle that are intended to lower cholesterol in their patients, due to the increased health risks associated with high cholesterol. However, some studies indicate an inverse relationship between serum lipids, especially total cholesterol (TC) and depression (Shin, Suls, & Martin, 2008). However, these studies are controversial, in part due to their cross-sectional design (Sansone, 2008). The current study uses longitudinal data collected two time over a three year interval from 1,028 men who were participants of the Normative Aging Study (NAS); Mage at baseline = 65.48, SD = 7.83, range 43 – 90). Depressive symptoms (DS) were measured by the Brief Symptom Inventory subscale,  $\alpha = .85$  (Derogatis & Melisaratos, 1983). Preliminary analyses used a zero-inflated Poisson cross-lagged path model in Mplus 6.0 to examine bidirectional relations between TC and DS over three years. Results showed a modest relationship between TC at T1 and DS at T2: a one SD (37.03) increase in cholesterol raised the odds of not having depressive symptoms at T2 by a factor of 1.40 ( $B = .008$ ,  $p < .01$ ), controlling for age at baseline. This longitudinal study supports earlier cross-sectional work suggesting an increased risk of depression when treating high cholesterol.

## SESSION 1220 (POSTER)

### ENVIRONMENTAL ISSUES AND AGING

#### ASSOCIATIONS BETWEEN NEIGHBOURHOOD BUILT ENVIRONMENT AND WALKING AMONG COMMUNITY-DWELLING SENIORS LIVING IN SMALL TOWNS OR RURAL AREAS: RESULTS FROM THE NUAGE STUDY

M. G  n  reux<sup>1,2,3</sup>, M. Roy<sup>2</sup>, M. Levasseur<sup>2</sup>, J. Breau<sup>4</sup>, H. Payette<sup>2,1</sup>, 1. *Department of community health sciences, Faculty of medicine and health sciences, University of Sherbrooke, Sherbrooke, Quebec, Canada*, 2. *Research center on aging, Health and social services center - University institute of geriatrics of Sherbrooke, Sherbrooke, Quebec, Canada*, 3. *Direction de la sant   publique et de l'  valuation de l'Agence de la sant   et des services sociaux de l'Estrie, Sherbrooke, Quebec, Canada*, 4. *Department of medicine, Faculty of medicine and health sciences, University of Sherbrooke, Sherbrooke, Quebec, Canada*

Objective: In large cities, several features of the built environment have been associated with seniors' walking. However, little knowledge is currently available for such associations in small towns or rural areas. This study thus aimed to examine associations between features of the built environment and walking frequency and duration among community-dwelling seniors living in small towns or rural areas. Method: This study was based on a cross-sectional sample of 904 older adults (2006-2007; females=50.7%) aged 67-82 years from the Quebec Longitudinal Study on Nutrition and Aging and living in the Sherbrooke area (Qu  bec, Canada). Data were self-reported and collected by means of interviewer-administered questionnaire. Features of the neighbourhood built environment were: 1) perceived ease of walking, 2) feeling of day-time security, and 3) proximity to  $\geq 1$  neighborhood resources (services, amenities) within a 5-minute walk of the participant's residence (yes/no). Outcomes were walking frequency ( $\geq 5$  versus  $< 5$  days/week) and duration ( $\geq 1$  versus  $< 1$  hour/day). Using multivariate logistic regression, associations were adjusted for sociodemographic characteristics (age, sex, and education level), and multimorbidity (number of chronic conditions). Results: More than two fifths (41.2%) and one quarter (26.7%) of seniors respectively walked frequently and for long periods. Walking frequently was independently associated with perceived ease of walking (OR=2.17;95%CI=1.28-3.69), feeling of day-time security (OR=3.17;95%CI=1.15-8.71) and proximity to  $\geq 1$  neighborhood resources (OR=1.76;95%CI=1.01-3.05). None of the built environment features were associated with walking duration. Conclusions: Future studies should investigate why features of the built environment were associated with walking frequency but not with walking duration.

#### RESPONSES TO AIR QUALITY ALERTS: DO ELDERLY AMERICANS SPEND LESS TIME OUTDOORS?

A. Sexton, *Abt Associates, Minneapolis, Minnesota*

Air pollution levels can vary dramatically from day to day based on predictable weather variables. Thus episodic policies aimed at reducing exposure on high pollution days may be cost effective relative to policies aimed at reducing pollution exposure across all days. Episodic approaches seek to reduce exposure by increasing averting behavior among at-risk individuals. This paper uses data from the American Time Use Survey (ATUS), a nationally representative survey, to study whether the elderly—those most at risk due to health complications from high pollution—respond to daily information on air-quality levels or to air-quality alerts issued during periods of high pollution by reducing their vigorous outdoor activities (VOAs), and thus minimizing their exposure. The ATUS contains information on all VOAs, thus allowing for a comprehensive study of elderly individuals' responses to air-quality information. Results show that on average elderly individuals respond to air-quality alert days by spending 59 percent less time in VOAs on

that day, which represents a 65-minute reduction. Further, there is no evidence that they make-up forgone VOAs at other times when the health risk is lower. Although averting behavior in response to air-quality alerts is a positive result regarding public health, there are negative health affects associated with an overall reduction in VOAs. After attending this session, participants will have a better understanding of the overall effects of air quality and air-quality alerts on behavior of the elderly population, and will also be informed as to the important policy implications that these results suggest.

#### **HOME AND COMMUNITY ENVIRONMENTAL FEATURES, ACTIVITY PERFORMANCE, AND COMMUNITY PARTICIPATION TO SUPPORT AGING IN PLACE AMONG OLDER ADULTS WITH FUNCTIONAL LIMITATIONS**

H. Yang, J.A. Sanford, *CATEA, Georgia Institute of Technology, Atlanta, Georgia*

This paper describes relationships among home and community environmental features, activity performance (i.e., independence-dependence and ease-difficulty) in the home, and community participation potential (i.e., frequency of going into community) to support aging in place as a comprehensive understanding of the interrelationships among home and community environments, performance, participation is still lacking. The study employed a cross-sectional survey design. A subset of data on older adults with functional limitations (N = 122), sixty three (63) with mobility and 59 with other limitations, were utilized in this study from a larger project's subject pool. Results showed significant and positive correlations between environmental barriers, activity dependence and difficulty at home, and less community participation potential in the mobility limitation group. While kitchen and bathroom features were most limiting to home performance, bathtub or shower was the only home feature that explained community participation (adjusted  $r^2 = .055$ ,  $P < .05$ ). Compared to environmental features, home performance explained much more community participation. Difficulty in getting in and out of a bathtub/shower accounts for almost one-third of community participation (adjusted  $r^2 = .306$ ;  $P < .001$ ). In the community, destination social environment was the only community feature that explained community participation (adjusted  $r^2 = .130$ ;  $P < .01$ ). Study results help to prioritize intervention and suggest that environmental modifications should be conceived as a continuum of interventions from home to community in order to support both the activities and community participation that are necessary for successfully aging in place.

#### **FACILITATING AGE-FRIENDLY COMMUNITY USING SOCIAL CAPITAL APPROACH AND UNIVERSITY-LOCAL PARTNERSHIP**

S. Pasupuleti, S. Balaswamy, *Criminal Justice & Social Work, The University of Toledo, Toledo, Ohio*

Rapidly increasing aging population necessitated improving environment for older adults so that they can successfully age in their familiar environment. By 2020, there will be 97,000 individuals 60+ in Lucas County, which is a 27% increase. The "Age Friendly Toledo initiative" has been in place for making the community by improving - physical, social and emotional support systems. Community-wide efforts are being made to transform the Toledo community to become age-friendly to accommodate the changing demographics using the WHO's guidelines elements. Since 2006, the World Health Organization (WHO) is advocating for global efforts to transform communities as age-friendly. This two year project combines a social capital approach and community organization principles to facilitate collaboration among diverse stakeholders to build inclusive age-friendly community in a city with meager resources. The first phase consisted of monthly meetings with identified stakeholders, recruitment and training of volunteers, formation of a local committee and data collection on needs. Surveys are designed on the key domains postulated by WHO like outdoor spaces and build-

ings, transportation, housing, social participation, respect and social inclusion, civic participation and employment, communication and information and finally community support and services. The study focused to assess service needs and gaps in the city/county with help of focus groups, archival data and field observations. Findings suggest challenges in collaboration due differing interests, resource constraints, resistant to investments, diverse views on allocation of scarce resources, and economic uncertainties. Elders views were positive, reflects resiliency, and self-sustainability. Implication for theory and practice will be discussed.

#### **THE HAZARDS OF BAD AIR: FINE AIR PARTICULATE MATTER AND COGNITIVE FUNCTION IN OLDER U.S. ADULTS**

J.A. Ailshire, *Andrus Gerontology Center, Univ Southern California, Los Angeles, California*

Impaired cognitive function has serious negative health, social, and economic consequences for older adults, their caregivers, and society. Although a number of individual risk factors for cognitive decline and low cognitive function have been identified, relatively little research has focused on potential environmental risk factors, such as air pollution. This study examines the link between residential air pollution exposure and cognitive function among older U.S. adults. The study sample includes 9,660 non-Hispanic white and non-Hispanic black men and women ages 60 and older who participated in the 2000 Health and Retirement Study, a nationally representative study of older adults, and lived in their residence since 1999. Individual data were combined with data on 1999 levels of fine air particulate matter (PM) from the Environmental Protection Agency's Air Quality System monitors. Cognitive function was measured in terms of episodic memory and mental status. In unadjusted models mean cognitive function declined with increasing levels of fine PM. Cognitive function continued to be lower among individuals living in the most polluted areas, even with adjustment for demographic and socioeconomic characteristics and health status. Associations between cognitive function and fine PM were stronger among women, suggesting that exposure to pollution may be more detrimental to the cognitive function of older women. This is the first study to show how exposure to air pollution influences cognitive function in a national sample of older men and women, and suggests that fine air particulate matter may be an important environmental risk factor for reduced cognitive function.

### **SESSION 1225 (POSTER)**

#### **EPIDEMIOLOGY**

#### **REEXAMINING THE ASSOCIATION BETWEEN FERTILITY AND LIFESPAN: TESTING THE DISPOSABLE SOMA THEORY IN A MODERN HUMAN SAMPLE OF TWINS**

E. Chereji<sup>1</sup>, N.L. Pedersen<sup>2,1</sup>, C. Prescott<sup>1</sup>, 1. *University of Southern California, Los Angeles, California*, 2. *Karolinska Institute, Stockholm, Sweden*

Research on the existence and direction of the relationship between fertility and lifespan has yielded mixed results. One evolution-based theory, the disposable soma theory (DST), proposes a trade-off between fertility and lifespan in females with natural selection favoring allocation of resources toward reproduction at the expense of longevity. The present study used data from the Swedish Twin Registry to test whether additional children are related to decreased lifespan (as proposed by the DST) and whether demographic covariates explain any relationship found. Data from pairs of twins were analyzed to elucidate whether the association between fertility and lifespan is accounted for by individual-level factors or by genetic and environmental factors shared by family members. Fertility and longevity information from female and male

twins (N=15,622) born 1901-1925 were analyzed using survival analysis. Contrary to the DST, women with children had significantly longer lifespans relative to those who were childless [males without kids (ref)=1.00, males with kids=1.06, females without kids=1.20, females with kids=1.27]. Although women in general lived longer than men, the survival advantage associated with parenthood was similar for the sexes and the effect did not depend on number of offspring. Adjustments for demographic factors and co-twin fertility did not alter the prediction for an individual's survival, indicating that the association is attributable to individual-level factors associated with fertility rather than family-level environmental or genetic factors shared by co-twins. These results, derived from a large, population-based sample, are inconsistent with the disposable soma theory as applied to modern humans.

### **METABOLIC FUNCTIONING AND TRAJECTORY OF GRIP STRENGTH AMONG OLDER JAPANESE ADULTS: A BIOPSYCHOSOCIAL PERSPECTIVE**

J. Liang<sup>2</sup>, L. Nyquist<sup>2</sup>, J.M. Bennett<sup>2</sup>, S. Shinkai<sup>3</sup>, Y. Fujiwara<sup>3</sup>, A.E. Aiello<sup>2</sup>, A. Botosaneanu<sup>1</sup>, 1. *Yale University, New Haven, Connecticut*, 2. *University of Michigan, Ann Arbor, Michigan*, 3. *Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan*

**Background.** Socioeconomic differences in physical performance have been documented in older adults. Despite the increase in obesity and related metabolic dysfunction, the association between metabolic functioning, psychosocial resources and physical performance trajectories in older adults has not been evaluated. **Methods.** We used longitudinal data from 1,381 Japanese adults aged 70 years or older to assess the association between psychosocial characteristics (education, gender, age, self-rated well-being), metabolic functioning (percent body fat, weight, triglycerides, HDL-cholesterol, HbA1c) and trajectories of grip strength (GS). Hierarchical linear models with time-constant and time-varying covariates estimated the GS trajectory (intercept and rate-of-change). **Results.** GS declined over 9 years following a linear trajectory. Women showed a lower GS intercept ( $b = -12.191, p < 0.001$ ) but a slower rate of decline ( $b = 0.195, p < 0.01$ ) compared with men. Higher education was associated with a stronger GS at baseline ( $b = 0.184, p < 0.01$ ) but not with differences in the rate of change over time. Higher baseline body-weight was associated with stronger baseline GS ( $b = 0.268, p < 0.001$ ) and a faster rate of decline in GS ( $b = -0.018, p < 0.05$ ); percent body-fat was negatively related to GS intercept ( $b = -0.220, p < 0.001$ ) and positively to the rate of decline ( $b = 0.021, p < 0.05$ ). There were no significant correlations between GS trajectory parameters and triglycerides, HDL-cholesterol, or HbA1c. Metabolic functioning fully mediated the educational differences in GS intercept and partially mediated gender differences in GS rate-of-decline. **Conclusion.** Differences in metabolic functioning profiles partly explain psychosocial differences in muscular strength in older adults.

### **PHYSICAL ACTIVITY AND MORTALITY RISK AMONG OBESE AND NON-OBESE OLDER ADULTS**

B.A. Shaw<sup>1</sup>, J. Newsom<sup>2</sup>, 1. *University at Albany, School of Public Health, Rensselaer, New York*, 2. *Portland State University, Portland, Oregon*

**Introduction:** Prior research has found physical inactivity to be a predictor of mortality among middle aged adults, regardless of weight status. The purpose of this study was to examine the degree to which inactivity continues to predict mortality among older adults in various body mass index (BMI) categories. **Methods:** Baseline data came from a sample of close to 20,000 adults, ages 51 and older, who participated in the 1998 Health and Retirement Study (HRS). Each respondent was asked if they participated in vigorous physical activity at least three times per week; those who responded negatively (56% of sample) were defined as inactive. BMI was also assessed at baseline. Mortality status and date of death were tracked until 2008. The mortality risk associated with inactivity was estimated separately for normal-weight, overweight, and

obese adults, after controlling for sociodemographic variables and baseline functional status. **Results:** Inactivity was associated with an increase in mortality risk of approximately 50-70%, with negligible variation across BMI categories. However, among normal-weight and overweight adults, the risk of inactivity declined significantly with increasing age, while no such decrease was evident among obese adults. **Conclusions:** During later life, physical inactivity is increasingly common with advancing age, and its prevalence is particularly high among obese adults. Nevertheless, the health impact of inactivity does not diminish among older obese adults as it does among non-obese adults. Efforts to identify and address factors, other than functional ability, that may be inhibiting physical activity among obese individuals are still needed in later life.

### **THE ASSOCIATION OF DIABETES WITH INCIDENT COGNITIVE AND MENTAL HEALTH OUTCOMES IN OLDER PUERTO RICANS**

M. Crowe<sup>1</sup>, A. Garcí a Gurucharri<sup>2</sup>, O.J. Clay<sup>1</sup>, K. Markides<sup>3</sup>, A. Dávila<sup>2</sup>, 1. *University of Alabama at Birmingham, Birmingham, Alabama*, 2. *University of Puerto Rico, Río Piedras, Puerto Rico*, 3. *University of Texas Medical Branch, Galveston, Texas*

**Objective:** We examined diabetes as a predictor of incident cognitive impairment, depressive symptoms, and comorbidity of these outcomes in a nationally representative sample of adults age 60+ years in Puerto Rico. **Methods:** There were 2,726 participants from the Puerto Rican Elderly: Health Conditions study who completed cognitive testing at baseline and four-year follow-up, and who did not have early-onset diabetes (onset <age 30). Cognitive impairment was defined as scoring <1.5 standard deviations below a predicted score based on age and education for the Minimalist Cabán (MMC). The 20-point MMC includes items related to verbal and visual memory, orientation, and executive function. Scores on the 15-item Geriatric Depression Scale were categorized as normal (0-4), mild (5-8), moderate (9-11), or severe (12-15). Incident depression was defined as change to a higher category at follow-up. **Results:** Diabetes was associated with 43% greater risk of incident cognitive impairment (OR=1.43, 95% CI: 1.15-1.79), 60% greater risk of incident depression (OR=1.60, 95% CI: 1.25-2.04), and 83% greater risk of comorbid cognitive impairment and depression (OR=1.83, 95% CI: 1.31-2.57) in models adjusted for age, gender, race, and years of education. Associations with cognitive impairment and comorbidity remained statistically significant after additional adjustment for vascular health conditions and diabetes-related complications. The relationship between diabetes and incident depression was explained by diabetes-related complications. **Conclusions:** Diabetes is strongly associated with adverse cognitive and mental health outcomes in older Puerto Ricans. Prevention and treatment of diabetes in this population may help to preserve cognitive and mental health in later life.

### **MODELLING THE IMPACT OF CHRONIC DISEASES ON DISABILITY-FREE LIFE EXPECTANCY IN THE VERY OLD**

A. Kingston<sup>1</sup>, J. Bond<sup>2</sup>, J. Collerton<sup>1</sup>, K. Davies<sup>1</sup>, L. Robinson<sup>2</sup>, T. Kirkwood<sup>1</sup>, C. Jagger<sup>1</sup>, 1. *Institute for Ageing and Health, Newcastle University, Newcastle upon Tyne, United Kingdom*, 2. *Institute of Health and Society, Newcastle University, Newcastle upon Tyne, United Kingdom*

**Aims:** Although there has been some research on the effect of different diseases on disability incidence and mortality, results are rarely reported in terms of composite indicators of disability-free life expectancy. Here we describe both the methods and results of the impact of different diseases on total, disabled and disability-free life expectancy using three waves of data from the Newcastle 85+ Study, a large, representative cohort (n=852; including community-dwelling and those in institutional care) all born in 1921 and interviewed at age 85 with follow up at 18 and 36 months. **Methods:** Multi-state models with three states (none/mild disability, moderate/severe disability and death) were

fitted with death as an absorbing state using the msm package in R. We assumed that transitions from non/mild disability to death were via moderate/severe disability. Eight diseases were added singly as covariates into the model but also with a disease count (excluding that disease) to adjust for comorbidity. From the resulting transition intensities remaining years of life and remaining years with and without moderate/severe disability were calculated through microsimulation. Results: Those with dementia lived 0.5 years less overall but 0.2 years more with moderate/severe disability and 0.7 years less with none/mild disability. Those with arthritis lived 0.5 years more but 0.2 years fewer in none/mild disability and 0.7 years more in moderate severe disability. We will present results showing the impact of each disease on the transitions in disability and the life expectancy in each state, alongside the methodology implemented to elucidate our findings.

### RECENT TRENDS IN COMPLEX HEALTH PROBLEMS IN THE OLDEST OLD IN SWEDEN 1992-2010

B. Meinow, I. Kåreholt, M.G. Parker, *Aging Research Center (ARC) Karolinska Institute & Stockholm University, Stockholm, Sweden*

Studies addressing multiple morbid conditions in elderly populations usually focus on disease and physiological indicators relevant for the medical care system. Few studies include both medical and functional indicators, which together indicate the need for integrated care from different providers of medical and long-term care (home-help, institutional care) as well as informal caregivers. When assessing elder-care needs and the wellbeing of the oldest old, trends of complex health problems seem more useful than single health items that may follow diverse trends over time. This study identified severe problems in three health domains (health items/symptoms, mobility, cognition/communication) in three nationally representative samples of the Swedish population aged 77+, including institutionalized people and proxy interviews for those who were too frail to be interviewed themselves. People with severe problems in two/three domains were considered having complex health problems. Changes in the proportion of people with complex health problems between 1992, 2002 and 2010 were analysed with logistic regressions as well as differences according to age, gender, and education. Results showed a significant increase of elderly people with complex health problems from 19% in 1992 to 26% in 2002. Between 2002 and 2010/11 there has been no significant change. Gender, age and education had significant independent effects on the odds of having complex health problems. Patterns were similar for men and women. From a social policy perspective, stable prevalence rates of complex health problems among the oldest old since 2002 emphasize the continuing need for extensive collaboration between medical and social services.

### ASSOCIATIONS BETWEEN HEALTH-RELATED MEASURES AND INCOME IN LOCAL OLDER POPULATIONS: JAGES2010

R. Ohtsuka<sup>1</sup>, K. Kondo<sup>2</sup>, M. Nakade<sup>3</sup>, K. Suzuki<sup>2</sup>, C. Murata<sup>4</sup>, D. Matsumoto<sup>5</sup>, K. Shirai<sup>6</sup>, H. Miura<sup>1</sup>, *1. National Center for Geriatrics and Gerontology, Obu, Aichi, Japan, 2. Nihon Fukushi University, Nagoya, Aichi, Japan, 3. Tokaigakuen University, Nagoya, Aichi, Japan, 4. Hamamatsu University School of Medicine, Hamamatsu, Shizuoka, Japan, 5. Kio University, Kitakatsura-gun Kouryou-tyo, Nara, Japan, 6. University of the Ryukyus, Nakagami-gun Nishihara-tyo, Okinawa, Japan*

**BACKGROUND:** Links between socioeconomic status and health-related measures have been reported in many studies. However few of them compared health-related measures by income in Japan. **OBJECTIVE:** We used data from the Japan Gerontological Evaluation Study (JAGES) to examine the effects of income on health-related measures in local older populations. **SUBJECTS:** From August 2010 to April 2011, postal surveys (including field interviews for a part) were sent to 117,494 older people living in 27 municipalities in Japan who had not been cer-

tified to receive long-term care. Responses were received from 78,769 people (response rate: 67.0%). **METHODS:** We calculated equivalent income and examined health-related measures, including obesity, meat/fish and fruit/vegetable consumption, sports participation, walking, smoking, alcohol consumption, sleep problems and sleep quality. Respondents were grouped into low, middle or high income, and data were analyzed using logistics regression after adjusting for age. **RESULTS:** We compared health-related measures with the high income group as the reference ( $p < .01$  for all results below). In the low income group, more women were obese and, in both men and women, meat/fish consumption frequency, fruit/vegetable consumption frequency and sports participation were lower, walking time was shorter, smoking was more prevalent, alcohol consumption less prevalent, sleep problems were more frequent and sleep quality was poorer. **CONCLUSION:** The results of this study suggested that lower equivalent income was associated with a lower tendency to perform favorable health-related measures in older people. Future studies are needed to examine other social and environmental factors related to health promotion.

### CHOLESTEROL TRAJECTORIES AND MORTALITY: FINDINGS FROM THE NORMATIVE AGING STUDY

L. Lee<sup>1,3</sup>, C.M. Aldwin<sup>4</sup>, Y. Jeong<sup>4</sup>, M. Levenson<sup>4</sup>, A. Spiro<sup>1,2,3</sup>, *1. Department of Epidemiology, Boston University School of Public Health, Boston, Massachusetts, 2. Department of Psychiatry, Boston University School of Medicine, Boston, Massachusetts, 3. Behavioral Science Division, National Center for Posttraumatic Stress Disorder, VA Boston Healthcare System, Boston, Massachusetts, 4. Human Development & Family Sciences, School of Social & Behavioral Health Sciences, Oregon State University, Corvallis, Oregon*

Cholesterol is a major risk factor many illnesses in late life, including cardiovascular disease and Alzheimer's disease (Finch, 2011). However, most studies utilize a two-point design, using baseline cholesterol to predict subsequent illness. We examined individual trajectories in total cholesterol (TC) across 26 years in 991 men from the Normative Aging Study (NAS) (Mage = 60.9 years, SD=6.7, range 50-90 in 1985). Serum total cholesterol was measured enzymatically approximately every 3 years between 1985-2010. The Content Scales of Anger, Anxiety and Depression in the Minnesota Multiphasic Personality Inventory-2, administered in 1986, were used to construct a latent factor representing disposition toward negative emotionality. Hierarchical linear regression was conducted to examine longitudinal change in TC. Results yielded a mild quadratic curve, with mean TC showing a decreasing trend that became slightly more accelerated in later age. There was significant individual variation in TC intercepts and slopes. Preliminary results from a Cox regression implemented in a structural equation modeling framework indicated that both the TC intercept and slope were predictive of mortality (HRintercept = 1.50, 95%CI: 1.34, 1.69; HRslope = 1.33, 95%CI: 1.21, 1.45), suggesting that individuals with higher TC at baseline or less decline in TC over age experienced earlier mortality. The effects were independent of disposition toward negative emotionality. As most of the NAS men were not on statins during the study period, the decrease in cholesterol probably reflects the decrease in weight that occurs in late life.

### SESSION 1230 (POSTER)

#### FALL RISK

#### ASSOCIATION OF FALLS AND ANTIDEPRESSANT USAGE IN OLDER ADULTS

A. Swailes, J.D. Flatt, J. King, E. Luksik, C. Narkevic, S.M. Albert, *BCHS, University of Pittsburgh, Pittsburgh, Pennsylvania*

**Background:** Falls are the primary cause of injury and hospitalization among older adults, and can lead to limited mobility, the inability

to live independently, and death. Previous research suggests that certain medications may lead to more frequent falls. Purpose: To examine the effects of antidepressant usage on fall risk in older adults in the independently-living senior population in Pennsylvania. Methods: Prescription data were collected in a baseline interview via telephone for seniors aged 50 and older. These seniors were contacted monthly during the next 5 months to track falls, injuries, and hospitalizations. Results: At the time of the baseline interview, seniors that reported taking antidepressants ( $n=205$ ) were twice as likely as those who were not taking antidepressants ( $n=1336$ ) to report a fall in the previous 30 days (12.2% vs. 6.1%,  $p<0.01$ ). Conclusions: These preliminary data suggest that antidepressant usage is associated with an increased risk of falling in an elderly population. Fall prevention strategies should consider antidepressant usage as a possible risk factor for falls, and encourage communication between seniors and their healthcare providers about the possible secondary effects of their medications.

### **COGNITIVE IMPAIRMENT AS A POTENTIAL FALL RISK IN COMMUNITY-DWELLING OLDER ADULTS**

J.D. Flatt, A. Swailes, J. King, E. Luksik, C. Narkevic, J. Nutini, C. Petruzzini, S.M. Albert, *University of Pittsburgh, Graduate School of Public Health, Behavioral and Community Health Sciences, Pittsburgh, Pennsylvania*

Background: Falls are a major concern for older adults and lead to increased risks of morbidity and mortality. Research has suggested that older adults with cognitive impairment may be at an increased risk for falls. Purpose: Examine the effects of cognitive impairment on fall risk and circumstances in community-dwelling older adults in Pennsylvania. Methods: Data were collected by telephone for up to 5 months from seniors aged 50 and older. Cognition was assessed via the Memory Impairment Screen (MIS) at baseline and participants were contacted monthly about falls and circumstances. Results: At baseline, older adults with cognitive impairment ( $n=168$ ) were more likely to report falling both in the past year and the past 30 days ( $p<.05$ ) compared to those with no impairment ( $n=1632$ ). Examining those who reported a fall during the 5 monthly follow-ups ( $n=250$ ), cognitively impaired older adults were more likely to be recurrent fallers ( $p<.001$ ). In regards to fall circumstances, older adults with cognitive impairment were more likely to have fallen inside their home (67% vs. 44%,  $p<.05$ ) and when bending or changing position (30% vs. 13%,  $p<.05$ ). Conclusion: These results provide insight into the fall risk and circumstances in older adults with cognitive impairment. Fall prevention efforts should consider cognitive impairment as a risk factor for falls and targeted prevention strategies may be necessary.

### **ATTENTIONAL NETWORK TASK PERFORMANCE AND FEAR OF FALLING IN OLDER JAPANESE ADULTS**

F. Togo<sup>1</sup>, A. Ohnishi<sup>2</sup>, K. Ishimatsu<sup>3</sup>, 1. *Graduate School of Education, The University of Tokyo, Tokyo, Japan*, 2. *National Institute of Occupational Safety and Health, Kawasaki, Japan*, 3. *Graduate School of Health Care Sciences, Jikei Institute, Osaka, Japan*

The present study assessed the associations between attentional performance and fear of falling in 37 male volunteers, aged 60-69 years. Reaction times (RT) for the Attentional Network Task (ANT) were collected. For the ANT, stimuli consisted of a row of 5 items with the third (central) item as either a leftward or rightward pointing arrow. Participants focused on the central target and pressed one key when the central target pointed to the left or a different key when it pointed to the right. The two items (flankers) on either side of the central target were either horizontal lines (neutral condition) or arrows. The congruent and incongruent flanker conditions consisted of flanking arrows pointing in the same and opposite direction as the central target, respectively. On some trials, warning cue was presented 400 ms before the stimuli. Cues were presented at central fixation point, or both above and below the fixation point, or on the target location. We assessed the efficiency

of the segregated alerting, orienting, and executive control networks by measuring how response latencies were influenced by alerting cues, spatial cues, and flanking stimuli, respectively. Participants completed 96 trials of the flanker task. Fear of falling was assessed by the Modified Fall Efficacy Scale. Response latencies did not correlate with the level of fear of falling for spatial cues and flanking stimuli, but correlated significantly for alerting cues. These results indicate that impaired alerting system which controls alert state correlate with falls in the elderly.

### **ADAPTED ACTIVITY CARD SORT: A PATIENT CENTERED MEASURE OF AVOIDANCE DUE TO FEAR OF FALLING**

C. Merz<sup>1</sup>, J. Wetherell<sup>2,1</sup>, 1. *University of California San Diego, San Diego, California*, 2. *VA San Diego Healthcare System, San Diego, California*

Avoidance of activities due to fear of falling (FF) can lead to social isolation, physical disability and loss of independence, yet there is currently no gold standard measure to assess avoidance due to FF. The Survey of Activities and Fear of Falling in the Elderly (SAFFE) fails to capture avoidance among higher functioning older adults, focusing instead on simple activities of daily living (e.g., getting out of bed, preparing simple meals). To develop a new measure of avoidance due to FF, we have modified the Activity Card Sort (ACS): a set of pictures of older adults engaging in various leisure, physical, and social activities. Our adapted ACS has modified the original measure to include activities that would likely be avoided due to FF (e.g., taking a bath) and exclude others (e.g., playing cards), from which participants select their top 5 activities that they would like to do/do more if they were not afraid of falling. To date, we have administered the Adapted ACS to 27 older adults. We will present data on psychometric properties and sensitivity to change for 50 participants completing an intervention for FF. Due to its patient centered approach and ability to capture avoidance of activities among higher-functioning older adults, we propose our Adapted ACS as a new/alternative method of measuring avoidance due to FF.

### **EXPLORING THE ASSOCIATIONS BETWEEN FALL RISKS AND COMPLEMENTARY AND ALTERNATIVE MEDICINE (CAM): FINDINGS FROM THE NEW YORK CITY HEALTH INDICATORS PROJECT**

A. Caron, *CUNY School of Public Health, New York, New York*

Background: Falls account for nearly half of all injury-related deaths, 18,000 hospitalizations and 24,000 emergency room visits among older adults in New York City annually. Studies indicate that use of Complementary and Alternative Medicine (CAM) is higher in New York City than national average. This study explored associations between CAM use and falls. Methods: Secondary analysis was performed on cross-sectional data from a 2008 survey including 1273 senior center attendees aged 60 and older. Falls outcome was a self-reported fall or multiple falls within 12 months. CAM therapies were grouped based on the National Health Interview Survey (NHIS) and separately compared to the falls outcome while controlling for competing effects. Multivariate logistic regressions were used to determine which CAM groups impacted falls. Results: Prevalence of falls was 26.8% and consistent with national average. Prevalence of having tried CAM was 92%. Those having tried manipulative body therapy were at a higher risk of falling (OR=1.65 CI 1.26, 2.15). Use of mind body therapy showed a downward trend in fall risk when introduced to the final regression equation (OR= .81 CI .62, 1.01). Conclusions: Results indicated that those having tried certain CAM may be at a higher risk for falling and certain CAM modalities may negatively impact fall risks. Because of their access to high-risk patients, certain CAM practitioners should be included in falls prevention efforts and certain CAM modalities should not be overlooked as a means for older adults to control conditions associated with falling.

## PROSPECTIVE PREDICTORS OF FALLS AND RECURRENT FALLS

C.L. Peronto, T. Chen, J.D. Edwards, *Aging Studies, University of South Florida, Tampa, Florida*

Among older adults, falling leads to physical and psychological traumas (Campbell, Borrie, & Spears, 1989; Malmivaara, Heliö vaara, Knekt, Reunanen, & Aromaa, 1993), and is a leading cause of death due to unintentional injuries among older adults in the US (Centers for Disease Control and Prevention, 2005). The goal of this study was to examine prospective predictors of falls and recurrent falls across three years. Participants (n=509) were community-dwelling and ranged from 63 to 90 years of age (M=73, SD=5.22). Measures of speed of processing, executive function, psychomotor speed, and known risk factors of falling were included in correlation and logistic regression analyses. Results indicated poor executive function (Trail Making Test), slower speed of processing (Digit Symbol Substitution Test), and slower psychomotor speed (Digit Symbol Copy Test) were significantly associated with falls. Poor executive function and speed of processing performance (Stroop, Trail Making Test, and Digit Symbol Substitution Test) as well as slower psychomotor speed were significantly related to recurrent falls. Logistic regression results indicated that only medication use, far visual acuity, and psychomotor speed were significant independent predictors of falls. Regarding recurrent falls, being white, medication use and balance were significant predictors. Although cognitive measures at baseline were significantly associated with falls and recurrent falls at follow-up, these measures did not predict falling after considering known risk factors of falls and psychomotor speed. Thus, it may be that simple measures of psychomotor speed are more salient predictors of falls than cognitive measures.

## FROM RESPONDING TO PREVENTING: A FALL PREVENTION TOOL TO EMPOWER EMERGENCY RESPONDERS

J. Pynoos, P. Beck, E. Nabors, G. Misiaszek, *University of Southern California, Los Angeles, California*

Emergency Medical Services (EMS) personnel are often the first to arrive at the scene of a fall – most of which occur at home. Providing EMS with the tools to prevent rather than only respond to an older person falling is essential in falls prevention (FP). The FP Connect project aims to enhance the capacity of Los Angeles (LA) County EMS/Fire personnel to address fall risks and reduce repeat falls. The goals of FP Connect are: 1) to strengthen the FP referral network within Los Angeles by coordinating community partners so that older adults who fall can receive the support and services they need to age safely in their homes; and 2) to enhance the capacity of LA County Fire Department and its EMS so that they can play a more effective role when responding to older adults who have fallen. Translational research described in this session includes qualitative and quantitative analysis from 1) six on-the-scene ‘ride-alongs’ with EMS/Fire personnel in Los Angeles, Inglewood, and West Hollywood, 2) four pre- and post- focus groups with EMS/Fire personnel, and 3) the use of LA County falls data to determine fall “hot spots” in order to maximize the impact of the intervention. Five fall “hot spots” were determined for pilot locations if the demonstrated falls incidence was greater than 2,500 per 100,000 older adults in the population. Using a mixed-methods approach, the presenters will critically review the impacts on the participating EMS/Fire personnel themselves and their interventions with older adults who have fallen.

## SESSION 1235 (POSTER)

### FAMILY CAREGIVING 2

#### THE FEASIBILITY OF A WEB-BASED PSYCHOSOCIAL ASSESSMENT FOR CAREGIVERS OF PERSONS WITH DEMENTIA

V. Steiner, L.L. Pierce, C.E. Gies, *University of Toledo, Toledo, Ohio*

Over 5 million people live with dementia. Often family caregivers do not seek outside help due to care and time constraints. This quasi-

experimental study examined the experience of using a psychosocial assessment to understand caregivers’ needs, in the assessment’s original face-to-face interview format versus a new self-administered web-based format. Ten family caregivers (5 male; 5 female) from one mid-west state were randomized to an interview or web-based group. Participants in the interview group had the assessment administered by one advanced practice nurse (APN) in a face-to-face format. Participants in the web-based group accessed the study’s web site and completed the assessment online, which was then reviewed by a second APN. Participants in both groups, as well as the nurses, completed a paper/pencil Survey to capture their perception of the assessment experience. No statistically significant differences were found between the two caregiver groups. Overall the caregivers rated the assessment as excellent or good; thought it was easy to complete; and captured their real needs. All participants reported that every caregiver should have access to this assessment. One theme that emerged from the written comments was that the assessment helped caregivers in reviewing their own needs, which they tend to deny or ignore. APNs using the assessment reported that the web-based format was very easy to use, while the interview format was difficult to use. Web-based assessment is an effective and efficient method for healthcare professionals to use to identify caregivers’ needs, providing a means for planning appropriate interventions.

#### SUICIDAL IDEATION IN FAMILY CARERS OF PEOPLE WITH DEMENTIA: AN AUSTRALIAN STUDY

S.T. O’Dwyer<sup>1,2</sup>, W. Moyle<sup>1,2</sup>, S. Van Wyk<sup>1</sup>, *1. Research Centre for Clinical and Community Practice Innovation, Griffith University, Brisbane, Queensland, Australia, 2. Dementia Collaborative Research Centre (Carers and Consumers), Queensland University of Technology, Brisbane, Queensland, Australia*

Background: Family carers of people with dementia experience higher than average rates of depression, anxiety and hopelessness. While these three conditions have all been linked to suicide in other populations, there have been no studies of suicidal ideation or attempts in dementia carers. The aims of this pilot study were to: (1) provide an initial exploration of carers’ experiences of suicidality; (2) identify potential risk and protective factors in this population which could be used to guide further research. Method: In-depth interviews were conducted with family carers of people with dementia. Transcripts were analysed thematically. Results: Nine carers (4 male, 5 female; 25-82 years) participated. Four participants had experienced suicidal ideation while caring. None had attempted suicide. Four emergent themes outlined ‘experiences of suicidal ideation’, ‘coping strategies’, ‘protective factors’ and ‘risk factors’. Risk factors included mental and physical health problems (including depression and hopelessness) and family conflict. Protective factors included social support, faith, and a sense of responsibility. Conclusion: Some family carers of people with dementia contemplate suicide in response to challenges associated with the caring role. The identified risk and protective factors are consistent with other suicide research and potentially modifiable. Future research should focus on confirming the rate of suicidal ideation in this population and developing screening tools and targeted interventions for at-risk carers. After this presentation, participants will be able to discuss the issue of suicidality in dementia carers; explain some of the risk and protective factors; and identify directions for future research and policy development.

#### TREND IN FAMILY SUPPORT OF ELDERLY PEOPLE IN TAIWAN

L.E. Ku, L. Liu, *IOG, NCKU, Tainan, Taiwan*

Background: Family support comprises the backbone of long-term-care provision in Taiwan, yet little is known about how care provisions and the composition of caregivers has changed over time. Methods: Data are drawn from three waves of the Taiwan Longitudinal Study on

Aging (1999, 2003, 2007) to examine the trend of caregiver support for disabilities in activities of daily living (ADLs) in a nationally representative sample of Taiwanese elders 65 and older. Predictors of receiving paid help versus informal support were modeled using Generalized Estimating Equations. Results: Among elders with at least one of six ADLs in Taiwan, the percentage of those receiving any ADL help has decreased from 83% in 1999 to 79% in 2007. In 2007, primary caregivers who provided ADL assistance were adult children (30%), paid helpers (25%), spouses (21%), and other family or friends (24%). A sharp increase was found (from 6% to 25%) for paid helpers but a decline (from 42% to 30%) was observed for adult children caregivers over time. Results showed that the likelihood of receiving paid help was higher in 2003 and 2007, when compared to 1999. Age and female were significant predictors for receiving paid ADL help, as well as higher socio-economic status. However, living with spouse or adult children did not affect the likelihood of receiving paid help. Conclusion: Findings suggest a change in the traditional family support system in Taiwan with the rise of paid help, although family still accounts for a major source of care for ADL-disabled elders.

### THE LABYRINTH AS A TOOL TO MANAGE STRESS OF EMPLOYED FAMILY CAREGIVERS

C. Rudebock<sup>1</sup>, M. Powers<sup>1</sup>, C. Murray<sup>1</sup>, J. Allen<sup>1</sup>, B. Shadden<sup>2</sup>, I.

*University of Central Oklahoma, Edmond, Oklahoma, 2. University of Arkansas, Fayetteville, Arkansas*

Labyrinths, a form of walking meditation, are used in a variety of health-related settings as a tool for stress reduction. Limited empirical research is available using the labyrinth to manage stress especially among family caregivers. The purpose of this study was to evaluate the labyrinth as a tool for managing stress among employed family caregivers. Sixteen employed family caregivers were randomly assigned to one of two groups. The intervention group walked the labyrinth for 12 weeks, while the delayed-intervention control group began walking in the 7th week. Participants completed the perceived stress scale, Zarit Burden Interview, and Job Satisfaction scale at baseline, 6 weeks, and 12 weeks. Data were analyzed using an analysis of variance with repeated measures to determine interaction, group, and time effects. Results indicated no significant interaction or main effects for any dependent variable. However, there was a trend toward a time effect for perceived stress ( $p = .14$ ;  $d = 0.64$ ) with lower levels of perceived stress after the 12-week intervention. Walking logs indicated that both groups were compliant with the labyrinth intervention. Qualitative comments from participants suggested that the labyrinth was a short relaxing pause from an otherwise hectic day. While preliminary, the findings indicated that walking the labyrinth may be an effective way to reduce stress of employed family caregivers. In addition, the labyrinth appears to be a feasible activity to incorporate into a demanding work/caregiving schedule. Further study of the labyrinth as a tool to manage stress among employed family caregivers is warranted.

### DOES STROKE CAREGIVING AFFECT COGNITION? AN INVESTIGATION OF CHANGE OVER TIME

A.L. Botticello<sup>1,2</sup>, P. Chen<sup>1,2</sup>, I. Outcomes & Assessment, Kessler Foundation Research Center, West Orange, New Jersey, 2.

*University of Medicine & Dentistry of New Jersey, Newark, New Jersey*

Purpose Prior research attributes stroke caregiving to diminished health and functioning, but is largely limited by cross-sectional methods. The purpose of this study is to assess stroke caregivers experience greater declines in cognitive functioning over time relative to their non-caregiving peers. Methods Data are from the Health and Retirement Study (HRS), a longitudinal study of a nationally representative cohort of older adults. This analysis uses HRS data collected between 1996 and 2008 from couples living in the same household. Stroke caregivers are defined as persons whose spouse reported experiencing a stroke and

functioning limitations ( $N=333$ ). Non-caregivers are persons whose spouse had neither a history of stroke nor functioning limitations attributable to another chronic condition ( $N=992$ ). Cognitive functioning is assessed in five domains: working memory, semantic memory, and episodic memory, time orientation, and learning. Growth curve models are used to estimate differences by caregiving duration for each domain controlling for gender, race, and the time-varying effects of age, income, wealth, perceived health, and depressive symptoms. Results Preliminary analyses reveal that caregivers experience significantly steeper declines over time relative to non-caregivers in episodic memory, working memory, and learning. Significant variation in the effect for caregiving between individuals is largely independent of age, but is accounted for by individual differences in background, socioeconomic status, and well-being for learning and episodic memory but not for working memory. Implications The findings from this study suggest that the demands of providing long-term assistance to a spouse who has suffered a stroke increases cognitive decline over time.

### EFFECTIVENESS OF DYADIC INTERVENTIONS FOR CARE RECIPIENTS WITH DEMENTIA AND THEIR CAREGIVERS

H. Moon, K.B. Adams, *case western reserve university, Cleveland, Ohio*

The need for dyadic intervention is enhanced with increasing numbers of older adults with early-stage dementia. The purpose of this paper is to review the effects of dyadic interventions on caregivers and care recipients at the early stage of dementia. Four databases, Ageline, Medline, EBSCO and Psycinfo, were searched and relevant literature from 2000 onwards was reviewed. The twelve studies identified used a variety of intervention approaches, including support group, counseling, cognitive stimulation, skill training, and notebook-keeping. The review suggests that intervention programs for early-stage dementia caregiving dyads were feasible and well accepted by participants. The reviewed studies provided rich evidence of the significance of mutual understanding and communication to partners' well-being and relationship quality within the caregiving process. The findings suggest that these intervention approaches improved cognitive function of the CRs, social relations, or the relationship between CG and CR, although evidence of long-term effectiveness is lacking.

### STRESS PROCESS MODEL OF CAREGIVER AND CARE RECIPIENT

K. Martincin, K. Judge, *Cleveland State University, Cleveland, Ohio*

Demographic information such as race and education level, cognitive abilities, level of dependency, relationship strain, and social isolation of the caregiver may create negative outcomes for the individual with dementia (IWD), including depression and worse physical health outcomes. However, few studies have investigated this interaction between characteristics of caregivers and psychosocial outcomes of IWDs. In addition, no conceptual model has been proposed that explicitly links both caregiver and care recipient characteristics and the resulting interactions. The purpose of this poster is to provide a comprehensive review of key caregiver variables that may contribute to outcomes of community dwelling individuals with dementia. Drawing from the Stress Process Model (Pearlin, Megaghan, Lieberman, & Mullan, 1981) for Caregivers and the Stress Process Model for Individuals with Dementia (Judge, Menne, & Whitlatch, 2009), this poster will present a theoretical model for understanding and examining the stress process for caregiving dyads, including how primary stressors, secondary stressors, and an individual's environment can contribute to psychosocial outcomes. Discussion will focus on how this new theoretical model can be used to examine the complex interactions between caregivers and IWDs, along with specific interventions that may mitigate the negative symptoms of dementia for both care partners. Two measurable objectives of this poster are first increased awareness of the current use of the Stress

Process Model and second increased awareness of potential new uses of the Stress Process Model, including use for the caregiving dyad of IWDs.

## SESSION 1240 (POSTER)

### FAMILY LIFE

#### LOVE DURING DIVORCE: DOES AGE MATTER?

J.G. D'Ambrosio, A.C. Faul, *Kent School of Social Work, Univ Louisville, Louisville, Kentucky*

Love is an anomaly for people experiencing divorce. This paper explores if maturation helps marital relationships end with understanding, generosity, humility and altruistic love. A research study tested predictors that can increase or decrease anger and hatred toward former spouses. It also tested mediators inherent in humans that can mediate the negative relationship between hate and the showing of love actions toward former spouses. The study starts with the development and validation of the Sorokin Psychosocial Love Inventory (SPSLI), a scale based on Sorokin's Love theory that measures both hateful and loving actions for individuals going through a divorce. A sample of 523 divorcing individuals was recruited and asked to complete a survey where data on basic demographics, the SPSLI, together with various measures related to anger, attorney influence, equity, adult attachment styles, empathy, altruism, compassion, sympathy and collectivism were gathered. Through structural equation modeling it was found that infidelity, differences in priorities and abuse as reasons for divorce tend to result in increased hate and anger, as well as negative lawyer influences, and a predisposition toward anger. Surprisingly it was also found that older adults tend to feel more hate toward their former spouses, contradictory to what was expected. This paper explores if older adults become more realistic in their attitudes toward love and relationships. However, the data also indicates the ability of older divorcing individuals to allow altruistic values and collectivist attitudes mediate the hate they feel toward former spouses, resulting in the ability to show love.

#### THE INFLUENCE OF FAMILY RELATIONS ON NEGATIVE EVENTS IN THE LIVES OF ADULTS: A SIBLING ANALYSIS

M.J. Hogerbrugge, A.E. Komter, W. Vollebergh, *Faculty of Social and Behavioral Sciences, Utrecht University, Utrecht, Netherlands*

Past research in the field of psychology has consistently shown the influence of childhood family relations on both internalizing and externalizing problems of children during childhood, adolescence, and even in(to) adulthood. Similarly, one of the most well established findings in the field of sociology is the link between various forms of social integration, including integration into family, and suicide. This study integrates these psychological and sociological branches of research by answering the question to what extent current family relations (e.g., family integration) affect the likelihood that an adult family member experiences internalizing and externalizing problems, which include, among others, having mental health problems, being seriously ill or handicapped, having a drug or alcohol addiction, having financial problems, and criminal conviction. Using longitudinal panel data from three waves of the Netherlands Kinship Panel Study, a multilevel analysis was conducted to examine how much of the variance in the experience of internalizing and externalizing problems among adult siblings can be attributed to the family environment, relative to the variance found at the individual level. By adding measures for characteristics of the current extended family, such as the amount of contact between siblings and parents, patterns of support exchange, the size of the extended family, the geographical distance between family members, and controls for the family environment during adolescence, we showed the processes and mechanisms through which current family relations exert an influence on the likelihood of experiencing internalizing and externalizing problems during adulthood.

#### LIVING WITH ALZHEIMER'S DISEASE: CHILDREN OF DAUGHTER CAREGIVER'S IN AN INTERGENERATIONAL HOUSEHOLD

R.C. Montano<sup>1,2</sup>, A. Donovan<sup>1</sup>, *1. Capella University, San Diego, California, 2. Eve Mar, San Diego, California*

Daughter caregivers, who take on responsibility of caring for a parent with Alzheimer's disease, while simultaneously being involved in their own contemporary family relationships with children, create intergenerational households. The purpose of this session is to understand the care dynamic within the intergenerational household when Alzheimer's disease is present. A qualitative case study with four daughter caregivers and eight teenage to young-adult children, was conducted to examine and understand (a) the impact on the daughter caregiver-child relationship, when the daughter caregiver takes on responsibility of caring for a parent with moderate Alzheimer's disease or higher, and (b) the role children of daughter caregivers' play in this intergenerational household. The focus of this study was to explore and understand participants' subjective perspectives regarding caregiving as a social phenomenon in the natural setting. The case study approach allowed the researcher to view the familial relationship as a bounded entity using Adlerian and structural family theories to guide the research. After attending this session, participants will be able (a) to promote positive perceptions children have about familial caregiving in the intergenerational household; (b) to evaluate levels of willingness children have for contributing to the care dynamic; (c) to encourage intergenerational bonding and preservation of familial experiences despite the debilitating impacts of Alzheimer's disease on the grandparent within the contemporary family; and (d) to identify contemporary family distress in order to balance roles and preserve relationships.

#### INTERGENERATIONAL RELATIONSHIPS AMONG THE MAASAI OF TANZANIA

J.M. Kalavar<sup>1</sup>, C. Buzinde<sup>2</sup>, M. Kokkel<sup>3</sup>, J. Simon<sup>4</sup>, *1. Penn State University, New Kensington, Pennsylvania, 2. Penn State University, State College, Pennsylvania, 3. College of African Wildlife Management, Moshi, United Republic of Tanzania, 4. African Wildlife Foundation, Arusha, United Republic of Tanzania*

This project examined the impact of cultural tourism on intergenerational relationships among the Masaai of Tanzania, an indigenous ethnic community whose culture has been commodified for international tourism. Marginalized indigenous communities worldwide are undergoing transitory periods of change as a result of globalization, technological innovations, etc. Consequently, to increase their resource base, many indigenous communities adopt tourism as a tool to enhance community well-being. Examining intergenerational relationships among the Masaai community requires an understanding of the gender-based age grading system which is unique to their ethnic group. Unlike occidental societies which tend to define generations based on age, the Masaai draw on cultural ceremonies and natural events to differentiate between, for instance, adolescence, adulthood and late adulthood. Using six focus groups of varying ages, data was collected primarily from two selected villages, Esilalei and Oltukai, located near famous wildlife parks. Findings suggest that cultural tourism is perceived differently by different age groups of the Masaai people. Though cultural bomas (homesteads) visited by tourists represent economic opportunities for participants, there is considerable exploitation of this indigenous group. The elderly Masaai men and women bemoan the loss of cultural traditions and family structure while the younger generation prioritizes wealth. A rise in alcoholism, increase of elder neglect and mistreatment, and family lifestyle changes were evident. Definitions of community well-being and the impact of cultural tourism varied by gender and age of the Masaai people. Findings from this study carry the potential to influence our understanding of intergenerational relationships within under-researched indigenous contexts.

## LONGITUDINAL ANALYSIS OF LONELINESS AND INTERGENERATIONAL FAMILY CONTACT AMONG JAPANESE OLDER ADULTS

E. Takagi<sup>1</sup>, Y. Saito<sup>2</sup>, 1. *Health Science, Towson University, Towson, Maryland, 2. Nihon University, Tokyo, Japan*

This study investigated how longitudinal trend of intergenerational living arrangement and family contact are related to the sense of loneliness expressed by Japanese older adults. We analyzed five waves of data in the Nihon University Longitudinal Study of Aging (NUJLSOA) between 1999 and 2009 (n=13620). We pooled interval observations with two to three year apart and constructed 7737 cases of pooled data on loneliness. We examined intergenerational family contact represented as: 1) coresidence with a child, 2) frequency of face-to-face contact with children, and 3) frequency of contact with children by phone. We also included a number of variables to describe the level of older parents' family resources, such as living alone and widowhood. The results indicated that both coresidence with children and relatively frequent face-to-face contact with children were associated with lessened sense of loneliness among older parents. On the other hand, both statuses of living alone and widowhood were associated with heightened sense of loneliness. We also observed a strong positive association between parent's poor health status (both self-rated health and ADL disability) and older parents' sense of loneliness. We contend that despite the changing cultural climate that values independence in later years, intergenerational support and contact play a critical role in maintaining older adults' psychological well-being in Japan. We discuss our results in relation to the current Japanese socio-cultural context where the traditional family norm is in decline and growing numbers of older adults are living alone.

## INTERGENERATIONAL AGE GAP AND LINEAGE MEMBER'S WELL-BEING

R. Sun, *Department of Sociology, Cleveland State University, Cleveland, Ohio*

The improvement in life expectancy over the last century has enhanced the prevalence of multi-generation lineages, where four or even more generations live at the same time. Ethnographic studies documented a link between the timing of fertility, which determines intergenerational age gaps, and their impact on family members' well-being. To date, however, there has been no study based on large sample data to systematically examine such a relationship. We used the third wave of the National Survey of Families and Households, 2001-2003, to assess whether the mean and variation of age gaps between generations within a family lineage are associated with a family member's well-being, and whether such associations vary by race. Well-being outcomes are measured by self-rated health, depression level, and the General Well-Being Scale. The mean and standard deviation of age gaps between two adjacent generations within a three- or four-generation lineage were calculated. We used linear and logistic regressions for the analysis. The results indicate that family members who belong to a lineage with longer age gaps are more likely to report better health, lower degree of depression, and better general well-being than those from shorter age gap lineages. But such associations are only found for whites, not blacks. Higher variation in age gaps is related to lower well-being outcomes for both whites and blacks. In conclusion, the age gaps between generations matter to individual member's well-being within a family lineage.

## PROMOTING RESILIENCE: COUNSELING GRANDPARENTS TO RAISE EFFECTIVE GRANDCHILDREN

R. Maiden, *Psychology, Alfred University, Alfred, New York*

The goals of this paper is to provide a case study that demonstrates feasible guidelines for mental health practitioners to counsel grandparents raising their grandchildren with the goal of enhancing the resilience of their grandchildren. One might say that these grandchildren who

rise from the ashes of broken homes and relationships, chaotic family circumstances, and impoverishment are the poster children for resilience. These children are frequently faced with adversity, trauma, tragedy, and significant sources of daily stressors within their families that few of us ever experience on a consistent basis—often including the presence alcohol and drug abuse, and verbal, physical, and sexual assault. Of course, not all multi generational families experience such negative life events. Nevertheless, the majority of those seen in counseling do. The sensitive clinician can help these children “bounce back” through utilizing family systems and cognitive-behavioral therapies. The counselor needs to focus on family rules, communications, and meta-communications—the hidden meaning of the communication. They also need to teach grandparents how to parent their grandchildren through implementing a modified cognitive-behavioral program and to address and revise their own irrational beliefs about raising children, often a mirror image of how they were raised which just keeps the negative cycle ongoing generation after generation. . Moreover, the counselor needs to be willing to go beyond the counseling session to external venues running interference with school authorities, lawyers, courts, foster care, social service systems, and to collaborate with a whole host of other external agencies to assist in healing these families.

## UNDERSTANDING U.S. CHINESE OLDER ADULTS' EXPECTATIONS AND PERCEIVED RECEIPTS OF FILIAL PIETY: A CROSS-SECTIONAL STUDY

F. Huang<sup>1</sup>, M.A. Simon<sup>2</sup>, E. Wong<sup>3</sup>, B. Wong<sup>3</sup>, E. Chang<sup>1</sup>, Y. Li<sup>1</sup>, X. Dong<sup>1</sup>, 1. *Rush University Medical Center, Chicago, Illinois, 2. Northwestern University, Chicago, Illinois, 3. Chinese American Service League, Chicago, Illinois*

Background: Despite research in recent years have started to address ways in which the practice of filial piety may impact the health of Chinese older adults, little is known concerning the changing expectations or actual receipts of care in the context of immigration. Methods: This cross-sectional study categorized filial piety into six different domains, including care, respect, please, make happy, obey and offer financial support. In an interview format, we accessed participants' expectations of filial piety and the perceived receipt of filial care from adult children. Results: Among the surveyed participants (N=1,112) in Chicago Chinese community, mean age was 74.8 and 64 % were female. Concerning filial piety expectations, 95.14% of the participants placed above average expectations on respect, followed by make happy (93.96%) and greet (91.4%). Least expectations were placed on financial support (40.66%). Regarding perceived receipt of filial care 78.5% felt that their children exhibit above average amounts of respect; yet, 38.7% felt their children provided average and below care, 29.46% felt their children evoked average and below level of happiness. With respect to discrepancies, most cases occur in financial support; 40.66% of the participants expected above average expectations of financial support, yet 61.7% participants perceived the receipt of above average financial support. Conclusion: Filial piety is an integral aspect of the intergenerational relationship in the Chinese community, and a population-based longitudinal study is necessary for further scrutiny of the relationship between filial piety and its impact on well-being.

## SIBLING RELATIONSHIPS IN ADULTHOOD: EFFECTS OF STAGES OF LIFE, SEX CONSTELLATION, AND BIRTH ORDER

M. Lim<sup>1</sup>, Y. Chee<sup>2</sup>, 1. *Ewha Womans University, Department of Psychology, Seoul, Republic of Korea, 2. Ewha Womans University - Human Ecology Research Institute, Seoul, Republic of Korea*

Although there have been studies on sibling relationships in a certain age period such as in adolescence or later life, little is known about changes and characteristics of sibling relationships over varying developmental stages considering effects of sex constellation and birth order. Guided by adult attachment theory and life course perspectives, this

study examined whether (1) sibling relationships (warmth, conflict) are different throughout adult life stages (early, middle, older adulthood); (2) sibling relationships differ by sex constellation (sisters, brothers, mixed-sex groups) and birth order (firstborns, middleborns, lastborns). Data were collected from 1,037 adults aged 20-90 in Korea, with one closest sibling in mind. MANOVA and Contrast Analysis indicated that while warmth significantly declined from early to middle adulthood and then maintained through older adulthood, conflict declined from early to middle adulthood with an increase in older adulthood though not significant. In early adulthood, sisters showed higher levels of both warmth and conflict than brothers and mixed-sex siblings. Also, interaction effects of sibling sex and life stages revealed that sisters' conflict decreased drastically from early adulthood to middle adulthood, presenting lower conflict than brothers. Mixed-sex group showed the lowest warmth and conflict throughout the adulthood. In the entire adulthood, middleborns showed greater warmth and lower conflict compared to firstborns and lastborns, indicating the closest sibling relationships with others. Firstborns and lastborns showed no significant differences in warmth and conflict. Life stages and birth order interactions were not significant. Findings in the cultural context and implications for future research will be discussed.

## SESSION 1245 (POSTER)

### FRAILTY: MEASUREMENT AND RISKS

#### DEVELOPMENT AND VALIDATION OF A MULTIDIMENSIONAL PROGNOSTIC INDEX FOR OLDER SUBJECTS LIVING AT HOME

A. Pilotto<sup>1,2</sup>, P. Gallina<sup>1</sup>, A. Fontana<sup>2</sup>, D. Sancarlo<sup>2</sup>, S. Maggi<sup>3</sup>, S. Bazzano<sup>1</sup>, L. Ferrucci<sup>4</sup>, D. Donato<sup>1</sup>, 1. Azienda ULSS 16 Padova, S. Antonio Hospital, Padova, Italy, 2. Geriatrics, I.R.C.C.S. Casa Sollievo della Sofferenza, San Giovanni Rotondo, Italy, 3. National Research Council (CNR), Padova, Italy, 4. National Institute on Aging, Baltimore, Maryland

Mortality prediction in older patients living at home represent a cornerstone to optimize the care processes. Aim of the study was to develop and validate a Multidimensional Prognostic Index for mortality (MPI) based on information collected by the Regional Standardized Comprehensive Geriatric Assessment Chart (SVAMA) in a large population of older subjects living at their home. We selected 12,020 subjects aged >64 (M=4415, F=7605; mean age=81.84±7.97) who underwent a complete SVAMA evaluation (January 2004–December 2010) at the Azienda ULSS 16 Padova, Italy. The study population was divided in two cohorts: 1) development cohort included 7876 subjects (M=2909, F=4967) and 2) validation cohort included 4144 subjects (M=1506, F=2638). The MPI-SVAMA was calculated from the linear combination of nine domains evaluated by six validated scores, i.e. cognitive status by Short Portable Mental Status Questionnaire, Activities of Daily Living, motility capabilities by Barthel motility index, pressure sores risk by Exton-Smith scale, nursing care and social support needs by a structured interview, and age, gender and main diagnosis. The MPI-SVAMA score ranged from 0 to 1 and three grades of severity were calculated on the basis of determined cut-offs. The discriminatory power (C-index) for mortality of MPI-SVAMA were 0.827 and 0.832 at 1-month and 0.791 and 0.792 at 1-year in development and validation cohorts, respectively. The discriminatory power for institutionalization was 0.798 and 0.783 at one-month and 0.787 and 0.779 at 1-year in development and validation cohorts, respectively. The MPI-SVAMA efficaciously evaluated mortality and institutionalization risk in older resident at home.

### THE PAULSON-LICHTENBERG FRAILTY INDEX

D. Paulson, P.A. Lichtenberg, Department of Psychology and Institute of Gerontology, Wayne State University, Detroit, Michigan

Frailty is a common, medically-relevant late-life syndrome that confers risk for decline in independence, health and longevity. Frailty is emerging as a significant healthcare concern for the aging US population. Fried's frailty phenotype is a commonly-used index, but offers limited utility with large publicly-available datasets such as the Health and Retirement Survey (HRS). The Paulson-Lichtenberg Frailty Index (PLFI) is theoretically based in Fried's frailty phenotype with greater emphasis on subjective frailty indicators and includes variables in the HRS database. In this model, frail individuals reported 3 or more of the following: wasting (loss of 10% or more of body weight over 2 years), slowness, weakness, falls and fatigue. PLFI validity was tested in a sample of 8,845 adults over the age of 65 (mean age=74.5 years) drawn from the HRS data. To facilitate interpretation, Fried's (2001) analyses describing their frailty phenotype were simulated in this study. The sample was predominantly female (58.8%) and Caucasian (85.4%). Using the PLFI, frailty was identified in 12.2% of respondents ages 65-74, 17.5% of those between ages 75-84, and 32.3% over the age 85 and over. Frail elders were more likely to be older, female, Black, have fewer years of education, lower income, worse self-rated health, report greater disease burden, more depressive symptoms, and greater disability ( $p < .001$  for all comparisons). PLFI score was highly predictive of future hospitalization and mortality. In conclusion, the PLFI is a valid measure of frailty. This frailty index, defined within a large, demographically-representative dataset, can facilitate epidemiological study of frailty.

### PREDICTIVE VALUE OF MULTIDIMENSIONAL FRAILTY INDICATORS FOR NEGATIVE OUTCOMES OF FRAILTY

B.H. Ament, M.E. de Vugt, G.I. Kempen, F. Verhey, Maastricht University, Maastricht, Netherlands

Background: Frailty is considered a predictor for negative outcomes such as disability, quality of life and hospitalization. Frailty measures have been developed that include different domains. These all assume a cumulative model of frailty i.e. create frailty scores by adding up different frailty items from different domains. We examined whether particular the physical domain of frailty was exacerbated by other domains in the prediction of negative outcomes of frailty. Methods: Frailty was measured at baseline by means of the Groningen Frailty Indicator (GFI, theoretical score range 0-15) which comprises a physical, cognitive, social and psychological domain. Disability, quality of life and hospitalization were measured at 12 months. Results: The sample (n=342) included 38.9% frail men and 61.1% frail women (mean age 77.9, range 70-92). Mean overall baseline score on the GFI was 6.8. Linear regression analyses showed that the overall GFI score was significantly related to disability at 12 months ( $p < .001$ ). Additional analysis showed that only the physical domain was even stronger related to disability ( $p < .001$ ). The physical domain was significantly related to quality of life at 12 months ( $p < .05$ ) but not stronger than the overall GFI score ( $p < .01$ ). With respect to hospitalization, no significant associations were found. Overall, no significant interactions were found. Conclusion: Depending on what outcome one would predict with the GFI, the focus should be more on either the different domains separately or on the overall GFI score. The effect of physical frailty was not exacerbated by other frailty domains.

### THE CHANGES OF FRAILTY RISK IN JAPANESE ELDERLY WOMEN AND ITS RELATED FACTORS

H. Uchida<sup>1</sup>, Y. Fujiwara<sup>2</sup>, S. Shinkai<sup>2</sup>, T. Nishigaki<sup>1</sup>, Y. Yamashita<sup>3</sup>, Y. Hori<sup>4</sup>, H. Toji<sup>2</sup>, Y. Hasegawa<sup>3</sup>, 1. University of Hyogo, Himeji, Japan, 2. Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan, 3. Department of Long term care insurance, Himeji City Office, Himeji, Japan, 4. Himeji City Aboshi Health and Welfare Service Center, Himeji, Japan

This study was to determine the changes of frailty risk and to clarify its related factors among the community-dwelling Japanese elderly

women, based on the results of the follow-up surveys. The participants were 47 (aged 72.4±5.2) elderly women who lived in Himeji City, Hyogo, Japan. We distributed a questionnaire including age, family structure, self-rated health, short version of Geriatric Depression Scale (GDS), lifestyle behaviors (hobbies, gardening, walking, sports activities etc.), and frailty checklist (homeboundness, falls and poor nutrition), and also measured height, body weight, body mass index and physical fitness tests (grip strength, walking speed, standing on one leg with eyes open). We carried out the surveys in November and December in 2010 and 2011. Selected variables were compared after dividing the participants into “group with increasing frailty risk (IFR)” and “group with no risk (NR)”. The number of “IFR” was 11 (23.4%). IFR had significantly higher “body mass index” and “GDS score”, and lower frequency of “walking” and shorter time of “standing on one leg with eyes open” ( $P < 0.05$ , respectively) than those of NR. From the results of multiple logistic regression analysis using the step-wise method, there was a significant relationship between IFR and high score of GDS (Odds ratio: 1.590, 95%CI: 1.047-2.416), adjusted for age. This study found that mental health status was a predictive of increasing frailty risk in the community-dwelling elderly women and that this association was independent of related factor.

## SESSION 1250 (POSTER)

### GENDER ISSUES

#### **GENDER DIFFERENCES IN THE ASSOCIATION BETWEEN SOCIOECONOMIC STATUS AND HEALTH BEHAVIORS AFTER AGE 50: IMPLICATIONS FOR THE SOCIAL STRATIFICATION OF MORTALITY RISK IN THE SECOND HALF OF LIFE**

B.A. Shaw<sup>1</sup>, S. Fors<sup>2</sup>, N. Agahi<sup>2</sup>, 1. *University at Albany, School of Public Health, Rensselaer, New York*, 2. *Aging Research Center, Karolinska Institute/Stockholm University, Stockholm, Sweden*

**Introduction:** The purpose of this study was to examine the degree to which key health behaviors are socioeconomically stratified after the age of 50, and to determine whether these behaviors are stratified differently for men and women. In addition, we assessed gender differences in the role that individual health behaviors play in mediating socioeconomic disparities in mortality risk. **Methods:** Baseline data came from a sample of over 20,000 adults, ages 51 and older, who participated in the 1998 Health and Retirement Study (HRS). Each respondent's smoking status, alcohol use, physical activity, and body mass index (BMI) were measured at baseline, as was their education level. Mortality status and date of death were tracked until 2008. **Results:** Each health risk behavior, except for heavy drinking, was more prevalent among those with lower socioeconomic status. Socioeconomic stratification of the health behaviors was generally steeper among men than women, although obesity was more steeply stratified among women. Estimates from a series of multivariate Cox regression models indicate that these health behaviors accounted for about 60% of the socioeconomic differences in mortality risk among men, and about 30% among women. **Conclusions:** During later life, the association between socioeconomic status and health risk behaviors is particularly strong among men; consequently, individual health behaviors are a better explanation for socioeconomic disparities in health and survival among men compared to women. Further research is needed to determine whether these same patterns are evident across different cohorts and within other developed nations.

#### **HEALTH-RELATED BEHAVIORS IN THREE COHORTS OF OLDER ADULTS: ARE SOCIOECONOMIC AND GENDER DIFFERENCES NARROWING?**

N. Agahi<sup>1</sup>, S. Fors<sup>1</sup>, C. Lennartsson<sup>1</sup>, B.A. Shaw<sup>2</sup>, 1. *NVS, Karolinska Institutet, Aging Research Center, Stockholm, Sweden*, 2. *University at Albany, Albany, New York*

**Introduction:** Recent cohorts of older adults have higher levels of education, better health, and have generally experienced more favorable socioeconomic conditions throughout life compared to prior cohorts. Furthermore, opportunities, resources and health habits previously reserved for men, are increasingly shared by women. This study examines health-related behaviors in three cohorts of older adults, focusing particularly on differences between men and women, and different educational groups over time. **Methods:** Three nationally representative samples of older Swedish adults aged 77 and older (SWEOLD), collected in 1992 ( $n=537$ ), 2002 ( $n=621$ ) and 2010 ( $n=931$ ), were analyzed with regard to smoking, daily vegetable consumption, social participation (both formal and informal), and engagement in physical leisure activities. **Results:** In 1992, there were no gender differences in daily vegetable consumption and active social participation, however smoking was more prevalent among men and physical inactivity more prevalent among women. Health behaviors generally improved in subsequent cohorts. By 2010, gender differences in physical inactivity narrowed, partly due to increased activity levels among women, but also because more men were physically inactive. As for socioeconomic differences, persons with higher education were more likely to eat fresh vegetables on a daily basis and to be socially and physically active in 1992. These educational differences were also found in 2002 and 2010, despite later cohorts having higher education. **Conclusions:** Gender differences seem to have narrowed while educational differences have remained. More work is needed to examine if health behavior disparities during late life are a reflection of lifelong differences in health behaviors.

#### **AGING AND MEN'S BODY IMAGE**

T. Liechty, K. Sveinson, L. Dahlstrom, *University of Regina, Regina, Saskatchewan, Canada*

The majority of body image research has focused on women and girls, ignoring the experiences of men. Although recent literature has called for additional research into body image for men, most of this work has focused on younger men and boys. The purpose of this study was to explore older men's body image. We conducted individual interviews and follow up focus groups with 15 men aged 60 to 70. We analyzed transcripts using open and axial coding to identify over-arching themes. Findings highlighted the unique body image perspectives of men and the influence of the aging process. All participants believed that appearance is an important aspect of body image and some described appearance concerns (generally related to weight). Most participants, however, heavily prioritized health or physical ability. Furthermore, participants linked this priority to aging and most felt they had reasonable self-expectations based on their age. Most said their ideal body had changed as they matured from one that is slender, young, and muscular to one that is “reasonably healthy.” Some participants described body image concerns in youth such as wanting to be bigger, taller, or more muscular. These concerns were generally related to feedback from parents, siblings, coaches, and doctors. Those who had never experienced appearance concerns attributed this to their gender, generation, or upbringing. The most common bodily frustrations expressed were related to the reduced ability to accomplish tasks such as doing yard work or playing sports. The findings contribute to understanding men's perceptions of aging and body image.

#### **STIGMA TOWARD ALZHEIMER'S DISEASE IN EL SALVADOR: AN AGE BY GENDER EFFECT ON HELP SEEKING ATTITUDES**

E. Valdivieso, *Universidad Centroamericana, San Salvador, San Salvador, El Salvador*

The present study attempted to measure the effect of gender and age on stigma toward Alzheimer's disease in El Salvador. No previous

studies have examined stigma toward AD in a Central American country. Participants were Salvadoran citizens, with ages ranging from 20 to 80 years old. One hundred forty adults participated, who were divided in three age groups: (a) 20 – 35 years, (b) 40 – 55 years, and (c) 65 – 80 years. Sixty women and eighty men were interviewed. None of the participants were caregivers or had a friend or family member with AD. The survey measured stigma toward AD through indicators of social exclusion, help seeking attitudes and participation in patient's hygiene. In order to complete this survey, participants were asked to suppose they had a family member recently diagnosed with AD. An age by gender effect was found on help seeking attitudes ( $p < .01$ ). The differences between men and women were found in the middle age ( $p = .008$ ) and older adult ( $p = .007$ ) groups. Women reported to be more willing to seek for help than men, in particular, female older adults. No differences on gender were found in the young adult group. The gender effect was also found when participants were asked if they would escort their family member to a doctor's appointment ( $p = .04$ ), and care for the patient's hygiene ( $p < .05$ ) and feeding ( $p = .05$ ). Educational programs aimed at promoting gender equity and AD awareness among Salvadoran population, are clearly indicated.

### **BODY SATISFACTION AMONG DIVERSE OLDER WOMEN: THE IMPORTANCE OF BODY FUNCTION AND APPEARANCE**

N. Sabik, *psychology, University of Michigan, Ann Arbor, Michigan*

Recent research has indicated that older women are not free from body image concerns, and very little is known about what aspects of the body are most relevant for diverse older women. To address this new frontier in aging research, data were collected on 132 European American and 125 African American community based women. An exploratory factor analysis on body satisfaction items was performed to create 2 subscales measuring different dimensions of body image—satisfaction with body function and satisfaction with appearance. A confirmatory factor analysis revealed that the same factor structure was appropriate for both ethnic groups, but mean differences indicated that older women in different ethnic groups are not uniformly experiencing body satisfaction. Furthermore, regression analyses indicated that these subscales were differentially related to appearance comparison, subjective age, and feminine traits among women in the two groups. Body image and body function are important predictive variables that contribute significantly to quality of life among older women, and future research needs to explore the nuances of different dimensions of body image and functioning among diverse older women.

## **SESSION 1255 (POSTER)**

### **GEROTECHNOLOGY**

#### **FACILITATING AUTONOMY IN ASSISTED LIVING THROUGH TECHNOLOGY: IS IT AS EASY AS PI?**

M. Brazda<sup>2,1</sup>, C.R. Bennett<sup>2</sup>, M.C. Nemeč<sup>2</sup>, A. Frankowski<sup>2</sup>, *1. UMB, Baltimore, Maryland, 2. UMBC, Baltimore, Maryland*

Autonomy in assisted living (AL) is often expressed as the ability of residents to retain their independence through individualized decision-making; this relies in part on the options available to them in their AL. Three possible ways for residents to facilitate or enhance their autonomy are through the use of mobile health technology, the Internet, and low cost computer platforms. For this study we conducted a literature review of older adults' use of mobile health technologies and the Internet, and we explore the impact of low cost computer platforms, such as the Raspberry Pi Foundation of the United Kingdom's single board computer, brand named Raspberry Pi. Multiple databases were accessed for the review, including EBSCOhost, Ageline, and Google Scholar searching with appropriate keywords such as older adults, elderly, age and aging, socio-economic status, mobile health, computers, and Inter-

net use. Our analysis shows that (1) mobile health interventions could positively effect treatment of chronic disease in older adults, (2) the expansion of older adults' use of the Internet, including the communications capabilities of email and social networks, extend their feelings of autonomy in AL, and (3) there is a computer ownership disparity among older internet users that could be addressed by the availability of low cost computers, such as the Raspberry Pi.

### **IMPLEMENTATION OF EVERYDAY PERSONALIZED ASSISTIVE TECHNOLOGY TO SUPPORT SENIORS WITH DEMENTIA**

C. Kerssens, J.P. Zamer, *SimpleC, LLC, Atlanta, Georgia*

There is a need for well-designed technologies that facilitate aging in place for persons with dementia (PWD) and their caregivers. Given that independence is a major determinant of quality of life and well-being, technologies that support independence could be beneficial. We report on the observed and perceived change in resident status in a technology implementation study. Our technology offers psychosocial interventions through short personalized audiovisual programs that engage and cue, and that address specific yet common challenges in PWD (e.g., apathy, agitation). Shows play on a touch screen computer inside residents' rooms. For the pilot, 11 residents (7 female, mean age 87.7 years) in assisted living and memory care who needed help with behavior, mood, activity participation, sleep, or care events (ADL) were selected by three facility staff ('observers') to receive the technology intervention. Observers tallied the presence of 47 problems prior to (baseline), and 1 and 2 months into intervention. They also rated residents' status. Compared to baseline, the frequency of problems reduced during intervention between 47% and 81% across outcome domains, most notably the prevalence of sleep, ADL and behavior problems. Observers perceived residents' status predominantly as stable rather than better or worse. Observers agreed more on the absence of symptoms than on their presence. Our findings suggest that the intervention was associated with improvement of many care challenges, and that assistive technology can play an important role in an aging society where dementia is prevalent and human support finite.

### **TECHNOLOGY PERFORMANCE IN OLD AGE: A QUESTION OF VISUO-SPATIAL ABILITIES AND WORKING MEMORY OR SELF-EFFICACY AND TECHNOLOGY ATTITUDES?**

L.I. Schmidt<sup>1</sup>, H. Wahl<sup>2</sup>, *1. Network Aging Research, Heidelberg University, Heideberg, Germany, 2. Heidelberg University, Department of Psychological Ageing Research, Heidelberg, Germany*

In the context of demographic change and technological progression, there is an intensive discussion on potentials of technology serving older adults. However, research on technology use mostly excluded older participants, especially those with cognitive impairment. Therefore, this project aimed to better understand the role of cognitive factors as well as additional psychological constructs with potential relevance for technology use (e.g., self-efficacy) on performance in everyday technology tasks important for older adults. In particular, the use of a blood pressure meter, an age-friendly mobile phone and an e-book reader was assessed in cognitively healthy participants and in participants with mild cognitive impairment. Besides a state-of-the art cognitive assessment including visuo-spatial abilities and working memory, we considered self-efficacy, obsolescence, and technology attitudes. In a feasibility study participants (mean age: 62 years) were videotaped after cognitive assessment and questionnaire examination while handling the devices in order to establish a high quality rating of various performance related parameters. Based on two trained observers evaluating 33 video sequences in accordance with a respective coding scheme, we

found high interrater agreement (94.6%). Additionally, significant positive correlations between successful handling and both working memory and visuo-spatial abilities, but also with self-efficacy and attitude related dimensions were found across all devices - most pronounced in the mobile phone. These preliminary findings suggest that a combined cognitive aging, self-efficacy and technology attitude perspective is needed to understand variation in the use of technology in later life. Results are extended in the ongoing study with a total of 80 participants.

#### **USABILITY PROBLEMS OF OLDER ADULTS WHILE WEARING DIFFERENT MOBILE DEVICES FOR MEASURING ECG**

M. Haesner<sup>1</sup>, M. Gövercin<sup>1</sup>, E. Steinhagen-Thiessen<sup>1</sup>, I.B. Steinke<sup>2</sup>, *1. Geriatrics Research Group, Charité, Berlin, Germany, 2. Siemens AG, Berlin, Germany*

In the area of personal health systems, most products are developed for the mass-market not taken into account the special needs of an older target group. For devices which have to be worn permanently this is a crucial requirement. Most ECG devices however, are developed for hospital usage rather than for everyday life. Muhlsteff et al. 2004 characterise the design of most currently available ECG systems as quite clumsy and uncomfortable for long-term use with no reference to the end-user viewpoint. Here we present data of a prospectively-designed pilot study to evaluate the usability of four different ECG belts. The aim was to identify important aspects for acceptance and usability on the basis of subjective user ratings and structured interviews of twelve older participants. The intent was to incorporate these findings directly into the development process of a new modular health monitoring system. In the study each participant was allowed to select the system he or she was willing to wear for a minimum of three hours. After putting on the preferred belt the participant was required to perform a spectrum of different exercises in a standardized setting. The belts had no significant differences in design, although they did possess variability in thickness, texture and ventilation. This led to various comfort issues (even skin irritation) and usability problems regarding the physical manipulation of the belts for these devices – attachment to the chest, adjustment of tension and use of the locking mechanism. These findings are gathered in a requirements checklist for a user-friendly ECG belt for older adults.

#### **CONNECTED SENIORS: THE BENEFITS OF COMPUTER ENGAGEMENT IN A RETIREMENT COMMUNITY**

T. McCallum, J.I. Alva, *Psychological Sciences, Case Western Reserve University, Cleveland, Ohio*

Computer use, while on the rise among older adults, still lags behind all other age groups. Technology acceptance models suggest that beyond basic access to computers and the internet, older adults are more likely to use computers on a regular basis if they have the assistance and support. In this project, we examined the impact of a program designed to connect older adults to the internet. A group of 24 older adults received computer tablets and weekly instruction on navigating the internet for three months. Compared to baseline, participants reported higher levels of optimism and mastery after three months. No changes were found in social connectedness, social engagement, computer engagement, loneliness, or self esteem.

#### **CONNECTIONS FOR ELDERLY HOME CARE VIA MOBILE COMMUNICATION AND TECHNOLOGY**

C.E. Smith, U. Piamjariyakul, *School of Nursing, University of Kansas, Kansas City, Kansas*

Background: Advances in illness treatments, reliable technologies, cost containment, and family preferences for home-care have resulted in growing populations of individuals dependent on family members for home care. PEW (2011) reports, 45 million Americans report seeking health information from the internet because they are caregivers.

Mobile health information connections to internet are highly recommended and 78% of adults report daily mobile Internet use via their cell phones. Purpose: Our study long-term goals are to understand how mobile technologies empower families in communication with health professionals and reduce their home healthcare burden. Methods: This poster presents our intervention program that provides mobile wireless technology communication to remove barriers of distance and fulfill patient and caregiver desires for visual interaction with professionals and peers from home. Our intervention uses easy-to-use computer PC tablet; a smart phone with simultaneous mobile and visual connection to multiple professionals and peer groups in real time. Also there are smart phone prompts for an access to our Internet illustrations on home-care to engage family caregivers in healthy living activities. In our past internet studies the average age of caregivers is 63 years with one third of them in fair to poor health. Conclusion: National reports indicate that patients and caregivers are asking to have distant connections. It is likely in the next 5 years that small, portable, inexpensive video-tablets-mobile-phone-internet units will be sent home as part of hospital discharge equipment, plugged-in at home for immediate audio-visual contact and long term e-connected healthcare. Result to date will be discussed.

### **SESSION 1260 (POSTER)**

#### **GRANDPARENTING**

##### **THE IMPACT OF GRANDPARENT CAREGIVING ON SUPPORT EXCHANGE BETWEEN GRANDPARENTS AND GRANDCHILDREN: THE MEDIATING ROLE OF THE EMOTIONAL BOND BETWEEN GRANDPARENT AND ADULT CHILDREN**

L. Xu, I. Chi, *School of Social Work, USC, Monterey Park, California*

Background: Mutuality of support provision is a necessary precondition of family solidarity. However, the provision and receipt of care between grandparents and grandchildren has largely been neglected. In addition, few studies have examined the impact of grandparent caregiving on support exchange between grandparent and grandchildren and how the middle generation plays their roles in such grandparent-grandchild support exchange. Methods: Data were drawn from the 4th Wave of Anhui Study of China; the dataset contained 1,982 observations nested within 926 families. The dependent variable was the support exchanges between the grandparent and each grandchild, which includes providing/receiving instrumental support, monetary support and emotional support. Multiple logistic regressions and Structural Equation Models (SEM) were conducted respectively. Results: The results showed that grandparents generally received more support from their grandchildren than they provided to them (10.3% receiving vs. 4.3% providing on instrumental support, 42.9% vs. 10.2% on financial support and 85.5% vs. 36.5% on emotional support). The results of multiple logistic regressions indicated that caregiving to grandchild in the past were significantly associated with all these six dimensions of support exchange. Further SEM analysis showed that the emotional bond between grandparents and their adult children (the middle generation) partially mediated the association between grandparent caregiving and grandparent-grandchild support exchange ( $\beta$  (SD) = 0.063 (0.030),  $p < .05$ ). Discussion: This study not only confirms the intergenerational solidarity theory and social exchange theory. It also helps us to better understand the family dynamics of the three generations in such rapidly social change era in China.

## PILOT TESTING OF THE GP-PRAISEDD: PROMOTING WELLBEING IN SKIPPED GENERATION GRANDFAMILIES

R.D. Satyshur, B. Resnick, *University of Maryland, Baltimore, Maryland*

**Aims:** This purpose of this study was to utilize a socio-ecological model approach testing feasibility of a community based intervention with skipped generation caregiving grandparents. The GP component of the (GP-PRAISEDD) intervention to improve health for parenting grandparents consists of three classes addressing specific grandfamily challenges. Topics include: Stress Management, Positive Disciplining and Children's Emotional and Educational Needs. **Methods:** A single group pre and posttest design evaluated intervention feasibility. Pilot subjects consisted of 9 grandmothers (48 -65 years) who had full time parenting responsibility. Participants attended 1hour classes /discussion groups conducted by a registered nurse. Participants received an initial home visit prior to intervention for measure completion and then again 4 weeks post intervention. **Stress Measure:** Brief Symptom Inventory (BSI); **Social Support:** Family Support Scale (FSS). T-test for paired samples compared pre and post mean scores. **Results:** The GP-PRAISEDD resulted in decreased psychological distress scores and increased social support scores. Class discussions facilitated sharing information and resources related to challenges facing grandparent caregivers such as role confusion, loss of personal freedom, fighting with grandkids, not fitting in, delaying retirement or quitting and poorer health. Grandparents reported a need for support groups and the importance of respite care to minimize stress. **Conclusions:** Educational interventions may be a first step in changing behaviors to promote wellbeing. Ongoing work needs to address services and policies to provide for missing resources and reduce caregiving burden contributing to better health.

## I CAN'T FALL APART: SUPERWOMAN SCHEMA AMONG DIABETIC AFRICAN-AMERICAN CAREGIVING GRANDMOTHERS

D.L. Carthron<sup>1</sup>, T. Ward<sup>2</sup>, *1. School of Health Sciences, Winston-Salem State University, Winston-Salem, North Carolina, 2. Duke University School of Nursing, Durham, North Carolina*

**Background:** African-American older adult women have long been heralded as the epitome of strength, adapting to ever-changing societal and psychosocial changes including assuming the role caregiver for their grandchildren. Since African-American women disproportionately suffer from diabetes, these grandmothers may have difficulty self-managing their diabetes. **Purpose:** to explore and understand the coping and resilience mechanisms of African-American caregiving grandmothers with diabetes. **Methodology:** Six African-American caregiving grandmothers in North Carolina were interviewed 5 times over 12 months. During analysis, codes were developed and defined in a code book. Interviews were coded with data organized in a matrix to facilitate deep understanding of each case and facilitate cross-case analysis. **Results:** All participants exhibited behaviors of "Superwoman Schema" which is associated with delayed self-care, stress embodiment and alterations in physical and mental health. Some felt that they had to be strong for their families stating "I can't fall apart". Many participants delayed or dismissed diabetes self-care activities stating "if I think about it [diabetes], then I have to do something about it". Most stated that they dealt with stressful situations such as multicaregiving and financial constraints by "doing what you have to do". **Conclusion:** The results strongly suggest that the "Superwoman Schema" may normalize a distress inducing level of selflessness and powerlessness in this population. The delay or omission of diabetes self-care activities may ultimately lead to an increased vulnerability to diabetes-related complications. Future research should be directed toward the development of interventions to increase resilience while increasing the engagement in diabetes self-care activities.

## GRANDMOTHERS AND GRANDCHILDREN: HOW FAMILY STRUCTURE AND GRAND/PARENTAL MONITORING AFFECT CHILDREN'S DEPRESSIVE SYMPTOMS AND VIEWS OF FAMILY FUNCTIONING

C. Musil, J. Zauszniewski, C. Warner, M. Singer, *Case Western Reserve University, Cleveland, Ohio*

There has been much attention to grandmothers as caregivers to grandchildren, but less consideration to the grandchildren raised in this family structure. McCubbin's Model of Family Stress and Adaptation served as a framework to examine how resourcefulness, grand/parental monitoring, subjective and instrumental support, and family structure affect grandchildren's depressive symptoms and perceptions of family functioning. The sample included 156 Ohio grandchildren (age 8-19) whose grandmothers participated in a larger study of grandchild caregiving and health. After appropriate assent and consent were obtained, 71 grandchildren raised by grandparents, 27 grandchildren in multi-generational homes, and 58 grandchildren living with parents completed a survey packet. Measures of resourcefulness (Zauszniewski's Children's Resourcefulness Scale), subjective and instrumental support (Duke Social Support Index), parental/guardian monitoring (Singer's Parental Monitoring Scale), family functioning (McMaster Family Assessment Device), and depressive symptoms (CES-D) were included. Data were analyzed using hierarchical multiple regression analysis. Grandchildren with fewer depressive symptoms reported more subjective support and better resourcefulness; family structure and grand/parental monitoring were not significant predictors of depressive symptoms (Adj. R<sup>2</sup>=.25). Grandchildren who perceived that their families functioned better reported more grand/parental monitoring and subjective and instrumental support, and tended to be more resourceful; children who were older or raised by grandmothers perceived more problems in family functioning (Adj. R<sup>2</sup>=.40). The importance of grand/parental monitoring to grandchildren's perceptions of family functioning and of resourcefulness to grandchildren's mental health are considered within the context of family structure and overall family dynamics, and suggest points of intervention with families, especially grandmother-headed and multi-generational homes.

## IS GRANDPARENTING DIFFERENT FOR CHILDREN WITH AND WITHOUT EDUCATIONAL NEEDS?

G. Kypriotakis<sup>1,3</sup>, M. Kypriotaki<sup>2</sup>, E. Kornilaki<sup>2</sup>, *1. Case Western Reserve University, Cleveland, Ohio, 2. University of Crete, Rethimno, Greece, 3. Geriatric Research Education and Clinical Center (GRECC), Loius Stokes VAMC, Cleveland, Ohio*

There is a growing body of research evidence on the role of grandparents (GPs) on their grandchildren's upbringing. Grandparents play a crucial role in their grandchildren's life and their involvement has beneficial outcomes for them. However, less research evidence is available on GPs' involvement with their special needs grandchildren. The aim of this study is to explore and compare GPs' involvement in families: a) with a typical developing grandchild (TDC), and b) with a grandchild with special educational needs (SNC). The participants were: a) 104 GPs of TDC and, b) 53 GPs of SNC. GPs were administered a structured questionnaire. The results revealed that GPs are an important source of support both for their TDC and SNC. Care was their prime responsibility, followed by indoor and outdoor activities. GPs followed the family traditions alike for their TDC and SNC, but they narrate events from the past more frequently with their TDC. Similarly, GPs offer their advice alike to their TDC and SNC, but it was mainly the TDC that trusted their problems to them. Almost all GPs described the relationship with their grandchild in a positive light, but GPs of TDC enjoyed a higher quality of relation and felt emotionally closer to them compared to SNC. Maternal followed by the paternal grandmothers were more actively involved than grandfathers in the child's life. The age of

the GPs was in inverse relation with their involvement. Geographic distance was important only for TDC, while GPs health affected their involvement with their SNC.

## FAMILY COMMUNICATION AND FAMILY STRUCTURE

C. Musil, *Case Western Reserve University, Cleveland, Ohio*

Clear and direct communication within families and across the generations is a principal indicator of effective family functioning, but one that can be difficult to achieve. Problems within the family, family support and family structure, as well as one's depressive symptoms might influence perceptions of family communication, while coping strategies such as resourcefulness may improve both perceptions and actual communication effectiveness. Therefore, this study examined factors affecting perceptions of family communication: family structure, intra-family strain, instrumental and subjective support, resourcefulness, and depressive symptoms. This sample included 485 community-dwelling women who participated a study on caregiving to grandchildren. Family structure was determined by whether grandmothers were raising grandchildren ( $n=183$ ), living in multigenerational homes ( $n=135$ ), or did not live with nearby grandchildren ( $n=163$ ). Using mailed questionnaires, participants completed the FAD Communication Subscale, the Family Inventory of Life Events, the Resourcefulness Scale, the CES-D Depression Scale, and Duke Social Support Index. Data were analyzed using hierarchical regression analysis for the entire sample and by family structure. Between 23-31% of family communication was explained by the model, with somewhat different factors contributing to family communication by structure. While subjective support contributed to perceptions of support across all family structures, depressive symptoms and family strain detracted from family communication for primary caregivers; less instrumental support and more family strain ( $p<.06$ ) influenced perceptions of family communication problems among non-caregivers. For the full sample, resourcefulness and living in a multigenerational home enhanced family communication. Findings underscore the relevance of family support to perceptions of family communication.

## SESSION 1265 (POSTER)

### HEALTH IN DIVERSE POPULATIONS

#### AGE-RELATED DIFFERENCES IN BREAST CANCER SCREENING AMONG KOREAN AMERICAN WOMEN

E. Lee<sup>1</sup>, K. Nandy<sup>1</sup>, U. Menon<sup>2</sup>, L. Szalacha<sup>2</sup>, 1. *Univ. of California, Los Angeles (UCLA), Los Angeles, California*, 2. *The Ohio State University, Columbus, Ohio*

Korean American (KA) women continue to have one of the lowest rates of mammography screening adherence compared to non-Hispanic white women. We compared 15-month screening outcomes between non-adherent younger (40–49 years of age,  $n=218$ ) and older (50 and older,  $n=210$ ) groups of KA women who participated in a culture-specific intervention: Korean Immigrants & Mammography—Culture-Specific Health Intervention (KIM-CHI). At baseline, older women were less educated, had a usual source of care, and were more likely to have had a mammogram in their lifetime than their younger counterparts. No group differences were found in health beliefs other than perceived barriers, in which the older women reported significantly lower barriers than women in the younger group. Older women had 1.6 times the odds of reporting a mammogram than did younger women at 15 months post-baseline (95% CI: 1.05, 2.37). In addition to the intervention effect, for younger women, having a usual source of care was a predictor of mammography completion (OR = 4.55, 2.21–9.36). For older women, having a usual source of care (OR = 3.30, 1.59–6.82) and history of mammography (recent vs never: OR=4.52, 1.2-16.99; more than 2 years

ago vs never: OR=2.10, 0.57-7.72) were predictors of mammography completion. In summary, the KIM-CHI program was effective in improving mammography uptake among non-adherent KA women in both age groups.

## COMPARISON OF DIFFERENT CULTURE RATERS OF MOOD AND COGNITION IN OLDER ADULTS FROM TWO ETHNIC GROUPS

C.L. Williams, R.M. Tappen, M. Rosselli, *Christine E. Lynn College of Nursing, Florida Atlantic University, Boca Raton, Florida*

Accurate assessment of mental health and cognition in older individuals from different ethnic groups may be complicated by cultural norms and attitudes of the observer. The purpose of this study was to identify the potential influence of raters' cultural background on assessment of cognitive status, mood, affect and depression. Fifteen trained raters who were either Afro-Caribbean (AC), European American (EA) or Hispanic American, scored videotaped interviews of 30 European American (EA) and 34 Afro-Caribbean (AC) adults age 55 or older resulting in 418 observations. There were significant differences in mood ratings using Dementia Mood Assessment Scale ( $F=54.5$ ,  $p<.01$ ) and affect using the Observed Emotion Rating Scale ( $F=10.37$ ,  $p<.01$ ) but not depression (Cornell Scale for Depression in Dementia). There were differences in global ratings on the Clinical Dementia Rating Scale ( $F=5.5$ ,  $p<.01$ ) but not the Mini Mental State Examination or the FULD Object Memory Evaluation. The raters' background did influence subjective ratings of dementia, emotions and mood but not objective cognitive tests. Scores for negative emotion on the Observed Emotion Rating Scale were low ( $M=1.26$ ,  $SD 1.49$ ) and scores on the Cornell Scale for Depression in Dementia were below the cutoff for depression ( $M=1.25$ ,  $SD 1.8$ ). Detection of differences in depressive symptoms and negative emotions was a challenge in this healthy community-dwelling population. Future research should include populations at risk or in treatment for depression.

## THE LINKS BETWEEN PHYSICAL PERFORMANCE, SELF-RATED HEALTH AND MORTALITY AMONG OLDER ADULTS IN THE US AND ENGLAND

M. Ofstedal, J. Bound, M. Kim, *University of Michigan, Ann Arbor, Michigan*

The integration of physical measures and biomarkers in population-based surveys has become increasingly common in recent years. These measures are considered to be an important complement to self-reported health measures that are typically collected in large surveys. Yet the value of these measures has not yet been fully demonstrated. This paper assesses the value of three physical performance measures (grip strength, lung function and walking speed) as predictors of self-rated health and of mortality among older adults. Data come from the 2006-2010 waves of the Health and Retirement Study, a national panel study of men and women over age 50 in the United States, and the 2004-2008 waves of the English Longitudinal Study of Ageing, the British counterpart to the HRS. We use an ordered probit model to predict self-rated health and logistic regression to predict mortality over a 4-year period among men and women age 65 or over. The base model for each outcome includes the physical performance measures and basic sociodemographic factors. The full model adds measures of self-reported disease and functional status. Preliminary results suggest that the performance measures are strongly associated with both self-rated health and mortality in both countries. In general, these associations are slightly to moderately attenuated when self-reported disease and functional status are controlled, but they remain significant predictors of self-rated health and mortality. This suggests that the performance measures cap-

ture a unique component of health that is not explained by the self-reported measures.

### **CULTURAL CONSIDERATIONS IN ASSESSING FUNCTIONING IN HISPANICS WITH AND WITHOUT SCHIZOPHRENIA**

D. Tiznado<sup>1</sup>, P. Helu-Fernandez<sup>2</sup>, E. Roman<sup>3</sup>, J. Ho<sup>2</sup>, B. Mausbach<sup>2</sup>, T.L. Patterson<sup>2</sup>, D. Jeste<sup>2</sup>, V. Cardenas<sup>2</sup>, 1. *Psychology, University of Missouri-Kansas City, Kansas City, Missouri*, 2. *University of California- San Diego, San Diego, California*, 3. *San Diego State University, San Diego, California*

Schizophrenia has been associated with substantial functional deficits, although methods of quantifying these deficits have been elusive. Research suggests the UCSD Performance-based Skills Assessment (UPSA) is a valid and reliable method for assessing functional capacity. However, Hispanics with and without schizophrenia may underperform on this test, prompting the need to establish appropriate methods for accurately interpreting test results. We present preliminary results on the role of diagnostic, educational, and acculturative effects on UPSA scores for Hispanics. Participants were 83 Hispanics ages 32-80; 55 had a DSM-IV diagnosis of schizophrenia or schizoaffective disorder, and 28 were healthy controls. Functional capacity was measured using the UPSA. Acculturation was measured using the Acculturation Rating Scale for Mexican Americans (ARSMA). Multiple regression was used with age, gender, years of education, mean ARSMA item response (range = 1-5), and diagnostic group as predictors of UPSA scores. Participants with a diagnosis of schizophrenia had significantly lower UPSA total scores ( $t(81)=5.91, p<.001$ ). Education ( $t(81)=2.82, p=.006$ ) and acculturation ( $t(81)=2.81, p=.006$ ) were also related to UPSA scores. UPSA scores increased 2 points for each year of education and 8 points for every point increase on the ARSMA. Hispanic healthy controls and patients with schizophrenia score significantly lower on the UPSA than their non-Hispanic counterparts. However, when adjusting for education and acculturation, ethnic differences in UPSA scores are eliminated. Therefore, individuals administering the UPSA should take into account these variables when assessing Hispanic individuals.

### **DOES INTER- AND INTRA-RACIAL DISCRIMINATION RAISE THE RISK OF HYPERTENSION?**

K.N. Taylor-Watson, L.R. Wilkinson, K.F. Ferraro, *Sociology, Purdue University, Lafayette, Indiana*

**Objective:** This study examines the impact of perceived racial discrimination on hypertension among African Americans. We formulate three research questions. First, does perceived racial discrimination raise the risk of hypertension? Second, does the combined effect of inter- and intra-discrimination convey greater risks of hypertension among African American adults? If so, do these risks differ by age? **Methods:** This study uses data from the National Survey of American Life (NSAL), which was designed to examine racial and ethnic disparities in the United States among persons 18-94 years of age ( $N=4,932$ ). The measurement of discrimination distinguishes whether individuals reported being treated unfairly by Blacks, Whites, both, or not at all. Logistic regression analyses with robust standard errors estimate the effect of frequency of both inter- and intra-racial discrimination on hypertension. **Results:** Results reveal that compared to respondents reporting no racial discrimination, those reporting discrimination by a single racial/ethnic group were 44 percent more likely to report hypertension ( $p<0.01$ ) and 91 percent among those reporting discrimination by both Black and White people ( $p<0.01$ ). This finding was observed among both middle-aged and older adults, but the effect was stronger for middle-age adults. **Discussion:** This research is innovative by identifying how both inter- and intra-racial discrimination influence the risk of hypertension in middle and later life. The

findings reveal that perceived discrimination among African American adults is associated with earlier onset of hypertension, consistent with the weathering hypothesis. Additionally, compared to older participants, younger adults are more vulnerable to the effects of racial discrimination.

### **GROUP MEMBERSHIP AND MORTALITY RISK AMONG THE JAPANESE ELDERLY: NEW EVIDENCE FROM A NATIONAL SAMPLE**

Y. Minagawa<sup>1,2</sup>, Y. Saito<sup>2</sup>, 1. *Sociology, University of Texas at Austin, Austin, Texas*, 2. *Nihon University, Tokyo, Japan*

There is a well-established literature on the health benefits of social integration; more socially integrated individuals are, the research suggests, at lower risk of suffering from physical and mental health problems. Using three waves of data from the Nihon University Japanese Longitudinal Study of Aging (NUJLSOA: 1999, 2001, and 2003), we examine the effects of social integration on the risk of mortality among Japanese adults aged 65 and over during the four-year study period. The analyses lead to several important conclusions. First, integration into society, defined by group membership, is inversely associated with mortality risk among older men and women. Those who belong to at least one social group display lower odds of dying compared to those who do not belong to anything during the follow-up period ( $p<.001$ ). Second, the protective effects of group affiliation remain strong, even when sociodemographic characteristics, functional health, and family relationships are accounted for ( $p<.001$ ). Third, we further find that group membership offers protection against death, regardless of the kinds of activities that individuals pursue ( $p<.05$ ). Both self-development activities (e.g., educational and hobby circles) and community participation (e.g., neighborhood associations) are related to lower risk of death, net of all controls. The present findings provide strong evidence to suggest the beneficial effects of social integration on health in the Japanese context. Overall, this research highlights the importance of "active aging" in achieving "successful aging" in Japan.

### **ELDERLY TURKISH MIGRANTS IN DENMARK AND THEIR ACCESS TO PUBLIC HEALTH CARE SERVICES**

S. Yazici<sup>1</sup>, A. Blaakilde<sup>2</sup>, S. Petersen<sup>2</sup>, 1. *Gerontology, Akdeniz University, Antalya, Turkey*, 2. *University of Copenhagen, Center for Healthy Ageing, Copenhagen, Denmark*

**Background/purpose** Countries like Denmark are challenged regarding retired migrants. Many of the migrants obtained low-paid, physically demanding jobs, and did not learn the language of the host country. As they age, this situation can eventually cause problems such as social isolation, poor financial situation, reliance on children or relatives for translation purposes, and, not the least, a suffering from multiple, interacting health problems. Health practices of Turkish elderly people living in Denmark are studied in order to gain phenomenological knowledge about their health status, what kinds of specific problems they are facing, and how their needs can be met. **Methods** Twenty semi-structured interviews with Turkish migrants, aged 42 -80, fieldwork in health settings and local, public centers. User-driven innovation methodology was employed while arranging a local theme-day about health practices, inviting elderly Turkish people to attend and discuss. **Findings/results** The interviewees feel old, ill, and worn-out at a chronological age much below ethnic Danes. Many of them do not understand the Danish language properly, and hence, do not have satisfactory knowledge about the possibilities of health promotion initiatives and healthcare services in Denmark, where public health and health care services are systematized and rather effective. There is a need to find and support this minority group in other ways than what is already

practiced concerning the ethnic Danish population. Conclusion The health situation of retired Turkish migrants calls for more attention in order to meet their needs. The presentation will provide suggestions about what to do to obtain this goal.

#### **'A FAMILY OF OUR OWN' INTIMATE RELATIONS OF ELDER LESBIAN, BISEXUAL AND TRANSGENDERED WOMEN**

J. Bromseth, *Centre for gender studies, Stockholm university, Stockholms universitet, Sweden*

The position of LGBT-people's rights and possibilities as citizens has changed radically over the last 30 years in the Western world, along with larger structural changes of the organizing and meaning of family, intimacy and close relations. LGBT-persons life conditions and strategies to create viable lives are historically and culturally situated, and so is the meaning and content of intimate relations (Weeks et al 2001). In this presentation I will look into how intimate relations are filled with meaning by elder lesbian, bisexual and transgendered women in Sweden and how they negotiate, reproduce and resist the hegemonic hetero-relational norms. It builds upon interviews with lesbian, bisexual and transgendered women 60+ and participant observation in the lesbian community where elder women take part in a large city in Sweden. Many refer to their families as 'chosen', including different variants of important close relations, including friends, partners, ex-lovers, LGBT-community, pets, children as well as biological relatives (Weston 1989). The chosen families represent a positive notion of a supportive and accepting social relation, filling many of the functions traditionally associated with biological families. The most important social relations seem to consist of friends and partners, where biological relatives are considered less important in emotional or practical support (Heaphy, Yip and Thompson 2004, Fredriksen-Goldsen et al 2011). What characterizes the complex social web of intimate relations, and is it even fruitful to build on the concept of 'family' in describing them?

#### **IS THERE COMPRESSION OF MORBIDITY IN SPAIN? RECENT TRENDS IN MORTALITY AND MORBIDITY**

A. Solé -Auró, *University of Barcelona, Barcelona, Spain*

Evidence on trends in prevalence of disease and disability can clarify whether countries are experiencing a compression or expansion of morbidity. The prevalence of most chronic diseases (arthritis, heart problems, diabetes, hypertension and obesity) appears to have been increasing in both Europe as in other developed countries indicating an expansion of morbidity as indicated by disease prevalence. It is likely that better treatment, preventive measures (such as cancer screening and treatment of cardiovascular risk factors) and increases in education levels have contributed to the declines in mortality and increases in life expectancy. It should be noted that, the increase in presence of disease appears to be less associated with disability. This paper examines whether there has been an expansion or compression of morbidity in Spain. Using trends in mortality and morbidity from major causes of death and linking these together to provide estimates of life expectancy with and without diseases and loss of functioning, using a repeated cross-sectional Spanish health survey in 1997 and 2006. Because mortality is not recorded on the Spanish National Health Survey, mortality information came from the National Statistics Institute database. Increasing survival among people with diseases can lead to a higher prevalence of diseases and functioning loss in the older population. Higher prevalence of health problems can lead to a higher pressure on the health care system and growing burden of disease for individuals.

## **SESSION 1270 (POSTER)**

### **INNOVATIONS IN ASSESSMENT AND MEASUREMENT**

#### **RELIABILITY AND VALIDITY OF THE NEWLY DEVELOPED COMPUTERIZED UCSD PERFORMANCE-BASED SKILLS ASSESSMENT**

R.C. Moore<sup>1</sup>, T.L. Patterson<sup>1</sup>, A. Harmell<sup>1,2</sup>, J. Ho<sup>1,2</sup>, V. Cardenas<sup>1</sup>, B. Palmer<sup>1</sup>, D. Jeste<sup>1,3</sup>, B. Mausbach<sup>1</sup>, *1. Psychiatry, University of California, San Diego, La Jolla, California, 2. San Diego State University/University of California, San Diego, Joint Doctoral Program in Clinical Psychology, San Diego, California, 3. The Sam and Rose Stein Institute for Research on Aging, University of California San Diego, La Jolla, California*

This study investigates reliability and validity of a newly developed scale for assessment of everyday functioning, Computerized UCSD Performance-Based Skills Assessment (C-UPSA), in a sample of 21 patients with schizophrenia (Sz; mean age =54.52+/-4.09 years) and 20 healthy comparison subjects (HCs; mean age =58.75+/-12.10). C-UPSA retained four of the five subtests from the original UPSA (Patterson et al., 2001) with test items and instructions remaining the same. The C-UPSA total score was significantly correlated with UPSA total scores ( $r = 0.73, p < 0.001$ ), which is comparable to the test-retest reliability of the original UPSA ( $r = 0.63-0.80$ ; Leifker et al., 2010). The C-UPSA was also significantly correlated with UPSA-Brief scores ( $r = 0.71, p < 0.001$ ), and neuropsychological status ( $r = 0.77, p < 0.001$ ) in Sz. Furthermore, the Sz group scored significantly lower than the HCs on the C-UPSA ( $t = 5.06, p < 0.001$ ). ROC curves were generated to determine the optimal C-UPSA value for discriminating between performance of Sz and HC, with a resulting cutoff score of 75 (sensitivity =0.70, specificity =0.95, AUC =0.882, 0.779-0.985 95% CI,  $p < 0.001$ ). Thus, the C-UPSA appears to be highly related to the original UPSA, and was able to accurately identify if a person had a diagnosis of schizophrenia 95% of the time. The C-UPSA has several advantages over the standard version, including increased portability, decreased administration time, and minimization of examiner impact on the participant. Future research would benefit from establishing this test as a clinical and research tool to effectively assess functional capacity.

#### **INTEGRATIVE ASSESSMENT OF HEALTH CARE NEEDS USING THE INTERMED FOR THE ELDERLY (IM-E) INTERVIEW**

B. Wild<sup>1</sup>, I. Maatouk<sup>1</sup>, S. Lechner<sup>1</sup>, D. Niehoff<sup>1</sup>, H. Müller<sup>2</sup>, H. Brenner<sup>2</sup>, W. Söller<sup>3</sup>, W. Herzog<sup>1</sup>, *1. Department of General Internal Medicine and Psychosomatics, University Hospital Heidelberg, Heidelberg, Germany, 2. Division of Clinical Epidemiology and Ageing Research, German Cancer Research Center, Heidelberg, Germany, 3. Department of Psychosomatics and Psychotherapy, General Hospital Nürnberg, Nürnberg, Germany*

Background: The INTERMED interview is an integrative assessment method to identify patients with complex (bio-psycho-social) health care needs. The INTERMED for the Elderly (IM-E) was developed to assess health care needs specifically in the elderly population. The IM-E was applied in the frame of the third follow-up of the ESTHER study – a large German epidemiological cohort study that investigates chronic diseases in the elderly population. Methods: A subsample of  $n = 3124$  ESTHER participants ages 55 to 80 was visited at home. With these participants, a comprehensive geriatric assessment was carried out. At the end of the home visit, the IM-E was conducted to assess the health care needs of the participants. Results: An IM-E sum score could be calculated for 3121 participants (=99%); 8.2 % ( $n = 256$ ) had an IM-E sum score  $\geq 21$ . These persons – classified as patients with complex health care needs – showed a significantly reduced health related quality of life (HRQOL) and significantly increased depression severity scores com-

pared to participants with an IM-E sum score < 21. 88% of patients with complex health care needs were multimorbid; they showed significantly reduced HRQOL and increased depression severity compared to multimorbid patients without complex health care needs. Conclusion: According to our data 8.2% of the elderly population living at home is in need of additional integrated care. Most of these patients are multimorbid. Multimorbid patients with complex health care needs are significantly impaired regarding HRQOL and depression severity compared to multimorbid patients without complex health care needs.

### **VALIDITY OF THE HRS COGNITIVE TEST IN THE DETECTION OF COGNITIVE IMPAIRMENT AND DEMENTIA: DOES RACE MATTER?**

Z. Zhang, *Michigan State University, East Lansing, Michigan*

Prior research showed that although standardized screens for dementia had substantial sensitivity in detecting dementia for Blacks and Whites, the specificity of these screens was poorer for Blacks than for whites. This means that cognitively normal Blacks are more likely to be misdiagnosed as impaired compared to Whites. In the proposed study, we will evaluate the performance of the cognitive test (i.e., the modified version of TICS with a 35-point scale) among Blacks and Whites in the Health and Retirement Study (HRS) using the Aging, Demographics, and Memory Study (ADAMS), the first population-based dementia study in the United States. The ADAMS selected a random and stratified subsample of 1,770 HRS respondents aged 70 or older from the 2000 and 2002 waves of HRS. Among this group, clinical and neuropsychological assessments were completed for 856 respondents to determine a diagnosis of normal, cognitive impaired, not demented (CIND), or dementia. We will use receiver operating characteristics (ROC) analysis to examine the accuracy of the HRS cognitive test in identifying 1) demented from the nondemented elderly, 2) cognitive impaired (i.e., CIND or dementia) from cognitively normal elderly among Whites and Blacks respectively. The analytic sample included 119 Blacks and 464 Whites who took the HRS cognitive test. Preliminary results showed that the cognitive test in HRS had good diagnostic validity for both Whites and Blacks. However, the optimal cutoff points for detecting cognitive impairment and dementia differed for Blacks and Whites.

### **MODERN METHODS FOR MODELING OF INTRAINDIVIDUAL DATA: EXTRACTING MORE INFORMATION FROM THE SAME DATA**

P.R. Deboeck<sup>1</sup>, M. Montpetit<sup>2</sup>, C.S. Bergeman<sup>3</sup>, 1. *Univeristy of Kansas, Lawrence, Kansas*, 2. *Illinois Wesleyan University, Bloomington, Illinois*, 3. *University of Notre Dame, Notre Dame, Indiana*

Much of developmental psychology has focused on macro-temporal change, change that occurs over the course of months or years, while less focus has been placed on understanding how change occurring at the daily level contributes to development. Modeling of intraindividual time series, such as those collected through daily diaries or experience sampling, have the potential to shed light on these processes. Many methods, such as cross-lagged panel models, only provide a single estimate to describe the magnitude of the relationship between changing variables. While it is often useful to first gauge the magnitude of a relationship, modern analysis methods offer the potential for extracting differing pieces of information from such relationships. This presentation examines how a series of specific questions can be asked about the relationship between daily negative affect and stress: 1) How long does it take for the effect of stress on negative affect to reach its maximum? 2) What is the maximal relationship of stress on negative affect? and 3) How long does the effect of stress on negative affect persist? Using data from the Notre Dame Study of Health and Well-being, we demonstrate how a method for continuous time modeling of intraindividual time series can be used to ask specific questions as to how people differ in

their stress and negative affect relationship, and how these differences relate to interindividual traits.

### **'BELOW THE SURFACE': AN EXPLORATION OF THE CHALLENGES OF COLLABORATIVE RESEARCH IN SOCIAL GERONTOLOGY**

R. Means<sup>1</sup>, J. Eales<sup>2</sup>, N. Keating<sup>2</sup>, 1. *Faculty of Health & Life Sciences, University of the West of England, Bristol, United Kingdom*, 2. *University of Alberta, Edmonton, Alberta, Canada*

The emphasis upon interdisciplinary research in gerontology by major funders permeates the current research milieu despite literature on the challenges of collaboration in practice and the more limited literature on research collaboration itself. Informed by empirical data drawn from the collective past experiences of UK and Canadian social science researchers, this paper looks below the surface at the 'messy' realities of collaborative research. Participants spoke of ambiguities inherent in the research process. Three tensions stood out as critical: personal connections, governance structures and research outcomes. Findings underline the challenges faced if the potential of interdisciplinary research is to be realised.

### **DESIGNING A MEASUREMENT INSTRUMENT TO EVALUATE POST-TRAUMATIC GROWTH IN MIDDLE-AGED MALE SURVIVORS OF CIVIL WAR IN BOSNIA AND HERZEGOVINA (1992-1995)**

M. Vracevic, *University of Connecticut, Storrs, Connecticut*

Purpose: The study describes development of a measurement instrument of posttraumatic growth (PTG), the Post-Traumatic Growth Scale (PTGS). This instrument was designed specifically for evaluation of post-traumatic growth in soldiers-survivors of the Civil War in Bosnia and Herzegovina 1992 - 1995. A goal of the study was to create a measurement instrument that allows for comparison between husbands and wives on their perceptions of posttraumatic growth in husbands, overall and across domains. Post-Traumatic Growth Scale (PTGS) is an adaptation of existing post-traumatic growth inventories. It is a 7-point likert-scale instrument that examines change since the traumatic experience in domains of daily activities, plans/goals for the future, views of self, views of the world, and relationships with others. Methods: The sample consists of two hundred (N=200) husbands and wives, former residents of Bosnia and Herzegovina who have lived through the war, who are middle-aged (age 45+), come from low and middle SES, have obtained high school and/or college education, and speak English, Bosnian, Croatian, and Serbian languages. The participants were recruited in person, through purposeful and snowball sampling procedures. A demographic questionnaire and qualification screener were used to collect basic information about the participants and the Post-Traumatic Growth Scale (PTGS) was administered. A scale development procedures, content validity process, factor extraction and factor analysis, as well as internal consistency and reliability of the Post-Traumatic Growth Scale (PTGS) are presented. Results: Conclusions and limitations of the Post-Traumatic Growth Scale (PTGS) are discussed.

### **DEVELOPMENT AND VALIDATION OF CRITERION-REFERENCED, CLINICALLY RELEVANT FITNESS STANDARDS FOR MAINTAINING PHYSICAL INDEPENDENCE IN LATER YEARS**

J. Jones, R. Rikli, *Cal State University, Fullerton, Fullerton, California*

Purpose. To develop and validate criterion-referenced fitness standards for older adults that predicts the level of physical capacity needed for maintaining physical independence into later life. The proposed standards, based on findings from both cross-sectional and longitudinal research, were developed to accompany a previously validated fitness test battery for older adults that is being widely used throughout the United States and in many other countries—the Senior Fitness Test.

Methods. Following established measurement protocols, a criterion measure of physical independence was identified for use in establishing fitness standards that could predict physical independence in later years. Next, data from a large cross-sectional study of 7,183 older adults ages 60-94, together with findings from longitudinal research on physical capacity and aging, were used as the basis for proposing fitness standards (cut off scores) that are associated with having the ability to function independently. The final step in the process involved conducting a follow-up study on a sub sample of older adults (N = 82) to test the standards for their accuracy (validity) and consistency (reliability) as a predictor of physical independence. Results. Performance standards were developed for men and women ages 60-94 indicating the level of fitness needed to remain physically independent until late in life. Reliability and validity indicators for the standards were acceptable, with coefficients ranging between .79 and .97. Implications. The proposed standards provide health professionals with easy-to-use reference points for evaluating physical capacity in older adults relative to that needed for physical independence, and for planning interventions.

## SESSION 1275 (POSTER)

### INTERVENTIONS

#### EVALUATING NURSING HOME PRESCRIBERS' ANTIBIOTIC DECISION-MAKING PROCESSES

R.M. Bertrand<sup>1</sup>, L. Olsho<sup>1</sup>, L. Goodman<sup>1</sup>, D.T. Hurd<sup>1</sup>, J. DeAngelis<sup>1</sup>, C. Mitchell<sup>2</sup>, P.D. Sloane<sup>2</sup>, S. Zimmerman<sup>2</sup>, *1. Health Policy, Abt Associates Inc, Cambridge, Massachusetts, 2. University of North Carolina, Chapel Hill, North Carolina*

Antibiotics are among the most commonly prescribed pharmaceuticals in nursing homes (NHs), yet reports indicate a high proportion are inappropriate. The adverse consequences of inappropriate prescribing include drug reactions/interactions, secondary complications, and emergence of multi-drug resistant organisms. In an effort to reduce antibiotic overprescribing, a quality improvement program was implemented in six North Carolina NHs, with comparison data collected in six control NHs. In addition to primary outcomes based on prescribing data, we examined secondary outcomes to better understand the decision-making processes of prescribers. Secondary data were collected via web-based surveys administered to prescribers at the twelve sites. Nearly all reported ordering an antibiotic for urinary tract (UTI; 93%), skin/soft tissue (SST; 86%), and respiratory (RI; 100%) infections during the last 60 days. Only seven percent reported ordering an antibiotic for fever of unknown origin. Prescribers used a five-point scale (0-5) to rate the importance they place on nine sources of information they might use to make an antibiotic decision. Resident-reported symptoms (2.85) and resident history (2.85) were most highly rated for UTI, and clinical examination was most highly rated for SST (4.00) and RI (3.42). Family request was rated as having very little or no overriding importance for UTI (.38), SST (.00), and RI (.23). Prescribers also rated their clinical experience as very low when making antibiotic decisions for RI (.15). Findings provide insight regarding the decision making process, and will be presented relative to the change over time in the primary outcome of the rate of antibiotic prescribing.

#### SURVIVAL ANALYSIS OF PLACEMENT INTO NURSING FACILITIES AFTER TERMINATION OF HCBS PROGRAM

D.A. Chiriboga<sup>1</sup>, S. Rhew<sup>1</sup>, L.M. Brown<sup>1</sup>, S. Wang<sup>1</sup>, K. Kwag<sup>2</sup>, Y. Jang<sup>1</sup>, *1. Aging and Mental Health Disparities, University of South Florida, Tampa, Florida, 2. St. Louis University, St. Louis, Missouri*

Examined was risk of nursing home placement for 244 individuals with Alzheimer's disease, after termination of the family-focused home and community based service (HCBS) Alzheimers Program (MAP) in which they were enrolled. A Medicaid waiver program, MAP offered 10 different services; approximately half were more directed at either

the caregiver or recipient needs, and a case manager monitored status and changing needs through monthly contacts. Our previous research had found that while monthly costs for MAP were significantly higher than three out of four comparison HCBS programs, the risk of nursing home placement (NHP) was significantly reduced. Reported here is whether or not the risk of NHP continued to be lower after re-assignment to a variety of other Medicaid programs. The sample consisted of both the former MAP participants and Medicaid recipients enrolled in one of the four original HCBS comparison groups: the Aged and Disabled Waiver Program (ADW). The majority of both groups were women and over age 80. All ADW participants had been enrolled in that program prior to MAPs closure, and both groups were followed for a period of 14 months after MAP closure (May 1, 2010 through June 30, 2011). Survival analyses indicated that former MAP participants no longer were lower in risk of NHP. One conclusion is that the dual focus on needs of caregiver and recipient made a difference. However, evaluation of tailored intervention programs like MAP remains more of a "black box" design, due both to the multiple options and individualized care plans.

#### ENHANCING PHYSICAL CAPABILITIES THROUGH SUPPORTIVE RELATIONSHIPS IN THE GROUP INTERVENTION PROGRAM

M. Ogawa, R. Hirayama, C. Ura, F. Miyamae, E. Nomoto, R. Takahashi, *Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan*

In this study, we explored (a) the development of supportive relationships among Japanese older participants in a group intervention program to form exercise habit and (b) whether and how such relationships are associated with changes in participants' subjective health status over the course of the program. Research on social relationships has indicated that perceived supportiveness of social partners motivates individuals to engage in health-promoting behavior including regular exercise, which then helps these individuals maintain and improve their health status. Aligned with this research, we aimed to clarify the process through which the relationships among participants influence their health status in exercise-oriented intervention programs. Participants were 62 community-dwelling older adults in Tokyo who participated in a 12-week intervention program (M age = 71.9). The program was designed for participants to acquire the habit of walking exercise through group activities. Throughout the program, every two to three weeks, participants evaluated (a) supportiveness of their group members and (b) their physical capabilities. Using data from the third week, when participants first evaluated their physical capabilities, we estimated a latent growth model, whereby changes in supportiveness, changes in physical capabilities, and the association between the two were analyzed. Results suggest that the development of supportive relationships with group members enhances participants' physical capabilities. The initial level of supportiveness was positively correlated with that of physical capabilities, and the growth of supportiveness had a significant positive effect on that of physical capabilities.

#### ACTIVE ENGAGEMENT THROUGH IPAD: EFFECTS OF TECHNOLOGY ADAPTATION AS AN INTERVENTION ON COGNITIVE AGING

M.Y. Chan, S. Haber, L.M. Drew, D. Park, *University of Texas At Dallas, Richardson, Texas*

Evidence shows that lifestyle variables, such as staying actively engaged, may alter the trajectory of cognitive aging and help maintain cognitive performance (Hultsch et al., 1999). This pilot study investigated whether learning and using a new technological device (i.e. iPad) can serve as a means of sustained active engagement that will influence the development and maintenance of cognitive ability (Schooler et al., 1999). Healthy older adults aged 65+ were recruited from the community for the experimental (iPad) group (N=19), and the control group was an age and education-matched sample drawn from the con-

trol group a larger lifestyle engagement study (N=19). The iPad group completed an 8-week training in using the iPad for various activities (e.g. games, planning vacation, diary homework). The Placebo group completed a structured set of activities (e.g. crossword puzzles, watching documentaries, etc.) that did not involve learning a new skill. Cognitive ability was measured at pre- and post-training in 9 different cognitive domains. Data was analyzed using a repeated-measure ANOVA on standardized scores, with adherence hours to the program as a covariate. Overall, there was significant improvement in the iPad group for processing speed and both immediate and delayed recall memory, when compared to the Placebo group ( $p < .05$ ). However, the Placebo group showed greater improvements in mental control, when compared to the iPad group. Although the iPad group showed significant improvements in three cognitive domains, more investigation is necessary before a definitive conclusion can be made about the impacts of technological device learning on cognitive performance.

### **DEVELOPING SUPPORTIVE RELATIONSHIPS IN THE GROUP INTERVENTION PROGRAM TO FORM EXERCISE HABIT**

R. Hirayama, M. Ogawa, C. Ura, F. Miyamae, E. Nomoto, R. Takahashi, *Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan*

Evidence shows that group-based intervention programs are effective in helping Japanese older adults incorporate physical activities into their daily lives. The effect of such intervention programs, however, depends on whether participants can form a supportive relationship with their group members, thereby encouraging each other to engage in physical activities regularly. From a structural perspective of social relationships, our aim in this study is to explore whether and how participants develop the relationship with their group members differently by gender, age, and education level. Our data were from 62 community-dwelling older adults in Tokyo who participated in a 20-week group intervention program to form walking exercise habit (mean age = 71.9). Divided into 10 groups, participants evaluated how supportive their group members were every two to three weeks over the course of the program. Using two-level latent growth modeling, we analyzed (a) the trajectory of changes in perceived supportiveness of group members and (b) whether and how the trajectory might vary by individual characteristics (i.e., gender, age, and education level) and by group composition (i.e., gender ratio and variability among members in age and education level). Results suggest that participants' gender and education level matter for the development of supportive relationships with group members, with little influence of group composition. Whereas men were higher than women in the initial level of supportiveness, women reported a greater increase in supportiveness than men. Participants' level of education was positively associated with both initial level of and growth in perceived supportiveness of group members.

### **REMINISCENCE IN INTERGENERATIONAL CONVERSATIONS**

O. Gould<sup>1</sup>, S. MacNeil Gautreau<sup>1</sup>, J.D. Webster<sup>2</sup>, *1. Psychology, Mount Allison University, Sackville, New Brunswick, Canada, 2. Langara College, Vancouver, British Columbia, Canada*

Although reminiscences occur frequently in conversation, little research has addressed whether their production accommodates the needs of the intergenerational conversation partner. Here, 29 intergenerational dyads (Mage = 19.00 (1.36) and 73.37 (5.33) years) engaged in three guided conversations. Participants reported privately on conversation satisfaction, reminiscence frequency (a simplified version of the Reminiscence Functions Scale) and estimated the reminiscence behavior of the other generation. Older adults were significantly more satisfied with the conversations than their younger partners across four indicators of satisfaction (i.e., enjoyment ( $\eta^2 = .04$ ), awkwardness ( $\eta^2 = .18$ ), length ( $\eta^2 = .21$ ), and relaxed ( $\eta^2 = .07$ ). Younger adults significantly overestimated the older adults' frequency of reminiscing ( $\eta^2$

= .31), particularly for the reminiscence function of boredom reduction, and older adults significantly underestimated younger adults' reminiscence frequency ( $\eta^2 = .36$ ), particularly for the reminiscence functions of boredom reduction and bitterness revival. Finally, we used difference scores to assess how accurately each judged the other generations' frequency of reminiscing (a possible indicator of age stereotypes). The relationship between accuracy and the partner's conversation satisfaction was significantly different for the two age groups ( $p < .05$ ). Specifically, the less accurate older adults were in estimating young people's reminiscing frequency, the less the young partners' reported conversation satisfaction. In contrast, the less accurate younger adults were in estimating older people's reminiscing frequency, the more conversation satisfaction was reported by the older partners. The discussion will focus on the role of reminiscence as a predictor of intergenerational conversation satisfaction.

### **ENGAGING AFRICAN-AMERICAN ELDERS IN LATE-LIFE ANXIETY TREATMENT RESEARCH**

S. Shrestha<sup>2,1</sup>, M. Armento<sup>2,1</sup>, D. Zeno<sup>2</sup>, M. Stanley<sup>2,1,3</sup>, N.L. Wilson<sup>1</sup>, *1. Psychiatry and Behavioral Medicine, Baylor College of Medicine, Houston, Texas, 2. Michael E DeBakey Veterans Affairs Medical Center, Houston, Texas, 3. South Central Mental Illness Research Education and Clinical Care, Houston, Texas*

Risk for inadequate recognition of mental health symptoms and care is particularly high for ethnic-minority elders in low-income, underserved communities and research in this area is limited. Commonly identified barriers to successful engagement of older African-Americans in treatment research are stigma, mistrust, racism, and beliefs about symptoms and treatment. Lessons from late-life depression treatment studies underscore the importance of using culturally appropriate language, culturally tailored treatment and creative outreach activities to overcome these barriers. However, minorities are under-represented in anxiety trials and there is some indication that older adults are less able to identify symptoms of anxiety than those of depression. This poster will describe strategies used to engage African-American older adults in Calmer Life, a culturally tailored, participant-centered intervention for older adults. Through active participation of churches and social service agencies and consultation with the Calmer Life Community Advisory Council, we deployed multiple approaches to reach 49 and ultimately consent 29 African-American elders in a pilot study including: 1) interactive presentations using alternative language to increase awareness of signs and symptoms of anxiety and increase understanding about the benefits of treatment. 2) use of print materials with positive graphics and consumer language 3) sign-up methods to solicit consumer interest while maintaining confidentiality. 4) involvement of trusted community leaders in outreach efforts. A consumer-focused video featuring reports of study participants who successfully completed the intervention and comments from community partners was an outgrowth of this pilot work; and will support future studies of community-based anxiety treatment.

## **SESSION 1280 (POSTER)**

### **LIFE SPAN AND DEVELOPMENTAL CHANGE**

#### **GENDER DIFFERENCES ON THE RELATIONSHIP BETWEEN CHILDHOOD SES AND COGNITIVE FUNCTIONING IN LATER LIFE: MODERATING EFFECT OF RACE/ETHNICITY AND EDUCATION**

J. Lyu, *UMass Boston, Boston, Massachusetts*

The purpose of this study was to investigate the gender differences on relationship between childhood SES and cognition among older adults. In addition, moderating effects of race/ethnicity and respondent's education on above association were also examined. Using data from

the 2008 Health and Retirement Study (HRS), the sample was subdivided into female and male groups, which consisted of 5,131 and 3,749 subjects, respectively. Cognition was measured by self-reported cognition survey items, which added up to 35 points. Childhood SES was measured by three indicators: parents' education, father's job, and family SES at childhood. Adjusted for confounding variables, a multivariate analysis showed that childhood SES is negatively associated with cognition for both subsamples but no significant gender difference was found. However, the effect of childhood SES on cognition was significantly moderated by race/ethnicity for both subsamples. In addition, respondent's education showed significant moderating effect only among female subsample. These findings suggest that although the association between childhood SES and cognition is not different by gender, the moderation effects of race/ethnicity and respondent's education may be different by gender.

### THE TRAJECTORY OF DISENGAGEMENT AMONG JAPANESE ELDERLY PEOPLE: USING GROUP-BASED TRAJECTORY MODELS

T. Nakata, *Hokusei Gakuen University, Sapporo, Japan*

The aim of this study is to examine the differences in the disengagement trajectories and its factors among elderly Japanese people. The word 'disengagement' is used to mean withdrawing from society like 'disengagement theory'. Though every people in their later life are said to disengage, actual figure of the disengagement and its factor have not known yet. In this study, it will be revealed applying latent class growth models using panel data. This study employed the National Survey of the Japanese Elderly, from wave I (1987) to wave IV (1996), which was conducted by Michigan University and Tokyo Metropolitan Institute of Gerontology. A number of friends, which is operational definition of the disengagement, was used as a dependent variables and age was independent variables. Education and gender were used as time-stable covariates and occupational and marital status and self-rated health were used as time-dependent covariates. The results of this analysis are as follow; 1) Dividing into four groups was adequate. 2) Those groups showed quite different trajectories. The first group showed almost no friend consistently, the second one decreased step by step, the third one increased with age in dribs, and the fourth one showed a trajectory with sharp decrease. 3) the second group was consisted of female and the second and fourth group were consisted of the highly educated. This results clear up that the processes separate interpopulationally, but the characteristics of the respondents except occupational status do not demonstrate the type of the process.

### HOURLASS HALF-FULL OR HALF-EMPTY? PREDICTING FOCUS ON OPPORTUNITIES OR LIMITATIONS ACROSS ADULTHOOD

P. Lemaster<sup>1</sup>, J. Strough<sup>1</sup>, A. Parker<sup>2</sup>, W. Bruine de Bruin<sup>3</sup>, N. Pichayayothin<sup>1</sup>, T. Karns<sup>1</sup>, 1. *West Virginia University, Morgantown, West Virginia*, 2. *RAND Corporation, Pittsburgh, Pennsylvania*, 3. *Carnegie Mellon University, Pittsburgh, Pennsylvania*

Future time perspective (FTP), the subjective sense of time ahead, is a core component of Carstensen's (2006) socioemotional selectivity theory. Research based on college students and middle-aged women rejected a one-factor model of FTP for a two-factor model: focus on opportunities and focus on limitations (Cate & John, 2007). Our objectives were to replicate these findings in a nationally representative, cross-sectional sample from the American Life Panel (N=3469; M age = 49.51, range=18-93) and to identify individual differences that predicted a focus on opportunities versus limitations. Confirmatory factor analyses indicated the two-factor model better fit the data than a one-factor model ( $\Delta\chi^2=3093.70$ ,  $p<.01$ ; CFI=.891). With age, focus on opportunities declined, while focus on limitations increased. In a subsample (N=1075), greater perceived health ( $\beta=.16$ ,  $p<.001$ ), better perceived decision-making ability over time ( $\beta=.15$ ,  $p<.001$ ), and greater action orientation

relative to preoccupation ( $\beta=.16$ ,  $p<.001$ ) predicted a focus on opportunities, over and above age ( $\beta=-.47$ ,  $p<.001$ ). Lower perceived health ( $\beta=-.18$ ,  $p<.001$ ), being male ( $\beta=-.11$ ,  $p=.002$ ), and lower action orientation relative to preoccupation ( $\beta=-.13$ ,  $p=.001$ ) predicted focus on limitations, over and above age ( $\beta=-.36$ ,  $p<.001$ ). Income, marital status, work status (retired or not), the presence of children in the home, anxiety and avoidance in close relationships, greater action orientation relative to hesitation, and social comparisons of decision-making ability were unrelated to focus on opportunities or limitations. Results illustrate the utility of conceptualizing FTP as comprised of two dimensions and the need for further research on individual differences associated with a focus on opportunities and limitations.

### FUTURE TIME PERSPECTIVE AFFECTS HOW THE PAST IS RECALLED IN YOUNG ADULTHOOD AND MIDLIFE

B. Demiray Batur<sup>1</sup>, S. Bluck<sup>2</sup>, 1. *University of Zurich, Zurich, Switzerland*, 2. *University of Florida, Gainesville, Florida*

Midlife is described in classic developmental theory as a period of shifting time horizons in time lived and time left to live. To examine relations between views of the future and the past at different points in the lifespan, the study assessed relations of adults' chronological age (i.e., time lived) and future time perspective (i.e., perceived time left to live) to qualitative characteristics of their autobiographical memories. Young and late middle-aged adults recalled a distant past, and a recent past autobiographical memory. Each memory was rated for a variety of experiential characteristics: emotional positivity, negativity, vividness, importance, and centrality to self-concept. Participants also indicated how open and optimistically they view their future (i.e., Future Time Perspective). Regression analyses examined the unique and combined power of future time perspective and chronological age group in predicting how individuals experience the remembered past. Regardless of age, individuals with a more open, optimistic future perspective rated their memories as more positive, less negative and more important. Additional effects of future time perspective were moderated by age group: Only younger adults showed a relation between increased future time perspective and reporting of more vivid memories that are more central to the current self-concept. In sum, the findings suggest that how individuals look to the future is related to how they recall both the recent and the distant past differentially in young adulthood and midlife. Discussion focuses on the remembered past and anticipated future as part of an 'extended self' across adulthood.

### SHOPPING IN LATER LIFE: IMPLICATIONS FOR PHYSICAL AND COGNITIVE HEALTH

E. Evans, *Psychology, University of Liverpool, Liverpool, United Kingdom*

In an ageing population, risks for cognitive decline affect the independence and quality of life of older adults and present challenges to the national economy and the health care system. The National Institutes of Health have identified a need for research into four key areas that have promise for improving cognitive ageing: cognitive activity; physical activity; social engagement; and nutrition (Hendrie et al., 2006), all of which can be studied through shopping activities. The current study utilises in-depth semi-structured interviews to identify the cognitive activity, social interaction and physical activity associated with shopping behaviours in an older cohort. Twenty community-dwelling participants (mean age 80) were interviewed with a focus on shopping frequency, motivation, transport used and social interaction while shopping. The current study suggests that shopping behaviours are multidimensional and encompass a combination of mental, social and physical activity. In terms of physical activity, there is considerable individual variation dependent upon both how mobile each participant is and on their keenness to shop. In the current sample there is evidence of cognitive processes in the planning of shopping trips and decision-making while shopping. Furthermore, shopping provides an opportunity for

social stimulation. The findings presented here show that shopping activity is a valuable area in which to study both physical and cognitive health in later life.

### AGE DIFFERENCES IN WISDOM AMONG KOREAN IMMIGRANTS

S. Kim, B.G. Knight, *Gerontology, University of Southern California, Los Angeles, California*

Pioneering studies of wisdom have focused on conceptual and definitional issues. Several studies have shown that in Western cultures there are age differences in the emphasis assigned to the sub-factors of wisdom. To begin to expand these findings to Eastern cultures, we examined age differences in wisdom by comparing a modified Three Dimensional Wisdom Scale (3D-WS) between two age groups of Korean immigrants. To make the measure more relevant to Eastern cultures, a potential additional wisdom factor, Modesty and Unobtrusiveness, based on Eastern implicit theories of wisdom, was added to the existing 3D-WS dimensions (Cognitive, Reflective, and Affective). Self-Transcendence, Emotion Regulation, Openness to experience, Life Satisfaction, and Social desirability bias measure were administered to test validity of the scale. A MANOVA was performed on preliminary data from older adults ( $n=35$ ) and younger adults ( $n=50$ ) to test age differences in the wisdom factors. The multivariate result was significant for age,  $F=7.931$ ,  $df=(4,79)$ ,  $p<.001$ , indicating a difference in the wisdom construct between older and younger adults. The univariate  $F$  tests showed older adults scored higher than younger adults on the Affective factor,  $F=4.426$ ,  $df=(1,82)$ ,  $p=.038$ , and the Modesty and Unobtrusiveness factor of wisdom,  $F=18.34$ ,  $df=(1,82)$ ,  $p<.001$ . The modified 3D-WS was positively correlated with Adult Self-Transcendence Inventory, Life Satisfaction Scale, and Emotional Regulation. Our findings suggest that Korean immigrant older adults consider the affective dimension as more central to wisdom, and have a more Eastern approach to wisdom than younger adults.

### AGE AND TIME PERCEPTIONS: A TALE OF MULTIPLE MECHANISMS

J.L. Rutt, C.E. Loeckenhoff, *Cornell University, Ithaca, New York*

Research suggests that individuals differ in temporal construals and that this may influence life goals and future planning. While there is growing evidence for age differences in perceived time left in life, age patterns in other aspects of temporal construal are not yet well-established. The present study examined age effects across five different aspects of time perception. Eighty-seven participants (aged 21-89,  $M=49.7$ ,  $SD=18.6$ ) completed measures of subjective position in the life span, perceived time left in life (Carstensen & Lang, 1996), future self-continuity (Ersner-Hershfield et al., 2009), subjective compression of time (Zauberman et al., 2009), and general future-orientation (Zimbardo & Boyd, 1999). For each measure, we examined correlations with age and associations with other measures of time perceptions. With the exception of a significant correlation between perceived time left in life and subjective position in the life span ( $r=-.60$ ,  $p<.001$ ), associations among the measures were negligible, suggesting that they capture unique aspects of temporal construal. Age effects were strongest for subjective position in the life span ( $r=.85$ ,  $p<.001$ ) and perceived time left in life ( $r=-.50$ ,  $p<.001$ ). Moderate age effects were found for subjective compression of future time ( $r=-.32$ ,  $p=.003$ ) and future self-continuity ( $r=.24$ ,  $p=.03$ ). There were no age differences in general future-orientation ( $r=-.06$ , *n.s.*). Findings suggest that older adults are aware of limitations in future time and the approaching end of their lifespan. They are also more likely to subjectively compress future time, but this does not appear to affect perceived connectedness to future selves and active future planning.

## SESSION 1285 (POSTER)

### LONG TERM CARE

#### TRAUMATIC STRESSORS, COPING RESOURCES, AND WELL-BEING AMONG OLDER ADULTS IN PRISON: FORGING A GERONTOLOGICAL RESPONSE

T.M. Maschi, *Graduate School of Social Service, Fordham University, New York, New Jersey*

**PURPOSE:** The purpose of this study was to examine the mediating effects of coping resources on the relationship between lifetime traumatic stressors and well-being (physical and mental). To date, these relationships have not been examined among older adult offenders, particularly prisoners. **METHODS:** The study used a cross-sectional correlational design with 569 NJ state older prisoners (aged 50+). Using the Dillman et al. (2004) four step mail methods and the Life Events Stressors Checklist-Revised, Coping Resources Inventory, Brief Symptom Inventory, Post Traumatic Stress Checklist, and the CDC Health-Related Quality-of-Life Inventory. **FINDINGS:** Controlling for race and age, structural equation models (SEM) were estimated to examine the relationship between lifetime traumatic stressors, individual (cognitive, emotional, spiritual, physical) and social coping (social support) and well-being (physical and mental health). The SEM results ( $X^2=89.04$ ,  $df=43$ ;  $CFI=.943$ ;  $RMSEA=.043$ ) suggested that experiencing lifetime trauma was significantly and inversely related to participants' use of individual level cognitive, emotional, spiritual, and physical coping ( $B=-.15$ ,  $p<.05$ ) and social coping ( $B=-.09$ ,  $p<.05$ ) resources. Lifetime traumatic stressors also exerted a significant direct effect on negative well-being ( $B=.42$ ,  $p<.001$ ) in the form of poor physical, global mental health, and post-traumatic stress symptoms. Furthermore, support was shown for the mediating role of individual coping resources and social support on the relationship between lifetime trauma stressors and negative well-being as significant ( $p<.05$ ) indirect effects were also observed. **IMPLICATIONS:** These results provide empirical information that can guide improved interdisciplinary-gerontological practice, particularly in the form of trauma-informed assessment and intervention strategies for older prisoners. Policy implications included sentencing reform efforts, improved service provision and alternatives are advanced.

#### OLDER ADULTS IN PRISON: INTERNATIONAL PROMISING PRACTICES FOR COST SAVINGS PRISON AND COMMUNITY REINTEGRATION PROGRAMMING

T.M. Maschi<sup>1</sup>, M.E. Morrissey<sup>1</sup>, D. Viola<sup>2</sup>, F. Sun<sup>3</sup>, 1. *Graduate School of Social Service, Fordham University, New York, New Jersey*, 2. *New York Medical College, New York, New York*, 3. *Arizona State University, Phoenix, Arizona*

According to the World Health Organization (2010), there are over 10 million people living in penal institutions of which 10% are aged 50 and older. The aging prison population has steadily increased since the 1990s, especially in the U.S, China, Japan, Canada, and England. Aging prisoner studies reveal their high levels of physical and mental health problems, fear of dying in prison, and stress related to prison release (Maschi et al., 2011). Most international correctional systems are ill-prepared to address the complex healthcare needs and specialized long-term care and reentry programming. The aging prisoner issue is of special importance to the U.S. and China in light of the high costs of incarcerating older adults and recent national policy and legal reforms, such as the 2010 Criminal Law of China, which bans the death penalty for people age 75 or older, except for extreme homicide cases (Guo, 2011). This paper describes the global aging prisoner population with emphasis on international cost savings program innovations that target older adults in prison and upon prison release. The central arguments for a specialized system for older adults are presented, which include older offenders low dangerousness levels and recidivism rates, their

deteriorating health due to prolonged incarceration and international policy recommendations, such as compassionate release, victim-offender reconciliation, and non-prison sentencing (Chui, 2010). The paper concludes with common elements of prison and community services, which include the use of case coordination, interdisciplinary collaboration, and prisoner volunteers in the provision of medical, mental health, and social services

#### **DEVELOPMENT AND EVALUATION OF AN E-LEARNING PROGRAM FOR NURSING ASSISTANTS: MANAGING CHALLENGING RELATIONSHIPS IN NURSING HOME CARE ENVIRONMENTS**

E. Marziali<sup>1</sup>, C.S. Mackenzie<sup>2</sup>, I. Tchernikov<sup>1</sup>, 1. *Baycrest, Toronto, Ontario, Canada*, 2. *University of Manitoba, Winnipeg, Manitoba, Canada*

**Objectives:** An e-learning program for nursing assistants (NAs) with a focus on management of stress arising from relationship conflicts with residents, families and co-workers was evaluated in a national survey of participant responses to the content, e-format, and applicability of the program to care practices. **Methods:** NAs and their nursing supervisors were recruited from 17 long term care institutions across Canada (N=117). The e-learning program in DVD format could be viewed on computers or TVs at times convenient for NAs. Modules focused on NAs' management of work-related relationship conflict and self-care, nursing supervisor's support of NAs' management of work-related stress, and animations of NAs management of conflict situations. At each institution an educator recruited participants, arranged time and equipment for viewing DVDs, and arranged conference call follow up focus groups that were audio recorded and analyzed qualitatively. **Results:** Overall the NAs viewed the e-learning content and format as useful and relevant to their work situations. NAs reported greater confidence in managing conflicts with residents and less comfort dealing with families, co-workers and supervisors. Many NAs felt that their input to care planning was ignored and/or rarely solicited. Due to resident care demands, team meetings did not exist in many institutions and were infrequent in most others. **Conclusions:** This readily accessible e-learning program is useful as an initiation tool for new hires and a refresher course for more experienced NAs. The program will be revised to reflect gaps in institutional support of NAs management of work-related stress.

#### **REDUCTION OF NOSOCOMIAL WHEELCHAIR USE IN NURSING HOMES: MEETING THE TRIPLE AIM**

J. Rabig, *MHS Institute, Masonic Health System, Leeds, Massachusetts*

Nosocomial wheelchair use has been defined by the author as the use of wheelchairs by nursing home residents for reasons that are not related to the resident's physical condition or needs. The drivers of nosocomial wheelchair use in the nursing home population include: long walking distances that are not navigable without rest stops, a lack of resting stations in long corridors; the facilitation of staff efficiency, and the reliance on wheelchair use as a falls prevention and risk management strategy. The risks of wheelchair use include those associated with disuse. Nursing home wheelchair users experience high levels of skin breakdown, urinary tract infections, pneumonia, depression and social isolation. The paper will discuss a the Center for Medicare and Medicaid Innovation Advisor Project which targeted a reduction in the complications of wheelchair use in a 120 bed skilled nursing home. The project implemented a robust admission screening process for new residents, a program of exercise and progressively decreasing hours of wheelchair use in eligible residents and increasing the number hand or foot self-propelling residents. The targeted aims were devised using the Institute for Healthcare Improvement "Triple Aim" framework: improve the health of the population, enhance the patient experience of care and reduce, or control, the per capita cost of care.

#### **THE IMPORTANCE OF THE HOME FOR ELDERLY: CONTRIBUTION OF THE HOME CARE SERVICE**

E. Castro<sup>1</sup>, S. Magalhães<sup>2</sup>, 1. *University Fernando Pessoa Health Sciences School, Porto, Porto, Portugal*, 2. *Portuguese Catholic University Faculty of Social Sciences, Braga, Braga, Portugal*

Today, modern societies are faced with the significant growth of population aging, resulting in even large changes, particularly on social, economic and cultural levels, which may be determinants in population health. These changes raise relevant questions regarding to issues concerning social protection and sustainability of it. There is, thus, a new challenge for society: How to provide better quality of life for the elderly, since old age brings a growing loss of skill acquisition. In this conceptual framework and social policies, the Home Care Service operates on gerontological perspective to intervene, and have a fundamental role in the biopsychosocial process of aging. The purpose of this study was to evaluate how important is the home for elderly, as well as verifying its perception about the contribution of HCS for stay at home. The study involved 50 Portuguese participants, 30 women and 20 men, aged between 65 to 97 years, and with no appreciable cognitive deficits. In support of our research, according to the literature review carried out carefully, and prepared questions, it was made a pilot sample study to test the appropriateness of the constructed instrument. The results obtained show the validity of the chosen questions. From these response, 11 items were identified. Using this questionnaire and data obtained, the results indicate the importance of the home for elderly and that the H.C.S. represents an instrument for the promotion of wellness, and physical, psychological and emotional balance, and quality of life improvement for the elderly in multidimensional indicators.

#### **ASSESSING WELL-BEING ALONG THE EDEN ALTERNATIVE JOURNEY: A NEW TOOL**

F.E. Wilby<sup>1</sup>, C.R. DuMond<sup>2</sup>, S. Ransom<sup>3</sup>, D. Hyde<sup>4</sup>, 1. *College of Social Work, University of Utah, Salt lake City, Utah*, 2. *St. John's, Rochester, New York*, 3. *Pinon Management, Lakewood, Colorado*, 4. *CIMRO of Nebraska, Omaha, Nebraska*

The Eden Alternative movement is at the core of the culture change movement in nursing home care in the United States and internationally with resident, staff, and family well-being it's center feature. Until now, the Eden Alternative did not have a valid and reliable tool to measure well-being. This study was designed to test the validity and reliability of the Eden Well-Being assessment. 430 employees, 237 residents, and 60 families completed the Eden Well-Being assessment tool. Participants came from 3 different geographical regions of the U.S. Factor analysis was conducted to examine the underlying concepts for each cluster of questions or factors using the Statistical Package for the Social Sciences Version 15 (SPSS 15). Seven underlying concepts were identified: identity, growth, autonomy, security, meaning, connectedness and joy. Additionally, reliability statistics were completed using SPSS 15 showing strong reliability for the instrument. The Eden Well-Being assessment tool is now ready for dissemination to a wider audience interested in measuring well-being in long-term care settings.

#### **ENVIRONMENTAL FACTORS AND FALLS WITHIN LONG-TERM CARE**

R. Woolrych, A. Sixsmith, *Simon Fraser University, Vancouver, British Columbia, Canada*

Falls are a common cause of death and serious injury in older people, demonstrating a significant cost burden (Dellinger and Stevens, 2006) and having deleterious impacts on individual quality of life (Ozcan et al, 2005). Despite this, there is little understanding of the circumstances of falls within long-term care, a major impediment to the development of intervention strategies. This paper presents ongoing work from a sub-project of a CIHR-funded grant entitled Technology for Injury Prevention in Seniors (TIPS) aimed at understanding environmental factors and falls within long-term care. The methodology for the

sub-project will be presented, utilising a ‘systems approach’ (Zecevic et al, 2007), drawing upon primary and secondary data to establish case studies of fall incidents that occur within a long-term care facility in Vancouver, Canada. This involves interviews and focus groups with older residents, visitors and care staff, observations of real time surveillance video captured within the facility and the use of fall incident reports and medical notes to establish a nuanced understanding of the circumstances leading to the fall. Early findings from the research suggest that a systems approach to investigating falls within LTC can yield substantial benefits, enabling a deeper understanding of the physical, behavioural and socio-environmental aspects of falls, providing evidence to design interventions which are context-specific. The paper highlights substantial challenges in adopting a systems approach to understandings falls, specifically the difficulties in compiling information-rich case studies, reconciling conflicting accounts of the fall incident and the generalisability of findings across long-term care facilities.

#### **CERTIFIED NURSE ASSISTANT CLINICAL LADDER**

A. Ashcraft, *SON, Texas Tech University Health Sciences Center, Lubbock, Texas*

This presentation will examine implementation of a career ladder for nurse aides. The ladder consists of three levels that may be delivered over 8 or 16 weeks: Level 1: Personal Growth and Development and Normal Changes of Aging, Level 2: Health Care issues of the Older Adult, and Level 3: The CNA role in Dementia, Palliative Care, and the Survey Process. Surveys were given prior to CNAs beginning Level 1 and after completion of Level 3 to evaluate job perception. The following tools were utilized. 1. Laschinger’s Conditions for Work Effectiveness Questionnaire—means revealed “some” opportunity and access to support in present job as well as “some” innovation, flexibility, and visibility of work-related activities. Paired t test revealed significance ( $p = .01$ ) for the chance to gain new skills and knowledge on the job. 2. Roller’s Perception of Empowerment Instrument—means revealed participants were neutral about their freedom to make decisions and involvement with changes concerning their job but disagreed with determining organizational goals and changes. 3. Yeatts and Cready Dimension of Empowerment Measure—means revealed participants felt they had the skills and knowledge to do a good job but participants did not feel administration was open to their ideas and solutions and did not listen to their suggestions. Paired t test revealed significance ( $p = .03$ ) for CNAs being allowed to make their own decisions. The CNA Career Ladder is an opportunity to foster professional behavior and improve job satisfaction for CNAs. Survey results reveal the importance of including this subset of caregivers when considering changes in the workplace.

#### **A COMPARATIVE STUDY OF PHYSICAL ENVIRONMENT OF TWO ADULT DAY SERVICES (ADS) CENTERS IN TAIWAN**

C. Liou, S.E. Jarrott, *Virginia Tech, Blacksburg, Virginia*

Studies have shown that the physical environment is an important determinant of psychosocial and health outcomes for elders, particularly those with dementia. Because adult day services (ADS) centers are increasingly serving persons with dementia, it becomes important to assess the physical environment of those care settings. Reviewing current literature on measuring physical environment within long-term care settings, some features are highlighted to support a good quality of care environment, such as privacy, safety, stimulation, space, familiarity, and orientation. Because studies of the physical environment have been conducted primarily in nursing home facilities in Western society, little is known about physical features in ADS settings in Asia. In this study, we selected two ADS centers (medical model vs. social model) in Taiwan to describe their environments and consider their role in influencing interactions between clients and staff. Data were collected with an ethnographic method involving field observation and client and staff

interviews. The physical features of the medical model center, such as a nurses’ station, hospital beds, and institutional furniture reflected a hospital-like environment, which created a patient-nurse relationship between clients and staff. The physical features of the social model center included a unique community-like setting with reminiscent features indicating purpose of different areas. Here, clients and staff treated each other as friends or family members, sometimes to the clients’ detriment. Different physical features of these two centers influenced clients’ perceived quality of life and staff’s care delivery. Findings can be used to guide the design of ADS centers in Taiwan.

#### **VOICES FROM DOWN HOME: THE RELATIONSHIP BETWEEN EXPERIENCE AND MEANING FOR LONG TERM CARE RESIDENTS IN NOVA SCOTIA, CANADA**

E. Roberts, *Human Environmental Sciences, University of Missouri-Columbia, Columbia, Missouri*

Much has been written about autonomy in long term care (LTC), but ethical significance of actual autonomy is not to celebrate being old or frail from afar, but rather to close the gaps with elders in LTC. Agich (2003) writes that the significant point about stories is that what people tell about their lives comprise one of the most important modes of access to what is important to them. Stories drawn from life can indicate the things that people value the most; they tell us who the person is and with what they most identify. In order to answer the question of what features of everyday experience structure the expression or manifestation of autonomy in action in LTC, in early 2012, case studies were conducted in two LTC communities in the province of Nova Scotia, Canada. Observations took place for 8 weeks and interviews were conducted with residents, family members and staff, with nine resident interviews conducted in each of the communities. Rubenstein (2002) writes that the qualitative interview is noteworthy in its role as an entry point to the subjectivity of individuals and these research results indicate that the inherent differences in biographical context of a resident’s life experiences will often be a determinant of autonomy, and acceptance of an individual’s current living situation.

#### **POSITIVE PERSPECTIVES AND VIBRANT CAREGIVERS: A TALE OF OLDER HOME HEALTH AIDES**

D. McCaughey, G. McGhan, E. Walsh, *HPA, Penn State University, State College, Pennsylvania*

Purpose: Fueled by an aging population coupled with increasing pressure to move institutionalized care into the community, the need for home health aides (HHAs) is growing exponentially. Repetitive injury, high job demands, poor benefits, and low pay foster the ongoing shortage of qualified HHAs. Anecdotal evidence suggests that older workers are more prone to workplace injuries and can be more costly to employee than younger workers. Methods: Using data from the 2007 National Home Health Aide Survey (US DHHS), we examined: 1) relationships between injuries and HHA outcomes; and 2) frequency of HHA injuries and sick days. Post hoc analyses were conducted to identify differences among the HHAs by age groups ( $n = 3377$ ). Results: OLS and multinomial logistic regression identified injured employees have lower job satisfaction ( $\beta = -.119$ ,  $p\text{-value} < .001$ ), higher turnover intentions ( $\beta = .069$ ,  $p\text{-value} < .001$ ), and are less likely to recommend their agency for care ( $\beta = -.099$ ,  $p\text{-value} < .001$ ) than non-injured employees. Older workers (over 55 years and 23.7% of sample) were found to have significantly higher job satisfaction ( $F = 5.35$ ,  $p < .001$ ) and lower turnover intention ( $F = 8.15$ ,  $p < .001$ ) but no significant differences in injury rate or sick days taken. Conclusions: Study results identify older workers have better outcomes and offers evidence that older workers in this sample were neither injured or sick more often than their younger counterparts. With an aging workforce and the need to fill existing vacancies, older workers offer a viable and accessible employee pool to help long-term-care organizations meet the growing demand for HHAs.

## MENTAL ILLNESS AND BEHAVIORAL PROBLEMS IN THE NATIONAL STUDY OF RESIDENTIAL CARE FACILITIES (NSRCF)

C. Poon, *Psychology Department, The Nebraska Medical Center, Omaha, Nebraska*

**Purpose:** As psychiatric hospitals continue to shrink in size and life expectancy continues to rise, more long-term care residents may carry a mental health diagnosis. This study examined the estimated prevalence of mental illness and behavioral problems in residential care facilities other than nursing homes, and the use of pharmacological interventions to manage behavioral problems in these facilities. **Design and Methods:** The NSRCF included 8094 residents sampled from 2268 facilities in the United States in 2010. Logistic regression was performed on the resident Public-Use File using the Mplus 6.1 software. **Results:** 89% of all residents were aged 65 and above. 64% had at least one mental health diagnosis. Excluding individuals with dementia, 22% still carried a diagnosis such as depression or schizophrenia. 38% of all residents exhibited behavioral problems such as aggression or refusal of care in the past 30 days. 22% of all residents received medications to manage behavioral problems or reduce agitation. Residents with a mental health diagnosis were more likely to have exhibit behavioral problems in the past 30 days (odds ratio = 4.75; 95% confidence interval: 4.23-5.35,  $p < .001$ ). These residents were also more likely to have been prescribed medications to manage their behavioral problems or agitation (odds ratio = 4.64; 95% confidence interval: 3.66-5.90,  $p < .001$ ). **Implications:** Integrating mental health services and staff training in residential care facilities other than nursing homes is crucial in improving behavior management in this growing long-term care setting.

## SYSTEMATIC REVIEW OF INTERVENTION ELEMENTS OF ACUTE GERIATRIC UNIT CARE

M. Fox<sup>1</sup>, M. Persaud<sup>1</sup>, I.K. Maimets<sup>1</sup>, S. Sidani<sup>3</sup>, D. Tregunno<sup>1</sup>, K. O'Brien<sup>2</sup>, D. Brooks<sup>2</sup>, *1. Nursing, Fac of Health, York Univ, Toronto, Ontario, Canada, 2. University of Toronto, Toronto, Ontario, Canada, 3. Ryerson University, Toronto, Ontario, Canada*

In response to an increasingly older hospital population, there have been calls to adopt the Acute Care for Elders (ACE) model on all hospital units where older adults are admitted. However, acute geriatric unit care is poorly understood. We conducted a systematic review of papers describing intervention elements of 12 trials included in a meta-analysis reporting significant benefits of acute geriatric unit care in reducing falls, delirium, functional decline, cost of care, and improving discharge outcomes for acutely ill or injured older adults. Twenty-seven papers describing 12 trials were included in this review. Information describing intervention elements of the 12 trials was transcribed verbatim and analyzed using categorical content analysis. The categories were defined by the intervention elements of the Acute Care for Elders (ACE) model. Acute geriatric unit care was most often characterized by: assessment of patients' physical, cognitive, and psychosocial functioning; strategies to prevent functional decline; and frequent review of drugs known to adversely affect older adults' functioning; followed by early rehabilitation and discharge planning. Acute geriatric unit care was provided by interdisciplinary teams who met regularly to plan older adults' care. Pre-trial team education, consisting of geriatric, rehabilitation, and/or interdisciplinary team working principles was also characteristic of acute geriatric care units. Patient-centered care, frequent medical review, early rehabilitation, and early discharge planning may represent the optimal combination of clinical interventions required for outcome achievement. Interdisciplinary team work and enhanced geriatric education may be important for service providers to consider when designing and implementing acute geriatric unit care.

## DISCHARGE PLANNING DECISION SUPPORT: TARGETING THE RIGHT PATIENTS

D.E. Holland<sup>1</sup>, K.H. Bowles<sup>2</sup>, S. Potashnik<sup>2</sup>, A.L. Hanlon<sup>2</sup>, M. Topaz<sup>2</sup>, *1. Mayo Clinic, Rochester, Minnesota, 2. University of Pennsylvania School of Nursing, Philadelphia, Pennsylvania*

**Background:** Improved methods to efficiently and accurately identify hospitalized older adults in need of comprehensive discharge planning (DP) and post-acute care services are critical based on limited time and resources available to discharge planners. Two evidenced-based decision support tools - The Early Screen for Discharge Planning (ESDP) and the Discharge Decision Support System (D2S2) were tested to determine if the tools helped clinicians identify high risk patients. **Methods:** Prospective quasi-experiment; 344 usual care and 390 intervention medical patients at an academic medical center enrolled in two phases: Phase 1, both tools were administered but not shared with clinicians (usual care); Phase 2, high/low risk scores were shared (intervention). Outcomes (self-reported problems and unmet needs [PADQ-E] and quality of life (QOL) [EQ-5D] were obtained within 6 weeks after discharge. **Results:** High scores on both tools were associated with more problems and worse QOL in both phases ( $p < .001$ ). Although patients with high scores had more unmet needs than patients with low scores, the differences were not statistically significant and sharing the tool advice did not change their frequency. **Conclusions:** The tools clearly identified patients likely to have more problems and quality of life issues after discharge; however, sharing the tool scores alone did not influence the frequency of problems, unmet needs, or QOL issues. Next steps are to further analyze the data to understand which questions predict particular post discharge outcomes and then, using these results, share information with the clinicians so that they can better match services with patient needs.

## EFFECTIVENESS OF ACUTE GERIATRIC UNIT CARE: SYSTEMATIC REVIEW AND META-ANALYSIS

M. Fox<sup>1</sup>, M. Persaud<sup>1</sup>, I.K. Maimets<sup>1</sup>, K. O'Brien<sup>2</sup>, D. Brooks<sup>2</sup>, D. Tregunno<sup>1</sup>, E.G. Schraa<sup>1</sup>, *1. Nursing, Fac of Health, York Univ, Toronto, Ontario, Canada, 2. University of Toronto, Toronto, Ontario, Canada*

**OBJECTIVE.** To determine the effectiveness of acute geriatric unit care compared to usual care. **DESIGN.** Systematic review and random effects meta-analysis of 12 randomized control and quasi-experimental trials with parallel comparison groups retrieved from multiple databases and journals. **SETTING.** Acute care geriatric and non-geriatric hospital units. **PARTICIPANTS.** 5209 acutely ill or injured adults with an average age of 81 years. **INTERVENTIONS.** Acute geriatric unit care included patient-centered care, frequent medical review, early rehabilitation, early discharge planning, and/or prepared environment. **MEASUREMENTS.** Falls, pressure ulcers, delirium, functional decline in 2 week pre-hospital and hospital admission statuses, length of hospital stay, discharge destination (home and nursing home), mortality, cost, and hospital readmission. **RESULTS.** Acute geriatric unit care was associated with significant benefits in falls [risk ratio (RR) = 0.51, 95% CI 0.29, 0.88], delirium (RR = 0.71, 95% CI 0.59, 0.86), functional decline in 2 week pre-hospital admission status (RR = 0.84, 95% CI 0.76, 0.93), discharge home (RR = 1.08, 95% CI 1.03, 1.13) and nursing home (RR = 0.82, 95% CI 0.68, 0.99), and lower cost (weighted mean difference = -235.93, 95% CI -442.07, -29.79). A trend toward fewer pressure ulcers was observed. No significant differences were found in mortality or hospital readmission. Because of heterogeneity, results were inconclusive for functional decline in hospital admission status and length of hospital stay. **CONCLUSIONS.** Acute geriatric unit care reduces falls, delirium, functional decline in 2 week pre-hospital admission status, cost, and improves discharge destination outcomes in octogenarians with acute illnesses or injuries.

## THE IMPACT OF SOCIAL WORK CONSULTATION ON THE QUALITY OF DEMENTIA CARE

W.C. Canio<sup>1,2</sup>, K.I. Connor<sup>2</sup>, S.D. Vassar<sup>1,2</sup>, M.L. Lee<sup>1,2</sup>, B.G. Vickrey<sup>1,2,3</sup>, J. Chodosh<sup>1,2,3</sup>, 1. UCLA, Los Angeles, California, 2. VA Greater Los Angeles Healthcare System, Los Angeles, California, 3. RAND Health, Santa Monica, California

**Background:** The prevalence of Alzheimer's disease and other dementias is expected to triple by 2050. Social work consultation for primary care practice may improve dementia care quality, specifically, caregiver mediated treatment, education, psychosocial support and safety. **Objective:** To evaluate the association between social work consultation and dementia care quality within a Medicare Advantage Plan using evidence-based dementia quality of care indicators. **Methods:** Using a cross-sectional survey, we asked informal caregivers of people with dementia about dementia care processes, to measure treatment, education/support, and safety quality indicators. We compared proportions of indicators met for those with and without social work consultation (SWC). We compared met indicator proportions of the SWC group with quality benchmarks from a dementia care management program, ACCESS, which utilized care managers supported by evidenced-based protocols and procedures. **Results:** Among 93 caregiver respondents (response rate: 53%) over 90% were spouses, children or child in-laws of the care recipient. All caregivers attended medical visits with the care recipient; 78% always attended. Sixty-four percent (64%) of caregivers had social work consultation. The proportions of met quality indicators more than doubled for 6 of 13 indicators ( $p < 0.05$ ) for dyads with SWC compared to those without. Quality was, however, even greater for 9/13 indicators within the ACCESS care management program (additional proportional improvement range: 7.1% - 35.9%,  $p \leq 0.02$ ). **Conclusion:** Social work consultation and higher dementia care quality are strongly associated. Nonetheless, there is greater quality when this consultation is supported by detailed decision support protocols and procedures in dementia care management.

## SESSION 1290 (POSTER)

### MENTAL HEALTH FUNCTIONING

#### A MEASURE OF EXECUTIVE FUNCTIONING DISTINGUISHES AMONG NURSING HOME RESIDENTS WITH DEMENTIA, PSYCHOTIC DISORDERS, AND MOOD DISORDERS

L.A. Gerolimatos<sup>1,2</sup>, B. Edelstein<sup>1,2</sup>, 1. Department of Psychology, West Virginia University, Morgantown, West Virginia, 2. Hopemont State Hospital, Terra Alta, West Virginia

Individuals with psychiatric disorders often display impairments in executive functioning (Egger et al., 2007; Joshua et al., 2009), but which components of executive functioning are associated with specific disorders is unclear. We examined the extent to which executive functioning distinguishes among individuals with dementia ( $n = 36$ ), psychotic disorders ( $n = 40$ ), and mood disorders ( $n = 17$ ). Residents ages 37 to 96 ( $M = 68.37$ ,  $SD = 11.72$ ) at a state-operated nursing home completed the Executive Interview (EXIT; Royall et al., 1992). A discriminant functions analysis predicting diagnosis from EXIT scales revealed two functions, X2 ( $14$ ,  $N = 93$ ) =  $24.26$ ,  $p < .05$ , which adequately distinguished among disorders. Function 1 and Function 2 accounted for 68.2% and 31.8% of between-groups variance, respectively. Perseveration ( $r = .81$ ), frontal release signs ( $r = .54$ ), intrusions ( $r = .46$ ) and utilization behaviors ( $r = .52$ ) loaded on Function 1. Intrusions ( $r = .41$ ) and lack of spontaneity ( $r = .63$ ) loaded onto Function 2. Function 1 distinguished dementia from the other groups, and Function 2 distinguished between mood and psychotic disorders. The jackknifed classification procedure correctly classified 60.2% of residents. Follow-up ANCOVAs revealed that the psychotic disorders group exhibited higher perseveration and frontal release signs compared to the other groups.

The mood disorders groups showed lower perseveration, frontal release signs, utilization behaviors, and lack of spontaneity than the other groups. The groups did not differ on intrusions. Implications for understanding executive functioning and managing associated problem behaviors across psychiatric disorders are discussed.

### FUNCTIONAL IMPAIRMENT ASSOCIATED WITH GERIATRIC HOARDING DISORDER

C. Ayers<sup>1,2</sup>, K.L. Strickland<sup>1</sup>, J. Wetherell<sup>1,2</sup>, 1. VA San Diego Healthcare System, San Diego, California, 2. UC San Diego, San Diego, California

Hoarding Disorder (HD) is a severe psychiatric condition that causes significant impairment across multiple life and functional domains in older adulthood. The purpose of the presentation is to highlight specific areas of functional impairment (e.g., moving around inside the house, eating at a table, sleeping in bed) that are impacted by clutter. Results revealed that geriatric hoarders ( $N=28$ ) are significantly more impaired on a measure of activities of daily living than non-psychiatric geriatric controls ( $N=25$ ). HD participants reported moderate to severe difficulty finding important things (86%), moving inside the house (61%), eating at the table (57%), using the kitchen sink (40%), using the stove (28%), and using the refrigerator (28%). Of concern, almost 18% of HD participants reported that they could not exit their home quickly and 11% could not use their toilet because of the clutter. Finally, hoarding severity has a significant positive relationship with functional impairment. Clinicians should ensure that they are measuring functional impairment in order to identifying appropriate behavioral interventions when working with geriatric hoarding cases. After attending this session, participants will be able to describe specific activities of daily living impairment experienced by older adults with hoarding. Further, participants will be able to define how to appropriately assess functional impairment in hoarding cases.

### THE DEVELOPMENTAL TIMING OF TRAUMA EXPOSURE: A LIFE COURSE PERSPECTIVE

C.M. Ogle<sup>1</sup>, D.C. Rubin<sup>1,3</sup>, I.C. Siegler<sup>1,2</sup>, 1. Duke University, Durham, North Carolina, 2. Duke University School of Medicine, Durham, North Carolina, 3. Center for Autobiographical Memory Research, Aarhus, Denmark

The deleterious effects of traumatic experiences can persist for decades. The research supporting this claim is, however, primarily limited to events that occurred in childhood or young adulthood and to special populations of older adults, chiefly veterans and Holocaust survivors. Less is known about the long-term impact of traumas encountered at other stages of the life course among non-clinical older adults. The present study addressed this issue by examining whether the negative consequences of trauma exposure are greater for traumas experienced during childhood, adolescence, young adulthood, midlife, or older adulthood in a large sample of community-dwelling older adults with a broad range of trauma histories ( $n = 1,995$ ). Each of these developmental periods is characterized by age-related changes in cognitive and social processes that may influence psychological adjustment following a traumatic event. After adjusting for socio-demographic factors, results indicated that older adults who experienced their worst trauma during childhood exhibited greater PTSD symptom severity, lower happiness, an impaired ability to cope with stress, and less social support compared to older adults who experienced their worst trauma later in life. Differences in cumulative trauma exposure, as well as objective and subjective event characteristics, added little explanatory value to the results. Findings underscore the importance of examining the developmental context of trauma exposure when seeking to understand the long-term consequences of such events during older adulthood. The policy implications of our results for older adults with histories of childhood compared to adulthood trauma will be discussed.

## DAILY OBSERVED WALKING SPEED AND SELF-REPORTED LOW MOOD IN COMMUNITY-DWELLING OLDER ADULTS

S.M. Thielke<sup>1,2</sup>, J. Kaye<sup>3,4</sup>, T. Hayes<sup>3</sup>, N.C. Mattek<sup>3</sup>, A.R. Quinones<sup>3</sup>, *1. University of Washington, Seattle, Washington, 2. Puget Sound VA Medical Center, Seattle, Washington, 3. Oregon Health & Science Univ, Portland, Oregon, 4. Portland VA Medical Center, Seattle, Washington*

**Background:** Changes in activity level are considered a hallmark symptom of depression. Little is known about the objective activity patterns of community-dwelling older adults during periods of low mood. **Setting:** 122 participants in the Intellect Systems for Assessing Aging Changes (ISAAC) study. **Design:** Sociodemographic and health-related characteristics were established at baseline. Mood was assessed by self-report each week. Mean and standard deviation of walking speed were estimated using unobtrusive in-home motion sensors. We ascertained the association between global or weekly low mood and mean or standard deviation of walking speed. **Results:** 8037 weekly mood observations on 122 participants were analyzed; on average there were 119 weekly observations per participant. 1.7% of observations involved low mood. After controlling for covariates, global mean walking speed was not associated with more frequent report of low mood. Weekly mean walking speed was not associated with weekly report of low mood. Weekly standard deviation in walking speed was highly associated with weekly report of low mood. **Conclusions:** Low mood involved walking in “fits and starts” rather than faster or slower. Research about behavioral consequences of mood states should account for variability of parameters, not just their mean values. Additional research can refine use of objective activity measures for surveillance, clinical care, and intervention design.

## SELF-CONCORDANCE AND WELL-BEING IN LATER LIFE: THE ROLE OF COMMUNAL AND AGENTIC GOALS

X. Zhang<sup>2,1</sup>, A.M. Au<sup>1</sup>, T. Tsien<sup>1</sup>, H. Fung<sup>3</sup>, *1. Hong Kong Polytechnic University, Hong Kong, China, 2. Peking University, Beijing, Beijing, China, 3. Chinese University of Hong Kong, Hong Kong, China*

252 mid-age and older adults (54 – 96 years old) residing in Hong Kong were recruited to test the self-concordance model (Sheldon & Elliot, 1999). We further differentiated and tested the model using communal and agentic goals. It was hypothesized that with an emphasis on communal goals as people age and in a culture where communion was highly valued, only the communal goals but not agentic goals should be more influential for participants' well-being. The results from Structural Equation Modeling (SEM) confirmed our hypothesis, such that although both communal and agentic goal striving were positively linked to psychological well-being through the mediation of goal attainment, only communal goal striving could directly predict psychological well-being. Moreover, a significant communal goal striving x goal attainment interaction was also found, suggesting that for individuals who considered communal goals important, the more they succeeded in attaining communal goals, the happier they will be, however this association was not true for those who considered communal goal less important, and the agentic goal striving x goal attainment interaction was not significant, indicating that the self-concordance model was only true for communal goals in Hong Kong participants. Findings from the present study highlighted the importance of considering the context of culture norm and age for a comprehensive understanding of the relationship between goal striving and well-being.

## PHYSICAL HEALTH RISKS, SOCIAL RESOURCES, AND DEPRESSIVE SYMPTOMS AMONG OLDER ADULTS: FINDINGS FROM THE SURVEY OF OLDER FLORIDIANS (SOF)

N. Park, Y. Jang, B. Lee, J. Ko, D.A. Chiriboga, *University of South Florida, Tampa, Florida*

**Purpose:** The objective of this study was to: (1) identify risk profiles of older adults based on physical health indicators (chronic con-

ditions, physical disability, and self-rated health); and (2) examine the moderating effect of social resources in the relationship between physical health risks and depressive symptoms. **Methods:** The data source was the Survey of Older Floridians, a statewide sample of 1,432 older adults aged 65 and older from four racial/ethnic groups: Whites (n=503), African Americans (n=360), Cubans (n=328), and non-Cuban Hispanics (n=241). Using latent profile analyses, we developed typologies of physical health risks and examined the association between physical health risk profiles and other variables (background characteristics, social resources—social support and religious service attendance—, and depressive symptoms). We performed hierarchical multiple regression analyses to explore direct and interactive effects of physical health risks and social resources on depressive symptoms. **Results:** Latent profile analyses identified a three-group model of physical health risks: low-risk (n=1,154), moderate-risk (n=203) and high-risk (n=75). In multivariate analyses, moderate- and high-risk groups had significantly higher levels of depressive symptoms. Social support reduced depressive symptoms for moderate- and high-risk groups, with the reduction being most pronounced for the moderate-risk group. **Conclusions:** Using a person-centered approach, the present study contributes to identifying subgroups of older adults who are most in need of services and who would benefit from social-support-based interventions.

## PERCEPTIONS AND EMOTIONS AFFECT BEHAVIOR TOWARD MENTALLY ILL OLDER ADULTS

A. Webb<sup>1</sup>, J.M. Jacobs-Lawson<sup>2</sup>, *1. Martin Methodist College, Pulaski, Tennessee, 2. University of Kentucky, Lexington, Kentucky*

Previous studies have shown that perceptions and emotions affect behavior toward mentally ill individuals. The vast majority of these studies have focused on younger adults; thus, little is known about how mentally ill older adults are perceived. The purpose of this study was to determine the combined effect that perceptions and emotions have on behavior toward mentally ill older adults. Participants (N = 276, aged 19-88 years) were presented with four vignettes depicting an older adult with a mental illnesses. For each vignette, participants indicated (a) the extent they perceived the older adult to be responsible for his/her condition, dangerous, or dependent on others; (b) degree of anger, pity, or fear they felt toward the person, and (c) willingness to help and their desired social distance from the older adult. The results revealed that perceptions and emotions significantly influenced behavioral reactions to the mentally ill older adults. Higher levels of fear, anger, dangerousness, and perceived responsibility predicted a lower desire to help, while perceptions of higher levels of dependency and feelings of pity increased desire to help. Higher levels of fear, anger, dangerousness, perceived responsibility, and dependency also increased desired social distance, whereas higher pity reduced it. Further analysis revealed that illness type moderated the impact of emotions and perceptions on behavioral reactions to mentally ill older adults. These results suggest that to effectively reduce stigma experienced by mentally ill older adults, we must first alter false perceptions of mental illness.

## PREDICTORS OF GENERAL LIFE SATISFACTION AND MENTAL WELLBEING IN MIDDLE-AGED TO OLDER PERSONS WITH SCHIZOPHRENIA

J.S. Ho<sup>1,2</sup>, R.C. Moore<sup>2</sup>, T. Davine<sup>3</sup>, S. Abel<sup>2</sup>, V. Cardenas<sup>2</sup>, T.L. Patterson<sup>2</sup>, B. Mautsach<sup>2</sup>, *1. San Diego State University/University of California, San Diego Joint Doctoral Program in Clinical Psychology, San Diego, California, 2. University of California San Diego Department of Psychiatry, La Jolla, California, 3. San Diego State University, San Diego, California*

Previous work has illustrated the protective effects of positive psychosocial factors in the face of psychiatric disorders. A diagnosis of schizophrenia, which is characterized by classic symptoms of psychopathology, as well as interpersonal, cognitive, and affective problems, has a pervasive negative impact on quality of life. The current

study investigated the predictors of general life satisfaction and mental wellbeing in 162 middle-aged to older persons with schizophrenia (ages 39-72). General life satisfaction was assessed with a single item on the Lehman Quality of Life Interview (QOLI), whereas mental wellbeing was measured using the Short Form 12 (SF-12) Health Survey's Mental Health Composite Score (MCS). The SF-12 has demonstrated both reliability and validity in persons with severe mental illness. A multiple regression model was used to predict general life satisfaction using age, goal-orientation (Recovery Assessment Scale; RAS), financial adequacy, social contact, and social self-efficacy (QOLI), symptom severity (Positive And Negative Syndrome Scale; PANSS), and depression (Calgary Depression Scale; CDS). A similar multiple regression model was used to predict mental wellbeing. Results indicated that depression ( $B = -.136, p < .001$ ;  $B = -1.047, p < .001$ ), and social self-efficacy ( $B = .038, p < .001$ ;  $B = .152, p = .021$ ) were significant predictors of both life satisfaction and mental wellbeing, respectively. Thus, interventions for persons with schizophrenia may benefit from focusing on depression and social self-efficacy to improve general life satisfaction and subjective mental wellbeing.

### THE ROLE OF OLDER AGE IN RECEIPT OF EVIDENCE BASED TREATMENT FOR MAJOR DEPRESSIVE DISORDER (MDD)

M.A. Becker, T. Boaz, R. Andel, *University of South Florida, Tampa, Florida*

Research indicates that 80% to 90% of persons with major depressive disorder (MDD) can be successfully treated, yet depression often goes unrecognized or improperly treated. The American Psychiatric Association and other national organizations have developed evidenced-based practice (EBP) guidelines to achieve greater consistency and quality in clinical care. The purpose of this study was to examine the role of age in receipt of evidence based treatment for MDD among Florida's Medicaid enrolled adults. This study used two and a half years of Medicaid claims data. Regression analyses were used to determine the importance of age and other predictive factors for adherence to the APA guidelines and the relationship of predictive variables to mental health service use. In all, 15,950 persons met inclusion criteria. Findings show MDD increased with age. Over three fourths (75.6 %) of the sample were female. Approximately 37.2% were identified as White, 9% as Black, 42.3% as Hispanic, and 11.5 as "Other". Only 33% of participants received treatment that conformed with APA guidelines. Hispanics were most likely to receive medication treatment that adhered to guidelines, while Whites were least likely. Fewer older adults received treatment that adhered to the EBP guidelines. Multiple logistic regression analysis produced the following results: Age 18-44 vs 65+: OR = 1.31 (95% CI: 1.16-1.47); Age 45-64 vs 65+: OR = 1.43 (95% CI: 1.30-1.59). Non-adherence to APA guidelines was the norm rather than the exception. Both age and race disparities were found. Findings provide a basis for future research and clinical training.

### CONTRIBUTING FACTORS TO IMPROVED QUALITY OF LIFE AMONG ELDERLY IMMIGRANT CANCER SURVIVORS: FINDINGS FROM TWO U.S. REGIONS

H.Y. Lee<sup>1</sup>, S.E. Lee<sup>2</sup>, S. Jin<sup>1</sup>, 1. *School of Social Work, University of Minnesota, Twin Cities, St. Paul, Minnesota*, 2. *San Jose State University, San Jose, California*

Studies have consistently shown cancer diagnosis, treatment, and follow-up care to be associated with decreased quality of life. However, research that directly examines the quality of life of elderly immigrant cancer survivors is sparse. Addressing that gap, this study examines contributing variables to improved quality of life among elderly Korean immigrant cancer survivors. To investigate the contributors, our qualitative study utilized face-to-face, in-depth interviews with Korean immigrant elders: 10 individuals from New York (NY) and 10 from Minnesota (MN). Each interview was digitally audio-recorded and

transcribed verbatim in Korean. Grounded theory was employed to analyze the data, using Atlas ti 5.0. Analysis of the MN and NY interviews revealed four primary contributors to improved quality of life seen in common between locales: (1) reliance on religion and faith through prayer and religious activities, (2) socialization with friends, (3) governmental financial and medical support, and (4) a positive outlook and mindset. In terms of differences in contributors between regions, participants from MN emphasized social support from the Korean American community, whereas those in NY reported the importance of socialization at Korean ethnic churches. These findings suggest that intervention programs aimed at improving quality of life should consider mobilizing elderly immigrant cancer survivors' religious and social networks. Moreover, specialized programs or practices for improving quality of life among cancer survivors should further consider regional features.

### DOES RACE AFFECT THE RELATIONSHIP BETWEEN SOCIAL SUPPORT AND PSYCHOLOGICAL DISTRESS?

A.V. Hyams<sup>1,2</sup>, C. Huang<sup>1,2</sup>, L.D. Vinson<sup>1,2</sup>, M.R. Crowther<sup>1,2</sup>, F. Scogin<sup>1,2</sup>, 1. *Psychology, The University of Alabama, Tuscaloosa, Alabama*, 2. *The Center for Mental Health and Aging, Tuscaloosa, Alabama*

*Objectives:* Researchers have demonstrated a negative relationship between social support and psychological distress (PD) in Caucasians and African-Americans. Few studies have examined racial differences in social support and its impact on PD. This study explored whether social support has greater impact on PD in older African-Americans than older Caucasians. *Methods:* Data was drawn from the Project to Enhance Aged Rural Living (PEARL), an efficacy study of home-delivered cognitive-behavioral therapy (CBT). Subjects aged 65+ (N=162) completed the SCL-90, a 24-item social support measure, and a self-reported health item before randomization into CBT or control groups. Three months post-intervention, they were re-assessed. A 2 (African-Americans vs. Caucasians) x 2 (high social support vs. low social support) analysis of covariance (ANCOVA) was conducted to examine the impact of social support on PD. *Results:* At baseline, self-rated health predicted PD for each racial group ( $p \leq .01, \eta_p^2 = .04$ ). Among both races, social support negatively predicted PD ( $p \leq .05, \eta_p^2 = .03$ ). After the CBT intervention, self-rated health was still a significant predictor of distress. Although all subjects' PD decreased, African-Americans with more social support had even lower distress, while Caucasians exhibited similar distress with high or low social support. *Conclusion:* Older adults' self-rated health predicted PD across time. Perhaps due to the therapeutic relationship between CBT therapist and subject, social support did not significantly predict distress after three months, but its importance varied by race. African-Americans demonstrated a preference for social support while Caucasians appeared indifferent to social support.

### THE EFFECTS OF SOCIAL SUPPORT ON CBT-ENHANCED QUALITY OF LIFE IN OLDER ADULTS: AN EXPLORATORY STUDY

M.A. LaRocca, R. Zamora, F. Scogin, *Clinical Psychology, University of Alabama, Tuscaloosa, Alabama*

Empirical studies of the psychological wellbeing of rural older adults are lacking, and the role of social support in quality of life in this population warrants investigation. The current study extended the findings of Scogin et al. (2007) by exploring the role of social support in changes in quality of life resulting from home-delivered cognitive behavioral therapy (CBT). One hundred thirty-four predominantly African American participants, characterized primarily as rural, low resource, and physically frail, were randomly assigned to either CBT or a minimal support control condition. Replicating the findings of Scogin et al., a 2 (treatment group) x 2 (time) mixed between-within subjects ANOVA revealed that CBT participants evidenced significantly greater improvements in quality of life. After controlling for baseline social support,

these improvements were slightly diminished, although still significant. Findings were similar when controlling for race. Among overall women, however, controlling for social support rendered quality of life improvement as no longer significant. Moreover, correlations between social support and quality of life change scores showed a stronger link for women. These findings suggest that among older adults, women with a greater level of social support are more likely to benefit from home-delivered CBT.

### **HAPPINESS IN OLD AGE: A STUDY OF PSYCHOLOGICAL WELL-BEING OF OLDER ADULTS LIVING IN THE COMMUNITY**

R.K. Akashi<sup>1</sup>, A. Mui<sup>2</sup>, *1. Meijigakuin University, Tokyo, Japan, 2. Columbia University, New York, New York*

An aspect of aging is that gains decrease and losses increase (Freund & Ebner, 2005). Nevertheless, the bulk of older adults subjectively express positive feelings despite what others define as objectively negative status (Lawton, 1983). This evidence suggests that individual perception is an important element in understanding older adults' psychological well-being. This study examined how three aging groups (those aged 50-64,  $n=219$ ; those aged 65-74,  $n=271$ ; and those aged 75 and over,  $n=256$ ) subjectively define happiness and differ in their definitions. Based on critical theory premising that knowledge should entail the subjective perceptions of study objects, happiness was measured by subjective indicators of the number of the past seven days that the respondent "felt happy" and/or "enjoyed life" preceding the survey. The data was derived from the Aging, Status, and Sense of Control study (2001) of a national U.S. sample. One-way ANOVA statistics revealed that older adults in all three age groups mostly felt happy and mostly enjoyed life. Multiple regression analysis found that marital status, previous happiness in 1995, previous depressive status in 1995, external locus of control, and perceived social support were significantly associated with happiness among those aged 50-64. Significant happiness predictors for those aged 65-74 were previous happiness in 1995, perceived health, functional limitations, and financial difficulties. For those aged 75 and over, previous happiness in 1995, functional limitations, perceived social support, and voluntary activity predicted happiness. These study findings endorse positive subjective aging although the determinants of happiness differ across age groups.

### **STRESSORS AND DEPRESSIVE SYMPTOMS IN OLDER ADULTS WITH DIABETES: WHAT IS THE RELATIONSHIP?**

L.C. Jones<sup>1</sup>, O.J. Clay<sup>1</sup>, F. Ovalle<sup>2</sup>, M. Crowe<sup>1</sup>, *1. University of Alabama at Birmingham - Department of Psychology, Birmingham, Alabama, 2. University of Alabama at Birmingham - Division of Endocrinology, Diabetes, & Metabolism, Birmingham, Alabama*

Background: Depressive symptoms in older adults are widely under-recognized and undertreated in medical settings. When these symptoms are the result of stressors including health, cognitive, and social issues, diagnosis and treatment becomes difficult. This study seeks to better understand the relationship between various stressors and depressive symptoms in older adults with diabetes. Method: Individuals from the University of Alabama at Birmingham (UAB) Center for Translational Research on Aging and Mobility Recruitment database who self-reported a diabetes diagnosis and individuals who received treatment for diabetes at the UAB Diabetes & Endocrine Clinic were recruited to participate in the Diabetes and Aging Study of Health (DASH). Data from the baseline DASH telephone interview were utilized. A multiple regression analysis that included demographics, health conditions, cognition, and diabetes distress was utilized to examine the relationships between these measures and depressive symptoms. Results: The sample consisted of 234 older adults with diabetes (mean age = 73.46) with 46% being male, 50% Caucasian, 45% African American, and 5% from other racial backgrounds. Results revealed that individuals who experienced

neuropathy ( $\beta = .13$ ,  $p = .0102$ ), stroke ( $\beta = .20$ ,  $p = <.0001$ ), respiratory issues ( $\beta = .10$ ,  $p = .0378$ ), and higher levels of diabetes distress ( $\beta = .49$ ,  $p = <.0001$ ) reported more depressive symptoms than those who had not experienced these issues. Conclusion: Results suggest that various adverse health issues and diabetes distress have an impact on depressive symptoms in older individuals with diabetes. Future research should explore possible explanatory paths for these relationships.

### **NEIGHBORHOOD SAFETY AND PSYCHOLOGICAL DISTRESS AMONG RACIALLY/ETHNICALLY DIVERSE OLDER ADULTS**

P.K. Ghimire Risal, Y. Jang, *School of Aging Studies, University of South Florida, Tampa, Florida*

The study examined the association between perceived neighborhood safety and psychological distress in diverse older adults (Whites, African Americans, Hispanics and Asians). We used the 2009 California Health Interview Survey (CHIS) dataset. The sample included 19,817 respondents residing in California age 60 years and older: Whites ( $n = 16,412$ ), African Americans ( $n = 803$ ), Hispanics ( $n = 1,514$ ), and Asians ( $n = 1,088$ ). A series of hierarchical regression model of psychological distress (measured by Kessler's K6 score) were examined in each racial/ethnic group with an entry order of (1) demographic characteristics (age, sex, marital status, education, language proficiency, and income), (2) health-related variables (chronic health condition, self-rated health), and (3) neighborhood safety (measured with a single item with 1-4 Likert Scale). Compared to racial/ethnic minority groups, Whites were more likely to have positive ratings on neighborhood safety. However, the impact of neighborhood safety on psychological distress was found to be significant across all groups, even with control for demographic and health-related confounding variables. Findings highlight the significant role of neighborhood safety in the mental health of older adults regardless of their race or ethnicity. In efforts to promote mental health of older adults, environmental factors should be taken into consideration.

### **TESTING THE FEASIBILITY OF A DAILY ALCOHOL CONSUMPTION DIARY WITH OLDER ADULTS: A PILOT STUDY**

P. Sacco<sup>1</sup>, B. Resnick<sup>2</sup>, D. Svoboda<sup>1</sup>, C. Smith<sup>3</sup>, *1. Social Work, University of Maryland, Baltimore, Baltimore, Maryland, 2. University of Maryland School of Nursing, Baltimore, Maryland, 3. University of Maryland, Gerontology, Baltimore, Maryland*

Many older adults consume alcohol, and do so without experiencing negative health effects. Understanding alcohol use patterns is a critical factor in understanding motivations for drinking such as stress relief or socialization. However, most research in this area has relied on retrospective measurement, which is limited in describing patterns of drinking (e.g. daily drinking variation) and may contain recall bias. This pilot study assessed the feasibility of data collection using a modified daily data collection with older adults. This study surveyed older adults ( $n=25$ ) residing in a CCRC. We conducted an initial assessment including sociodemographics, the SF-12, the Geriatric Depression Scale, and the Alcohol Use Disorders Identification Test (AUDIT). Participants were then called daily for 7 days and asked about alcohol consumption (number and type of drinks, setting of drinking), daily activities, sleep, loneliness, and mood. After the final phone call, each participant was interviewed, in person, about the acceptability of this approach. A comparison between these methods found that daily reports of alcohol use were concordant with retrospective screening for drinking frequency ( $r_{\text{spearman}}=.77$ ;  $p<.001$ ) and amount ( $r_{\text{spearman}}=1.00$ ;  $p<.001$ ). Mean drinks per day was 0.99, but 40% averaged 2 drinks and 8% averaged 3 drinks. Hazardous drinking (4%) and probable depression (12%) were rare in the sample. Only stress was associated with consumption on drinking days ( $b=-.17$ ;  $p<.05$ ). Based on find-

ings, this daily diary method is not burdensome to CCRC residents, is consistent with validated screening instruments, and better describes variation in drinking among older adults over time.

### **MENTAL HEALTH LITERACY: A RESEARCH-BASED MODULE FOR OLDER ADULTS**

K. Woodson, A.A. Geraci, *National University, San Diego, California*

Literacy is the foundation for reading, writing, and comprehension. Mental health literacy comes from the term “health literacy,” and has a powerful role in how people retrieve and utilize health information. Mental health literacy is having the facility to identify and comprehend mental illness, understand how to find help, and to be informed about prevention and early intervention (Goldney, Fisher, Wilson & Cheok, 2002). Literacy impacts mental health knowledge, mental health status, and access to mental health services. Those with low literacy are impacted because they may hide their problem out of shame (Parker, 2002). Furthermore, depression later in life produces a broad range of cognitive and physical impairments, social isolation, and suicide (Walker, et al., 2010). Given these risks it was important to develop a module for older persons who may have limited literacy skills, have experienced some physical and cognitive changes, and have or know persons with serious mental illness. The literacy module developed on depression was reviewed by six literacy and mental health experts in San Diego County and is intended to provide older adults with the knowledge to combat depression. Upon completion of this mental health literacy module, learners will be able to identify symptoms of depression, differentiate emotions of depression, and understand treatments for moderating depression. Finally, by sharing this module with the community it is expected to contribute to existing mental health literacy research, raise awareness of mental health issues to prevent, and reduce mental health stigma in the County of San Diego.

### **HOW OLDER INMATES COPE WITH THE PSYCHOLOGICAL STRESS OF INCARCERATION**

E. Collins<sup>1</sup>, A. Begovic-Juhant<sup>2</sup>, K. Kopera-Frye<sup>3</sup>, J. Hughes<sup>4</sup>, 1. *Social Work, Case Western Reserve University, Cleveland, Ohio, 2. Cleveland State University, Cleveland, Ohio, 3. University of Louisiana at Monroe, Monroe, Louisiana, 4. Walton County Schools, Monroe, Georgia*

Abstract The challenges of incarceration are numerous for the older inmate. Problems such as ill health, loss of external social support, and dying while incarcerated may create considerable psychological stress. This research explored if religiosity/spirituality and social support were pertinent as coping mechanisms to older inmates' mental health as measured by depressive symptomatology. Sixty-five inmates participated (34 males and 31 females), ranging in age from 50 to 81 years, incarcerated five years or more. Participants were recruited from four different Ohio correctional facilities. Inmates completed a semi-structured questionnaire consisting of demographics and established measures of depression, along with open-ended questions related to health, family, religiosity/spirituality, and social support. Correlation analysis was conducted to examine if religiosity/spirituality and social support played a significant role in reduction of depressive symptomatology. Results revealed that both inmates' religiosity/spirituality and social support from fellow inmates were significantly and negatively related to depression ( $r = -.36, p = .01$ ;  $r = -.31, p = .01$  respectively). In addition, age was negatively related to depression ( $r = -.28, p = .02$ ), suggesting that the older the inmate, the less likely that inmate will exhibit depressive symptomatology. This is plausible because according to Socioemotional Theory, the older the individual is the more likely that individual will seek supportive, meaningful, and sustaining relationships. In summation, supporting inmates' religiosity/spirituality while encouraging development of relationship building skills may result in an increased quality of mental health for the aging inmate. Keyword: Older inmates, depression, religiosity/spirituality, social support.

### **LONELINESS, SOCIAL ENGAGEMENT AND DEPRESSIVE SYMPTOMS IN OLDER KOREAN AMERICANS: GENDER DIFFERENCES**

N. Park, Y. Jang, B. Lee, W.E. Haley, D.A. Chiriboga, *University of South Florida, Tampa, Florida*

Purpose: The present study conceptualized loneliness as a mediator in the relation between social engagement and depressive symptoms and explored gender differences in the mediation model among older Korean immigrants. Various indices of social engagement were considered including living arrangement, social network, and activity participation. Methods: Using data from 674 community-dwelling Korean American older adults, we first examined the mediation effect of loneliness in the relation between each of three indices of social engagement (not living alone, social network, and activity participation) and depressive symptoms. Subsequently, gender differences in the mediation model were examined. Results: As hypothesized, loneliness was found to mediate the relation between each of the indices of social engagement and depressive symptoms. We also observed gender differences in the strength of mediating effects; the harmful effect of living alone was greater among men, whereas women were more likely to be benefitted from larger networks with others and more participation in social activities. Implications: Our findings suggest that loneliness may explain the mechanism by which deficits in social engagement affect depressive symptoms. Gender differences should be considered in interventions for social engagement and mental health promotion.

### **MEMORY FUNCTIONING IN GERIATRIC HOARDING PATIENTS**

K.L. Strickland<sup>1</sup>, C. Ayers<sup>1,2</sup>, Y. Iqbal<sup>1</sup>, 1. *Va San Diego Healthcare System, San Diego, California, 2. University of California, San Diego, San Diego, California*

Hoarding Disorder (HD) is a severe psychiatric condition that is associated with various neurocognitive deficits. The purpose of this presentation is to highlight short-term and long-term memory functioning of geriatric hoarders (N = 41) in comparison to healthy, age-matched controls (N = 25). Results revealed that there are no differences between geriatric hoarders and healthy, age-matched controls on any aspect of memory functioning, as measured by the California Verbal Learning Test (CVLT-II). These results are interesting as memory impairment has been found in mid-life adults with hoarding. Further, older adults with HD often report memory problems as a reason for needing to keep items. Our findings may help challenge these beliefs about reasons for saving in geriatric HD patients. These promising findings impact clinician intervention in that memory functioning may not be an obstacle in providing treatment to geriatric hoarders.

## **SESSION 1295 (POSTER)**

### **MENTAL HEALTH IN LATER LIFE**

#### **SELF-RATED HEALTH AS A MODERATOR OF THE RELATION BETWEEN STRESS AND DEPRESSIVE SYMPTOMS IN MIDDLE AND LATER LIFE**

J. Park, *Retirement Research Center, Samsung Life Insurance, Seoul, Republic of Korea*

This study aims to examine the role of self-rated health between stress and depression in middle and later life. Based on Lazarus and Folkman's (1984) stress and coping theory, it was hypothesized that self-rated health would be inversely related with depressive symptoms and alleviate the negative impact of stress on depressive symptoms in middle and later years. Self-rated health was measured by five-point Likert scale. Stress was measured by three dimensions: finance, work, and family. Depressive symptoms were measured by ten items of four-point Likert scale that showed a good reliability ( $\alpha = .79$ ). A total of 327 respondents aged 55 to 89 (Mean=65.8, SD=7.973) were selected

from the 2009 Korean General Social Survey (KGSS), an annual national survey funded by Korea Research Foundation. This study employed a cross-sectional design and used hierarchical multiple regression model with SPSS version 19.0. The moderating role of self-rated health to the relationship between stress and depressive symptoms was examined by interaction effect. Results indicated that stress was positively and self-rated health was inversely associated with depressive symptoms in the present sample. Self-rated health presented an interaction effect with stress at a significant level ( $Beta = -.146, p = .009$ ), counteracting the negative impact of stress on depressive symptoms. Healthy respondents were less likely to experience depressive symptoms even when they were feeling stressful. These findings imply that health state and health care efforts may be a viable coping mechanism to reduce the level of depressive symptoms and improve the quality of life among middle-aged and older Korean adults.

### **INTO THE WILD: THE DMH EXPERIENCE**

C. Keenmon, *Geriatric Psychiatry, UCLA, Los Angeles, California*

**Objective:** As the Population of the United States Ages, More Older Adults are Living with Chronic Medical and Psychiatric Conditions. For Those Elderly Adults Who are Homebound or Have Difficulty Accessing Health Services, Home Visit Programs may Overcome Barriers such as Stigma, Immobility and Lack of Adequate Transportation. From an Educational Perspective, Home Visit Rotations are Considered Core Training Experiences for Geriatric Psychiatry Fellows. Home Visit Experiences Allow Trainees to Develop the Clinical Skills Needed to Adequately Treat Elderly Adults with Serious Mental Illness, to Lead Multidisciplinary Treatment Teams, and to Educate Other Healthcare Providers. Outlined is a New Geriatric Psychiatry Fellowship Home Visit Rotation Developed Jointly between an Academic Institution and a County Mental Health Program. **Methods:** The Author Describes in Detail a New Rotation in which a University of California Los Angeles Geriatric Psychiatry Fellow Completed Home Visits with Treatment Teams at the Los Angeles County Department of Mental Health. **Results:** In Addition to Providing Psychiatric Consultation in the Home Setting, the Geriatric Psychiatry Fellow Attended a Didactic Series, Participated in Multidisciplinary Team Rounds, and Provided Teaching to the Los Angeles County Department of Mental Health Staff. **Conclusion:** Collaborative Relationships between Academic Institutions and Community Health Programs Create Opportunities for Geriatric Psychiatry Fellows to Manage Older Adults with Serious Mental Illness, Develop Leadership Skills, and Provide Education to Providers from Other Disciplines.

### **SELF-ESTEEM OF ELDERLY MEN AND ELDERLY WOMEN IN KOREA: DOES FAMILY MATTER?**

C. Kim<sup>1</sup>, Y. Ko<sup>2</sup>, 1. *Department of Sociology, Dongguk University, Seoul, Republic of Korea*, 2. *Graduate School of Public Health Seoul Nat'l University, Seoul, Republic of Korea*

The present study addresses the issue of subjective aspect of quality of life in old age. It examines whether and how the self-esteem of the elderly persons in Korea would differ. In particular, the study pays much attention to the salience of family as well as gender differentials in it. Using a nationwide survey on Elder abuse conducted by Korea Institute for Health and Social Affairs in 2009, the study ran regression analysis for elderly men and elderly women. The preliminary result shows that for both men and women, the self esteem is positively related to economic resources and health. However, the presence of spouse and son and the extent of family cohesion are significant for women but not for men. Self esteem is higher for married women, than for unmarried women; for women with a son than for women with daughters only. And women with higher score of family cohesion reveal higher self-esteem. However, such effects are not found for elderly men. These results are consistent with the argument that elderly women are more family centered than their counterparts.

### **GENUINE EMPATHIC ACCEPTANCE: EMBODYING THE CORE CONCEPTS OF CLASSICAL ROGERIAN PERSON-CENTERED PSYCHOTHERAPY IN THERAPEUTIC AND CARING RELATIONSHIPS WITH OLDER ADULTS**

A. Washburn<sup>1</sup>, S. von Humboldt<sup>2</sup>, M. O'Hara<sup>1</sup>, 1. *National University, San Diego, California*, 2. *ISPA, Lisbon, Portugal*

The three intertwined conditions—empathy, unconditional positive regard, and congruence—and praxis traditions of classical, i.e., Rogerian, person-centered psychotherapy are particularly suited to work with older adults, whose personhood is sometimes unacknowledged by others but whose losses are often balanced by gains and growth. This presentation examines what it means to embody authentic, empathic acceptance in a therapeutic or caring relationship with older clients, including those with mild cognitive impairment and dementia. The American Psychological Association has defined the foundational competencies for clinical practice with older adults, including skills related to ethical and legal issues, cultural diversity, and self-reflection. Whereas these skills, and an understanding of the social/psychological dynamics of the aging process, are important, critical for the person-centered therapist are the attitudes he or she brings to the encounter with the older adult. For example, by clearly and warmly communicating acceptance of each aspect of the older person's experience, the person-centered therapist is facilitating what is perhaps a naturally unfolding process for many older adults—the development of his or her unconditional positive self-regard. And for the empathic therapist or caregiver who is intensely attending to expressed and intuited feelings of the older person comes an opportunity, with the client, for deep learning about human life near the end of life. The presentation concludes by contrasting the core concepts of classical person-centered psychotherapy and counseling with those evident in some current models of person-centered treatment and care.

### **DEPRESSION AND FINANCIAL WELLNESS IN LATER LIFE**

Y.G. Lee, E.B. Fauth, *Family, Consumer, and Human Development, Utah State University, Logan, Utah*

Using data from the 2008 Rand Health and Retirement Study (HRS), this study examined the connection between the level of depressive symptoms and financial wellness among Americans aged 65 or older ( $N = 6,127$ ). To understand the level of depressive symptoms among older Americans, this study utilized eight of the Center for Epidemiologic Studies-Depressed (CES-D) scores. The sum of the eight depressive items: e.g., depressed, effort, sleepless, loneliness, not get going, unhappiness, and not-enjoying life was included in the analyses to measure depressive symptoms of older Americans. The higher the scores were, the higher the respondents' depressive feelings were. The descriptive statistics indicated that the average level of depressive symptom of the sample were 1.45 (minimum 0, maximum 8), and about 56 percent of the sample experienced some levels of depressive symptoms. This study found that older Americans with higher levels of depressive symptoms reported lower levels of financial assets, non-financial assets, and net worth. The OLS results indicated that all else being equal, the levels of depressive symptoms negatively influenced the levels of household wealth among Americans in later life. Based on the findings of this study, it is important for social workers, health care practitioners, or physicians to understand the correlates of depressive symptoms and financial wellness among Americans in later life. Thus, those professionals will be able to more effectively help older individuals with higher levels of depressive symptom and those with lower levels of financial resources.

### **THE EFFECTS OF HEALTH ON DEPRESSIVE SYMPTOMS: LONGITUDINAL FINDINGS FROM THE GRANDMOTHER STUDY**

C. Musil<sup>1</sup>, A. Jeanblanc<sup>2</sup>, J. Zauszniewski<sup>1</sup>, C. Warner<sup>1</sup>, 1. *Case Western Reserve University, Cleveland, Ohio*, 2. *Jeanblanc and Rosser, Richmond Hts., Ohio*

Theoretical and empirical evidence suggest that poor health contributes to depressive symptoms, but do changes in health over the past

year reflect or contribute to current ratings of health and depressive symptoms, and do depressive symptoms affect future health? These questions were examined with three waves of data collected two years apart from 243 Ohio grandmothers who participated in a longitudinal study of grandmothers' caregiving to grandchildren. Grandmothers were classified by caregiving status as primary caregiver grandmothers raising grandchildren, multigenerational home grandmothers living with adult children and grandchildren, or non-caregivers to grandchildren; all maintained stable caregiving status across waves. We used AMOS 19 to build a three-wave, cross-lagged auto-regressive model examining the relationships between self-rated health, CES-D rated depressive symptoms, and health compared to prior year's health, with control variables of age, race, and grandchild caregiving. Final model fit statistics were Chi Square=122.45, DF=53,  $p < .001$ ; CFI=.94; TL=.91 and RMSEA=.06. All auto-regressive paths were statistically significant. At each wave, the contemporaneous causal paths from self-rated health to health comparisons and depressive symptoms were supported, as were the paths from health comparisons to current depressive symptoms. Cross-lagged paths from depressive symptoms to subsequent wave self-rated health were significant. Younger grandmothers reported more depressive symptoms and primary caregivers had worse health. The effects of poor and declining health persist and show lingering effects on depressive symptoms, but the converse is also true: improvements in health can have important mental health effects, and are a starting point for discussion.

## SESSION 1300 (POSTER)

### MINORITY HEALTH AND AGING

#### SATISFACTION WITH MAIL-ORDER PHARMACY SERVICES AMONG AGED UNDERSERVED AFRICAN AMERICANS

M. Bazargan<sup>1</sup>, H. Yazdanshenas<sup>1</sup>, D. Wisner<sup>2</sup>, K.T. Watson<sup>2</sup>, J. Smith<sup>1</sup>, G. Orum-Alexander<sup>1</sup>, 1. *College of Medicine, Charles R. Drew University of Medicine and Science, Los Angeles, California*, 2. *Master of Public Health Program, Charles R. Drew University of Medicine and Science, Los Angeles, California*

**Purpose:** This study examines the level of satisfaction with pharmacy services among a community-based sample of underserved aged African Americans to compare the level of satisfaction between mail-order pharmacy and traditional pharmacy patrons. In addition, this study investigates adherence, duplication, use of expired medication, or misuse of any Rx or OTC medication. **Methods:** This study recruited 400 elderly African Americans from 16 churches located in South Los Angeles. We conducted a comprehensive data collection of participant's medication use. Using the Satisfaction with Pharmacy Services Questionnaire the level of satisfaction with pharmacy services between mail-order pharmacy and traditional pharmacy users was examined. **Results:** Fifty percent of the participants take 8 or more medications. Only 15% of participants were using mail-order pharmacy services. Almost 75% of participants illustrated various challenges associated with medication use (poor adherence, duplicate medication, expired medications, mislabeled medications, or poor general knowledge). Ten percent of participants' Rx containers were mislabeled. Nine percent of participants used expired medication. Mail-order pharmacy patrons were more satisfied than traditional pharmacy patrons with their pharmacy services. **Conclusion:** This study documented a higher level of satisfaction with mail-order pharmacy services among underserved elderly African Americans. Regardless of level of satisfaction with pharmacy services, this study demonstrates that there is urgent need for an interventional study to promote adherence to prescribed Rx regimens, to increase awareness of use and misuse of Rx and OTC medications, and to promote communication with primary care providers regarding use of Rx and OTC medications among aged underserved African Americans.

#### RACIAL DIFFERENCES IN CORRELATES OF SYSTOLIC BLOOD PRESSURE IN COMMUNITY-DWELLING OLDER ADULTS

C.D. Ford<sup>1</sup>, P. Sawyer<sup>2</sup>, P.A. Parmelee<sup>3</sup>, M.R. Crowther<sup>4</sup>, R.M. Allman<sup>5</sup>, 1. *College of Nursing, The University of Alabama, Tuscaloosa, Alabama*, 2. *University of Alabama at Birmingham, Birmingham, Alabama*, 3. *The University of Alabama, Tuscaloosa, Alabama*, 4. *The University of Alabama, Tuscaloosa, Alabama*, 5. *Birmingham/Atlanta GRECC and University of Alabama at Birmingham, Birmingham, Alabama*

**Objectives:** To describe the correlates of measured systolic blood pressures among older African Americans and Whites. We hypothesized that psychosocial factors would be independent correlates of elevated blood pressure. **Methods:** A random sample of community-dwelling Medicare beneficiaries aged 65+, stratified by gender, race, and residence, completed in-home assessments including sitting systolic blood pressure (SBP), socio-demographics, measures of physical and mental health, and health care utilization. Factors significantly correlated with SBP were tested using multivariable models to examine the independence of relevant associations among African American and White participants. **Results:** 958 participants [mean age= 75.3 (SD = 6.8); 49% African American; 49% female; 52% rural]. Mean (SD) SBP was 138(SD=19.5); SBP in African Americans was 2.7 mmHg higher than Whites ( $p=.03$ ). African Americans were more often diagnosed with hypertension, and were being prescribed greater numbers of anti-hypertensives (79.7% vs 62.3%,  $p < .001$ ; and 1.3 vs 0.9;  $p < .001$ , respectively). In multivariable models, BMI was significantly and independently associated with SBP among both African Americans and Whites ( $p < .05$ ); lower income was associated with higher SBP in Whites ( $p < .01$ ) but not for African Americans and feeling relaxed and free of tension was significant for African Americans ( $p < .05$ ) only. **Conclusion:** Despite being more likely to be prescribed anti-hypertensives, older African Americans' SBP remained higher than Whites. Reports of being relaxed and free of tension were associated with higher SBP among older African Americans. Additional research is needed to understand these associations.

#### COMPREHENSIVE REVIEW OF MEDICATION DUPLICATIONS BASED ON PHARMACEUTICAL AND THERAPEUTIC CLASSES AMONG UNDERSERVED AGED AFRICAN AMERICANS

H. Yazdanshenas<sup>1</sup>, M. Bazargan<sup>1</sup>, G. Orum-Alexander<sup>1</sup>, K.T. Watson<sup>2</sup>, D. Wisner<sup>2</sup>, 1. *College of Medicine, Charles R. Drew University of Medicine and Science, Los Angeles, California*, 2. *Master of Public Health Program, Charles R. Drew University of Medicine and Science, Los Angeles, California*

**Purpose:** We aimed to describe pattern of medication duplication and medication class duplication (Therapeutic and Pharmaceutical) in prescription and over the counter data in a community-based sample of underserved aged African Americans. **Methods:** This study recruited 400 elderly African Americans (over 65 years old, taking at least two medications) from 16 churches located in South Los Angeles. Interviewer administer questionnaire was used to collect medication use data. **Results:** A) In analyzing for the 400 patients we determined a total of 3063 medications were used. B) Across all pharmaceutical classes: 1) There were a total of 796 medication duplications. 2) Duplication of medication frequency occurred 299 times across all patients. 3) The highest frequency of medication duplication based on the number of medications (in each classes) occurred in the following order: a) Vitamins, Hematinic & Electrolytes (82%), b) Non-Insulin Hypoglycemic Agents (53%), and c) Anti-parkinsonism Agents (50%). C) Across all Therapeutic classes: 1) There were a total of 2366 medication duplications. 2) Duplication of medication frequency occurs 761 times across all patients. 3) The highest frequency of medication duplication based on the number of medications (in each classes) occurs in the following

order: 1. Cardiovascular, Hypertension & Lipids (96%), 2. Supplement (82. %), 3) Autonomic & CNS, Neurology & Psych (79 %). Conclusion: Results suggest there is a need for an interventional study to promote awareness of use and misuse of medications, especially medication duplications and it is critical that health care providers continue developing technology and resources to address duplication related issues among the elderly.

### EATING BEHAVIORS OF OLDER AFRICAN AMERICANS: AN APPLICATION OF THE THEORY OF PLANNED BEHAVIOR

C.W. O'Neal<sup>1</sup>, K.K. Wickrama<sup>1</sup>, P.A. Ralston<sup>2</sup>, J. Ilich-Ernst<sup>2</sup>, C.M. Harris<sup>2</sup>, C. Coccia<sup>3</sup>, I. Young-Clark<sup>2</sup>, J. Lemacks<sup>2</sup>, 1. *Child and Family Development, University of Georgia, Athens, Georgia*, 2. *Florida State University, Tallahassee, Florida*, 3. *Texas A&M University at Kingston, Kingsville, Texas*

Data show that African Americans (AA) engage in more health-risk behaviors, including poor nutrient consumption (Fulgoni., 2007). From the theory of planned behavior (TPB), behavior performance should be strongly based on behavioral intention, which is the result of the individual's attitude towards the behavior, perceived behavioral norms, and their behavioral control (Ajzen, 1991). The TPB also hypothesizes that perceived behavioral control moderates the intention-behavior relationship. However, little research has tested this theory for older AAs. Thus, the current study applies the TPB to explain the fruit and vegetable (F/V) eating behavior of older AAs (n = 207). Because research indicates that social support is particularly important for AAs' participation in health behaviors (Thrasher, 2004), we also incorporate F/V social support. METHODS AND RESULTS. Older AAs with more positive F/V attitudes (5-item scale on beliefs about F/V), F/V perceived norms (6-item scale on reflective appraisal), and F/V behavioral control (6-item scale on behavioral confidence) reported behavioral intentions to consume more F/Vs (5-item scale on planning/reminding) ( $\beta$ s = .37\*, .15\*, and .32\* respectively; \* =  $p < .01$ ). In turn, behavioral intentions ( $\beta = .53^*$ ) influenced F/V behavior latent construct defined by F/V preparing, eating, and self-monitoring (factor loadings from .47-.62). Subjective norms had a direct effect on F/V behavior ( $\beta = .35^*$ ,  $R^2 = .79$ ). Inconsistent with the TPB, the influence of behavioral intentions on behavior was not moderated by perceived behavioral control. Social support was unrelated to F/V behavior in the presence of TPB predictors. Model fit was reasonable ( $\chi^2/df = 2.81$ , CFI=.96, RMSEA=.09).

### ETHNOCULTURAL MINORITY OLDER ADULTS IN CANADA: THE MISSING EVIDENCE

S.D. Koehn<sup>1,2</sup>, S. Neysmith<sup>3</sup>, K. Kobayashi<sup>4</sup>, H. Khamisa<sup>2</sup>, 1. *Simon Fraser University, Vancouver, British Columbia, Canada*, 2. *Centre for Healthy Aging, Providence Health Care, Vancouver, British Columbia, Canada*, 3. *University of Toronto, Toronto, Ontario, Canada*, 4. *University of Victoria, Victoria, British Columbia, Canada*

This paper uses an intersectionality theoretical lens to explore assumptions regarding health and health determinants among ethnocultural older adults in Canada. These include older adults who do not identify with the Anglo-/Franco-Canadian majority and are typically 1st-3rd generation immigrants. A systematic scoping review of the grey and published literature was conducted to map existing research knowledge and identify gaps. The findings were discussed in four critical community feedback sessions. Approximately 3000 source documents were reviewed covering the period 1980-2010; 816 met the eligibility criteria; 183 were Canadian. Canada's two largest immigrant groups (since 1991)—the Chinese and South Asians—had the highest representation in Canadian literature, but considerable gaps exist. Very few studies evaluate specific health interventions or explore the impact of sponsorship status on health and health care access. There were a negligible number of studies including Chinese or South Asian older adults on any

of the three leading causes of death and hospitalization for older Canadians. Furthermore, and equally stressed in the community consultations, is the complete lack of information on diversity within ethnocultural groups. In sum, the current body of evidence on this population does not adequately represent the diversity found among them. Moreover, much of the qualitative literature essentializes culture at the expense of other determinants and barriers, whereas the quantitative literature suffers from oversimplification of variables and their effects often due to the absence of proportionally representative data that captures the complexity of experience in minority groups.

### STROKES AND REHABILITATION OUTCOMES IN RURAL NORTH CAROLINA

S.W. Williams<sup>1</sup>, A.C. Felix<sup>2</sup>, K.R. Faurot<sup>3</sup>, 1. *Allied Health; Speech & Hearing Division, UNC-CH, Chapel Hill, North Carolina*, 2. *UNC Department of Neurology, Chapel Hill, North Carolina*, 3. *UNC Department of Physical Medicine and Rehabilitation, Chapel Hill, North Carolina*

The risk of strokes, a leading cause of death and disability, increases with age. For those who survive the stroke, early and intensive rehabilitation maximizes recovery of function. However, similar to other stroke outcomes, disparities also exist in use of rehabilitation services after an acute stroke. This paper examines the relationship between predictors, including stroke severity and length of stay, of rehabilitation discharge after acute stroke. The sample of 62 patients was tri-racial and was recruited from a rural community hospital to participate in the Stroke Telemedicine Access Recovery (STAR) Project. The STAR Project was designed to maximize access to stroke recovery services in a rural community in the stroke belt. We used a biopsychosocial model to conceptualize predictors and descriptive statistics and linear regression to describe the sample and examine relationships between variables. Most of the sample were female (65%); 77% were 55 years of age or older; 45% were white, 31% African American, and 23% American Indian. The average length of stay was 6 days and the rehabilitation discharge destination was inpatient rehabilitation for 29.5% of the sample with the other 70% discharged to an outpatient setting. Multivariate findings show that length of stay and rehabilitation disposition were not statistically related, however length of stay did increase with greater stroke disability. Given, the importance of early intensive rehabilitation after hospital discharge, more studies are needed to better understand predictors of rehabilitation discharge after acute stroke.

## SESSION 1305 (POSTER)

### QUANTITATIVE METHODS

#### CHASING THE MONEY, PLAYING THE ODDS: GAMBLING TRAJECTORIES AND COVARIATES

S.B. Maitland<sup>1</sup>, A. Davey<sup>3</sup>, J. Wiebe<sup>4</sup>, D. Hodgins<sup>2</sup>, B. Gottlieb<sup>1</sup>, 1. *University of Guelph, Guelph, Ontario, Canada*, 2. *University of Calgary, Calgary, Alberta, Canada*, 3. *Temple University, Philadelphia, Pennsylvania*, 4. *Responsible Gambling Council of Ontario, Toronto, Ontario, Canada*

Gambling behavior lies on a dynamic continuum. Some individuals choose not to gamble, others gamble socially or recreationally and some may experience problems with their gambling in varying degrees both in terms of volume and longevity. Little is known about trajectories of gambling behaviors and the factors associated with changes in these trajectories. Research suggests that problem gambling rarely occurs in isolation from other mental health struggles, including substance abuse (Petry & Weinstock, 2007). The current study examined adults scoring as low-risk, moderate-risk and problem gambling on the Problem Gambling Severity Index (PGSI) from the 2006 Manitoba general population gambling prevalence study. The sample (N=565, 58% female) included 36% (18-35 years of age), 30% (36-50 years old), and 33%

(51-83 years). Five occasions (i.e., baseline, 12-, 24-, 36-, and 48-week) were collected and latent growth curve models assessed changes in problem gambling. Higher initial levels of depressive symptoms were more likely to start the study with a greater severity of problem gambling, but less likely to persist at this higher level over the longer term. Regarding substance abuse, gambling and alcohol dependency are associated behaviors, whereas gambling and illicit drug use are incompatible over longer periods of time; greater participation in one activity necessitates decreasing participation in the other. Whereas factors such as depression, illicit drug abuse, interpretive control/bias, and perceived inability to stop gambling predicted higher levels of problem gambling at baseline, they were also associated with a faster rate of reductions in problem gambling over the longer term.

#### **BURST VS. DAILY MEASUREMENT: ISSUES IN CAPTURING INTRAINDIVIDUAL VARIABILITY**

K. Hooker<sup>1</sup>, S. Mejia<sup>1</sup>, T. Pham<sup>1</sup>, R. Metoyer<sup>1</sup>, N. Ram<sup>2</sup>, 1. Oregon State University, Corvallis, Oregon, 2. Pennsylvania State University, State College, Pennsylvania

Optimizing measurement for developmental research is increasingly important for understanding variability as a dynamic characteristic or process contributing to lifespan changes. Frequent repeated assessments are necessary for capturing intraindividual variability; but how many observations are needed depends on theory of process and heuristic considerations about what can reasonably be demanded from human participants. The question addressed is: Can shorter “bursts” of daily measurement reliably capture the same variability as longer streams of daily measurement over the same time period? We examined constructs known to display state-like fluctuation (positive affect [PA] and negative affect [NA]) as well as others (e.g., goal progress) in which daily fluctuations may be less extreme. 105 older adults in the Personal Understanding of Life and Social Experiences (PULSE) project were randomly assigned to a full study group that completed internet surveys on 100 consecutive days, or a “burst” group that completed only four 7-day epochs (total days = 28) spread over the same time period. Groups didn’t differ on intraindividual variability (iSD) of PA, NA, or goal progress. Analysis of post-hoc created and planned measurement bursts indicated that iMean and iSD reliabilities were high across measures (e.g., .99 and .90 for PA; .90 and .85 for NA; and .78 for within-person PA-NA correlations). These results are critical because they are the first to demonstrate empirically that researchers may not need to collect time-intensive daily measures over long time periods, but can be confident that well-planned measurement bursts will reliably capture some specific aspects of intraindividual dynamics.

#### **ALCOHOL CONSUMPTION AMONG THE OLDEST OLD IN SWEDEN – TRENDS OVER TIME AND METHODOLOGICAL CHALLENGES**

S. Kelfve<sup>1</sup>, K. Ahacic<sup>2</sup>, 1. Aging Research center - Karolinska Institutet & Stockholm University, Stockholm, Sweden, 2. Department of Public health - Karolinska Institutet, Stockholm, Sweden

The overall aim of this study is to describe trends in the frequency of alcohol consumption among the oldest old population in Sweden over the last 20 years. In addition, the methodological challenges involved will be analyzed and discussed. Data from a nationally representative survey of the oldest old population in Sweden (SWEOLD) from 1992, 2002 and 2010/2011 will be used. SWEOLD provides a unique longitudinal database that represents a very high proportion of the population aged 77+ in Sweden. By including institutionalized persons, using proxy interviews and achieving a high response rate, individuals are represented regardless of their health, possible cognitive impairments or place of residence. The prevalence patterns show significant increases in alcohol consumption in all age groups, both in men and women, even when controlling for health status. More individuals are consumers and those who consume drink more often. Less frequent alcohol con-

sumption was associated with high age, women, institutionalized individuals, proxy interviewed persons and those requiring extra effort to recruit. By excluding persons living in institutions or requiring a proxy interview – groups sometimes not represented in surveys – or accepting a lower response rate, the total prevalence of alcohol consumers is likely to be overestimated. A higher percentage of upcoming elderly cohorts in Sweden consume alcohol than previous cohorts. This has been associated with increasing health and financial problems. This emphasizes the importance of including elderly people in research on alcohol consumption and of finding solutions to the methodological challenges posed in surveying the oldest old.

#### **MEASUREMENT INVARIANCE OF THE GERIATRIC DEPRESSION SCALE ACROSS LATIN AMERICA AND THE CARIBBEAN**

O.S. Rostant, University of Michigan, Ann Arbor, Michigan

Purpose: To use multiple group confirmatory factor analysis to assess the stability of the factor structure of the Geriatric Depression Scale Short Form (GDS-15) across five Spanish speaking countries in Latin America and the Caribbean, as well as across gender and age. Sample: Data from the SABE study were analyzed. The sample consisted of 7573 cognitively intact community-dwelling older adults. Procedure: Multiple group confirmatory factor analytical models were used to test within country measurement invariance by gender and age. Results: Metric, scalar and strict invariance was obtained within the countries of Chile and Cuba by gender. Across Argentina, Mexico and Uruguay full measurement invariance did not hold by gender, however full metric invariance was obtained within each country. Full metric invariance across all countries suggests that the relationship between items and their latent factor (s) were equivalent between men and women. Partial scalar and strict invariance was obtained for the countries of Argentina, Mexico and Uruguay. Invariance analyses by age (young old versus old old) revealed that full metric invariance held across all countries. While partial scalar and strict invariance was obtained across all countries. Conclusion: In conclusion, the results of the invariance analysis of the GDS-15 indicate that comparisons may be made across gender in Chile and Cuba, while caution should be exerted in Argentina, Mexico and Uruguay when making gender comparisons. Additionally, caution must be used when comparing age groups across all countries.

#### **A VA GERIATRIC RESEARCH, EDUCATION, AND CLINICAL CENTER’S METHODOLOGY CENTER FOR RESEARCH SUPPORT**

C.J. Burant<sup>2,1</sup>, D.H. Canaday<sup>1,2</sup>, D.M. Kresevic<sup>1</sup>, B. Heath<sup>1</sup>, J.E. Denton<sup>1</sup>, G. Kypriotakis<sup>2,1</sup>, 1. Cleveland VAMC, Cleveland, Ohio, 2. Case Western Reserve University, Cleveland, Ohio

Geriatric Research, Education, and Clinical Centers (GRECCs) have been established in the VA system to improve the care of older veterans. A key component of the GRECCs mission is to conduct research; however designing and evaluating outcomes of these programs requires unique clinical and statistical skills. The Cleveland VA GRECC has responded to this need by developing an innovative Methodology Center. This center uses a three tiered approach: one-to-one consultation, interactive webinars on specific methodological and statistical content, and courses to support researchers in writing grants and publications. Consulting services and resources are available to enable researchers to formulate sound research projects and utilize the staff’s statistical computing skills for the analysis of data. Over the last year, the center has provided more than 130 consults. The center offers a series of classes and webinars on study design, research methods, and statistical analyses for the VA and its affiliated academic associates. From October 2010 to March of 2012, the center has given 15 webinars on research methods to over 190 participants. A series of satisfaction questions were provided after each webinar. Response rates of 100% agreement in satisfaction were found on 29 of the 40 (72.5%) questions evaluating the

webinars. The center has been quite successful in providing consultation for the submission of several grant proposals and publications. This presentation will discuss the development, structure and efficiency of this center, resources, curriculum and detailed analysis of the respondent's comments and evaluations.

#### **UTILIZATION OF SOCIAL MEDIA TO RECRUIT ADULTS OVER 40 FOR SENSITIVE RESEARCH TOPICS**

P.P. Brown, H. Ewen, *Sociology and Gerontology, Miami University, Oxford, Ohio*

Internet-based survey research and recruitment via social media is a relatively new phenomenon. Crooks and Bauer (2008) state that internet-based surveys not only save money but can reduce social desirability responses. Additionally, participants are more likely to disclose information that they may not divulge through traditional survey methods, thus internet-based survey research for sensitive topics such as sexuality should be expanded and explored. While the utilization of social media is unconventional, we as researchers must begin to explore more updated sources of communication as a recruitment and contact tool. Telephone and direct dialing surveys are becoming passé as more and more American households have cellular service only. As Smart phones emerge into the marketplace, the technology of immediate accessibility to the internet will further complicate the matter. Additionally, with universities, non-profits, and businesses looking for ways to conduct research and save money, especially during the current recession, more may turn to Facebook, LinkedIn, or other alternative social media outlets. With over 61% of Facebook users over the age of 35, the researcher concludes that gerontologists need to look at new ways of approaching their target populations. This presentation focuses on the use of social media (Facebook in particular) in obtaining a snowball sample of middle-aged and older women (over 40) for participation in a survey on sexuality. The presentation also presents the challenges of obtaining Institutional Review Board approval, the challenge of recruitment strategies with a comparison of traditional and non-traditional methods, and lessons learned through the process.

### **SESSION 1310 (POSTER)**

#### **RETIREMENT**

##### **QUALITY OF LIFE OF RETIREES: CONTRIBUTIONS OF PERSONALITY TRAITS, ACTIVITIES, AND HEALTH-RELATED BEHAVIORS**

W. Chan, N.A. Turiano, D. Mroczek, *Purdue University, West Lafayette, Indiana*

There are many factors that could explain why some older adults effectively adjust to the retirement process while others experience declines in health and satisfaction. However, recent emerging evidence suggests that individual differences in personality traits may be an important factor to determine the quality of life after retirement. The purpose of the current study is to explore if conscientiousness and neuroticism predict satisfaction levels and self-rated health in a subsample of retired older adults from the 2010 wave of the Health and Retirement Study (n = 763). Moreover, we investigated whether social/physical activities or health-damaging behaviors also predict satisfaction and health after retirement, net of personality factors. Hierarchical multiple regression analyses showed that lower levels of neuroticism but higher levels of conscientiousness predicted more positive levels of retirement satisfaction and self-rated health. Net of personality effects, frequent social activities predicted a greater retirement satisfaction and self-rated health, while frequent exercises were positively related to self-rated health. In addition, smoking predicted a reduced retirement satisfaction and self-rated health. Surprisingly, more days of having any drinking per week predicted both higher retirement satisfaction and self-rated health. These findings build on prior studies that indicate not only does personality

predict well-being after retirement, but activity levels and health damaging behaviors have an independent contribution to the quality of life of retirees. The current study provides additional support to the notion that social/physical activities may be beneficial while moderate drinking may not necessarily be harmful in old age.

#### **ANTICIPATORY SOCIALIZATION FOR RETIREMENT: A MULTILEVEL DYADIC MODEL**

J.G. Ingram<sup>1</sup>, A.L. Curl<sup>2</sup>, *1. Social and Behavioral Sciences, University of Arkansas at Pine Bluff, Pine Bluff, Arkansas, 2. University of Missouri, Columbia, Missouri*

Role theory, widely used to examine human behavior, has often been used to describe the transition from work to retirement. Anticipatory socialization, a role theory concept, describes the process that occurs prior to role transitions and assists in that transition by helping individuals learn the norms for the new role. However, not all workers engage in retirement planning. Lack of retirement planning is of concern because those individuals who do not plan for major life transitions tend to be less successful in adjusting to role changes. Data from the Health and Retirement Study were used (N = 1,115 dual-earner married couples); selection criteria required participants to be age 45 or older, working full- or part-time, and have complete data for the study variables. The sample was 87% White and 13% Black, with a mean age of 54.1 and 12.9 years of education. Using multilevel modeling of dyadic data, we examined predictors of anticipatory socialization (i.e., thinking about and discussing retirement). Higher education, higher income, and greater retirement wealth predicted greater anticipatory socialization by both husbands and wives. For wives (but not husbands): race (being White) and having a spouse who was looking forward to retirement predicted more anticipatory socialization. Those looking forward to retirement also engaged in more anticipatory socialization. This study found evidence of spousal congruence, with husbands, on average, engaging in more anticipatory socialization than wives. These findings identify couples that could most benefit from targeted efforts to increase anticipatory socialization, which predicts better retirement adjustment and satisfaction.

#### **TYOLOGY OF RETIREMENT READINESS AND CORRELATES OF THE KOREAN BABY BOOMERS**

G. Han<sup>1,5</sup>, J. Kim<sup>2</sup>, K. Kim<sup>3</sup>, S. Timmermann<sup>4</sup>, J. Migliaccio<sup>4</sup>, *1. College of Human Ecology, Seoul National University, Seoul, Republic of Korea, 2. Institute on Aging, Seoul National University, Seoul, Republic of Korea, 3. Pennsylvania State University, University Park, Pennsylvania, 4. MetLife Mature Market Institute, New York, New York, 5. Translational Gerontology and Retirement Research Center, Seoul National University, Seoul, Republic of Korea*

This study analyzed 3,783 non-retirees out of a total of 4,668 respondents to the 1st wave data(2010) of the Korean Baby Boomers Panel Study to examine how well Korean Baby Boomers are prepared for life after retirement across the 4 domains(Finance, Health, Mind, Social Engagement). And, to focus on the diversity in retirement preparation existing in the Korean Baby Boomers and to see in details strengths and weaknesses of each subgroup, we attempted to classify the sub-groups of retirement preparation among respondents and to explore attribute of each subgroup. Korean Baby Boomers showed the highest score in the social engagement, followed by health, mind, and the finance domain. Using Latent Profile Analysis based on 4 domains, we identified five retirement readiness types: Well-prepared, Average, Poorly-prepared, Poor Social Relationship, High-risk Type. Looking at the attributes of each type, Well-prepared type showed the highest level of education and household income and the highest percentage of regular employment than Average Type being considered a common type as this type comprised almost half of all respondents. High-risk Type being in the lowest retirement readiness score in all four domains, showed the lowest in SES, a much lower percentage of regular employment and a

much higher percentage of displaced worker, broken career paths, and people without a spouse than the Average Type. These findings have a variety of meanings as they presented us the need for interventions in the vulnerable groups for enhancing the quality of life after retirement.

#### **WHY DO THE JAPANESE WORK UNTIL OLD AGE?**

N. Yatomi, I. Sugawara, H. Akiyama, *Institute of Gerontology, The University of Tokyo, Kashiwa, Chiba, Japan*

Japan has been experiencing a rapid aging of her population over the past few generations. This rapid aging has forced changes in the various social welfare systems. One such change is in the pension system, with the impact on retirement age being enormous. Many companies have been pushing the retirement age back to 65 years old. Even still, Japanese people tend to be willing to work into old age. The purpose of this study is to examine the reason why Japanese people don't seem to mind to continue working until as they are as old as possible. The sample of this study is 2,000 residents who live in Kashiwa City, Chiba prefecture, a suburb of Tokyo located about 30 kilometers north of the capital. Structured interviews were conducted with 1,133 people aged 55 or over. The result shows that almost three-fourths of respondents selected the choice of working until as old as possible. However, they tended to prefer light work load. Of the four choices of reasons for why they wish to continue to work, the most popular reason selected was self-realization. The other three reasons were chosen in order of: to receive income; to engage in relationships with others; and lastly, to maintain health. Interestingly, the rate of "self-realization" as a choice does not decrease as much as "to receive income". This may suggest that Japanese elderly people may be seeking the meaning of life through their work and, therefore, are willing to work in and through old age.

#### **FINANCIAL LITERACY AND EARLY LEARNING AMONG YOUNG ADULTS**

J. Kopusko, D.A. Hershey, *Psychology, Oklahoma State University, Stillwater, Oklahoma*

A lack of financial literacy is a serious problem in our country, and it likely inhibits individuals' abilities to effectively plan and save for retirement. In the present study, college students were surveyed about various concepts related to financial planning for retirement. The goal was to develop an empirically-based developmental gradient that reflects individuals' financial knowledge levels. A second goal was to examine the prevalence rates of familiarity with certain key financial planning concepts. Participants completed a 14-item measure to indicate approximately when they became familiar with various financial concepts. Some of the concepts were simple in nature (e.g., "I understood that I needed to save money if I wanted to see my financial resources accumulate"), and some were more complex (e.g., "I am familiar with the concept of vesting"). Not surprisingly, most students reported that they became familiar with some of the more rudimentary concepts during their elementary school years. For more complex or technical financial concepts, individuals reported a later average age of learning, and a larger percentage of the sample indicated they were unfamiliar with the concept. More than half of all students reported being unfamiliar with concepts such as pension plans, retirement nest eggs, vesting, and retirement income replacement rates. This lack of knowledge could have a considerable impact on future patterns of lifespan planning and saving. Implications suggest that positive early financial learning experiences could help individuals to plan and save responsibly for the future.

#### **THE LIFE SATISFACTION AFTER RETIREMENT OF KOREAN OLDER ADULTS BY THE STATUS OF RETIREMENT**

M. Kim<sup>1</sup>, H. Lee<sup>2</sup>, *1. Daegu University, Daegu, Republic of Korea, 2. Joongbu University, Geumsan-Gun, Chungnam, Republic of Korea*

Descriptions: In Korea, retirement is enforced when people turn 65. But in some sectors it is earlier than that. Depending on voluntary retire-

ment or not, it will affect the results of retirement differently. If older adults are economically independent and still healthy, they will enjoy the rest of their life. However, if they retire involuntarily and their economic status is bad, it will have negative effects. Therefore, it will be interesting to compare the different outcomes by the status of retirement. It will also be interesting to examine how bio-psycho-social factors, economic status, spouse and children's work status affect older adults' life satisfaction. Method: This study used the 3rd wave of individual data of KReIS (Korean Retirement and Income Study). The data was collected in 2009 using national random sampling. The sample size of this study was 2,106 (voluntary retirement=708, involuntary retirement=1,398). The factors affecting the life satisfaction after retirement were compared by the status of retirement. Hierarchical multiple regressions were used to test factors affecting life satisfaction after retirement. Findings: For both groups if they were healthy physically and psychologically, and if they were satisfied with their leisure, their life satisfaction increased. For group 1 (involuntary retirement), if they were economically independent after retirement and had private pension, it had positive effects on their life satisfaction. For group 2 (voluntary retirement), the preparation of living expenses after retirement affected the life satisfaction positively. Whether or not spouses had a job affected their life satisfaction differently. Also, the spouse's attitude about retirement affected the life satisfaction of older adults.

#### **SESSION 1315 (POSTER)**

#### **SELF/OTHER ATTITUDES TOWARD AGING**

##### **THE ALLOPHILIA SCALE TO ASSESS STUDENT ATTITUDES TOWARD PERSONS WITH DEMENTIA**

T. Yamashita, J.M. Kinney, J. Brown, P. Sauer, *Miami University, Oxford, Ohio*

Despite longstanding recognition of the importance of assessing attitudes toward older adults, most instruments lack conceptual and methodological sophistication. Further, the majority of attitudinal measures assess negative rather than positive attitudes toward members of outgroups, with the goal of understanding and reducing negative attitudes. In contrast, Pittinsky and colleagues maintain that the assessment of positive attitudes can promote proactive and prosocial behavior. This distinction is important when evaluating educational interventions that target attitudes toward older adults and specific subpopulations of older adults (e.g., those with dementia). The Allophilia scale (Pittinsky et al., 2010) was designed to measure five domains of positive attitudes (i.e., affection, comfort, kinship, engagement, enthusiasm) toward members of different outgroups. We examined the psychometric properties of the Allophilia (i.e., "like or love for the other") scale when used to assess college students' attitudes (N = 532) toward older adults with dementia. Confirmatory factor analysis revealed good reliability and validity for both females and males. Subsequently we examined changes in students' attitudes (n = 465) as a function of participating in an introductory gerontology course and a structured, weekly intergenerational service learning program for individuals with dementia (n = 31). Pre/post-test comparisons indicate that students with positive attitudes were more likely to take advanced gerontology courses and students who participated in the service learning program demonstrated significantly more affection, comfort, enthusiasm and kinship toward older adults with dementia at the end of the program. Results have theoretical and methodological implications for the study of attitudes toward older adults.

## FUTURE OLDER SELVES: TESTING A MEDIATIONAL MODEL OF THE EFFECTS OF OUTGROUP CONTACT ON ATTITUDES TOWARDS AGING

S.E. Jarrott<sup>1</sup>, B. Levy<sup>2</sup>, T. Savla<sup>1</sup>, *1. Human Development (0416), Virginia Tech, Blacksburg, Virginia, 2. Yale University, New Haven, Connecticut*

Practitioners advocate that intergenerational contact improves attitudes about aging, but researchers present mixed results. We tested whether Pettigrew and Tropp's (2008) mediational model of the mechanisms (knowledge, anxiety, and empathy) of attitudinal change apply to how contact with elders influences attitudes towards own aging. Using a cross-sectional convenience sample of 368 undergraduates, statistical equation modeling indicated an acceptable fit for positive images ( $\chi^2(9) = 30.66$  ( $p < .01$ ); CFI = .98; RMSEA = 0.062) and negative images of self as elder ( $\chi^2(9) = 27.61$  ( $p < .01$ ); CFI = .97; RMSEA = .06). As predicted, greater quantity and quality of intergenerational contact was associated with greater knowledge, lower anxiety, and greater empathy, as well as more positive and less negative images of aging. Also, anxiety about aging mediated the contact-image association; lower anxiety was associated with more positive and less negative images. Further, greater empathy mediated the greater contact- more positive image of aging self association but not the contact-negative image association. More empathy was associated with more positive images of aging self. Lastly, knowledge about aging mediated contact's influence on negative but not positive image of self as elder. More knowledge predicted more negative images of the aging self. Our findings indicate that more frequent and positive intergenerational contact contribute to more positive and less negative images of self as elder, which can inform early interventions targeting wellness in late life. Findings regarding knowledge may suggest that knowledge leads to ambivalence about aging self and should be explored further. Intergenerational programs should target mechanisms of aging anxiety reduction and empathy promotion to achieve positive outcomes for future elders.

## GRANDPA'S GRUMPY, GRANDMA'S A HOUSEKEEPER: GENDER-SPECIFIC AGE STEREOTYPES IN DIFFERENT LIFE DOMAINS

A.E. Kornadt, P. Voss, K. Rothermund, *Department of Psychology, Friedrich-Schiller-University Jena, Jena, Germany*

In her much-cited work, Susan Sontag (1979) argues for a double standard of aging, indicating that older men and older women are evaluated differently, and – on the side of older women – more unfavorably. Research on age stereotypes has so far largely neglected the gender specifics of age stereotypes. Recent findings regarding the domain-specificity of age stereotypes, however, provide a new and interesting perspective on this topic: Whereas in some life domains older women might be evaluated more negatively than older men, there might be no gender differences or even a more favorable evaluation of older women in other domains. Adopting a newly developed instrument for the assessment of domain-specific age stereotypes (Kornadt & Rothermund, 2011), a sample of younger ( $N = 86$ , aged 20-30), middle-aged ( $N = 86$ , aged 40-50), and older participants ( $N = 59$ , aged 60+) had to indicate their views of 'old women' and 'old men' in eight different life domains. We found considerable gender differences and also a gender by domain interaction: Whereas older women were evaluated more positively than older men in the domains family, leisure, and health, older men were evaluated more positively in the domain finances. No gender differences emerged for the domain friends. This study yields first support for the domain-specific interaction of age and gender stereotypes, and implies that a differentiated look on the phenomenon is necessary for a better understanding of aging processes in different social groups of aging societies.

## THE ROLE OF TRAIT NEUROTICISM, SELF-PERCEPTIONS OF AGING, AND DAILY PERCEPTIONS OF USEFULNESS FOR PERCEIVED STRESS

P. Allen<sup>1</sup>, S. Mejia<sup>1</sup>, K. Hooker<sup>1</sup>, H. Ko<sup>1</sup>, S. Choun<sup>1</sup>, T. Pham<sup>2</sup>, R. Metoyer<sup>2</sup>, *1. Oregon State University - Human Development and Family Sciences, Corvallis, Oregon, 2. Oregon State University - School of Electrical Engineering and Computer Sciences, Corvallis, Oregon*

Theory suggests that personality traits and Awareness of Age Related Change (AARC) in the social-cognitive domain should influence major outcomes such as physical and emotional wellbeing (Diehl & Wahl, 2010). The current study used self-perceptions of aging (SPA) as a measure of AARC to examine the joint influence of AARC and trait neuroticism on self-rated daily levels of perceived stress in a sample of 98 older adults (52-88 years) over 100 days in the internet-based Personal Understanding of Life and Social Experiences (PULSE) study. To address processing of AARC, a daily single-item rating of perceived usefulness and productivity ("Today I felt useful and productive") was also examined. A multilevel random coefficient model controlling for day, age, and gender tested the effects of neuroticism, self-perceptions of aging (SPA), and daily perceived usefulness/productivity ratings on a daily composite score of stress. We found SPA to predict stress level independent of neuroticism. Daily perceptions of usefulness/productivity were negatively associated with perceived stress level, and fully mediated the association between SPA and stress. Neuroticism was related to between person differences in this association, suggesting increased sensitivity to daily perceptions of usefulness/productivity among those high in neuroticism. Positive global SPAs alone do not appear sufficient to predict reduced levels of stress in our sample of older adults. Rather, enacting the global perception by perceiving oneself as useful and productive on a day-to-day basis is what allows for this relationship.

## LOOKING AS YOUNG AS YOU FEEL: FINANCIAL STRESS CAN MAKE YOU LOOK AND FEEL OLDER

S. Agrigoroaei, A. Lee, M. Lachman, *Brandeis University, Waltham, Massachusetts*

Stress has been identified as a key contributor to poor health and may even accelerate the aging process. Based on photographs of U.S. presidents at the beginning and end of their terms, some have suggested that job stress can lead to premature aging and greater mortality risk. We examined changes in the appearance of adults ages 26 to 75, based on photographs taken on two occasions eight to ten years apart, in relation to self-reported financial and work-related stress and subjective age. Photographs are from participants in the Boston sub-study ( $N = 229$ ) of the Midlife in the United States Study (MIDUS). On average, adults felt younger than they thought they looked, and also thought that they looked younger than others thought they did. Those who looked older relative to their actual age had poorer health, and those who felt younger than their actual age had greater life satisfaction. We examined the effects of financial and work stress on perceived age, controlling for age, sex, education, income, self-rated health, attractiveness, and amount of time between the two occasions. Those who reported higher levels of financial stress were perceived as older than their actual age and showed larger increases in perceived age over time. Higher levels of work-related stress were associated with feeling older than one looks. The results are discussed in terms of physical/biological changes associated with stress and their effects on appearance and subjective age.

## FUTURE TIME PERSPECTIVE ACROSS THE ADULT LIFESPAN: A MULTIDIMENSIONAL APPROACH

A.F. Brothers<sup>1</sup>, H. Chui<sup>2</sup>, M.K. Diehl<sup>1</sup>, *1. Colorado State University, Fort Collins, Colorado, 2. Flinders University, Adelaide, South Australia, Australia*

Future time perspective (FTP), or the perception of how much time a person has left, is an important construct in aging research. Most exist-

ing measures have assessed FTP as a unidimensional construct, but recent evidence suggests that FTP may be better represented as a multidimensional construct. Consequently, we developed items that were related to three a priori dimensions of FTP: Future as opportunity, future as being limited, and future as being ambiguous. This multidimensional structure was examined in a sample of 625 adults, ranging in age from 18–93 years. Factor analyses yielded a 4-factor solution: Factor 1—Future as Open, Hopeful; Factor 2—Future as a Time to Achieve Goals; Factor 3—Future as Limited; and Factor 4—Future as Uncertain. One-way analyses of variance were used to examine age differences in these dimensions as expected based on propositions of lifespan theory. These analyses showed that younger adults had a greater sense of openness toward the future compared to middle-aged and older adults. Conversely, older adults viewed the future as more limited than young adults. Young adults reported the highest level of ambiguity about the future. These age differences held equally for women and men. Across all ages, Factors 1 and 2 were positively correlated with extraversion, openness, and optimism, as well as subjective health, self-esteem, and life satisfaction. In contrast, Factors 3 and 4 showed significant positive associations with neuroticism and depressive symptoms. Findings suggest that it is informative to operationalize FTP as a multidimensional construct.

### **CHANGING PERCEPTIONS BY TALKIN' 'BOUT MY GENERATION WITH ANOTHER GENERATION**

L. Wagner, M. Barnett, *University of San Francisco, San Francisco, California*

Many college students anecdotally report having limited meaningful interactions with older adults. This lack of interaction can result in skewed perceptions between these age groups. To test whether regular intergenerational interactions might change these perceptions, a course at the University of San Francisco for both older (over age 55) and young (18–25 year old) adults was designed using social psychological principles to promote positive intergenerational contact. Thirty-six (18 older and 18 young adult) students met once a week for 8 weeks and discussed topical issues raised in assigned articles read outside of class. Discussions were held in 4–6 person intergenerational groups. Two field trips to locations chosen by each age group were also taken by these same small groups. Brief pre- and post-course questionnaires assessing frequency and interest in contact were distributed to both age groups, and a longer attitudinal measure was included in the young adult questionnaire. At Time 1, both older and young adults reported limited opportunities to interact with the other generation. Frequency of intergenerational contact outside of class did not change pre and post course, but many of the perceptions of the young adults showed significant change. Young adults reported significantly higher levels of belonging, comfort, and kinship with older adults after the course than before the course. Positive attitudes also increased, as well as the desire to be more like older adults and become friends with more older adults. Results suggest that the course may indeed improve intergenerational attitudes.

### **AGE DIFFERENCES IN NUMBER OF HEALTH CONDITIONS AND HEALTH RATINGS: HEALTH OPTIMISM IN OLDER ADULTS**

K. Douglas<sup>1</sup>, C.S. McCrae<sup>2</sup>, N.D. Dautovich<sup>1</sup>, *1. University of Alabama, Tuscaloosa, Alabama, 2. University of Florida, Gainesville, Florida*

Introduction: The purpose of this study was to investigate: 1) age differences in number of health conditions and self-rated health, 2) age differences in the relationship between number of health conditions and self-rated health, and 3) variables differentially associated with health ratings based on age. Methods: 50 younger ( $M=19.88$ ,  $SD=2.76$ ) and 50 older ( $M=67.81$ ,  $SD=6.73$ ) adults completed demographic questionnaires assessing number of health conditions, a subjective measure of overall health, Positive and Negative Affect Schedule, Beck Depression Inventory II, and Pre-Sleep Arousal Scale. Results: There was a significant difference in younger ( $M=.34$ ,  $SD=.68$ ) and older ( $M=1.24$ ,

$SD=1.25$ ) adults in number of health conditions,  $t(98)=-4.45$ ,  $p<.01$ , and a significant difference between younger ( $M=3.84$ ,  $SD=.88$ ) and older ( $M=3.48$ ,  $SD=.84$ ) adults in self-reported health,  $t(98)=3.48$ ,  $p<.01$ ). There was a significant correlation ( $r(50)=-.31$ ,  $p<.05$ ) between number of health conditions and self-rated health in older adults, with lower self-rated health associated with more health conditions. Positive affect predicted health ratings in older adults,  $\beta=.32$ ,  $p<.05$ . In younger adults, depression predicted health ratings,  $\beta=-.34$ ,  $p<.05$ . Conclusions: Older adults exhibit more health conditions and lower health ratings than younger adults. Implications for the age differences in factors predicting perceptions of health, such as positive affect in older adults and depressive symptoms in younger adults are discussed.

## **SESSION 1320 (POSTER)**

### **SEXUALITY**

#### **MEASURING OLDER ADULT SEXUALITY: HEALTHCARE PROVIDER KNOWLEDGE, ATTITUDES, AND BEHAVIORS**

S.A. Jacobson, *1. Hunter College, New York, New York, 2. Mount Sinai Hospital, New York, New York*

Background: Older people report a desire for healthcare providers to help them manage and maintain sexual health. However, many healthcare providers are hesitant to discuss sexuality with older patients. Many researchers use the Aging Sexual Knowledge and Attitudes Scale (ASKAS) to study the knowledge and attitudes of healthcare providers toward older adult sexuality. The ASKAS is limited in its utility today as it was developed thirty years ago. A more contemporary validated scale would improve current inquiry of the role of healthcare providers in older adult sexuality. Method: A thematic analysis using Baum and Clarke's six-phase method (2006) was conducted, drawing from available scales and related literature. Patterns and themes were identified to determine inclusion criteria for an updated scale. Results: The following themes were identified from existing scales: continuity of sexuality throughout the lifecycle; benefits of continued sexual expression; relationship status; masturbation; normal changes in male and female sexual functioning; relationship between disease and sexual functioning; and influence of medication on sexual functioning. Topics found in the literature, but excluded from currently available scales, include themes of LGBT and aging, treatments for male and female sexual dysfunction, sexually transmitted infections, and safe sex practices. Conclusions: This thematic analysis of available scales and literature lays sufficient groundwork for the development of a new scale to measure the role of healthcare providers in older adult sexuality. These findings, along with key-informant qualitative interviews will be used to develop items for a scale that will be tested for reliability and validity.

#### **THE "BIRDS & BEES" IN MIDDLE AGE & OLDER ADULTS: COMPARISONS OF ATTITUDES & KNOWLEDGE**

A.S. Graf, J.H. Patrick, *Psychology, West Virginia University, Morgantown, West Virginia*

A spike in sexually transmitted infections among older adult communities has challenged the common belief that older adults are not sexually expressive. One plausible explanation is that aging cohorts are increasingly sexually permissive. Using a subset of data from a larger study, comparisons were made between middle-aged ( $n=30$ ,  $M$  age=49.27) and older adults ( $n=27$ ,  $M$  age=64.04) on sexual information, attitudes towards sexual expression generally, and attitudes and knowledge of older adult sexual expression and function. Chi-square analyses indicated middle-age and older adults are similar in the type of sexual information experienced, except formal sex education (middle-age report more),  $\chi^2(1, N=56)=4.52$ ,  $p=0.034$ . T-tests comparing attitudes towards sex generally revealed no significant differences, but gender differences consistent with previous findings show that women are less approving of infidelity,  $t(59)=-2.67$ ,  $p=0.01$ ,  $CI_{.95}(-0.89, -0.13)$ ,

and casual sex,  $t(59)=-4.12, p<0.001, CI_{.95}(-1.48, -0.51)$ . Men reported sex as being more important to life,  $t(59)=3.45, p=0.001, CI_{.95}(0.35, 1.31)$ . No age or gender differences were found when comparing attitudes about older adults' sexual expression and function. A chi-square revealed that older adults show better knowledge of sexual function in older age than do middle-aged adults. Gender differences also indicate that women are more accurate in their knowledge. These findings suggest attitudes between age groups may not differ to a large degree, though differences did emerge between men and women. Further, middle-age adults may have some misconceptions about aging and sexual function, and these knowledge differences may vary as a function of gender.

#### **STAFF KNOWLEDGE AND PERCEPTIONS OF SEXUALITY AND DEMENTIA OF OLDER ADULTS IN LONG-TERM CARE**

E.A. DiNapoli<sup>1</sup>, G.L. Breland<sup>1,2</sup>, R.S. Allen<sup>1,2</sup>, 1. *University of Alabama, Tuscaloosa, Alabama*, 2. *Center for Mental Health and Aging, Tuscaloosa, Alabama*

Sexual expressions among long-term care residents may contribute to overall health; therefore, there is an increased need to further examine staff perceptions and prevalence of sexual expression among older adults in long-term care. One hundred staff members ( $M = 38.52$  years old;  $SD = 11.99$ ; Range 20 - 67; 94% women; 80% African American) from three skilled nursing homes completed a comprehensive survey examining whether religiosity, dementia knowledge or knowledge of sexuality among older adults effects staff attitudes and reports of prevalence of sexual expression among residents with and without dementia. Results indicated that the most frequently reported sexually active dyads were non-demented men with non-demented women, followed by demented men with demented women. In addition, staff with higher levels of education reported more sexual activity among non-demented residents. African American staff, however, were less likely to report sexual activity between non-demented men and demented women. Staff with higher levels of organizational and non-organizational religiosity reported less positive attitudes toward sexual expression among residents. Contrary to our predictions, there was not a significant association between staff knowledge of dementia and attitudes toward sexual expression among residents; whereas those with greater knowledge of sexuality among older adults trended toward reporting more positive attitudes of sexuality. Discussion will address the impact of staff knowledge and attitudes regarding sexuality and dementia on the sexual expression of residents in long-term care.

#### **SESSION 1325 (POSTER)**

#### **SUCCESSFUL AGING AND HEALTH**

##### **SOCIAL NEEDS FULFILLMENT, AGING, AND HEALTH: A CROSS-CULTURAL VALIDATION**

O. Adedugbe<sup>1,2</sup>, L.J. Ficker<sup>1,2</sup>, P.A. Lichtenberg<sup>1,2</sup>, 1. *Wayne State University, Detroit, Michigan*, 2. *Institute of Gerontology, Detroit, Michigan*

The present study examined the Social Production Function – Successful Aging questionnaire (SPF-SA; social needs) in older African Americans in Detroit, and compared the scores and pattern of responses with the original Dutch SPF-SA sample (Steverink & Lindenberg, 2006). We interviewed 501 community-dwelling African American elders with average age 70.8 years ( $SD = 8.9$ ). SPF-SA subscales of Affection, Behavioral Confirmation (e.g., feeling appreciated and useful), and Status (e.g., feeling influential and accomplished) have three questions each on a Likert-type scale. Detroit elders reported significantly higher behavioral confirmation and status fulfillment for all age groups, while affection fulfillment was similar to the Dutch sample. Patterns of physical loss were similar in both samples and elders who had the most losses reported lower status need fulfillment. Detroit elders with a higher num-

ber of social roles (e.g., being married, employed, and volunteering) scored higher on all SPF-SA subscales. Regression analyses were performed on self-reported problems in depression, cognition, and finances. Younger age, more physical loss, and low affection explained variance in depression and financial dissatisfaction (11.4% and 12.1%, respectively). Variance in cognitive complaints (10.4%) was explained by physical losses, social roles, and interaction between roles and behavioral confirmation. Our results confirm findings of Dutch researchers that social needs do not necessarily change with age; however, behavioral confirmation and status needs appear to be more sensitive to culture than affection. Some unmet social needs for elders are associated with difficulties with mood, cognition, and finances among African Americans in an urban context.

##### **REPEATABILITY OF THEMES FROM LAY-DEFINITIONS OF SUCCESSFUL AGING: THE MANITOBA FOLLOW-UP STUDY**

R.B. Tate, A.U. Swift, D.J. Bayomi, *Manitoba Follow-up Study, University of Manitoba, Winnipeg, Manitoba, Canada*

Since 1996, members of the Manitoba Follow-up Study cohort have been surveyed for their narrative response to the open-ended question: "What is your definition of successful aging?". Keyword coding identified 21 themes, leading to a longitudinal database spanning men's lives from a mean age of 78 years to over 90 years. Seven themes (independence, physical health, cognitive health, adaptation, lifestyle, companionship, and relationships with society) were found to have stable population prevalence with advancing age. Our objective was to examine the repeatability of these themes, at the individual level, from one survey to the next, over five survey times between 1996 and 2006. Generalized linear models for binary outcomes (presence or absence of a theme) on successive surveys were used. We also examined evidence for an interaction effect for repeatability of each theme with self-assessed successful aging, marital status, self-rated health, and life satisfaction. The adjusted odds ratio for a theme to remain in a definition from one survey to the next ranged from 2.17 [95%CI:(1.84,2.55)] for "independence" to 3.34 [95%CI:(2.44,4.56)] for "societal relationships". Significant interactions ( $p<0.05$ ) were apparent with self-assessed successful aging showing a greater likelihood of repeating the themes of cognitive health, adaptation and relationships with society among those who have not aged successfully, and higher likelihood of repeating the theme of lifestyle or companionship among those who have aged successfully. Also, men with excellent self-rated health (in contrast to those with less than excellent self-rated health) were more likely to repeat themes of adaptation, lifestyle and companionship.

##### **PROPOSING SUPPORT SYSTEMS FOR ELDERLY VOLUNTEERS WITH HEALTH ISSUES IN JAPAN**

K. Nonaka, H. Ohba, M. Yasunaga, M. Kuraoka, Y. Murayama, N. Sakuma, S. Shinkai, Y. Fujiwara, *Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan*

Objective: This study explores factors that affect elderly volunteers with health problems who are volunteers. We proposed support systems that volunteer group leaders could utilize, in order to facilitate each elderly volunteer continuing their activities regardless of their health issues. Methods: We recruited 10 volunteers, aged 65 years and over. These elderly volunteers read picture books to children in Tokyo schools. A criterion for participation in the study was the presence of one or more health problems. Semi-structured, in-depth interviews were conducted in 2010 and 2011. We analyzed the qualitative data using Grounded theory. Results: Perceived difficulties in continuing volunteering were more heavily influenced by ideas about aging and volunteering, and the perceived level of support offered by other group members, rather than perceptions of the severity of health problems. Volunteers who were confident in continuing accepted age-related loss of abilities as a natural part of the aging process, and saw volunteering as an opportunity for

social participation. Volunteers who perceived difficulties related to continuing considered the aging process as a loss of abilities essential to function as a “productive member” of society, perceiving volunteering as a form of social work with responsibilities. Moreover, volunteers who had perceived difficulties had less perceived support from their group members. Conclusion: It is important for volunteer group leaders to promote an organizational culture that accepts aging and the associated loss of abilities, and to facilitate a mutual support network among volunteer members.

#### **GENDER AND REGIONAL DIFFERENCES IN BIOPSYCHOSOCIAL RESOURCES OF SUCCESSFUL AGING: A COMPARISON OF CENTENARIANS RESIDING IN GEORGIA, IOWA, AND OKLAHOMA**

C.R. Hixson<sup>1</sup>, A.J. Bishop<sup>1</sup>, P. Martin<sup>2</sup>, L. Poon<sup>3</sup>, 1. *Oklahoma State University, Stillwater, Oklahoma*, 2. *Iowa State University, Ames, Iowa*, 3. *University of Georgia, Athens, Georgia*

This examination involved integration of psychosocial data within centenarian studies conducted in Georgia, Iowa, and Oklahoma (N = 434 centenarians, M = 101.03 years old, SD = 1.93). Univariate analyses were computed to evaluate mean differences of functional capacity, social provisions, economic security, depressive affect, and personality traits across gender and region. Functional capacity emerged as the only variable with significant mean differences between both gender,  $F(1, 408) = 7.39, p < .05$ , and geographical location,  $F(2, 408) = 15.36, p < .01$ . Relative to regional differences, centenarians residing in Oklahoma had significantly higher averages reflecting social provisions  $F(2, 315) = 144.52, p < .01$ , economic security,  $F(2, 242) = 93.12, p < .01$  and emotional stability,  $F(2, 401) = 12.20, p < .01$ . In addition, centenarians residing in Georgia reported significantly higher average scores involving functional capacity,  $F(2, 408) = 15.36, p < .01$ , and extraversion,  $F(2, 322) = 28.07, p < .01$ . Finally, centenarians residing in Iowa maintained a higher mean average score for depressive affect,  $F(2, 401) = 12.20, p < .01$ . No significant Gender X Regional differences were evident. Results have implications relative to identifying key biopsychosocial resources that independently vary by gender and regional location of extremely long-lived persons in the United States.

#### **AGE DIFFERENCES IN PROSOCIAL AND PROSELF INTERESTS FOLLOWING A REMINDER OF MORTALITY**

M. Maxfield<sup>1</sup>, J. Greenberg<sup>2</sup>, T. Pyszczynski<sup>1</sup>, 1. *University of Colorado, Colorado Springs, Colorado Springs, Colorado*, 2. *University of Arizona, Tucson, Arizona*

Terror management theory (TMT; Greenberg, Pyszczynski, & Solomon, 1986) suggests that awareness of mortality contributes to a diverse range of human behaviors: intolerance of different others, preference for similar others, and many other ways people strive to give life meaning and themselves value. Older and younger adults' responses to mortality differ (Maxfield et al., 2007 & 2012), which may be based on age differences in preferred sources for existential comfort. Based on the work of Erikson (1950/1963), we hypothesized that reminders of mortality would increase interest in making significant contributions to society, particularly among older adults. Older and younger adults were reminded of mortality or an aversive control topic and then asked to read two essays: one with outcomes providing great benefit to self but little-to-no benefit to society (proself) and one with outcomes providing great benefit to society but little-to-no benefit to self (prosocial). Participants were instructed to imagine themselves as the protagonist in these essays and indicate their satisfaction with the outcomes. A prosocial bias score was created by subtracting mean proself scores from mean prosocial scores. Results indicated that where contemplating mortality led older adults to display a greater prosocial bias, younger adults did not. In other words, there were no age differences in the control condition, but in the mortality condition, older adults displayed a significantly greater prosocial bias than younger

adults. From a TMT perspective, this is interpreted as a strategy for obtaining symbolic immortality by passing on valuable information to future generations.

#### **CHANGING PREDICTORS OF SELF-RATED HEALTH: CROSS-SECTIONAL AND LONGITUDINAL AGE-GROUP DIFFERENCES**

S. Weinz, S. Wurm, O. Huxhold, C. Tesch-Roemer, *German Centre of Gerontology, Berlin, Germany*

Numerous studies have shown that people who were asked to rate their own health, base their rating not only on their physical health status but include many more information. Furthermore, it is known that the importance of different indicators for self-rated health (SRH) varies with age. Previous findings on factors influencing SRH are mostly based on cross-sectional studies. Therefore, this study investigated whether cross-sectional age group differences also apply in the longitudinal perspective. Longitudinal data of community-dwelling adults aged 40 years and older from the German Aging Survey (DEAS) was used, analyzing two age groups (middle age: 40-64 years, N = 1.771; old age: 65+ years, N = 1.313). Latent multivariate regression models with a multiple group design were employed to analyze cross-sectional and longitudinal differences regarding the importance of various health indicators and psychosocial factors on SRH. Cross-sectional analysis showed age group differences for health indicators only: Chronic conditions, functional health status, and endurance sports were better able to predict SRH in middle-aged than in older adults. In contrast, the longitudinal analyses showed that the prediction strength of all health indicators did not change over time in both age groups. Psychological factors (depressive symptoms and positive affect) became more important over time in the older age group only. Together these findings suggest that especially in old age psychological factors become more important for SRH. This might explain how good and stable SRH besides worsening physical health status is possible up to old age.

#### **RV LIVING AND POSITIVE AGING: PATTERNS OF LEISURE ACTIVITIES AMONG OLDER RVERS**

S. Halbert, E. Sikorska-Simmons, *Sociology, University of Central Florida, Orlando, Florida*

Leisure is an important aspect of quality of life and successful aging. Research suggests that housing influences participation in leisure activities. The majority of studies on leisure, however, have been conducted among community-dwelling elderly, and little is known about leisure activities of older people in alternative housing. This study examined leisure activities among older RVers (i.e., individuals who chose to live and/or travel in a recreational vehicle). Consistent with previous research, the leisure patterns were examined according to gender, marital status, and self-rated health. The sample included 117 residents of an RV retirement park. Data were collected, using a self-administered questionnaire. Of the 117 participants, 48% were women, all were white, and 69% were married. The mean age was 76, and 59% were 75 or older. The most common activities were dining (88%), visiting friends (82%) and walking (70%). Compared to males, females were more likely to pursue educational activities (20% vs. 10%) and crafts (45% vs. 10%). Single RVers were more likely to engage in educational activities than married RVers (50% vs. 12.5%). Those who rated their health as “very good” were more likely to engage in outdoor sports than those whose health was “fair” (53.2% vs. 6.4%). These findings are in line with previous research which suggests that leisure activities vary by gender, marital status, and health. Compared to community-dwelling elderly, RVers were more likely to pursue outdoor activities and socially-oriented activities. More research is needed to examine positive effects of leisure activities on well-being.

## TRANSPORTATION SAFETY

**VALIDATION AND FEASIBILITY OF AN ORIENTATION ASSESSMENT ROADSIDE TOOL FOR LAW ENFORCEMENT OFFICERS**

L. Hill, J. Rybar, T. Styer, D. Salmon, UCSD, San Diego, California

Background: While most older adults are safe drivers, declining sensory and cognitive function can interfere with driving skills. While the individual, family members, and health professionals all play a role in identifying medical impairments, some impaired individuals continue to drive, and come to the attention of law enforcement. Purpose: The purpose of this paper is to report on the development and validation of a tool for the CHP in the identification of disorientation, most frequently due to dementia. Methods: Supported by the Office of Traffic Safety, and partnering with California Highway Patrol (CHP), we developed a training curriculum for law enforcement officers, including a roadside tool. In the pilot year, feedback from officers during training was used to modify the tool. Subsequently, validation of the tool was conducted using individuals diagnosed with dementia comparing with normal, age matched controls. Field testing was done with 'ride alongs' with officers, and trained officer interviews. Results: Retrospective testing compared the questions on this roadside tool with similar standardized questions on other dementia screens. Prospective testing was done with the questions in the order found on the screen. In both retrospective and prospective testing, three types of patients were compared, and sensitivity and specificity calculated: cognitively normal; mild cognitive impairment; dementia. The tool behaved favorably in these studies. Feasibility testing was done with 'ride alongs' and officer interviews, and the tool was found to be practical and acceptable. Conclusions: A roadside tool for use by law enforcement officers to determine disorientation was is feasible, useful, and acceptable.

**IMPACT OF ROAD SIGNAGE ON DRIVING PERFORMANCE OF OLDER AND MIDDLE-AGED DRIVERS ON RURAL HIGHWAYS**N. Gayzur<sup>1</sup>, L. Langley<sup>1</sup>, A. Saville<sup>1</sup>, K. Vachal<sup>2</sup>, E. Alvarez Vazquez<sup>1</sup>, R.D. Gordon<sup>1</sup>, 1. North Dakota State University - Department of Psychology - Center for Visual and Cognitive Neurosciences, Fargo, North Dakota, 2. North Dakota State University - Upper Great Plains Transportation Institute, Fargo, North Dakota

The proportion of drivers who are 65 and over is increasing, especially in rural areas. Road signage in rural areas can be sparse and less consistent than in urban areas. The purpose of the present study was to investigate older adults' driving performance on a simulated rural highway during day and night conditions. We manipulated the distance of destination road signs from the intersections (close – 200 feet; middle – 400 feet; far – 600 feet) and the presence of intersection warning signs (present or absent). The task of middle-aged (40-59 years) and older (60-80 years) participants was to turn at an intersection marked with a particular destination city. In general, older adults drove more slowly than middle-aged adults. Although general speed did not vary by lighting conditions, participants went into turns with greater speed at night than during the day. Older adults slowed down near destination signs more than middle-aged adults, particularly at night. Destination road sign distance impacted both age groups. When a sign was close to the intersection, drivers slowed down more at the sign, but went faster into the turn, than when the sign was at middle or far distances. Intersection warning signs also impacted both groups. When the warning sign was present, drivers slowed down more at the destination sign than when the warning sign was absent, particularly at night. These findings suggest that moving the destination road sign farther from the intersection

and using warning signs in rural areas would benefit middle-aged and older drivers.

**DETERMINING SUITABILITY TO DRIVE AMONG PEOPLE WITH STROKE WITHIN AN IRISH CONTEXT OF PRACTICE**T. Stapleton<sup>1</sup>, D. Connolly<sup>1</sup>, D. O'Neill<sup>2</sup>, 1. Trinity College Dublin, Dublin, Ireland, 2. AMNCH, Dublin, Ireland

Fitness to drive following stroke is usually determined on an individual basis and practice varies across clinical settings. The decision is typically informed by a combination of clinical factors and tacit clinical judgement of healthcare professionals. This study aimed to describe and explore this process within an Irish context. A sequential mixed method design using a follow-up explanation model was used. Quantitative data were collected in a prospective clinical study comprised of off-road and on-road assessment. Follow-up qualitative interviews were conducted to examine the clinical decision making preceding referral for driving assessment. Ethical approval was obtained for all phases of the research. Forty-six stroke patients (mean age 65) were recruited. All 35 patients who completed on-road driving assessment passed, albeit some with restrictions. A limited number of standardised off-road assessments may be useful in determining readiness for driving assessment, and differentiating between restricted and unrestricted drivers. The most significant determinants were the assessing therapist's overall impression of suitability to drive ( $P < 0.001$ ), measures of driving self-efficacy ( $P = 0.001$ ) and those of a proxy ( $P = 0.012$ ). Follow-up interviews with occupational therapists ( $n = 17$ ) and stroke consultants ( $n = 7$ ) highlighted observable rather than measurable behaviours such as insight, awareness, and impulsivity that influenced the stratification of patients suitability to drive post stroke. A combined approach using standardised assessment and behavioural observations appears to be accurate in stratifying stroke patient's suitability to drive. This combined approach may screen out inappropriate referrals and explain some of the sensitivity and specificity issues evident in research using quantitative approaches alone.

**EVALUATING THE DEMTECT AND SIMARD MD AS SCREENING TOOLS FOR OLDER DRIVERS**N.W. Mullen<sup>1</sup>, S.V. Ostap<sup>1</sup>, M. Bedard<sup>1,2</sup>, 1. Centre for Research on Safe Driving, Lakehead University, Thunder Bay, Ontario, Canada, 2. St. Joseph's Care Group, Thunder Bay, Ontario, Canada

With the number of older drivers increasing, effective tools are needed to assist with identifying drivers who may no longer be safe on the road. The SIMARD MD, a modification of the DemTect, was recently adopted in British Columbia, Canada, for physician use as a screening tool for older drivers. This study examined: a) how strongly older drivers' scores on the DemTect and SIMARD MD were associated with other measures of visual attention and cognitive status, and b) how strongly DemTect and SIMARD MD scores were associated with on-road driving scores. Thirty older drivers (17 men, 13 women; aged 70 to 87 years) completed laboratory assessments and an on-road driving evaluation. Performance on the DemTect and SIMARD MD was significantly associated with performance on the SMMSE, Trails B, UFOV, and ANT ( $r$  ranged from .44 to .59,  $p < .05$ ), but neither DemTect nor SIMARD MD scores were associated with performance on the driving evaluation ( $r = .19$ ,  $p = .31$ , and  $r = .17$ ,  $p = .36$ , respectively). Using the SIMARD MD cut-points identified by Dobbs and Schopflocher (2010), likelihood ratios showed that the SIMARD MD failed to accurately predict driving outcome. Neither the DemTect nor SIMARD MD appear to be suitable screening tools for older drivers. More research is needed with drivers who have been referred for a driving assessment before deciding whether other Canadian provinces should adopt the SIMARD MD for physician use.

## **MAINTAINING MOBILITY AMONG OLDER ADULTS IN MICHIGAN: RESULTS OF A TELEPHONE SURVEY TO IDENTIFY TRAVEL PATTERNS, NEEDS, AND PREFERENCES**

L.J. Molnar, D.W. Eby, L. Kostyniuk, R. St. Louis, N. Zanier, *UMTRI, Univ Michigan, Ann Arbor, Michigan*

Mobility, or the ability to get from place to place, enables people to conduct activities of daily life, stay socially connected, participate in activities that make life enjoyable, and enhance quality of life. As part of a larger project to help maintain safe mobility for Michigan's older adult residents, a statewide telephone survey of 300 adults age 70 and older, was conducted. The sampling frame consisted of records from the state's driver license database and included both drivers and non-drivers. Respondents' average age was 78, two-thirds were women, 60% were currently married, and nearly all were White. Results indicated that: most respondents lived in one or two person households that had one or two motor vehicles; few worked outside the home for pay, but a third volunteered; 20%-30% were in fair to poor health; and about 20% did not currently drive or rarely drove. Those who drove did not drive very much but were satisfied with their current mobility. Those who did not drive had stopped driving for a variety of reasons and about one-quarter were not satisfied with their current mobility. Respondents, regardless of driving status, engaged in a wide variety of mobility-related activities and reported low social isolation. Use of public transportation was low as was awareness of community programs such as volunteer driver, dial-a-ride/senior van, and voucher/senior discount programs. Those who did use public transportation were generally happy with it. Based on the results of the survey, a set of recommendations for maintaining safe mobility was developed.

## **TOP CAR TECHNOLOGIES AND SAFE DRIVING FOR A LIFETIME**

B. Tracton-Bishop<sup>1</sup>, L. D'Ambrosio<sup>2</sup>, *1. The Hartford, Simsbury, Connecticut, 2. MIT AgeLab, Cambridge, Massachusetts*

With an increasing number of high-tech safety and comfort features in cars today, drivers of all ages must often consider which ones are most beneficial for them. For older drivers, in particular, who have been on the road for quite some time, it's important to fully understand what new features offer and which ones may deliver meaningful benefits around their driving safety. This project explores what academics and practitioners who work regularly with older drivers think about newer technologies available for the automobile, and how they think these technologies may affect older adults' driving experiences. Older adults need to evaluate car technologies based on their vehicle, their driving abilities and their comfort level with technology. Through the study's findings older drivers can make better informed decisions about which technological safety features they may benefit from most.

## **SESSION 1335 (POSTER)**

### **HEALTH CARE**

#### **GOALS PRIORITY OF DRUG THERAPY AMONG ELDERLY PATIENTS: A PILOT STUDY ON PATIENT-CENTERED OUTCOMES**

H. Cheng, *medicine, university of virginia, Charlottesville, Virginia*

Background: elderly patients often take multiple drugs due to multiple co-existing chronic conditions. Drugs could achieve one or more of the following five goals: 1). Relieve symptoms; 2). Reduce complications; 3). Live longer; 4). Reduce hospitalization; 5). Improve independent function. However, one drug could achieve one goal while it could worse other goals. Therefore, eliciting goals priority of drug therapy will be critical for providers to help elderly patients to achieve their preferred goals. This pilot study was to explore how elderly patients rated goals priority of drug therapy. Methodology: It was an observa-

tional study. Community-dwelling elderly patients were asked to rate goals priority of drug therapy from most important to very important, important, less important, and maybe important at community outreach programs and Author's geriatric clinic. Descriptive analysis was performed using SPSS. Results: 42% elderly patients (37/88) was able to rate goals priority. Mean age was 76 y/o with 70% (26/37) as female. On average, they had 5 co-existing chronic conditions and took 7 drugs. Relieving symptoms was rated as the most important goal and living longer rated as the least important goal of drug therapy. However, goals priority varied among participants. Conclusions: this small pilot study demonstrated a challenge to elicit goals priority and variability of goals priority of drug therapy among community-dwelling elderly patients. Relieving symptoms rated as the most important goal of drug therapy and living longer rated as the least important goal could guide providers prescribe drug therapy for elderly patients.

#### **THE COMMUNITY "MATCHMAKER": CONNECTING THE RIGHT CARE TO THE RIGHT CLIENT**

S. Low, *Care Integration Division, Agency for Integrated Care, Singapore, Singapore*

In Singapore, there is a wide spectrum of community and residential healthcare services that cater to patients who need nursing care, rehabilitation or institutionalization. When patients are discharged from hospitals after an acute episode, they and their caregivers are often lost, stressed and unsure in navigating the system. Hence, the challenge in accessing the appropriate services. In 2009, Singapore's Ministry of Health set up the Agency of Integrated Care as the national healthcare integrator. One of its departments, the Referral Management Team (RMT) assists patients and their caregivers to navigate the healthcare system with ease and confidence, and matches the right services to the right patients to achieve better health outcomes. It primarily works with the acute and rehabilitation hospitals in moving patients along the continuum of care, ensuring safe handoffs. RMT mainly manages referrals for 3 categories of services. First, home nursing and medical services for patients who require nursing procedures at home, such as changing feeding tubes and wound management. Second, it looks at centre-based care in particular community rehabilitation. Specifically, for patients who require occupational or physiotherapy services at Day Rehabilitation Centers. Third, placements to residential service such as nursing homes, chronic sick facilities and psychiatric homes in particular for patients with high nursing needs but do not have available or capable caregivers. In 2011, RMT successfully matches over 7600 patients with a healthcare service. This presentation illustrates how RMT conducts assessment on patients' needs, co-ordinates referrals for patients to ensure appropriate clinical siting and gatekeeping.

#### **DIFFERENCES IN COMMUNICATION PERCEPTIONS INVOLVING CARE TRANSITIONS OF MEDICAID CLIENTS**

M.C. Corrigan, *Central Plains Area Agency on Aging, Wichita, Kansas*

Almost one in five hospitalized older patients is readmitted within a 30 day time frame at a cost of over \$26 billion. The Partnership for Patients initiative seeks to reduce care transition complications. The first step in designing improvement strategies is an assessment of the current system. Care transition perceptions of hospital discharge planners and community based service providers (CBSP) are crucial. This session presents analysis of data collected from 48 hospital discharge planners and 87 CBSPs in one mid-west community. Responders were asked to consider planning situations for clients with prior services under Medicaid and Medicare. Almost 74% of discharge planners indicated having at least 2 to 3 days to develop post-hospital plans, and 79% of indicated making contact with prior CBSP during this time. The perceptions of the CBSP did not match these perceptions. Almost half (49%) indicated that the hospital did not notify them about a client's admission; a

majority (66%) were informed by family members/caregivers. A majority (67%) felt they had difficulty getting information about the new functional limitations or needs. These differences in communication perceptions can contribute to care transition problems and re-hospitalizations. Data from the perceptions study has been used to design two projects: alert stickers placed on a client's Medicaid card and an online communication system connecting discharge planners with CBSP. Data collection on those two projects is now underway. After attending this session, participants will be able to discuss ways to increase communication between discharge planners and CBSP.

#### **PARADOXICAL VOCAL CORD MOVEMENT- A RARE CAUSE OF STRIDOR IN THE ELDERLY**

K. Alagiakrishnan<sup>1</sup>, Z. Goodarzi<sup>2</sup>, 1. *Geriatric Medicine, University of Alberta, Edmonton, Alberta, Canada*, 2. *University of Calgary, Calgary, Alberta, Canada*

**Introduction:** Paradoxical vocal cord movement (PVC) is a functional airway limitation due to the improper movement of the vocal cords. **Case Report:** A 90 year-old woman was admitted to the hospital with worsening shortness of breath, stridor and increased sputum production over the past 2 weeks. Her past medical history includes: hypertension, hypothyroidism, GERD, macular degeneration, a TIA, bladder prolapse, anxiety and vocal cord problems. She was a life-long non-smoker. The patient noted significant anxiety with occasional panic attacks and insomnia due to a past abusive relationship with her husband. On examination, the patient was afebrile with 20 breaths per minute at 97% on room air, her heart rate was 76bpm with a blood pressure of 200/98. She had a hoarse voice with inspiratory stridor. She was only able to speak in 2-3 word sentences, but had no other signs of respiratory distress. Otherwise, physical exam was unremarkable. Chest x-ray revealed no acute abnormalities. ECG showed no acute abnormalities. Blood investigations revealed low sodium of 126. Patient was treated for a possible respiratory infection with levofloxacin. Hyponatremia resolved with stopping thiazide diuretic. ENT was consulted to help delineate the nature of the stridor. Bedside laryngoscopy revealed a paradoxical movement of her vocal cords probably associated with anxiety; in her case, they moved towards midline with inspiration producing stridor. Voice exercises and breathing techniques from speech pathologist improved (reduced) her audible stridor. **Conclusion:** PVC is often misdiagnosed as asthma, due to the wheeze, stridor and apparent respiratory distress.

#### **DEVELOPING THE NEXT GENERATION OF LEADERS IN HEALTHCARE INNOVATION FOR OLDER ADULTS**

H. Goel<sup>1</sup>, J. Mohler<sup>2</sup>, N. Landman<sup>3</sup>, M. Fain<sup>2</sup>, 1. *University of Arizona, College of Medicine, Tucson, Arizona*, 2. *University of Arizona, Arizona Center on Aging, Tucson, Arizona*, 3. *Healthcare Transformation Institute, Phoenix, Arizona*

**Background/Rationale:** We developed an elective course for health professional students to provide them with competencies in health care policy and advocacy, to become the next generation of leaders in healthcare delivery innovation. Despite the needs of an aging society and the promise of health delivery innovation to provide value-based care, few health professional students pursue this career path. This elective builds a pipeline of future leaders prepared for this vital role. **Objectives:** Our objective was to engage and prepare the next generation of leaders in healthcare innovation, and assure that they achieve key competencies in health policy, chronic conditions/geriatric care, leadership and advocacy. **Methods:** The University of Arizona's program is a structured, faculty-mentored experience that encompasses healthcare administration, finance, delivery and policy. It includes training in leadership and professionalism, conflict resolution and team care. The students participate in observation and shadowing, and complete relevant readings about the US healthcare system, including provider, payer, population and patient perspectives, and advances in medical technology. Based

upon the student's interests, s/he completes a mentored capstone project, further building the skills needed to continue in healthcare innovation. **Conclusions:** The students benefit from a comprehensive mentoring program designed to identify, engage and guide the next generation of leaders in healthcare innovation. This elective facilitates the development of leaders capable of building value-based healthcare for older adults, leading to better health and better healthcare, at lower cost.

#### **HEALTH DIFFERENCES BETWEEN VA HOME-BASED PRIMARY CARE & STATE MEDICAID WAIVER PROGRAM CLIENTS**

T. Wharton<sup>1,2</sup>, J. Nnodim<sup>3,2</sup>, R.V. Hogikyan<sup>1,2</sup>, L. Mody<sup>2,1</sup>, M.L. James<sup>4</sup>, M. Montagnini<sup>1,2</sup>, B. Fries<sup>1,4</sup>, 1. *VA Ann Arbor Healthcare System Geriatric Research, Education and Clinical Center (GRECC), Ann Arbor, Michigan*, 2. *Division of Geriatric and Palliative Medicine, University of Michigan Health Care System, Ann Arbor, Michigan*, 3. *VA Ann Arbor Healthcare System, Ann Arbor, Michigan*, 4. *Institute of Gerontology, University of Michigan, Ann Arbor, Michigan*

Comprehensive health care for older adults is complex, involving multiple co-morbidities and functional impairments of varying degrees and numbers. In response to this complexity and associated barriers to care, home-based care models have become prevalent. The home-based primary care (HBPC) model, based at a Michigan Veterans Administration Medical Center, and the Michigan Waiver Program (MWP) that includes home-based care are two of these. While both models are formatted to address barriers to effective and efficient health care, there are differences in disease prevalence and functional performance between groups. Using a retrospective analysis of data collected using the interRAI-Home Care (HC), we examined a cross-sectional representation of clients enrolled in both programs in 2008. Veterans were more independent in basic activities of daily living, but there was no difference in the rate of falls between the groups. Veterans had more pain and higher prevalence of coronary artery disease ( $z=7.0$ ;  $p<.001$ ), Chronic Obstructive Pulmonary Disease (COPD;  $z=3.9$ ;  $p<.001$ ), and cancer ( $z=8.5$ ;  $p<.001$ ). There was no statistically significant difference between the two groups in terms of the prevalence of geriatric syndromes. Scores on subscales of the interRAI-HC indicated a greater risk of serious health decline and adverse outcomes for HBPC compared to MWP clients ( $1.4 \pm 1.1$  v.  $0.9 \pm 0.1$ ;  $z=2.5$ ;  $p=.012$ ). Overall, clients treated through MWP home-care in MI have higher than national average rates of dementias, diabetes, hypertension, and coronary artery disease.

#### **PATIENT EDUCATION FOR CHINESE ELDERLY BEFORE EYE SURGERY: A MORE EFFECTIVE MODE OF DELIVERY**

J. Hu, *Peking University Third Hospital, Beijing, China*

**Objective:** Older adults usually have memory and sensory impairments which can influence the effectiveness of patient education. This study was to explore a more effective mode of patient education especially delivered for elderly before they received eye surgery. **Methods:** Two hundreds and six older inpatients were consented and recruited from an Eye Center in Beijing China before they received eye surgery. They were randomly assigned into three patient education groups with different modes of delivery. There were 68 in the group educated by physicians and 68 in self-learning materials group. These were common education modes for patient education in China. The third group with 70 elderly was led by ophthalmological nurses who were trained with essential gerontology knowledge and communication skills. Questionnaires were filled out by the elderly before and after the education. The contents include the basic understanding of the surgery and related self-care knowledge and behavior. **Results:** The correct rate of answers for different groups were significant different ( $P<0.01$ ). The group educated by physicians had the lowest correct rate (68.45%), followed by self-learning materials group (72.9%). The group guided by nurses had

the highest correct rate of answer (97.23%). Conclusions: Compared with self-learning material group and physician-lead group, patient education delivered by nurse specialists is the best mode for patient education in elderly before they take eye surgery. Gerontology-related knowledge and skills can strengthen the effectiveness of patient education for elderly.

#### **HOME CARE FOR OLDER ADULTS AT HIGH RISK FOR HOSPITALIZATION: RESULTS OF A RANDOMIZED TRIAL**

J. Gonzalez<sup>1</sup>, S. Enguidanos<sup>1,3</sup>, S. Levine<sup>2</sup>, B.A. Steinman<sup>2,3</sup>, *1. Partners in Care Foundation, San Fernando, California, 2. HealthCare Partners, Tustin, California, 3. University of Southern California, Los Angeles, California*

Effective methods to improve and manage care for high-risk patients with multiple chronic conditions are urgently needed. This need is underscored by increased accountability brought by the Patient Protection and Affordable Care Act for improved quality and costs among hospitals and health plans. This study tested the efficacy of Choices for Healthy Aging (CHA), a home care program designed to improve access to medical care for older adults with multiple chronic conditions at risk for hospitalization. A randomized controlled trial was conducted among 298 older adults who scored at risk of hospitalization, using a risk stratification tool. Results. The intervention group reported significantly higher satisfaction with care than usual care recipients. CHA patients were less likely to be admitted to the hospital as compared to usual care, (25.6% and 37.1%, respectively). No statistically significant relationship was found between study groups for emergency department utilization; though a smaller proportion of participants in the CHA group (16.7%) utilized emergency department services compared to 21.4% usual care participants. Despite decreased odds of hospitalization, there was no difference in costs of care by study group. CONCLUSION: Provision of home care among older adults at high risk of hospitalization may improve satisfaction with care while reducing hospitalization. Lack of cost savings may be due to a targeting tool that may not be well-suited to identifying those with greatest need for home care, thus the population may not have had sufficient burden of illness to obtain cost savings. Further studies using improved targeting criteria are needed.

#### **CARE TRANSITIONS FOR OLDER HIP FRACTURE PATIENTS: A TALE OF TWO CITIES AND A TOWN**

J.B. Elliott, P. Stolee, *University of Waterloo, Waterloo, Ontario, Canada*

Introduction: Quality of care and patient safety are often at risk during transitions between health care settings. Following a hip fracture, older patients typically undergo transitions through several care settings during the course of their recovery. We explored care transition experiences of frail older hip fracture patients at three Canadian sites (a large urban, a small urban and a rural setting). Methods: Guided by an ethnographic approach, semi-structured interviews, observations and document reviews were completed with patients (n=21), family caregivers and healthcare providers during multiple post-surgical care transitions. Using data for similar patients from each of the three sites, a multiple case study analysis (Stake, 2006) was used to compare and contrast care transition experiences. Results: Similar difficulties in communication between patients, caregivers and healthcare providers were experienced in all three sites, although communication with rural family caregivers was often challenged by distance. Rural patients had fewer rehabilitation options; urban patients were more likely to experience complicated care trajectories. Discussion: There were noticeable similarities and differences between all three locations regarding communication, care pathways, rehabilitation options and caregiver support. Based on this research, we are currently developing, implementing and evaluating interventions to improve the quality of care transitions in each of the study locations.

#### **EFFECTS OF HORMONE REPLACEMENT THERAPY AND AGE ON HEART RATE VARIABILITY IN HEALTHY WOMEN**

N.M. Perseguini<sup>1</sup>, A.M. Takahashi<sup>1</sup>, E. Silva<sup>2,1</sup>, A. Borghi-Silva<sup>1</sup>, J.R. Rebelatto<sup>1</sup>, A. Porta<sup>3</sup>, N. Montano<sup>3</sup>, A.M. Catai<sup>1</sup>, *1. Universidade Federal de São Carlos, São Carlos, São Paulo, Brazil, 2. Universidade Metodista de Piracicaba, Piracicaba, Brazil, 3. Università degli Studi di Milano, Milano, Italy*

The Female Aging Process Has its own Characteristics Due to Hormonal Changes in Postmenopausal. Therefore, This Study Aimed to Investigate Hormone Replacement Therapy (HRT) Effect and Age Effect on Heart Rate Variability (HRV) Analysis in Healthy Middle-Aged and Elderly Women. Four Groups Were Evaluated: Group 1 (G1) - 14 Middle-Aged Without HRT (55±2.5 Years), Group 2 (G2) - 10 Middle-Aged With HRT (54±3.3 Years), Group 3 (G3) - 16 Elderly Without HRT (65±2.9 Years), Group 4 (G4) - 10 Elderly With HRT (62±2.9 Years). Postmenopausal Women Using Conjugated Equine Estrogen, Synthetic Hormone or Isoflavone Were Evaluated. The Beat-To-Beat Heart Rate Was Recorded in Supine Position for 10min. Statistical Analysis Was Carried Out Using the Sigma Plot For Windows Version 11.0. Age and HRT Effects on HRV Were Analyzed by Two-Way ANOVA. The Level of Significance Was Set at P<0.05. HRV Was Analyzed by Spectral Analysis: Low (LF) and High (HF) Frequencies in Normalized Units (nu), Predominantly Cardiac Sympathetic Modulation and Cardiac Parasympathetic Modulation Indicator, Respectively. LF/HF Ratio Was Also Calculated. There Was No Age Effect on HRV. However, it Was Found HRT Effect on HRV: LFnu and LF/HF Ratio Were Higher (Showing Cardiac Sympathetic Modulation Increased), While HFnu Was Lower (Representing Cardiac Parasympathetic Modulation Decreased) in G2 (48.7; 1.4; 49.5, Respectively) and G4 (47.6; 2.1; 51.2, Respectively) than G1 (41.7; 1.1; 56.6, Respectively) and G3 (25.7; 0.5; 72.3, Respectively). In Conclusion, The Studied Women Using HRT Presented Higher Sympathetic and Lower Cardiac Parasympathetic Modulation Compared to Women Not Using HRT.

#### **ASSOCIATION BETWEEN DIABETES MELLITUS SELF-MANAGEMENT AND SELF-RATED HEALTH AMONG 40 AND OLDER CHINESE IN MAINLAND, CHINA**

X. Pan, *Miami University, Oxford, Ohio*

Objective: the aim of the present study is to examine the association between diabetes mellitus (DM) self-management and self-rated health (SRH) among 40 and older Chinese population in Mainland, China. Design: the current study is a cross-sectional study by using the data of China Health and Nutrition Survey 1997-2009 (CHNS). Sample: 640 participants, who are with DM and managing the disease through either self-performing activities or self-regulation or both strategies, report their general health condition. Method: binary logistic regression is used to analyze the association between predictors and the outcome variable by controlling for age, gender, residency (rural vs. urban), SES, smoking and alcohol drinking status. Results: DM self-management is significantly associated with SRH (p<.05). People who are managing DM with both strategies are more likely to report their health as poor comparing to those who are managing the disease with one strategy (OR=1.30). Education and residency are also significantly associated with SRH, respectively (p<.05). Conclusion: DM self-management is a significant predictor for self-rated health among 40 and older Chinese in Mainland, China. The level of DM management reflects the severity of DM, which negatively impacts one's self-rated health.

#### **DEVELOPING EFFECTIVE COMMUNITY PARTNERSHIPS TO MEET PATIENT-CENTERED GOALS IN THE HEALTH CARE HOME**

C.E. Vanderboom, D.E. Holland, P. Targonski, *Mayo Clinic, Rochester, Minnesota*

Most healthcare systems do not connect with community resources beyond referral. Coordinating patient-centered care in Health Care

Homes (HCH) requires realignment between health care delivery systems and community service providers. Purpose: To develop and evaluate effective partnerships among patients/families, health care homes and community service providers to enhance care coordination using a Community Care Team intervention. Aim 1: Evaluate team cohesion and collaboration among community partners; Aim 2: Evaluate the effect of community partnerships on patient health outcomes (physical, emotional, social), care coordination and self-management support, and use of services compared to usual care. Methods: An RCT design was used. The sample included 60 older adults with multiple chronic conditions and their support persons from a Midwest HCH with randomization to intervention or usual care. The intervention was guided by the Chronic Care Model and the Wraparound Process and included a strengths-based assessment, an Action Plan based on patient priorities, and follow-up strategies. Team meetings were monitored to assure intervention fidelity. Qualitative data from interviews/focus groups and team and patient quantitative data collected at baseline and at 3 months were merged to address study aims. Findings: Preliminary data suggest high levels of team cohesion and collaboration and positive effects on care coordination and self-management. Data collection and analysis will be complete June, 2012. Conclusion: Findings will inform ambulatory care redesign and realignment strategies between health care homes and community service providers to improve biopsychosocial well being of older adults with multiple chronic conditions.

#### **CURRENT SITUATION OF DIAGNOSIS OF OBSTRUCTIVE SLEEP APNEA HYPOPNEA SYNDROME AND THE SCREENING INDICATORS**

S. Zhang, *People's Hospital, Peking Univ., Beijing, China*

Method: A total of 100 cases with suspected OSAHS were enrolled. The ESS scores were completed by questionnaire and the results of BMI, neck circumference and polysomnography (PSG) monitoring are analyzed. According to AHI, the patients were classified into non-OSAHS, mild, moderate and severe OSAHS groups, and the initial symptoms, the way of getting treatment, influence factors and so on were described. Analyze the time interval ('TI' for short) between the first time of realizing sleep-related disease, getting treatment and the relevant factors. The correlation of AHI with ESS, BMI, neck circumference and LSpO<sub>2</sub> was analyzed by comparing the ESS, BMI, neck circumference and LSpO<sub>2</sub> among the four groups. Results: There were 91.01% people who realized they have sleeping-related diseases, but only 14.61% went to clinic promptly. The longest TI was 31 years; there was no difference between the different demographic characteristics group ( $p > 0.05$ ). 61.80% people didn't go to clinic for having no influence on routine life; and 57.30% didn't realize it needs diagnosis and treatment. ESS has lower correlation with AHI ( $r = 0.290$ ,  $P = 0.003$ ), and BMI and neck circumference have moderate positive correlation, and LSpO<sub>2</sub> has moderate negative correlation. These indicators all have been correlated with the severity of OSAHS. According to Logistic regression, BMI was a risk factor and LSpO<sub>2</sub> was a protective factor. Conclusion: Regarding OSAHS, patients have poor knowledge and awareness to visit doctor. Healthcare education should be strengthened to improve their knowledge of OSAHS. And the community healthcare needs to be enhanced to improve the prevention, diagnosis and treatment of OSAHS. ESS plays an important role in screening the severity of OSAHS. ESS combined with BMI, neck circumference LSpO<sub>2</sub> and other objective index, would improve the value to screen OSAHS.

#### **HETEROGENEITY OF TREATMENT EFFECTS AND EVIDENCE-BASED GERIATRIC MEDICINE**

R. Varadhan, C. Weiss, *Geriatric Medicine, Johns Hopkins Center on Aging and Health, Baltimore, Maryland*

It is widely recognized that older adults are not well served by evidence based medicine. Older adults with two or more chronic conditions comprise the majority of patients seen in routine clinical practice.

Multimorbid older adults have increased susceptibility to adverse responses to treatment and may also have significant competing risks of mortality. However, they are either completely excluded or poorly represented in. While such restriction likely enhances the internal validity of the trials, it raises severe concerns about the applicability of evidence from such trials to most clinically relevant patient populations. Systematic reviews and clinical practice guidelines often conclude that there is insufficient evidence to guide clinical practice for elderly women and for frail older adults with multiple chronic conditions. There are numerous interventions whose efficacy and safety have not been reliably established in geriatric patients. To cite a couple of examples: (i) efficacy of treatments for prevention and treatment of heart failure in older women, (ii) efficacy of CT colonoscopy for cancer screening in patients > 65 years. How do we obtain reliable evidence on treatment effects to inform geriatric medicine? We discuss the methodological issues and challenges involved in obtaining reliable evidence on the effects of interventions for geriatric populations which are either excluded or poorly represented in clinical trials. We will present a case study to demonstrate our novel method for extending the applicability of trial evidence to a target group that is poorly represented in the trial.

#### **WHAT'S EVIDENCE GOT TO DO WITH IT: MEDICARE'S NEGLECT OF HOME CARE SOCIAL WORK COVERAGE FOR PERSONS WITH ALZHEIMER'S DISEASE AND THEIR CAREGIVERS**

W.D. Cabin, *Stockton College, Glen Rock, New Jersey*

Social work has limited use in Medicare home health (MedPac, 2011). Ironically most elderly live at home cared for by primarily family and friends (MetLife, 2010). The portion of the elderly population living at home with Alzheimer's disease (AD) has been rapidly increasing and is projected to continue through at least 2050 (Alzheimer's Association, 2011). Despite these projections, Medicare home health continues to limit social work coverage and eligibility. These limitations deny evidence-based bio-psychosocial interventions for persons with Alzheimer's disease and their caregivers. The limitations also limit home care social worker knowledge of such interventions. The paper presents the results of a quantitative study conducted between 2008-2010 in a major metropolitan area. One part of the study used a convenience sample of 243 home care social workers who completed a survey on knowledge and use of specific evidence-based AD interventions for home care patients. The survey found that 93% had no knowledge of the interventions and 100% did not use the interventions. The second part of the study involved 25 social workers in three different home care agencies applying one evidence-based AD intervention with a total of 182 patients and caregivers, with statistically-significant results in terms of quality of life, as measured by five normed scales.

#### **DIGNITY IN CARE FOR OLDER PEOPLE: THE PROFESSIONAL PERSPECTIVE**

C. Victor<sup>1</sup>, D. Cairns<sup>1</sup>, V. Williams<sup>1</sup>, S. Richards<sup>2</sup>, W. Martin<sup>1</sup>, A. LeMay<sup>4</sup>, D. Oliver<sup>3</sup>, *1. Brunel University, Uxbridge, United Kingdom, 2. Oxford Brookes University, Oxford, United Kingdom, 3. City University, London, United Kingdom, 4. University of Southampton, Southampton, United Kingdom*

Within the United Kingdom there is an increased emphasis on ensuring dignity in caring for older people in hospital. However, a wealth of empirical evidence and high profile reports continues to highlight examples in which the practice of dignified care does not occur suggesting there are gaps between policy and practice. This study focuses on 4 NHS Hospital Trusts in England recognised as providing dignified care and explores (1) how dignified care for older people is understood and delivered by the health and social care workforce and; (2) how organisational structures and policies can promote and facilitate/hinder the delivery of dignified care. We are using a case study approach using both quantitative (questionnaire) and qualitative (interviews and focus groups)

methods in settings where older people are cared for. This paper provides preliminary findings, based on 135 returned questionnaires, which explore health and social care staff's understandings and meanings of what dignity is and the key aspects when promoting the delivery of dignified care. Meanings of dignity included: respect, being treated as an individual, being involved in decision making and privacy. Respondents rated privacy and being treated as an individual as the most important aspects of dignified care with physical tasks such as physical care, helping with meals, which are traditionally perceived as core nursing tasks, attributed much less importance. Our qualitative data will explore these responses and examine the factors underpinning these responses.

### **THERAPEUTIC EFFECT OF FOREST BATHING ON HYPERTENSION IN ELDER PATIENTS**

G. Mao, Y. Lv, Y. Cao, Y. Wang, X. Hu, G. Wang, J. Yan, *Zhejiang Hospital, Hangzhou, Zhejiang Province, China*

**Objective** To provide scientific evidence supporting the efficacy of forest bathing as a natural therapy on human hypertension. **Methods** Twenty-four patients ( $67.21 \pm 3.89$  year-old) with essential hypertension were randomly divided into two groups. One group was sent to a broad-leaved evergreen forest to experience a 7-day/7-night trip, and the other was sent to a city area for control. **Blood pressure (BP) indicators, cardiovascular disease (CVD)-related pathological factors including ET-1, Hcy, AGT, Ang II, AT1, and AT2 as well as inflammatory cytokines IL-6, TNF- $\alpha$  were detected. Meanwhile, POMS evaluation was used to assess the mood state of subjects. The air quality in the two experimental sites was monitored, simultaneously. Results** The baselines of the indicators between the two groups were not significantly different. Little alteration of the indicators in the city group was observed after the experiment. While subjects exposed to the forest environment showed a significant reduction of BP in comparison to that of city group. The levels of bio-indicators in forest group were also lower than those in urban group and the baseline levels of themselves. POMS evaluation showed that scores of negative subscales were lowered after experiencing the forest bathing. Besides, the air quality in forest site was much better than that of urban area evidenced by the quantitative detection of negative ions and PM10. **Conclusion** Our results provided a direct evidence that forest bathing has therapeutic effects on human hypertension, which may partly result from its inhibition on several CVD associated factors, and thus inspiring its preventive efficacy against CVD.

### **HEALTH CARE OF ELDERLY FEMALE PRISONERS: IS AGE SPECIFIC TREATMENT NECESSARY?**

B.S. Elger, W. Bretschneider, V. Handtke, T. Wangmo, *Institute for Biomedical Ethics, University of Basel, Basel, Switzerland*

To date, very little is known about the healthcare conditions of ageing prisoners and almost no substantial knowledge is available concerning elderly female prisoners (EFP). Only a very few studies have explored this topic in the UK and the US. The aim of this study is to draw attention to the health issues faced by female prisoners in general and EFP in particular. A quantitative study was conducted in two prisons housing female prisoners: one located in the German- and the other in the French-speaking part of Switzerland. Healthcare related data from all available medical records of EFP were obtained (prisoners 50 years and older are deemed old). This EFP data was analysed and compared with a sample of younger female prisoners (YFP), younger than 50 years. Upon evaluating their healthcare patterns, it was evident that EFP were suffering from several health conditions such as musculoskeletal pains, osteoporosis, diabetes, and hypertension. Preliminary results highlight that EFP consume slightly more medications than YFP (15.0 vs. 12.6) and visits to nursing staff in the last six months were also more frequent for EFP (59 vs. 45.5). These numbers show that the healthcare patterns of EFP and YFP are not completely different. It is possible that other risk factors prevalent among prison population such as substance abuse and infectious diseases may have compounded their current health-

care patterns. However, with increasing age, EFP will display unique age specific needs, which would call for targeted and appropriate healthcare access.

### **COMMUNITY BASED PARTICIPATORY RESEARCH METHODS TO PARTNER WITH AN AMISH COMMUNITY TO RESEARCH CARE OF AGING ADULTS**

H.M. Farrar, J.S. Wilson, *University of Oklahoma, Claremore, Oklahoma*

Amish communities are increasingly utilizing English (term for non-Amish) healthcare resources to promote the health and well-being of their community members. This intersection between Western healthcare systems and the Amish culture has not been explored in the scientific literature. Amish sequestration, resistance to acculturation, and minority population status are important considerations before research is done to investigate these interactions. Community Based Participatory Research (CBPR) principles engaged an Oklahoma Amish population with academic researchers. Discussions between the researcher and an Elder of this community identified a need to know more about healthcare resources used to care for aging adults both within the Amish community of Oklahoma and from English healthcare systems. The researcher and the Elder collaborated upon a qualitative research design with a central research question, the consent, and recruitment process. CBPR principles and a qualitative research design promoted equality during the course of the research, ensuring that their community would receive an equal share of the benefits of the research without bearing a disproportionate burden. The researcher's IRB also provided oversight to ensure a sustainable relationship between the academic and Amish communities. Throughout this process, enhanced engagement, equalization of power differentials, and promotion of community confidence and trust was noted. The Amish, although very self sufficient, are vulnerable to being left out of healthcare research and benefits because of being sequestered. Use of CBPR principles and collaboration with IRB provided additional protections for this minority group as they engaged and partnered in the English process of research.

### **THE EFFICACY OF A COMMUNITY-BASED SENIOR OUTREACH PROGRAM IN THE REDUCTION OF HOSPITAL READMISSIONS AND EMERGENCY DEPARTMENT VISITS AMONG LOW-INCOME CHRONICALLY ILL SENIORS**

M.K. Prior, B. Bahret, *Social Work, University of Toledo, Toledo, Ohio*

This purpose of this presentation will be to report on the effectiveness of a community-based senior outreach program in decreasing rehospitalizations and emergency department visits among low income chronically ill seniors. Participants had been repeatedly hospitalized with chronic illnesses and were subsequently served in an in-home program designed to address their psychosocial and medical needs. Participation in the program was found to be related to lower hospital readmission rates and emergency department usage. Clients also reported decreased financial concerns and depression and anxiety and increased social support. The study adds to the growing body of work supporting community-based programs as effective strategies for decreasing health care usage and improving quality of life for chronically ill seniors.

### **EXPLORING THE DEPTHS OF HEALTH LITERACY: ARE WE TEACHING THIS AND WHY DOES IT MATTER?**

S. Toth-Cohen, T. Vause Earland, *Thomas Jefferson University, Philadelphia, Pennsylvania*

Healthcare practitioners often work with older persons with low health literacy without realizing that this issue is limiting the success of their interventions. They may also lack awareness of the serious impact that low health literacy can have, since it associated with lower reported health status, increased hospitalizations, and increased morbidity (Levasseur & Carrier, 2011). This is especially problematic in the

current US healthcare system, which places an increased demands on consumers to manage their own their own health (Smith & Gutman, 2011). Thus, educators in the health professions must instill a sense of responsibility in future practitioners to understand the important role they play in promoting health literacy. Furthermore, students in the health professions must acquire the tools necessary to empower their clients using health literacy principles. This session will review the foundations of health literacy and discuss its particular significance for health professionals who aim to empower older persons to take charge of their own health. Discussion will include strategies for fostering health literacy in consumers to meet the demands of a changing health care environment; applications of health literacy for productive aging; use of virtual worlds in promoting the health literacy of older adults; and the development of a new instrument to evaluate knowledge of health literacy in students and practitioners in the health care field.

#### **MUTUAL DEPENDENCE OF RISKS OF CANCER AND CHRONIC NON-CANCER DISEASES: MEDICARE-BASED ANALYSIS**

I. Akushevich, J. Kravchenko, S.V. Ukraintseva, K.G. Arbeev, A.I. Yashin, *Duke University, Durham, North Carolina*

Interrelationships between risks of incidence of aging-associated diseases occurring in the same individual during lifetime are unclear. However, this phenomenon is common, especially in older adults. Recognizing the factors which impact diseases risks, help to optimize prevention strategies. Quantitative evaluation of such mutual dependence can be performed using the Medicare-based datasets, but it stays largely unexplored. Using the SEER-Medicare data, we empirically evaluated age patterns of incidence of cancer and chronic non-cancer diseases occurred after the onset of an earlier developed disease and compared these patterns with age-patterns observed in general population. In most cases, the onset of the disease increased the risk of subsequent diseases. Approximately twofold increase of subsequent diseases risk was observed for secondary cancers among patients with primary cancers, for lung cancer among myocardial infarctions (MI), for MI among diabetes, for MI among chronic kidney diseases, for asthma among lung cancers, for hip fracture among Parkinson's diseases, and for kidney disease among patients with chronic obstructive pulmonary disease. Lower risk of subsequent disease was registered for cancer among Alzheimer's disease patients, for colon cancer among arthritis, for asthma among melanomas, for goiter among prostate cancers, and for prostate cancer among patients with diabetes. Thus, there exists a mutual dependence between chronic diseases in older adults. Being Black and being male affected the risk of certain subsequent diseases and exceeded respective hazard ratios in general population. The gender and racial disparities decrease with increase of the number of comorbidities supporting unification of characteristics of health with aging

#### **DEVELOPING A MODEL OF MEDICATION ADHERENCE AMONG FILIPINO ELDERLY**

F.B. Guiang, K.J. Guevara, A.I. Gutierrez, A.S. Habaluyas, M.P. Hizon, S.G. Idanan, A.B. De Guzman, *University of Santo Tomas, Manila, Philippines*

Anchored on Ajzen's Theory of Planned Behavior, this paper purported to develop and test a model of medication adherence among Filipino elderly (n= 325) relative to their medication belief, follow-up visits, consultation satisfaction, memory task, trust with physician, perceived stress, memory strategies, social support, memory load, depression, length of time taking the medication, number of conditions, and self-efficacy with medication adherence. Structural equation modeling (SEM) was employed to study causalities among all parameters. Results revealed that depression, trust with physician, and number of conditions affect adherence positively while event-based memory, consultation satisfaction, memory load, and external memory strategy affect otherwise. Some suggested variables were found to have no impact. As this study

reveals, careful consideration should be given to multiple factors and their interrelationship should be examined well. Since many factors can influence medication adherence behavior and the reasons of their non-compliance are also varied, multifaceted solutions must be developed.

#### **A CASE FOR CONSUMER ACTIVATION: LESSONS FROM CARE TRANSITIONS PILOTS**

E.S. Kearns, V. Parker Callahan, *Planning and Development, Greater Lynn Senior Services, Lynn, Massachusetts*

The Coleman CTI model has been used as a cornerstone for care transitions pilots across the country including those funded by the Administration on Aging (AoA) and the Center for Medicaid and Medicare Services (CMS). This paper examines findings based on evaluation of our regional ADRC care transitions project, which is one of sixteen funded nationally, and a modified pilot created in response to evaluation findings in the former. This paper presents findings and suggests recommendations for subsequent pilots. Findings indicate that the model fails in three areas: 1) hospitals are not uniformly ready to become open systems; 2) consumers are not well enough to understand and agree to coaching while sick and in the hospital; and 3) thirty days is not enough time to grow sustainable consumer activation. The paper includes analysis of variables from patient activation measure, Coleman's CT3, medical discrepancy tool, and red flags tool, and additional demographics; follow-up surveys; and coaches' focus groups. Recommendations informed by these findings have potential national implication for replicating an augmented model that includes: 1) using the CTI model to activate in some settings and at some points in time but not all; 2) moving from a hospital-centric model to activating community pulse points where coaches meet consumers and begin the activation process while they are out of the hospital and well; 2) using the hospital as one of many community pulse points; and 3) extending coaching beyond the 30-day period.

### **SESSION 1340 (POSTER)**

#### **HEALTH PROMOTION**

##### **COMMUNITY CASE MANAGEMENT SERVICE – A PILOT PROJECT AT AGENCY FOR INTEGRATED CARE**

K.H. Chua, *Care Integration Department, Agency for Integrated Care, Singapore, Singapore*

Purpose Singapore's ageing population (above 60 years old) will grow from about 10% to 26% in 2030. With increase in life expectancy and low fertility, those aged above 75 years old will grow from 2.6% in 2010 to 7.6% in 2030. This rapid increase will see more elderly with limitations in activities of daily living, mobility, higher prevalence of chronic conditions and possibly social issues such as lower involvement with family, society, work and financial adequacy. About CCMS In June 2011, the Agency for Integrated Care (AIC) piloted Community Case Management Service (CCMS) to improve the longitudinal integration of care services across the continuum. AIC is set up by Singapore's Ministry of Health to oversee, coordinate and facilitate all efforts in care integration. CCMS supports the 'frail frequent fliers' who move across hospitals, and the frail elderly to live in the community as long as possible. It takes a preventive approach to delay or avoid deterioration of the elderly, as well as unnecessary utilization of institutionalised care. CCMS scope includes specialised case management, complex care coordination, chronic disease management, education and information to empower clients, caregivers and caregivers' support. It aims to reduce unplanned hospital admissions and ED visits; improve or maintain quality of life for clients and families; and reduce caregivers' stress. Con-

clusion The programme will continue to enable our clients and caregivers have a better quality of life in the community.

### THE EFFECTS OF AGE AND EXPERIENCE ON COMMUNITY SUPPORT AMONG VOLUNTEER TO PREVENT ELDERLY ISOLATION

Y. Kanaya<sup>1</sup>, A. Kono<sup>1</sup>, E. Tadaka<sup>2</sup>, Y. Dai<sup>2</sup>, W. Itoi<sup>2</sup>, *1. School of Nursing, Osaka City University, Osaka, Japan, 2. Yokohama City University, Yokohama, Japan*

The purpose of the present study was to investigate relationships between community support for the elderly across years of experience and age among volunteer social worker (VSW). VSW are expected to support community-dwelling elders to detect and prevent social isolation in Japan. Methods : A total 748 VSW were administered questionnaires concerning community commitment (CC), self-efficacy in supporting community-dwelling elders (ESCE), generativity (G), and sense of community (SC). Two-way ANOVA on age and years of experience (0-3, 4-8 and >9 years) were performed on each of the measures. Results : Across all age groups, levels of CC was higher for those with 4-8 years and 9 and more years of experience than those with 0-3 years experience, while only those with 9 and more years of experience showed higher levels of ESCE relative to those with 4-8 years or 0-3 years of experience. There was not an interaction between age and experience of CC, but levels of CC was significant for the main effect of years of experience. There was not an interaction between age and experience of ESCE, but levels of ESCE was significant for the main effect of age. Levels of ESCE was greatest for older VSW compared with younger VSW. Conclusion : The results suggest that CC increased with more years of experience, while level of ESCS increased with age but not years of experience. At promoting activities of LVHG, it is important to educate them how to support community-dwelling elders from isolation at each ages.

### DO SOCIAL NETWORKS BUFFER THE NEGATIVE EFFECTS OF HEALTH PROBLEMS ON DEPRESSIVE SYMPTOMS FOR COMMUNITY DWELLING OLDER ADULTS?

J. Yoon, B.J. Bowers, *School of Nursing, Univ of Wisconsin-Madison, Madison, Wisconsin*

Research has demonstrated that stressors, such as physical or cognitive health problems, have negative effects of on mental health of older adults. Studies of stress-buffering model indicate that social networks are an important factor in reducing depression caused by life stressors. This study examined whether social networks decrease the effects of health related stressors on depressive symptoms for community dwelling older adults. A secondary data analysis was conducted on data from the Korean Longitudinal Study of Ageing. Analyzed of 8,688 adults over 65 years from the first wave in 2006 was conducted. Health related stressors were measured by IADL function and cognitive impairment. Social networks were measured by two family networks (marital status and number of children) and two non-family networks (level of relationships with friends/relatives and level of social activities). Moderating effects were examined by adding eight interaction terms of two health problem variables and four social network variables on the main effect regression model while controlling for demographics including age, gender and income. Results showed that relationship between cognitive impairment and depressive symptoms was moderated in the group of married older adults. And the relationship between the level of IADL function and depressive symptoms was moderated in the older adults who had closer relationships with friends or relatives. These results indicate that positive effects of social networks reduce the negative effects of health related stressors on psychological wellbeing in the sense of coping resources for older adults.

### VARIATION IN DNA REPAIR PATHWAY GENES IS ASSOCIATED WITH HUMAN LONGEVITY AND AGING PHENOTYPES

M. Soerensen<sup>1,2</sup>, K. Christensen<sup>1,2</sup>, T. Stevnsner<sup>3</sup>, V.A. Bohr<sup>3,4</sup>, L. Christiansen<sup>1,2</sup>, *1. The Danish Aging Research Center, Epidemiology, Institute of Public Health, University of Southern Denmark, Odense, Denmark, 2. Department of Clinical Genetics and Department of Clinical Biochemistry and Pharmacology, Odense University Hospital, Odense, Denmark, 3. The Danish Aging Research Center; Department of Molecular Biology and Genetics, Aarhus University, Aarhus, Denmark, 4. Laboratory of Molecular Gerontology, National Institute on Aging, National Institute of Health, Baltimore, Maryland*

Genetic factors contribute to variation in human life span as well as to aging-related traits such as cognitive decline and impaired physical functioning. The candidate genes thought to contribute to these phenotypes take part in several biological processes including oxidative stress, IGF/insulin signaling and DNA damage signaling and repair. We have previously explored 77 genes of the DNA damage signaling and repair pathway by investigating 592 tagging SNPs in 1089 oldest-old and 736 middle-aged Danes (Soerensen et al., in press). We found variation in the *H2AFX*, *MLH1*, *NTLH1*, *POLB*, *RAD52*, *RAD23B*, *WRN*, and *XRCC5* genes to be associated with longevity. Of these, variation in *RAD52* showed a non-significant tendency of similar direction of effect in a replication sample of German oldest-old. In the present study we investigated the 77 candidate genes with respect to aging phenotypes known to predict mortality in the oldest-old: physical functioning (grip strength), cognitive functioning and disability (activity of daily living). The most interesting findings of the present study are the associations of variations in *RAD23B* and *RAD52* to cognitive and physical functioning: the minor allele of a *RAD23B*-SNP associated with reduced cognitive functioning and the minor allele of a *RAD52*-SNP associated with increased grip strength (P-values (F-test) =  $8.1 \times 10^{-5}$  and  $2.7 \times 10^{-5}$ , respectively). Interestingly, we previously reported minor alleles of SNPs in *RAD23B* and *RAD52* to pose negative and positive effects on longevity, respectively. Finally, the *RAD23B*-SNP identified in the present study was in LD ( $R^2=0.71$ ) with rs1805329-*RAD23B* previously reported as negatively associated with longevity.

### A COMPARISON OF A VETERANS DIRECTED HEALTH CARE PROGRAM VS. COMMUNITY NURSING HOME PLACEMENT

F.J. Kier<sup>1,2</sup>, J. Snider-Meyer<sup>1</sup>, A.J. Byrne<sup>1</sup>, D.A. Levine<sup>1</sup>, S.K. Gresser<sup>1</sup>, H.M. Smith<sup>1,2</sup>, *1. RECC, Milwaukee VAMC, Milwaukee, Wisconsin, 2. Medical College of Wisconsin, Milwaukee, Wisconsin*

Many age-related illnesses require support and/or assistance from others in order for the affected individual to be able to adequately function, but do not require residence in a long term care facility (Benjamin, 2001). To assist such individuals who simply need an able-bodied person in order to remain in their homes, "consumer directed" models of care, whereby these individuals were able to "hire" a person of their selection to provide them with care, were developed, and became popular, with studies suggesting a high degree of user satisfaction (Wiener, Anderson, & Khatutsky, 2007; Clark, Hagglund & Sherman, 2008). Public policy makers felt that consumer directed home programs would also be less costly, but more research on the issue of cost savings needs to be done (Buntin, et al, 2006). The purpose of this study is to compare the cost effectiveness and patient satisfaction of a veterans directed health care program (VDHC) with traditional community nursing home (CNH) care. This study retrospectively compared the costs of care and patient satisfaction ratings of 23 patients in the VDHC program with a sample of 31 controls who are receiving care via the VA CNH program. Results showed significant cost savings with VDHC compared to CNH care. While there were statistically significant differences

between the two groups in terms of age, gender, ethnicity, and diagnoses, both groups appeared to have similar medical and/or psychiatric conditions that would typically require CNH or similar level of care, suggesting that VDHC programs would be cost effective for a portion of those patients who require continuous, supportive care.

#### **CARE PATHWAYS FOR COMMUNITY-DWELLING ELDERS PRESENTING VARIOUS PROFILES OF DISABILITY AND FRAILTY**

N. Dubuc<sup>1,2</sup>, L. Bonin<sup>3</sup>, L. Mathieu<sup>1,2</sup>, A. Tourigny<sup>3</sup>, M.Y. Tousignant<sup>1,2</sup>, C. Yves<sup>1,2</sup>, N. Delli-Colli<sup>2</sup>, 1. *School of nursing, Université de Sherbrooke, Sherbrooke, Quebec, Canada*, 2. *Research Center on Aging, Sherbrooke, Quebec, Canada*, 3. *University Laval, Quebec, Quebec, Canada*

**Introduction:** The home care and services provided to older adults with the same needs are often inadequate and highly varied. Care pathways (CPs) can resolve these issues. **Objective:** Present the development and validation of CPs for following up community-dwelling elders presenting various profiles of disability and indices of frailty. **Method:** A systematic, rigorous process was applied: (1) select a conceptual framework and determine expected characteristics; (2) document current practices and conduct a review of the literature; (3) define CPs based on the collective wisdom of an interdisciplinary working group; and (4) validate through consultation with a group of experts using the Delphi method and Lynn's approach (content validity index). **Results:** CPs are intended to prevent specific problems, maximize independence and promote successful aging. Based on real time data exploitation, they are organized according to a logical, dynamic process with the following general phases: (1) assessment and identification of risk factors; (2) synthesis of information and determination of needs; (3) planning interventions appropriate to the clinical situation and the expectations of the individual and family caregivers; (4) delivery and follow-up; (5) assessment of results and statement of discrepancies; and (6) revision and adjustment of plans. **Conclusion:** Clinically, CPs will facilitate the exchange of information between professions and services, and will support professionals in clinical decision-making with a view to adequately using resources and facilitating access to the necessary services. Once aggregated, the data will support managers in organizing the work of teams and providing follow-up for clients.

#### **DEVELOPMENT OF A SCALE TO EVALUATE THE QUALITY OF END-OF-LIFE HOME CARE SERVICES IN JAPAN**

A. Akiyama<sup>1</sup>, H. Hanabusa<sup>2</sup>, H. Mikami<sup>1</sup>, 1. *Division of Health Sciences, Osaka University Graduate School of Medicine, Suita city, Osaka, Japan*, 2. *Shinjuku Hiro Clinic, Shinjuku-Ward, Tokyo, Japan*

**Aim:** Evaluation of the quality of home care is an important issue for the improvement of end-of-life home care. The purpose of this study was to develop a scale to measure the quality of home care from the perspective of the bereaved family and to examine the reliability and validity of the scale. **Methods:** We conducted an anonymous mailed survey for 349 bereaved family members who received home care services from home care supporting clinics (HCSC) in the 23 wards of Tokyo, Japan. Questionnaires contained a 28-item questionnaire to measure overall satisfaction with home care and the Texas Revised Inventory of Grief (TRIG). **Results:** Of the 349 subjects, 143 responders were finally analyzed. Using the exploratory factor analysis we determined a 15-item HCSC scale consisting of six subscales: 1) good relationship with the physician, 2) care by medical staff, 3) fulfilled home care service system, 4) psychological well-being of the caregiver, 5) provision of direct care by the caregiver, 6) being free from pain or symptoms. Cronbach's alpha coefficient of this scale ranged from 0.77 to 0.93. Test-retest reliabilities ranged from 0.66 to 0.88. **Conclusions:** Our results indicate that the 15-item HCSC scale we developed is a useful tool with

satisfactory reliability and validity to measure the quality of end-of-life home care from the perspective of the bereaved family.

#### **VIOLENCE IN THE WORKPLACE IN NURSING HOME SETTINGS: A PRELIMINARY ANALYSIS**

C. VandeWeerd, M. Coulter, V. Chee, J. Nguyen, *Department of Community and Family Health, College of Public Health, University of South Florida, Tampa, Florida*

The World Health Organization estimates that more than half of all workers in the healthcare sector worldwide have experienced violent incidents at some point during their careers (World Health Organization, 2009). In an effort to better understand negative interactions experienced by staff in nursing homes, qualitative interviews were conducted with nine staff members employed in nursing homes throughout the United States. These semi-structured interviews focused on: (1) The experience and impact of physical, psychological, and sexual aggression towards staff from residents or co-workers; (2) The identification of the contextual factors that influence these interactions; (3) Recommendations for future changes in the workplace. Emergent themes identified included (1) A lack of support from administration in dealing with workplace aggression (2) Experiencing physical assault. Preliminary findings suggest that acts of co-worker to co-worker, and patient to co-worker violence are occurring in nursing home settings and represent a danger to nursing home employees. Effective screening and placement of dementia patients was suggested by front line nursing home staff to address these dangers. The results presented are preliminary. As our sample size increases, further analysis will confirm consistency across larger samples.

#### **WAIVER PROGRAMS MEDICATION RECONCILIATION: A COLLABORATION OF HOME CARE AND PRIMARY CARE PHYSICIANS**

K.S. Beckholt<sup>1</sup>, S. Spoelstra<sup>2</sup>, C.W. Given<sup>1</sup>, 1. *College of Human Medicine, Michigan State University, East Lansing, Michigan*, 2. *Michigan State University - College of Nursing, East Lansing, Michigan*

Medication reconciliation for the elderly can promote optimal health and improve quality of life. This research describes a "Medication Reconciliation Algorithm" founded upon current evidence based literature and protocols, tailored to the elderly. Purpose and need of medications are included along with comparison to the Beers list. Patient symptoms are assessed as well as adherence issues. Need for medication reconciliation is based on the mean of 11 medications with scripts from multiple physicians. A total of 15 "steps" define the algorithm. Clients served by Home and Community Based Waiver programs scheduled appointments with their primary care physicians. Patients had their medications reviewed/updated based upon a) their medication lists from their medical care records, b) the medication lists obtained by care managers during home care assessments, and c) the medications they bring to the medication reconciliation appointment. Differences existed related to multiple providers, hospitalizations. Purposes of medications, drug-drug interactions, and adherence were evaluated. The medications from each collection method were compared, the differences summarized and revised, and patient reported adherence to medications assessed. This work is designed to evaluate how primary care physicians can rely on medication lists and to develop collaboration with home care coordinators to reconcile medications and improve treatment of chronic conditions among the elderly.

#### **HOSPITAL AT HOME: TRANSITIONS OF CARE TEAM MODEL, REDUCING RE-ADMISSIONS WHILE TRAINING IN GERIATRICS**

B. Maloney, F. Silverman, *Social Work, Beth Israel Medical Center, New York, New York*

Beth Israel Medical Center is an urban teaching hospital in New York City. The Department of Social Work's Hospital at Home program pro-

vides a seamless patient centered transition through varied levels of care (ie. acute, sub-acute, and home). A multi-disciplinary team coordinated by a licensed social worker, consists of social work interns, medical residents, psychiatric fellows, nursing students, chaplaincy interns, para-professional health navigators and other community partners. This program bridges the gap in services during critical transitions of care. The continuity of care model ensures patient health and well-being, allowing safe and independent living in their home. Hospital at Home reduces hospital readmission through review of discharge orders, medication reconciliation, and community connection for otherwise isolated seniors. Services include bio-psycho-social, psychiatric and spiritual assessment, individualized care planning, monitoring vitals, fall prevention safety checks, health education and counseling. Health navigators assist with concrete needs. In addition, the program facilitates collaboration across disciplines, training young professionals in geriatric services - an effort that also allows for a low-cost program model.

#### **“GUIA PARA UM ENVELHECIMENTO + ATIVO”: A STEP-BY-STEP BROCHURE TO PROMOTE ACTIVE AGING**

M. Machado, V. Moniz-Pereira, F. Carnide, H. André, F. Ramalho, A. Veloso, *Biomechanics and Functional Morphology Laboratory, Faculty of Human Kinetics, Technical University of Lisbon, Cruz Quebrada, Portugal*

**PURPOSE:** Aging population has significant public health implications for Portugal. The purpose of this study was to develop a consensus home exercise program that outlines each of the major areas of fall prevention by promoting lifestyle choices and behaviors for an active aging. **METHODS:** A cross-sectional study was designed to identify fall determinants. 647 subjects, aged  $\geq 65$ , were randomly recruited in Lisbon's metropolitan area. Trained interviewers administered questionnaires including socio-demographic, health perception and fall parameters; Yale Physical Activity Survey; and Functional Fitness Tests (CS; UG from Senior Fitness Test and items 4-7 from Fullerton Advanced Balance scale). Logistic regression analysis was used to model fall occurrence considering 3 fall groups. **RESULTS:** Poor health and lack of functionality are the most determinant factors to assess fall risk in Portuguese elderly. **CONCLUSION:** We tailored a safe and easy exercise program through the judicious application of these research results and exercise principles.

#### **A CORRELATIONAL STUDY OF SOCIAL SUPPORT NETWORKS WITH QUALITY OF LIFE AND HEALTH PROMOTION BEHAVIORS AMONG CHINESE COMMUNITY-DWELLING**

Y. Sheng<sup>1</sup>, Z. Li<sup>1</sup>, S. Wei<sup>4</sup>, A. Li<sup>2</sup>, Q. Pi<sup>3</sup>, D. Kong<sup>5</sup>, Y. He<sup>1</sup>, *1. School of Nursing of Peking Union Medical College, Beijing, China, 2. Beijing Fang Zhuang Community Health Center, Beijing, China, 3. Beijing He Ping Li Hospital, Beijing, China, 4. Wuhan Health Bureau, Wuhan, Hubei, China, 5. Wuhan Center of Disease Control, Wuhan, Hubei, China*

**Methods:** A convenience sample of 1142 elderly persons whose age were above 60yrs were recruited in the communities of Beijing and Hubei province. LUBBEN social network scale, the World Health Organization Quality of Life—OLD scale and Health-Promoting Lifestyle Profile II (HPLPII) were used to measure the social networks, the QOL and the health promotion behaviors of the elderly people. **Results:** The average age of the elderly people who were involved in the investigation was  $65.56 \pm 7.07$ . There were positive correlations between social support network and QOL ( $r=0.183, P<0.01$ ), and health promotion behavior ( $r=0.201, P<0.01$ ) of community-elderly people. And there was a moderate intensity positive correlation between the QOL and health promotion behavior ( $r=0.419, P<0.01$ ). There were significant differences among the three correlations above ( $P<0.01$ ), family networks have a correlation with QOL ( $r=0.184, P<0.01$ ) and neighbor networks, friendship networks have a correlation with health promo-

tion behaviors of elderly people ( $r=0.158; r=0.134, P<0.01$ ). **Conclusions:** Findings demonstrate the importance of social networks on quality of life and health promotion behaviors in community healthy aging. Intervention programs which improving QOL and health promotion behaviors of elderly people should be developed based on a social support networks.

#### **AVOIDING THE AVOIDABLE THROUGH EFFECTIVE REPROCESSING OF RME**

T. Saucedo, L. Baynosa, J. Hill, C. Hall, A. Barela, M. Buschmann, *VHA - Greater Los Angeles, Anaheim, California*

**Background :** The CDC recommends prevention screening for colorectal cancer for those 50 – 75 years by sigmoidoscopy or colonoscopy. For endoscopic procedures, reprocessing of reusable medical equipment (RME) is required yet it has become an area of concern due to breaches in equipment reprocessing. Between 2004-2010, 11,400+ Veterans were potentially exposed to hepatitis B, hepatitis C, and HIV secondary to such breaches. Despite low risk, sequelae associated with RME infection undermine patient safety and public trust. **Purpose:** To create and implement a program for proper reprocessing of RME. **Methods / Action Plan:** An interdisciplinary, nurse-led team developed and implemented an RME program evaluating required documentation, i.e., comprehensive inventory lists, manufacturers' manuals, and standard operating procedures (SOPs). Physical locations for reprocessing, incidence of flash sterilization, and instrument repair costs were identified. Routine maintenance of major capital equipment for automated reprocessing of RME was evaluated. **Findings / Results:** Assessment revealed significant deficits in compliance including manufacturer guidelines, training and competencies. Multiple reprocessing areas were centralized to enhance oversight. Post-training audits noted 100% of all staff competent in reprocessing RME. Flash sterilization occurrences were reduced by  $>90\%$ . In 2010, post-intervention RME repair cost savings were \$186,796.60. **Conclusion:** Although no one enjoys colorectal prevention screening, it is much less worrisome when there is confidence in healthcare providers and their equipment. Studies have confirmed that older adults who had colorectal screening were 50% less likely to experience colorectal cancer. Correct reprocessing of RME is essential to ensure positive health outcomes in healthcare procedures.

#### **A LONGITUDINAL EFFECT OF A NOVEL EXERCISE PROGRAM ON COGNITIVE AND PHYSICAL FUNCTION IN OLDER ADULTS**

T. Okura<sup>1</sup>, Y. Mitsuishi<sup>2</sup>, J. Yoon<sup>1</sup>, N. Kitano<sup>2</sup>, J. Yoon<sup>2</sup>, E. Himori<sup>2</sup>, T. Kim<sup>2</sup>, Y. Soma<sup>2</sup>, *1. Faculty of Health and Sport Sciences, University of Tsukuba, Tsukuba Ibaraki, Japan, 2. Doctoral Program in Physical Education, Health and Sport Sciences, University of Tsukuba, Tsukuba Ibaraki, Japan*

To prevent physical frailty and a decline in cognitive function in older adults, regular physical activity and exercise training are considered indispensable. We have developed a novel exercise program for preventing falls and dementia called “Square-Stepping Exercise” (SSE), which can induce functional activation of the brain. We previously demonstrated a short-term (3 months) effect of the SSE in older Japanese people. The purpose of this study was to investigate the longitudinal effect on the cognitive and physical functions of community-dwelling, older, Japanese women who regularly performed the SSE over 2 years. Our study had 2 groups: the SSE Group ( $n=25$ , mean age  $70.8 \pm 3.5$  years) in which participants voluntarily continued the SSE program once or twice per week for 2 years; and the Control (C) Group ( $n=28$ , mean age  $72.2 \pm 4.8$  years) who were randomly selected from the basic resident register. We evaluated cognitive function using the Five Cognitive Function Test and used a standard group of 11 physical performance tests to evaluate physical function. The SSE Group improved significantly in physical function such as walking ability ( $p<0.001$ ), hand dexterity ( $p<0.05$ ) and reaction time ( $p<0.001$ ), while

no improvement was observed in the C Group, and walking ability declined ( $p < 0.01$ ). There was a greater increase in the cognitive function score in the SSE Group (+16.8%, effect size:  $\eta^2 = 0.44$ ) compared with the C Group (+9.8%,  $\eta^2 = 0.29$ ). These results suggest that regular and voluntary performance of SSE by older women over two years could help them maintain or improve their cognitive and physical functions.

#### **UTILIZING THE OMAHA DOCUMENTATION SYSTEM TO MEASURE THE BENEFITS OF PROVIDING ROSEN METHOD EXERCISE SESSIONS TO ADULTS FIFTY-FIVE AND OLDER AT AN INDEPENDENT LIVING COMPLEX TO INCREASE MOVEMENT AND ENHANCE WELL BEING**

T. Adelman, *The Valley Foundation School of Nursing, San Jose State University, San Jose, California*

**Purpose:** This study measures the benefit of adult residents participating in weekly gentle Rosen Method exercise sessions at an independent living facility in Northern California over a twelve-week period. **Design and Methods:** The Omaha Documentation System was utilized to measure the knowledge, behavior, and status, of adult residents, fifty-five years of age and older, prior to providing gentle Rosen Method Exercise classes and again 12 weeks later. **Results:** Residents expressed an increase in well being after participating in the weekly Rosen Method exercise class. In addition their knowledge on the importance of movement increased, their behaviors indicated an improvement in activity levels, and their overall health status and energy improved as indicated by the Omaha Documentation System measures. **Implications:** Rosen Method Exercises are a gentle, health promoting and sustaining activity for adults motivated to increase movement in their lives. **Key Words:** Omaha Documentation System; Rosen Method Exercise; Community Health.

#### **RELATIONSHIP OF VITAMIN D3 DEFICIENCY TO DIABETES AND DEPRESSION IN OLDER ADULTS**

E. Farrington, M.D. Moller, *Yale University, School of Nursing, New Haven, Connecticut*

In recent years, vitamin D deficiency (25-hydroxyvitamin D) has gained much attention in the public eye and has been recognized as a pandemic, especially among the aging population. The aging process affects the way vitamin D is absorbed and metabolized in the human body. Older adults have decreased ability to absorb Vit D through the skin, often do not receive adequate sunlight, and often have poor nutrition, which further places them at an increased risk for vitamin D deficiency. This vitamin deficiency in late life may place older adults at an increased risk for developing other chronic diseases as well as exacerbating existing conditions. It has been well established that vitamin D promotes skeletal health and bone mineralization, however, the relationship between vitamin D and other chronic diseases, such as diabetes and depression, is controversial. Using an integrative literature review method, published research on vitamin D deficiency was obtained and the relationship between vitamin D3 deficiency in older adults and the development of diabetes, and depression was explored. Results have implications on the use of vitamin D3 supplementation in health care settings as nurse practitioners are at the forefront of health promotion, health maintenance and patient education.

#### **WITH ADEQUATE SLEEP, DOES BEDTIME AFFECT PHYSICAL AND COGNITIVE FUNCTION AND DEPRESSIVE SYMPTOMS?**

N. Kitano<sup>1</sup>, K. Tsunoda<sup>1</sup>, T. Tsuji<sup>1</sup>, J. Yoon<sup>1</sup>, T. Monma<sup>1</sup>, T. Muraki<sup>2</sup>, I. Sanada<sup>2</sup>, T. Okura<sup>1</sup>, *1. University of Tsukuba, Tsukuba, Ibaraki, Japan, 2. Ibaraki Prefectural University of Health Sciences, Ami, Ibaraki, Japan*

Although it is well-known that 6–8 hours of sleep provides many health benefits, little is known about the effect of bedtime on health. We investigated associations between bedtime, depressive symptoms, and

physical and cognitive function in older adults who usually sleep 6–8 hours per night. We mailed invitation letters to 1,347 Japanese adults aged 65–85 years and signed up 240 eligible subjects (73.4±4.9 years; 119 men, 121 women). Sleep duration and bedtime were self-reported. Subjects were assigned to 4 groups according to usual bedtime: before 9 PM (early), 9–10 PM (middle-early), 10–11 PM (middle-late), and after 11 PM (late). We measured physical function using 8 physical performance tests. We used the Geriatric Depression Scale to measure depressive symptoms, and the Five Cognitive Function Test for cognitive functions. An analysis of covariance was performed adjusted for age, gender, body mass index, and education. Individuals with an early bedtime performed significantly worse in the timed up and go, timed standing from a long sitting position, and choice stepping reaction time tests, compared with the other three groups ( $P < 0.05$ ). Moreover, although there was no statistical significance, the early bedtime group tended to have lower scores for depressive symptoms and cognitive function than the other three groups. Going to bed early may lead to poor physical performance in older adults, even when receiving 6–8 hours of sleep.

#### **DIFFERENCES AMONG PEOPLE WHO DISCONTINUE, CONTINUE OR LEAD EXERCISE AFTER INITIAL EXERCISE PROGRAM**

Y. Mitsuishi<sup>1</sup>, K. Tsunoda<sup>1</sup>, T. Muraki<sup>2</sup>, K. Hotta<sup>2</sup>, T. Tsuji<sup>1</sup>, J. Yoon<sup>1</sup>, J. Yoon<sup>1</sup>, T. Okura<sup>1</sup>, *1. University of Tsukuba, Tsukuba, Japan, 2. Ibaraki Prefectural University of Health Sciences, Ami, Japan*

The purpose of this study was to investigate group differences in physical function, depression status, and cognitive function at the end of an organized exercise program. After participating in our exercise program, participants were divided into one of three groups for this study: the Community Circle Group, which continued the exercise program at a community circle ( $n = 28$ , mean age 71.1±3.6 years); the Leader Group, which participated as a volunteer leader of a community circle ( $n = 27$ , mean age 70.1±3.4 years); and the Discontinue Group, which did not continue the exercise program ( $n = 40$ , mean age 71.8±5.5 years). We evaluated physical function using a standardized score of 11 physical performance tests and evaluated depression status using the Geriatric Depression Scale (a higher score represents a more unfavorable psychological status). Cognitive function was evaluated by the Five Cognitive Function Test. In comparing the three groups, the standardized physical performance score was significantly lower in the Discontinue Group ( $-2.2 \pm 7.5$ ) than in the Community Circle Group ( $1.6 \pm 4.0$ ) and Leader Group ( $2.8 \pm 4.8$ ). Depression status also was more unfavorable in the Discontinue Group ( $4.8 \pm 3.2$ ) than in the Community Circle ( $2.6 \pm 1.9$ ) and Leader ( $2.7 \pm 1.9$ ) Groups. Cognitive function was significantly lower in the Discontinue Group ( $67.0 \pm 20.2$ ) than in the Leader Group ( $83.7 \pm 16.3$ ). These results suggest that people who volunteer as a leader for or continue in an exercise program at a community circle after an initial exercise program have improved physical and cognitive functions and a favorable psychological status.

#### **ROLE OF MACRO AND MICRONUTRIENTS ON COGNITIVE FUNCTIONING AMONG OLDER ADULTS**

E. Handing<sup>1</sup>, B. Small<sup>1</sup>, K. Rawson<sup>1</sup>, N. Kumar<sup>2</sup>, *1. Aging Studies, University of South Florida, Tampa, Florida, 2. University of South Florida, College of Medicine, Department of Nutrition, Moffitt Cancer Center, Tampa, Florida*

In recent years, considerable attention has been focused on ways for older adults to maintain their cognitive abilities. A healthy diet has been shown to be positively related to cognitive performance among older adults. For example, adherence to a Mediterranean diet has been related to lower incidence of Alzheimer's disease (AD). Moreover, dietary antioxidants reduce free radical damage in the brain, and decrease

oxidative stress associated with aging and AD. One limitation of past research is the reliance upon questionnaires that focus on the frequency and adherence of general dietary patterns, without considering specific nutrient intake. In the current study, we administered 2-day 24-hour dietary recall that enabled us to evaluate the relationship between dietary nutrients and cognitive performance. Nutrient intake was further analyzed for primary energy sources, fat and cholesterol, carbohydrates, fiber, vitamins, carotenoids, and fatty acids using the National Data Systems database. Participants consisted of 55 older adults (Mean Age=74.23) who were participating in a clinical trial of a nutrition supplement on cognitive performance. Results indicate an association between intake of monounsaturated fatty acids, polyunsaturated fatty acids, vitamin B12, vitamin B1, and vitamin D3 on attention, working memory, visuospatial scanning, and speed of processing. The results suggest that dietary properties can be an important source of variation in the cognitive performance of older adults, as well as an avenue for future interventions.

### **ASSOCIATIONS BETWEEN WALKING HABITS, FREQUENCY OF PUBLIC TRANSIT USE AND OBESITY IN OLDER ADULTS: RESULTS FROM THE VOISINUAGE STUDY**

J. Desroches<sup>1,2</sup>, M. Brochu<sup>1,2</sup>, M. Levasseur<sup>1,4</sup>, L. Richard<sup>3,7,8</sup>, L. Gauvin<sup>5,6,7</sup>, Y. Kestens<sup>5,6,9</sup>, H. Payette<sup>1,10</sup>, 1. *Research Centre on Aging, Health and Social Services Centre – University Institute of Geriatrics of Sherbrooke (CSSS-IUGS), Sherbrooke, Quebec, Canada*, 2. *Faculty of Physical Education and Sports, University of Sherbrooke, Sherbrooke, Quebec, Canada*, 3. *Institut de recherche en santé publique de l'Université de Montréal, Université de Montréal, Montréal, Quebec, Canada*, 4. *School of Rehabilitation, Faculty of Medicine and Health Sciences, Université de Sherbrooke, Sherbrooke, Quebec, Canada*, 5. *Department of Social and Preventive Medicine, Université de Montréal, Montreal, Quebec, Canada*, 6. *Centre de recherche du Centre Hospitalier de l'Université de Montréal, Montreal, Quebec, Canada*, 7. *Léa-Roback Research Centre on Social Inequalities of Health in Montréal, Université de Montréal, Montreal, Quebec, Canada*, 8. *Faculty of Nursing, Université de Montréal, Montreal, Quebec, Canada*, 9. *Montreal Public Health Department, Montreal, Quebec, Canada*, 10. *Department of community medicine, Faculty of Medicine and Health Sciences, Université de Sherbrooke, Montreal, Quebec, Canada*

To reduce obesity rates, a high priority for the World Health Organization, a better understanding the relationship between lifestyle habits, neighbourhood factors and obesity is necessary. This study examined the association between the number of hours walking, the frequency of public transit use and obesity within an urban aging population. This cross-sectional study (632 older adults) is part of the VoisiNuAge longitudinal study. Data: obesity, personal characteristics and related-health variables (age, education, marital status and family income, physical and mental health status perception, number of medications and number of chronic diseases), lifestyle habits related to neighborhood (frequency of eating at restaurant, tobacco use, frequency of public transit use, availability of a motor vehicle and driver's license, number of year of residence in current dwelling, number of years of residence in neighborhood and number of hours walking per week) and neighborhood factors (availability to resources, proportion of services/amenities and restaurant density). Multiple linear regression analyses were performed. Lower number of hours walking, lower frequency of public transit use and lower frequency of meals intake explained 9.6% of obesity in older men after controlling for personal characteristics, lifestyle habits and neighborhood factors. In older women, poorer perceived physical health status, older age, tobacco use and lower family income explained 14.5% of obesity. Future studies should investigate why obesity is influenced

by the number of hours walking and the frequency of public transit use in older men while having no effect in women.

### **BEHAVIORAL HEALTH COACHING FOR RURAL VETERANS WITH DIABETES AND DEPRESSION**

S. Robertson<sup>1,2</sup>, A. Naik<sup>1,2</sup>, C. White<sup>3</sup>, M. Armento<sup>1,2</sup>, B. Lawrence<sup>1,2</sup>, J. Cully<sup>1,2</sup>, 1. *Health Services Research & Development Center of Excellence, Michael E. DeBakey Veteran's Affairs Medical Center, Houston, Texas*, 2. *Baylor College of Medicine, Houston, Texas*, 3. *Texas A & M, College Station, Texas*

Depression is Associated with Nonadherence to Self-Care and Poor Blood Glucose Control among Individuals with Diabetes. Concurrent Treatment of Depression and Diabetes Remains Limited, Especially in Rural Communities with Limited Access to Comprehensive Care. Our Study Tested the Feasibility and Preliminary Outcomes of a 10-Session (12-Week) Telephone-Delivered Coaching Intervention (Healthy Outcomes through Patient Empowerment [HOPE]) for Rural-Dwelling Older Adults with Uncontrolled Diabetes and Comorbid, Clinically Significant Depressive Symptoms. Eight Participants (Mean Age = 62) Were Recruited from the National VA Database System and Enrolled. Measures of Diabetes Control (HbA1c), Depressive Symptoms (Patient Health Questionnaire-9 [PHQ-9]), and Diabetes-Related Distress (Problem Areas in Diabetes Scale [PAID]) Were Obtained at Baseline, Post-Intervention and 6-Month Follow-Up. Clinically Significant Improvements Were Realized Post-Intervention and at 6-Month Follow-Up on All 3 Measures. Notable Effect Sizes using Cohen's d Were Found Post-Intervention and at 6-Month Follow-Up, Respectively, for HbA1c (d=0.36; d=0.28), PHQ-9 (d=1.48; d=1.7), and PAID (d=1.50; d=1.06). On Average, HbA1c Values Dropped 1.1% (SD = 1.7) from Baseline to Post-Intervention. PHQ-9 and PAID Scores Also Decreased by an Average of 5.14 (SD = 2.3) and 17.68 (SD = 10.7), Respectively. Improvements Were Sustained at 6-Months. Clinically Significant Changes in Outcome Measures among this Medically Complex Subset of Patients Provide Preliminary Evidence of the Effectiveness of a Telephone-Based Behavioral Coaching Approach to Chronic Illness Management. A Future Randomized Clinical Trial Will Test HOPE's Broader Effectiveness with Rural Veterans within an Implementation Framework.

### **AGE, SELF-EFFICACY AND STRESS-RELATED GROWTH: FINDINGS FROM THE DAVIS LONGITUDINAL STUDY**

X. Bi<sup>1</sup>, C.M. Aldwin<sup>2</sup>, 1. *Center for Health Care Evaluation, Menlo Park, California*, 2. *Oregon State University, Corvallis, Oregon*

It is widely believed that older individuals are more likely to be coping with chronic stressors which may be more difficult to resolve, and which may impact their ability to experience stress-related growth (SRG). We examined this in a cross-sectional sample of 424 members of the Davis Longitudinal Study (Mage = 42.85, SD = 11.50). Dividing the sample into individuals who reported that their problems had been resolved or not, we found that there were no age differences and no demographic differences between these groups. However, individuals who had not resolved their problem were less likely to use positive action coping and reported lower levels of self-efficacy. They also reported lower levels on four of the five indicators of stress-related growth. A confirmatory factor analysis identified significant differences between the pathways of the two groups ( $\Delta\chi^2 = 3.714$ ,  $\Delta df = 1$ ,  $p = 0.05$ ). In individuals who had not resolved their problems, there was no relationship between self-efficacy and SRG,  $\beta = -.014$ , but there was a significant pathway between these two variables for those who had resolved their problems,  $\beta = .159$ . Thus, middle-aged adults were just as likely to resolve their problems as younger adults, and resolution of problems was more dependent on coping strategies and self-efficacy than on demographics.

## DENTAL CARE AND DENTITION STATUS ARE ASSOCIATED WITH QUALITY OF LIFE IN OLDER VETERANS WITH DIABETES

D.L. Huang<sup>1,2</sup>, K.C. Chan<sup>2</sup>, B.A. Young<sup>1,2</sup>, 1. *Veterans Affairs Puget Sound Health Care System, Seattle, Washington*, 2. *University of Washington, Seattle, Washington*

**BACKGROUND:** This study's objective was to determine the association between quality of life and oral health measures in older veterans ( $\geq 65$  years) with self-reported diabetes. **METHODS:** Cross-sectional analysis of Behavioral Risk Factor Surveillance System 2006, 2008, and 2010 data. Quality of life was assessed using the Centers for Disease Control and Prevention Healthy Days Core Module (CDC HRQOL-4). Descriptive and multivariable logistic regression analyses were performed. **RESULTS:** Of 17,646 subjects, mean age was 74.8 years, 97.8% male, 19.9% racial/ethnic minority, 88.8%  $\geq$ high school graduate, 98.1% had health care coverage, 4.6% reported a cost barrier to health care, 36.1% reported no dental care in the past year and 81.5% had permanent teeth removed due to caries or periodontal disease. Approximately 41% of older veterans with diabetes reported fair or poor self-rated general health and on average 7.46 physically unhealthy days, 2.33 mentally unhealthy days and 7.78 activity limitation days. Logistic regression models evaluating self-rated general health showed that older veterans with diabetes who received no dental care in the past year had 1.35 odds of fair or poor self-rated general health (95% CI 1.19, 1.55) compared to those who received dental care in the past year. Those with permanent teeth removed had 1.27 odds of fair or poor self-rated general health (95% CI 1.07, 1.51) compared to older veterans who reported no permanent teeth removed. **CONCLUSIONS:** Lack of dental care in the past year and loss of permanent teeth were associated with worse self-rated general health in older veterans with diabetes.

## CHILDHOOD SOCIOECONOMIC STATUS AND ADULT BONE STRENGTH: FINDINGS FROM THE MIDLIFE IN THE U.S. STUDY

T. Mori<sup>1,2</sup>, C.J. Crandall<sup>3</sup>, S. Merkin<sup>4</sup>, T. Seeman<sup>4</sup>, N. Binkley<sup>5</sup>, G.A. Greendale<sup>4</sup>, A.S. Karlamangla<sup>4</sup>, 1. *Geriatric Research Education and Clinical Center, VA Greater Los Angeles Healthcare System, Los Angeles, California*, 2. *UCLA Fielding School of Public Health, Los Angeles, California*, 3. *Division of General Internal Medicine, David Geffen School of Medicine at University of California, Los Angeles, Los Angeles, California*, 4. *Division of Geriatrics, David Geffen School of Medicine at University of California, Los Angeles, Los Angeles, California*, 5. *University of Wisconsin-Madison Osteoporosis Clinical Center and Research Program, Madison, Wisconsin*

Adult bone mass depends on acquisition in childhood, which can be influenced by childhood socioeconomic conditions. Socioeconomic adversity is also associated with weight, an important factor in fracture risk. Composite indices of femoral neck strength integrate body height and weight, femoral neck axis length (FNAL), and bone mineral density (BMD) to index bone strength relative to loads borne during falls. These indices are inversely associated with incident fractures, and unlike BMD, are consistent with fracture risk differences between Asians and Caucasians, and between diabetics and non-diabetics. Data from 729 participants in the Midlife in the United States Study were used to create composite indices of femoral neck strength in different failure modes:  $BMD \cdot FNW / \text{weight}$  for compression,  $BMD \cdot (FNW)^2 / (FNAL \cdot \text{weight})$  for bending,  $BMD \cdot FNW \cdot FNAL / (\text{height} \cdot \text{weight})$  for impact. A childhood socioeconomic advantage score (range, 0-6) was created from parental education, self-rated financial status relative to others, and not being on welfare. Analyses were stratified by race (White/non-White) and gender, and adjusted for age, body mass index, menopause status in women, medication use, adult financial advantage, and adult education. Childhood socioeconomic advantage was independently associated positively with indices of compression strength (0.09 SD per advan-

tage unit) and bending strength (0.14 SD per unit) in white men, but not in the other three groups. Adult education level and current financial advantage were not associated with any strength index in any group. Childhood socioeconomic factors may influence adult bone strength, but the influences of minority race and menopause may swamp these effects in women and minority race groups.

## OPTIMISM AND MORTALITY AMONG THE OLDEST OLD

J.M. Jacobs<sup>1,2</sup>, Y. Maaravi<sup>1,2</sup>, J. Stessman<sup>1,2</sup>, 1. *The Jerusalem Institute of Aging Research, Jerusalem, Israel*, 2. *Geriatrics and Rehabilitation, Hadassah Hebrew-University Medical Center, Jerusalem, Israel*

**Purpose:** The influence of optimism among the oldest old is poorly defined. We examined the association between optimism and mortality from age 85-90. **Methods:** The Jerusalem Longitudinal Study (1990-2010) is a prospective study of a representative community-dwelling cohort, born 1920-21. Comprehensive assessment at 85 included a 7 question (0-2 points each) optimism scale, (maximum optimism scoring 14 points). Quartiles for optimism were determined (Q1 lowest-Q4 highest optimism). Mortality data were collected from age 85-90, from the Ministry of Interior. Cox proportional hazards ratios (HR) were determined after adjusting for gender, education, diabetes, ischemic heart disease, hypertension, depression, self-rated health, and cognitive impairment. **Results:** 1122 subjects were assessed at 85. Men had higher mean optimism score compared to women (8.45  $SD \pm 4.14$  vs. 7.34  $SD \pm 4.29$ ,  $p < 0.0001$ ). Subjects with highest optimism (Q4) were significantly more likely to be married, better educated, have improved self-rated health, with lower rates of comorbidities including diabetes, heart failure, hypertension, cognitive impairment (MMSE  $< 24$ ), depression and dependence in basic activities of daily living. Optimism was consistently associated with improved survival: Kaplan-meier survival analyses according to optimism quartiles (Q1,2,3,4) among men was 55%, 59.7%, 72.9%, 83.2% (log rank  $p < 0.0001$ ), and among women was 69.4%, 74.4%, 84.1%, 80% (log rank  $p = 0.011$ ). Using the lowest optimism quartile (Q1) as a reference (HR = 1), the adjusted HR's for mortality according to optimism was Q2 HR = 0.98 (95% CI 0.73-1.32), Q3 HR = 0.67 (95% CI 0.46-0.99), Q4 HR = 0.64 (95% CI 0.42-0.95). **Conclusions:** Optimism among the oldest old is associated with improved markers of health, and predicts improved survival.

## THE ASSOCIATION OF LOW TO MODERATE ALCOHOL USE WITH MULTIPLE INDICES OF SUCCESSFUL AGING

R.R. Gorney<sup>1,2</sup>, S. Koh<sup>1</sup>, C. Depp<sup>1,2</sup>, D. Jeste<sup>1</sup>, 1. *Psychiatry, UCSD, San Diego, California*, 2. *Veterans Administration Medical Center, La Jolla, California*

**Background** Low to moderate (L-M) alcohol use in older people has been associated with lower incidences of dementia, multiple medical problems and all-cause mortality. Little research has been performed on L-M alcohol use and its potential role in successful aging. We hypothesized that L-M alcohol use in older person would be associated with higher ratings on multiple domains of successful aging compared with those who abstain from alcohol. **Methods** Data was utilized from the Successful AGing Evaluation (SAGE) study, a structured multi-cohort population based study designed to assess successful aging in 1,006 community-dwelling men and women in San Diego County, aged 50-99 years. Random digit dialing was used to recruit subjects. Evaluation included a 25-minute phone interview followed by a self-report survey of various domains of functioning. Alcohol use was measured using 3 self-report questions and people were grouped into current abstainers, and current L-M drinkers (drink 2 or fewer drinks/day) based on their self reported use. **Results** A total of 746 people met criteria for either abstaining ( $n = 201$ ) or L-M alcohol use ( $n = 545$ ). When accounting for the potential confounders of age and gender, L-M alcohol users reported lower perceived stress, higher physical functioning, and better cognitive status, but no difference in life satisfaction. **Conclusions** Findings suggest an association between L-M alcohol intake and

improved scores on measures of successful aging across multiple domains when compared with abstainers. More research is needed in the area of alcohol use as it relates to successful aging.

### **WEB BASED QUALITY IMPROVEMENT SYSTEM DEVELOPMENT OF HOME HEALTH CARE FOR THE OLDER ADULTS**

H. Chang<sup>1</sup>, T. Lee<sup>2</sup>, 1. *Elderly Welfare, Namseoul University, Cheonan-city Choongnam, Republic of Korea*, 2. *Korea Electronic Research Institue, Ansan, Kyunggi, Republic of Korea*

Purpose In Korea a trend of longevity increases population over 65 years, in particular population over 75 grows, In 2008 new introduced public long-term care insurance system. New qualification system of long-term care worker was first introduced in 2008 same year. The present in 2010, elderly population is more than 5.4 million, long-term care workers about 1 million. There was not computerized management system so more than 16,000 home based long-term care institutions' caregivers are having note down their service record. Therefore most of the home based long-term care institutions' managers could not manage their tasks and caregivers effectively. Main purpose of this research will be development of total quality management system of home health care for the beneficiary older adults based on Korean national long-term care insurance system. More special interests are safety care management modules for the older adults. Methods 1. Research equipments as server and accessory and DB management s/w by Internet Data Center placed on outsourcing, terminal units (small notebook personal computers) with wireless Internet for home care workers to input data, education equipment as portable beam projector and movie camera, personal computers built up completion 2. Research on actual condition survey for home care needs of the enrolled older adults in community elderly welfare centers 3. Construction and operation of server and clients network as home-page(www.qlongtermcare.or.kr). System module development of homecare beneficiary services and safety management for the elderly (fall down prevention, safely bathing etc.) 4. Development of field based continuing on-line, off-line education program for homecare workers 5. Based on internet server-client network, input service data into upload representative modules via terminal units by homecare workers Results 1. Research on actual condition survey for homecare needed the elderly(302 elderly people nationwide), Average age 80.3 years, Female elderly 76.5%, illiteracy 24.5%. Care level: Grade I(severe case): 6.0%, Grade II: 8.3%, Grade III: 76.2%, Cognitive level: decision making<defects of short term memory<forget date, ADL function level: bathing<out of the room<dressing<meal assistance 2. Research on actual condition survey for homecare workers' field education needs level (169 homecare workers nationwide): Access Internet 57%, Average age 52years, Female workers 98% 3. Currently monitoring of server DB: According to plan for analysis performance of long-term care workers

### **COLLABORATING WITH OLDER ADULTS: AN INNOVATIVE WHEELCHAIR SKILLS HOME PROGRAM**

E. Giesbrecht, W.C. Miller, I.M. Mitchell, *University of British Columbia, Vancouver, British Columbia, Canada*

Background: Older adults frequently use wheelchairs to maintain engagement in important activities of life. However, the expense and limited availability of rehabilitation therapy means most receive little or no training in effective wheelchair use. The purpose of this study was to develop an individualized home training program monitored by an expert trainer that could be delivered via a computer tablet. The specific needs of novice older adult wheelchair users were addressed by incorporating principles from Andragogy and Social Cognitive theory. Method: Participatory Action Design integrates stakeholder involvement throughout the process of assistive technology research and development. A total of eight focus groups were conducted with three stakeholder groups: older adult wheelchair users, caregivers, and prescribing clinicians. Results: A team of occupational therapists and computer

scientists adapted the training program content, delivery, and user-interface for three successive prototypes in response to participant evaluation. Stakeholder feedback mirrored many of the incorporated theoretical principles and initiated substantive program innovations. Program content is self-paced and individualized to address participant-relevant goals. Brief, achievable, and progressive skill components enhance mastery experience for success. Training activities are practical and activity-oriented to maintain focus on engagement rather than physical demands. Video demonstrations employ older adult peers to promote vicarious experience and self-efficacy. Built-in tablet video recording allows for user self-appraisal and trainer evaluation. All three stakeholder groups strongly affirmed the training program. Conclusion: A collaborative research process culminated in a beta prototype ready for pilot testing. The training program will be evaluated in a multi-centre randomized control trial.

### **DECLINING RATE OF FATAL CRASHES IN OLDER DRIVERS AND RURAL DRIVING**

O. Ekundayo, R. Levine, I. Goldzweig, *Family and Community Medicine, Meharry Medical College, Nashville, Tennessee*

OBJECTIVE: The purpose of this study was to examine the most recent data on older drivers' fatal and nonfatal crashes in the United States to determine changes in fatal crash rates and examine its association with rural driving. METHODS: Data for calendar years 2005 to 2009 were extracted from the Fatality Analysis Reporting System. To calculate crash rates, licensed driver data were obtained from the Federal Highway Administration data. Multivariable logistic regression was used to examine the association of fatal crashes with rural driving. RESULTS: Fatal crash involvements per 100,000 licensed drivers declined for all age groups, but a strong decline was noticed among the very elderly drivers 85 years and older. Rate of fatal crashes fell from 23 fatal crashes per 100,000 drivers in 2005 among drivers in this age group to about 15 crashes per 100,000 drivers in 2009. Compared with drivers 65-69 years, odds ratio (OR), 95% confidence interval (CI) for fatality for age categories 70-74, 75-79, 80-84, and ≥85 years, were respectively, 1.36 (1.23 to 1.50), 1.57 (1.42 to 1.74), 2.07 (1.85 to 2.31), and 3.34 (2.92 to 3.80). Driving on rural roads compared to urban was associated with increased odds of involvement in fatal motor vehicle crash, OR 1.04, 95% CI 1.04-1.20. CONCLUSIONS: Older drivers still remain a high risk for fatal motor vehicle crashes, but there has been a substantial decline in rate of fatal crashes in recent years. Fatality occurring among older drivers is significantly driven by crashes occurring on rural roads.

### **EFFECT OF GREEN TEA ON ANTHROPOMETRIC PARAMETERS IN ELDERLY WITH METABOLIC SYNDROME**

C.H. Schwanke, A.E. Senger, I. Filho, M.G. Gottlieb, *Geriatrics and Gerontology Institute, PUCRS, Porto Alegre, RS, Brazil*

Objective: To evaluate the effect of the consumption of green tea (*Camelia sinensis*) on anthropometric parameters in elderly with metabolic syndrome (MS). Methods: intervention study. The sample was selected from the Geriatric Service of Hospital São Lucas of Pontifical Catholic University of Rio Grande do Sul. 45 elderly with MS were enrolled and allocated into two groups: green tea group (GTG, n= 24), who drank green tea (they received sachets of 1.0 g of green tea, and should drink three cups per day for 60 days) and control group (CG, n=21) without intervention. All participants were instructed to not make changes in their lifestyle and medicine intake. The diagnostic criteria for MS used were the International Diabetes Federation (IDF). The anthropometric measurements were evaluated before and after intervention, as well as blood pressure measurement. Results: There were a statistically significant (p<0.001) weight loss [71.5±12.6 kg to 70.3±12.6 kg], and decrease on BMI (30.5±4.3 kg to 30.0±4.4 kg), and on waist

circumference (99.0±12.8 cm to 96.8±13.0 cm) only in GTG. A statistically significant decrease on the difference before/after intervention was observed on BMI [-0.5±0.4 kg/m<sup>2</sup> in GTG and -0.2±0.6 kg/m<sup>2</sup> in CG (P=0.032)], and on waist circumference [-2.2±2.0 cm in GTG and -0.3±1.8 cm in CG (P=0.002)]. The intake of green tea did not change the blood pressure. Conclusion: The consumption of green tea was effective in reducing weight, BMI, and waist circumference in elderly with MS.

### ESSENTIAL ROLE OF SOCIAL SERVICES IN FULFILLING TRIPLE AIM GOALS

G. Shier<sup>2</sup>, M. Ginsburg<sup>1</sup>, J. Howell<sup>3</sup>, P.J. Volland<sup>1</sup>, R. Golden<sup>2</sup>, 1. *Social Work Leadership Institute, New York Academy of Medicine, New York, New York*, 2. *Rush University Medical Center, Chicago, Illinois*, 3. *County of San Diego Health and Human Services Agency, San Diego, California*

The Institute for Healthcare Improvement's Triple Aim: better care for individuals; better health for populations; and lower per capita costs; establishes goals for health care improvement and sets the framework for innovation efforts happening nationally. From the recent Center for Medicare and Medicaid Innovations Healthcare Innovation Challenge (CMMI HIC) to Affordable Care Act-driven initiatives such as the Community-Based Care Transitions Program (CCTP; Section 3026), considerable resources have been committed to meeting the Triple Aim. These investments concretely demonstrate the promise of improvement that health care leaders see in emerging models of care, including: care transitions; Patient-Centered Medical Homes (PCMHs); Accountable Care Organizations (ACOs); and payment system reform. A growing evidence base suggests that services to address the psychosocial factors impacting health must be integrated into innovation if the Triple Aim is to be realized. The National Coalition on Care Coordination (N3C) representing 40+ social, family caregiver, and professional organizations, formed in 2008 to advocate for better coordinated health and social services for older adults with chronic conditions. N3C efforts to synthesize and disseminate the evidence for a comprehensive approach to care coordination delivered by an interdisciplinary team process that links medical care with long-term social supports contributed to assuring the Patient Protection and Affordability Care Act (ACA) including access to care coordination. This paper explores the role of psychosocial factors in health care outcomes, highlights current evidence on the impact of social support services and makes suggestions to ensure the psychosocial dimension is adequately addressed in health care systems change.

### LISTENING TO THE NURSE PAYS OFF: AN INTEGRATED NURSE HEALTHLINE PROGRAM WAS ASSOCIATED WITH SIGNIFICANT COST SAVINGS

J. Navratil-Strawn<sup>2</sup>, K. Hawkins<sup>1</sup>, T.S. Wells<sup>1</sup>, S.K. Hartley<sup>2</sup>, R.J. Ozminkowski<sup>1,3</sup>, H. Chan<sup>2</sup>, R.J. Migliori<sup>3</sup>, C.S. Yeh<sup>4</sup>, 1. *Analytics and Data Management, OptumInsight, Ann Arbor, Michigan*, 2. *OptumHealth, Golden Valley, Minnesota*, 3. *UnitedHealth Group Alliances, Minnetonka, Minnesota*, 4. *AARP Services, Inc., Washington, District of Columbia*

Objective: To evaluate the impact of compliance with nurse recommendations about where to seek care on healthcare expenditures for a Nurse HealthLine (NHL) triage program. Methods: Data from 53,206 adults with an AARP® Medicare Supplement Insurance plan insured by UnitedHealthcare who called into a NHL triage program were included. About 46 percent of the NHL calls involved triage where the nurse recommended a course of action. Callers following the nurse's recommendation regarding where to receive care (e.g., emergency room, urgent care, doctor's office, or home) were classified as adherent, while those who did not were classified as non-adherent. Program-related savings were estimated by comparing the difference in downstream healthcare expenditures between adherent and non-adherent callers after using

multivariate modeling to adjust for case-mix differences between these groups. Results: 55 percent of callers were adherent. Nurses were over three times as likely (41% versus 13%) to recommend seeking a higher level of care (e.g. emergency room versus urgent care), indicating that the program focused on directing members to the appropriate level of care for their individual circumstance. The program resulted in a total savings of \$13.8 million dollars (p<0.05). Conclusions: This study focuses on compliance to nurse recommendations for a NHL triage program designed solely for Medicare members with supplement (Medigap) coverage. The program was associated with significant savings, most of which were attributable to Medicare.

### PSYCHOLOGICAL EFFECTIVENESS OF FITNESS WALKING FOR OLDER ADULTS

K. Yamauchi<sup>1</sup>, Y. Lau<sup>1</sup>, S. Oshita<sup>2</sup>, T. Ichikawa<sup>3</sup>, I. Yanagawa<sup>4</sup>, A. Ogita<sup>5</sup>, 1. *Institute of Physical Education, Keio University, Yokohama, Kanagawa, Japan*, 2. *Izumi Junior College, Sagami-hara, Kanagawa, Japan*, 3. *Matsuyama Shinonome Junior College, Matsuyama, Ehime, Japan*, 4. *Tohoku University of Art and Design, Yamagata, Yamagata, Japan*, 5. *Osaka City University Research Center for Urban Health and Sports, Osaka, Osaka, Japan*

Introduction: Walking exercise is popular in order to maintain health condition. According to announcement of Japanese government in 2009, forty eight percent of total population chose fitness walking among various exercise and sports. On the basis of this reality, sticks and grips were specifically designed for fitness walking in recent years. Fitness walking is suitable for older adults to strengthen not only legs muscle but also upper limbs. Fitness walking also reduce load of weight to legs and reinforce walking impulsion so that it's possible to walk long distance comfortably and consume calorie. Purpose: The purpose of this research was to investigate the psychological effectiveness of fitness walking among older adults and pursue possibility of endurance and practice of exercise. Methods: Four types of walking exercise were provided to older adults who are living in the suburb of K prefecture in Japan. These four types of exercise were normal walking, sticks walking, Nordic walking, and sports grip walking. After these trials, learners were asked about their impression by researchers in questionnaires. Mood check list as criteria were used to analyze their impression. Results: Compare with normal walking, three factors "pleasure", "relaxation", and "satisfaction" were increased among other three types of walking. Satisfaction was the highest in Nordic walking and sticks walking was high in secondly. Fitness walking is effective for older adults to be motivated and improve strength. Type of fitness walking should be chosen depend on learner's health condition.

### LATENT CONSTRUCTS FOR ADJUSTMENT TO AGING, AGE REPRESENTATION AND SUBJECTIVE AGE IN OLDER ADULTS

S. von Humboldt, I. Leal, *Research Unit in Psychology and Health, I&D, ISPA – Instituto Universitário, Lisbon, Portugal*

Aims: To investigate latent constructs that can act as major determinants in the adjustment to aging (AtA), age representation (AR) and subjective age (SA), and to explore relations between these constructs in an older adults cross-cultural population. Methods: Measures were completed using a variety of culturally appropriate methods, including demographics and interviews. Complete information on 33 older adults aged between 74-101 years (M=86.2; SD = 5.4) from eight different nationalities, was available. The data was subjected to content analysis. Representation of the associations and latent constructs were analyzed by a Multiple Correspondence Analysis (MCA). Standardized instruments measured regular cognitive abilities. Results: Findings showed a model for each pre-category. SA was explained by a two-factor model: 'age-cautious' and 'young-at-heart'. A three-dimension model formed by 'maximizers', 'optimizers' and 'essentialists' was indicated as a best-fit solution for AtA, and AR was best explained in a three-

dimension model by 'past-oriented', 'present-oriented' and 'future-oriented'. AtA is shown to bear associations with individuals' SA and AR in a model composed by 'enjoyers', 'engaged', 'regardful' and 'conciliated'. Conclusions: AtA is related to SA and AR in older adults. Enhancing AtA on shared perceptions of SA and AR might be an important target to improve older adults' interventions' outcomes in aging well. Key Words: Adjustment to Aging, age representation, older adults, subjective age, latent constructs.

#### **EOSINOPHILIC GRANULOMA OF THE TONGUE: A CASE REPORT WITH LITERATURE REVIEW**

K.E. Noel, M.S. Cappuccilli, D. Bolger, *Community Health, UMDNJ-New Jersey Dental School, Somerdale, New Jersey*

HIV/AIDS in the geriatric population adds to the complexity of managing their healthcare needs. The virus can affect every organ and every system in the body, producing uncommon clinical manifestations. The eosinophilic granuloma in this presentation with its unusual clinical appearance may be such a case. This lesion was diagnosed through clinical and histologic evaluation. The team approach is important. The dentist and staff are primarily responsible for maintaining the dentition, but the management of soft tissue lesions is also their responsibility. The presence of an eosinophilic granuloma in a geriatric immune-compromised patient initiates investigations into similar lesions, and in the endeavor for patient quality of life, the physicians and their staff also labor to minimize morbidity. An eosinophilic granuloma is a benign disease entity that is not clearly understood in terms of its etiology or pathogenesis. Mucosal trauma is a suspected cause, but it is usually unfounded, and spontaneous resolution adds to the enigmatic nature of this lesion. The clinical presentation can be alarming to a clinician who may be unfamiliar with this relatively rare lesion, and likewise the histologic presentation can be mistaken for a malignancy. Our patient in this case is a 62-year old African-American male who presented with a chief complaint of tenderness and varying episodes of pain on his tongue of 10-days duration. Oral examination revealed yellowish-white plaques on his dorsal tongue extending onto the anterior ventral surface as a raised, broad based growth. The growth was firm and also painful on palpation.

#### **MEDIATING FACTORS OF TECHNOLOGY ADOPTION BY SENIOR ADULTS: ENABLERS AND BARRIERS**

K.M. Daniel, *Nursing, UT Arlington, Arlington, Texas*

At least half of all American adults have at least 1 chronic disease. In adults over the age of 65, half have 3 or more chronic diseases. Chronic disease management is based on self-management. As our population ages, older patients and their families will consider adopting technology innovations to assist them in managing their health and safety at home. So although many of these products are designed with older adults in mind, adoption is not guaranteed. This purpose of this qualitative study was to describe the barriers and enablers that stakeholders (older adults, family caregivers, healthcare providers (physicians and nurse practitioners) and landlords or administrators of senior living facilities) perceive to the adoption of technology and compare to the Mahoney model for technology adoption. Focus groups and/or interviews of each category of end users were utilized to gather information about previous and current adoption and use of health and safety technology in the home. The overall goal of this study is exploration of the mediating factors in Mahoney's model that affect adoption of health and safety related technologies by older adults. Specific goals will be 1) to identify enabling factors most relevant or associated with different end-users, 2) to identify barriers throughout all groups, and 3) to identify mediating factors that may vary by age group or racial/ethnic characteristics of participants. Information learned from this study will be used to define the enablers and barriers to technology adoption by elder adults for the purpose of subsequent technology development.

## **SESSION 1345 (POSTER)**

### **INTERNATIONAL AND CULTURAL STUDIES**

#### **TOTAL AND ACTIVE LIFE EXPECTANCY IN CHILEAN OLDER PEOPLE. SOCIOECONOMIC AND GENDER DIFFERENTIALS**

C. Albala<sup>1</sup>, H. Sanchez<sup>1</sup>, L. Lera<sup>1</sup>, A. Fuentes<sup>2</sup>, X. Cea<sup>1</sup>, 1. *INTA, University of Chile, Santiago, Chile*, 2. *School of Public Health, University of Chile, Santiago, Chile*

**Background.** The rise of life expectancy (LE) in Chile has occurred at an unprecedented rate but this does not ensure that the years gained are healthy years. **Objective** To estimate the LE and the proportion of healthy years (ALE) gained in 2 cohorts of older people from different socioeconomic strata (SES) Methods. Follow up of 2 cohorts: the Santiago SABE cohort evaluated in 2000 in 1202 subjects 60+y community living in Santiago and the ISAPRE cohort of 266 people 60y and older from private health insurances (ISAPRES) registries. At baseline all the subjects completed home interviews including measures of disability/functional limitations and anthropometry. Functional limitation was defined as limitation in  $\geq 1$  ADL and/or  $\geq 1$  IADL and/or  $\geq 3$  mobility items. Mortality data were obtained from death certificates of the National Civil Registry. Evaluations done in 2005 and 2010 allows us to study the trajectories of disability according baseline gender and SES estimating LE and ALE (IMACH 0.98i). **Results.** LE at 65y in women from the ISAPRE cohort was 18.3y from which 11.1y(60.7%) were in healthy state (ALE) and the corresponding figures in men were TLE 17.9y and ALE 10.7y(62.9%). In the SABE cohort at 65y TLE in women was 16.6y from which 9.1y(45%) were in healthy state. The corresponding figures for SABE men were TLE 13.6y and ALE 8.7y(64.4%). **Conclusion** The years gained in LE in Chilean elderly, has not been accompanied by a decrease in functional limitation and disability, moreover the gained healthy years shows an uneven distribution among genders and SES. Funded by fondecyt grant 1080589

#### **EFFECTS OF BIOFEEDBACK AND ELECTRICAL STIMULATION ON URINARY INCONTINENCE AMONG OLDER WOMEN IN CHINA**

L. Ge, *Peking University Third Hospital, Beijing, China*

**Abstract: Objective:** To evaluate therapeutic effects of pelvic biofeedback and electrical stimulation and supporting psychological care on stress urinary incontinence in older women. **Methods:** Twenty menopausal female patients with urinary incontinence aged 60 to 79 (mean age 65.4 years) with a disease duration of more than 5 years were recruited in Beijing China. A biofeedback device with international certification was used with vaginal built-in electrodes for the functional rehabilitation of pelvic floor muscles. The intensity of electric stimulation was adjusted according to the responses of the patients during the therapeutic procedure with a range of 20~70mA. Two to three courses of treatment were administered to the patients depending on their responses and conditions. Patient education was implemented by healthcare personnel before every course. Real-time instructions on patients' pelvic floor muscle exercises were given during the therapeutic process with psychological support to achieve the best outcome. Glazer's assessment was conducted before and after the whole treatment to assess functional status of pelvic floor muscles. **Results:** Results for the rapid contraction test (Fast flick/rest) were significant different ( $p=0.038$ ) between before and after. However, the results of 60-second sustained contraction test did not show any significant difference before and after the treatment ( $p=0.441$ ). **Conclusion:** The pelvic biofeedback and electrical stimulation therapy combined with right Kegel exercise can significantly improve patients' self-control of the pelvic floor muscles, alleviating symptoms to a certain degree. The muscle strength of the type II fast-response muscle groups recovered more significantly than that of type I slow-response muscles.

## AGING BEHIND BARS: THE MEDICATION OF OLDER PRISONERS IN SWITZERLAND

V. Handtke<sup>1</sup>, W. Bretschneider<sup>1</sup>, A. Stuckelberger<sup>3</sup>, J. Page<sup>4</sup>, C. Ritter<sup>5,2,1</sup>, T. Wangmo<sup>1</sup>, B.S. Elger<sup>1</sup>, 1. *Institute for Biomedical Ethics, University of Basel, Basel, Switzerland*, 2. *University Center of Legal Medicine of Geneva and Lausanne, Lausanne, Switzerland*, 3. *Institute of Social and Preventive Medicine, Department of Community and Primary Care Medicine, Faculty of Medicine, University of Geneva, Geneva, Switzerland*, 4. *Institute for Ergotherapy, Health Department, Zurich University of Applied Sciences, Zurich, Switzerland*, 5. *Forensic Psychiatry Unit, University of Applied Sciences in Frankfurt am Main, Frankfurt am Main, Germany*

Population aging is a worldwide phenomenon that forces us to make radical changes on multiple levels of society. So far, studies have concluded that the health, both physical and mental, of prisoners in general and older prisoners in particular is worse than that of the general population. However, to date, very little is known about the actual healthcare conditions of aging prisoners and almost no substantial knowledge is available concerning the prescription of medication to older inmates. A quantitative study was conducted in eight prisons in Switzerland, including two women prisons. Medical records of 150 older prisoners (50+) were obtained upon patient consent and complete anonymity was ensured. Data gathered included basic demographic information, education and type of prison sentencing. Healthcare data obtained encompassed prevalence of diseases; visits to healthcare services and types of medication – prescribed and over the counter (OCT) – taken during the last five years. Preliminary results show that the age average was 58.6 years. Older prisoners took on average 11.3 medications during the last five years. More than half received pain-medication and cardiovascular drugs. Over a third used psychotropic medications. Prescriptions related to chronic diseases like type II diabetes or rheumatism accounts for 20% each. The data gathered in this study raise the issue of poly-pharmacy among aging prisoners and will provide evidence-based information on the medication of this vulnerable group. In the light of the principle of the equivalence of care, which Switzerland adheres to, older prisoners represent an important challenge for the prison healthcare services.

## HEALTH CARE SERVICES IN GERMAN SHARED-HOUSING ARRANGEMENTS FOR PEOPLE WITH DEMENTIA - RESULTS FROM THE WGQUAL STUDY

A. Worch, J. Gräske, K. Wolf-Ostermann, S. Meyer, *Alice Salomon Hochschule > University of Applied Sciences (ASH), Berlin, Germany*

Objectives Shared-Housing Arrangements (SHA) are a specific German kind of small-scale living facilities for older, care-dependent persons, predominantly with dementia. The community-dwelling residents are being served by community health care services (CCS), therapists and other medical services. There is a lack of current findings on structures and service providers in relation to residents' characteristics and outcomes. Methods In a standardized, written, cross-sectional study as part of the WGQual study, information of all CCS in Berlin were collected. CCS were asked for contacts to various services providers. In addition, residents' socio-demographics, quality of life (QoL, QUALIDEM), need-driven behavior (CMAI), dementia severity (GDS) and further outcomes were evaluated. Results 396 persons (69% woman) with a mean age of 78 years were assessed, 73% of them with a diagnosis of dementia - 58% with GDS $\leq$ 6 and 38% GDS=7. Residents' QoL is moderate (QUALIDEM total score: 69). 58% show at least one need-driven behavior. In the last 12 month, contacts to general practitioners (GPs) are high but to medical specialists (e.g. dentistry and gynecology low. 37% received physiotherapy, 19% occupational, 8% music-therapy and 2% speech therapy on prescription. With increasing dementia severity physio-therapies (Fisher Test;  $p=0,039$ ) and occupational therapies (Fisher Test;  $p=0,047$ ) are more often used. Conclusion The

prevalence of dementia and need-driven behavior requires a high level of professional care. The medical care provided by GPs is satisfactory, but by medical specialists improvable. The therapeutic treatment in SHA based on the disease is more common compared to findings in other settings.

## SELF-PERCEPTION OF QUALITY OF LIFE IN MEXICAN ELDERLY

N. Mendoza Ruvalcaba, E. Arias Merino, M.J. Arias-Merino, J. Cueva Contreras, *Universidad de Guadalajara, Guadalajara, Mexico*

Introduction Quality of Life (QoL) is considered as a multidimensional concept, which includes its self-appraisal as a subjective concept. Our aim is to know the self-perception of quality of life and the differences in age, education, symptoms of disease and sex. Methods This study was developed from Quality of Life Study in the CASOENAC project, FONCICYT-94670 (EU-CONACYT). To assess QoL was used the CUBRECAVI. Were included 1199 elderly 60 years and over in a multistage random sampling of the two main cities of the state of Jalisco and Colima (Mexico). Mean age was 70.19 $\pm$ 7.90, mean education 5.06 $\pm$ 4.73 years, were married 49.2%, widower 34.4%. Descriptive statistics and one-way Anova were performed. Results High QoL was rated by 10.9%, medium 63.7% and low 25.4%. There were found differences by age ( $p=.037$ ), education ( $p=.000$ ) and number of symptoms of diseases ( $p=.000$ ). Mean age of those who rated their QoL as high was 72.02 $\pm$ 7.74, medium 70.18 $\pm$ 7.85, low 69.43 $\pm$ 8.01. Mean education years of those who rated their QoL as high 2.31 $\pm$ 3.17, medium 4.86 $\pm$ 4.31, low 6.75 $\pm$ 5.59. Mean number of symptoms of diseases of those who rated their QoL as high was 10.78 $\pm$ 6.04, medium 8.76 $\pm$ 5.30, low 6.55 $\pm$ 4.89. No differences were found by sex. Conclusion Since QoL is a subjective concept, the results could be influenced by expectations of the participants, because a higher perception of quality of life was associated with older age, lower education and poorer health.

## CATASTROPHE CARE: AGING, WELLNESS, AND THE TSUNAMI IN JAPAN

D.B. Willis<sup>1,2</sup>, T. Shirai<sup>2</sup>, M. Obayashi<sup>1</sup>, 1. *Fielding Graduate University, Santa Barbara, California*, 2. *Saybrook University, San Francisco, California*

The extreme stresses on older people in Japan following the Great Tsunami of March 11, 2011, followed by the uncertainties of power, radiation, and general well-being of the society has been great indeed. This paper aims to delineate the impacts on aging populations in Japan, especially in Tohoku, where the catastrophe took place. Teams of various backgrounds have been working to deliver care consistent with what is understood about PTSD and its long-term consequences. This paper will report on our fieldwork in Tohoku, as well as a research project with samples from healthcare facilities in the Tohoku region. Nurses, doctors, and others have been surveyed, with comparison samples drawn from Kanto (Tokyo) and Kansai (Osaka-Kobe). We are particularly concerned about the theme of "risk" associated with disaster and PTSD. The team (two Japanese clinical psychologists and an American anthropologist who lived and worked in Japan for Japanese universities for 30+ years) will also report on earlier research conducted in South India following the Indian Ocean Tsunami of 2004.

## CROSS-NATIONAL COMPARISONS OF PHYSICAL PERFORMANCE VERSUS SELF-REPORTED DISABILITY: EVIDENCE ON TIMED WALK IN STUDY ON AGEING AND ADULT HEALTH (SAGE)

B.D. Capistrant, M. Glymour, *Dept of Society, Human Dev & Health, Harvard School of Public Health, Boston, Massachusetts*

**Background** Lack of data and validated measures challenge disability surveillance in lower and middle-income countries (LMIC), whose populations are aging faster than developed countries. Prevalence of disability is often estimated from self-reported ADL limitations; however,

little is known of how self-reports correspond to other measures of function and how this correspondence varies across LMICs. **Methods** Cross-sectional data from the WHO SAGE study samples of adults in China, India, Russia, South Africa, Ghana, and Mexico (total n=30,114) aged 50+ were used to compare performance of objective (4 meter walk; slow speed: <0.40 meters/second) and subjective (any/no self-reported difficulty walking across a room) measures of mobility. Correspondence was tested as sensitivity and specificity of any self report difficulty walking to identify slow walk speed; logistic regression was used to predict, among those with slow walk, who would report no difficulty. **Results** Across the countries, between 5% and 25% of people reported any difficulty walking across the room. The age- and sex-adjusted average walking speed was slowest in Russia (0.71 m/s) and fastest in China (0.97 m/s). However, correspondence between measures, or the fraction of people with slow walk who reported any difficulty walking across the room, ranged between countries (China=0.35; India=0.52; Russia=0.32; South Africa=0.28; Ghana=0.39; Mexico=0.70). Among those with slow walk, marital status, employment history and mental health (memory and depression) significantly predicted reporting no difficulty walking across the room. **Conclusions** Disability is highly prevalent in LMICs. The correspondence between objective and self-reported measures was generally modest and differed across LMICs.

#### AGING IN THE BERLIN AGING STUDY-I (BASE-I)

V. Moskiou, E. Steinhagen-Thiessen, R. Eckardt, *Research Group on Geriatrics, Charite-Universitaetsmedizin Berlin, Berlin, Germany*

With regard to highest ages the longitudinal Berlin Aging Study-I focused on individual courses of the aging process for up to 19 years (1990-2009) including seven follow-ups. The core sample of the study consisting of 516 individuals (70-104 years old) and representatively selected and stratified by age and gender, has been assessed concerning the physical and mental health, morbidity related risk profiles, medication quality, genetic and immunological factors as well as functional capacity and subjective health. In the last follow-up (2008-2009) the examination of 22 participants, aged 86-102 years, demonstrated many modifiable risk factors for illness and disability inducing new aspects of prevention and therapy. Furthermore, the longitudinal assessment proved the relative predictability of aging phenomena from earlier life history.

#### COMPARISON OF OLDER ADULTS' LEVELS OF ACCULTURATION ACROSS FOUR U.S. ETHNIC GROUPS

R.M. Tappen, C.L. Williams, M. Rosselli, *Florida Atlantic University, Plantation, Florida*

Few measures of acculturation allow comparison across cultural ethnic groups. The Cross Cultural Measure of Acculturation is designed to measure degrees of orientation to mainstream American culture and culture of origin. These levels were compared across two immigrant groups, Afro-Caribbean and Hispanic, and two non-immigrant groups, African American and European American older adults, Age ranges 54 to 100; one third male. The Afro-Caribbeans and Hispanic Americans were first generation averaging 28 years U.S. residence, the majority of African Americans were fifth generation and European Americans were second, third or greater. All the Hispanic Americans chose to be interviewed in Spanish. Scores on orientation to mainstream American culture differed significantly  $F(3,455) = 382.92, p < .001$  and all comparisons between ethnic groups were significant at .05 level. African Americans' mean score was 75 (SD = 13.12). The Hispanic mean was a low 38 (SD = 12.75) and the Afro-Caribbean mean was 52 (SD = 10.64). Scores on the orientation to culture of origin also differed significantly  $F(3,477) = 14.40, p < .0001$  but European American levels (M = 3, SD = 25.90) did not differ significantly from the Afro-Caribbean (M = 60, SD = 13.32) and African American (M = 71, SD = 13.32) scores did not differ significantly from the Hispanic American (M = 72, SD = 11.75). Results suggest that older adults

in different ethnic groups respond in different ways to pressures to acculturate to the mainstream or retain on orientation to their culture of origin.

#### PREDICTING SUBJECTIVE WELL-BEING IN A CROSS-CULTURAL OLDER POPULATION

S. von Humboldt, I. Leal, *Research Unit in Psychology and Health, I&D, ISPA – Instituto Universitário, Lisbon, Lisbon, Portugal*

**Aims:** This research aims to explore a causal model of subjective well-being predictors in a cross-cultural older population. **Methods:** Measures were completed using a variety of culturally appropriate methods, including mail-outs, self-administration and interviews. For the purposes of this study, the Positive and Negative Affect Schedule (PANAS), the Satisfaction with Life Scale (SwLS), one measure of cognitive functioning - the Mini-Mental State Examination (MMSE) and demographics, were included. All variables had fewer than 1% missing values and complete data were available for 709 older adults (M = 82.4, SD = 6.45, (range 74-102)) from eight different nationalities. Structural equation modeling was used. Controlling for age, gender and country of origin, we assessed the level of subjective well-being of elderly people, and its predictors. **Results:** Subjective well-being is predicted, not only by age progression, but also by adjustment to aging, among other variables. Age was significantly associated with cognitive impairment ( $\beta = .387; p = .003$ ) and perception of health ( $\beta = -.172; p = .004$ ). All estimates were statistically significant ( $p < .01$ ). **Conclusions:** Subjective well-being appears to be a catalyst to attitudinal markers of maturity and internal development, across cultures. This study highlights the predictors of subjective well-being in older age, warranting further study across cultures among frailer populations over time. Recommendations for future research on older adults' well-being measures and clinical practice are also presented. **Key Words:** Predictors, structural equation modeling, older adults, subjective well-being, adjustment to aging.

#### LATENT CONSTRUCTS FOR TIME PERSPECTIVE AND AGE REPRESENTATION IN PORTUGUESE AND ANGOLAN OLDER ADULTS

S. von Humboldt, I. Leal, *Research Unit in Psychology and Health, I&D, ISPA – Instituto Universitário, Lisbon, Portugal*

**Aims:** A focus in a balanced time perception is linked to higher levels of life satisfaction in senior years. This study aims to analyze the determinants of age representation (AR) and to explore the differences of latent constructs that can work as major determinants in AR, in Portuguese and Angolan older populations. **Methods:** Measures were completed, including demographics and interviews. Complete data were available for 32 Portuguese and Angolan older adults aged between 74-90 years (M=80.4; SD = 5.3). Data was subjected to content analysis. Representation of the associations and latent constructs were analyzed by a Multiple Correspondence Analysis (MCA). **Results:** The most prevalent response of the interviewed participants for AR was 'present challenge' (14.9%). Findings showed a model for each nationality. AR for Portuguese participants was explained by a two-factor model: 'present fatalistic' and 'future-oriented'. A two-dimension model formed by 'present hedonistic' and 'past positive' was indicated as a best-fit solution for Angolan elderly. **Conclusions:** AR is strongly explained by increased likelihood of specific constructs in its definition, although within distinct time perspectives. This cross-cultural study illuminates links among time perspective and age representation in older age, warranting further study across cultures among frailer populations over time. Recommendations for future research on older adults' time perspective and clinical practice are also discussed. **Keywords:** Age representation, Angolan, Portuguese, latent constructs, older adults; multiple correspondence analysis, time perspective.

## DIETARY TRAJECTORIES AND DIET QUALITY AMONG OLDER ADULTS FROM THE NUAGE STUDY

E. Vesnaver<sup>1</sup>, H.H. Keller<sup>2</sup>, H. Payette<sup>3,4</sup>, B. Shatenstein<sup>5,6</sup>, 1. *Department of Family Relations and Applied Human Nutrition, University of Guelph, Guelph, Ontario, Canada*, 2. *Department of Kinesiology, University of Waterloo, Waterloo, Ontario, Canada*, 3. *Département des sciences de la santé communautaire, Faculté de médecine et des sciences de la santé, Université de Sherbrooke, Sherbrooke, Quebec, Canada*, 4. *Centre de recherche sur le vieillissement, Centre de santé et des services sociaux, Institut universitaire de gériatrie de Sherbrooke, Sherbrooke, Quebec, Canada*, 5. *Département de nutrition, Faculté de médecine, Université de Montréal, Montréal, Quebec, Canada*, 6. *Centre de recherche, Institut universitaire de gériatrie de Montréal, Montréal, Quebec, Canada*

Older adults experience a number of age-related changes that can impact food intake and nutritional status. However, little is known about how older adults who have experienced a change in food intake view the stability of their diet. Based on a secondary analysis of interviews with older adults who demonstrated a change in diet quality over a 4 year period, we examined participants' perceptions of how their eating habits had changed using a Life Course Perspective. Participants were aged 73-87 years (n=18, 78% female); 10 had decreased diet quality and 8 had increased diet quality over this period. The original study was embedded in the Québec Longitudinal Study on Nutrition and Successful Aging (NuAge). NuAge participants with dietary data at years 1 and 4 of the study and presence of key barriers known to influence food intake were invited to take part in semi-structured interviews that explored how age-related changes affected participants' experiences with eating. The first part of the interview focused on dietary change over the study period. In the present study we thematically analysed the transcripts for themes of dietary change. Over 70% of participants thought that their eating habits had not changed since the beginning of the study, despite our quantitative data supporting a change. Three key themes emerged to describe this perception of dietary stability among participants: (1) steadfast habits, (2) minor changes, and (3) turning points. Implications for the application of the Life Course Perspective to older adult nutrition research will be discussed.

## HOME AWAY FROM HOME: ACCLIMATIZATION OF FILIPINO ELDERLY FROM BEING HOME TO SENSE OF BEING "AT HOME" IN AN ELDERLY INSTITUTION

F.B. Guiang, K.J. Guevara, A.I. Gutierrez, A.S. Habaluyas, M.P. Hizon, S.G. Idanan, A.B. De Guzman, *University of Santo Tomas, Manila, Philippines*

This grounded study examined the process of acclimatization or the process of changing perspectives of a person in order to feel "at home" in a nursing care facility among a selected group of Filipino elderly (n=20). As institutionalization of the elderly is atypical in the Philippine context, varied responses were analyzed to understand the factors and the course they undergo over a set period of time upon acclimatization. Through constant comparison method, an interesting model called the "Hourglass of Acclimatization" was emerged yielding two distinct phases. This included Conversion phase, describing the transformation of one's outlook of himself and his environment and Immersion phase, characterizing how an elderly involves himself completely into the life he is supposed to live. This emerged model can contribute to the development of nursing interventions focusing on elderly experiences in the entire course of relocation to a new environment other than what they call "home".

## THE CHALLENGES OF AGING-IN-PLACE IN ATLANTIC CANADA

S. Dupuis-Blanchard<sup>1</sup>, M. Simard<sup>1</sup>, O.N. Gould<sup>2</sup>, L. Villalon<sup>1</sup>, 1. *School of Nursing, Université de Moncton, Moncton, New Brunswick, Canada*, 2. *Mount Allison University, Sackville, New Brunswick, Canada*

The majority of North American seniors want to stay independent and age-in-place for as long as possible. In fact, only 7% of Canadian

older adults over the age of 65 years live in long term care facilities. Therefore, despite health challenges and loss of autonomy, many seniors do manage to live in their own home. We have little knowledge, however on the needs of seniors, the services required to age-in-place, and the differences between rural or urban communities. The findings from this qualitative study allow us to obtain a better understanding of the needs of seniors living in a rural and an urban community and services offered in the context of aging-in-place in the province of New Brunswick, Canada. The objectives were: 1) to identify the needs of seniors living in rural and urban communities related to aging-in-place; 2) identify existing services related to aging-in-place; and 3) understand the present contribution and vision for the future of community organizations offering services to seniors. Key informants from community organizations were interviewed individually and focus groups were held with older adults in the identified rural and urban communities. Interviews were recorded and transcribed followed by content analysis to identify common themes related to study objectives. Findings indicate that present home care services do not meet older adults' needs for aging-in-place nor are service ameliorations planned. This project allows a better understanding of the challenges of seniors living in rural and urban New Brunswick related to aging-in-place.

## HOME OWNERSHIP AND FALL-RELATED OUTCOMES AMONG OLDER ADULTS IN SOUTH KOREA

Y. Do<sup>1</sup>, C. Kim<sup>2</sup>, 1. *Duke-NUS Graduate Medical School Singapore, Singapore, Singapore*, 2. *Dongguk University, Seoul, Republic of Korea*

**Aim:** The purpose of this study is to test whether home ownership is associated with falls and other fall-related outcomes among older adults in South Korea. **Methods:** Using data from the first two waves (2006 and 2008) of the Korean Longitudinal Study of Ageing, four outcome variables were examined: 1) any falls in the past 2 years, 2) any serious fall injury requiring treatment in the past 2 years, 3) fear of falling, and 4) limiting activities due to fear of falling. To avoid the issue of reverse causality, information on outcome variables was derived from the second wave while using housing contract type and socioeconomic and health control variables from the first wave. **Results:** Results showed that compared with owned home, short-term rental home predicted a higher likelihood of reporting all the fall-related outcomes examined. **Conclusions:** Many of the previously identified environmental risk factors for fall-related outcomes (e.g., flooring, stairs and steps, kitchen, and bathrooms) are amenable to change, but the extent of the changes on these home-related risk factors are conditional on the residence characteristics of the elderly. The study findings suggest the important role of housing in fall-related outcomes among older adults.

## ADJUSTMENT TO AGING AND SUBJECTIVE AGE IN ROMANIAN AND PORTUGUESE OLDER ADULTS

S. von Humboldt, I. Leal, *Research Unit in Psychology and Health, I&D, ISPA – Instituto Universitário, Lisbon, Portugal*

**Aims:** To analyze the manifestations of adjustment to aging (AtA) and subjective age (SA) identified by older adults and to investigate the latent constructs that can work as major manifestations in AtA and SA in an older Portuguese and Romanian population. **Methods:** Measures were completed, using a variety of culturally appropriate methods, including demographics and interviews. Complete data were available for 64 older adults aged between 72-99 years (M=80.1; SD = 5.8). Data was subjected to content analysis. Representation of the associations and latent constructs were analyzed by a Multiple Correspondence Analysis (MCA). **Results:** The most prevalent response of the interviewed participants for AtA was 'Accomplishment, personal fulfillment, and future projects' (24.1%). 'With apprehension' (33.3%) was identified as the most frequent SA response. Findings showed a model for each nationality. AtA and SA for Portuguese elderly were explained by a three-factor model: 'conciliated', 'young-at-heart' and 'involved'. A

three-dimension model formed by 'satisfied', 'attentive' and 'concerned' was indicated as a best-fit solution for Romanian elderly. Conclusions: AtA and SA are strongly explained by increased likelihood of specific constructs in its definition. AtA was differently related to SA in older adults in both samples. Key Words: Adjustment to Aging, multiple correspondence analysis, older adults, Portuguese, Romanian, Subjective Age.

## SESSION 1350 (POSTER)

### MINORITY & DIVERSE POPULATIONS

**CHEWING FUNCTION IS ASSOCIATED WITH DEPRESSIVE SYMPTOMS OF JAPANESE FRAIL ELDERLY**  
M. Nishi<sup>1</sup>, S. Shinkai<sup>1</sup>, H. Yoshida<sup>1</sup>, Y. Fujiwara<sup>1</sup>, H. Murayama<sup>1</sup>, H. Amano<sup>1</sup>, N. Watanabe<sup>2</sup>, 1. *Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan*, 2. *Meiji Yasuda Institute of Life and Wellness, Inc., Tokyo, Japan*

**Background/Purpose :** With an aging population in Japan, the number of frail older adults is expected to increase as well. In addition, depression in older adults is also a serious problem, and the prevention of depression is an urgent issue. To address these problems, we examined the associated factors with depressive symptoms among frail elderly in Japan. **Methods:** We used data collected from a comprehensive health examination (aged  $\geq 70$  years) undertaken in 2005 within local areas in Japan. We used the Frailty Index which we developed (15-item Frailty Index, cut-off point 3/4) to screen the Japanese frail elderly and GDS-15 to assess depressive symptoms (cut-off point of 5/6). Chewing function was assessed by asking whether they are able to eat (chew) every foods or not. **Results:** Of 974 participants, 128 (13%) were evaluated as frail, and within the frail group, 52% were evaluated as depressed (16% in non-frail group). Among the frail elderly, there were no significant associations between age and depression and between sex and depression. Chewing function was significantly related to depression, using chi-square test (22% reported difficulty in chewing in depressed group and 8% in non-depressed group). Multiple logistic regression analysis showed that poor chewing function (having difficulty in chewing) was significantly associated with depression after adjusted for demographics, although physical performance and ability, history of disease were not significantly associated with. **Conclusions:** This finding suggested that it may be important to focus on chewing function for preventing depressive symptoms in frail elderly.

### COMPETING DEMANDS FOR SELF-MANAGEMENT OF DIABETES IN AFRICAN AMERICAN WOMEN CAREGIVERS OF PERSONS WITH DEMENTIA

C.S. Aaron, 1. *Menonite College of Nursing, Illinois State University, Normal, Illinois, Illinois*, 2. *University of Iowa, Iowa City, Iowa*

**Abstract** Charlene S. Aaron PhD (c) RN University of Iowa John A. Hartford BAGNC Archbold Scholar 2010-2012 Title- Competing Demands for Self-Management of Diabetes in African American Women Caregivers of Persons with Dementia Aim One: To compare the self-management of diabetes and glycemic control of older African American women with diabetes who have varying levels of dementia care intensity. Aim Two: To define the most difficult to perform self-management of diabetes activities for African American women who care for persons with dementia. Aim Three: To describe the relationship of time intensity of dementia caregiving with self-management of diabetes in older African American women. African Americans with chronic illnesses are at particular risk for worse health outcomes due to genetics, environment, income restrictions, and other barriers to healthcare, compared to Whites (Naples, Chahida, Eversley, & Moreno-John, 2010). There is a higher prevalence of diabetes in African American women as one in five African American women over age 55 has diabetes (ADA, 2011). In African American families, women juggle multiple responsi-

bilities and put their needs aside while prioritizing caring for the family. African American women prefer to care for their elder relatives at home rather than a nursing home. Because dementia care demands constant vigilance and can last up to 10 years, the intense caregiving may compete with the time allotted for self-management of diabetes. A cross-sectional descriptive design with a sample of N=50 African American women will quantify how African American women caregivers of persons with dementia maintain glycemic control.

### CHARACTERISTICS OF US EMERGENCY DEPARTMENT VISITS BY OLDER HOMELESS ADULTS: RESULTS FROM A NATIONALLY REPRESENTATIVE SURVEY

R.T. Brown<sup>1,2</sup>, M. Steinman<sup>1,2</sup>, 1. *University of California, San Francisco, San Francisco, California*, 2. *San Francisco VA Medical Center, San Francisco, California*

**Objectives.** Homeless adults age 50 and older experience premature onset of chronic illnesses and geriatric conditions, and use the emergency department (ED) at high rates. Although the proportion of the homeless population age 50 and older is increasing, little is known about use of health services among older homeless adults. **Methods.** To identify characteristics of ED visits among older homeless adults, we analyzed data from the National Hospital Ambulatory Medical Care Survey for 2005-2009, a nationally representative survey of visits to hospitals and EDs. We used sampling weights, strata, and clustering variables to obtain nationally representative estimates. **Results.** Homeless adults age 50 and older had 200,999 ED visits each year, accounting for 36% of visits by homeless patients. While demographic characteristics of ED visits (sex, race/ethnicity and geographic distribution) were similar in older compared to younger homeless adults, clinical and health services characteristics differed. Compared to their younger counterparts, older homeless adults had fewer discharge diagnoses related to psychiatric conditions (10% vs 20%,  $p=.002$ ) and drug abuse (7% vs 15%,  $p=.003$ ), but more diagnoses related to alcohol abuse (31% vs 23%,  $p=.03$ ). Older homeless adults were also more likely to arrive by ambulance (48% vs 36%,  $p=.02$ ) and to be admitted to the hospital (20% vs 11%,  $p=.003$ ). **Conclusions.** Older homeless adults have unique patterns of ED care compared to younger homeless adults. Health care systems need to account for these differences in use of the ED in order to meet the needs of the aging homeless population.

### POST-HOSPITAL MEDICATION RECONCILIATION IN OLDER CHINESE-AMERICAN HOME CARE PATIENTS: CORRELATION, PREVALENCE, AND FACTORS ASSOCIATED WITH POTENTIALLY INAPPROPRIATE MEDICATION AND MEDICATION DISCREPANCY

S.H. Hu<sup>1</sup>, E. Capezuti<sup>1</sup>, M. Boltz<sup>1</sup>, J.B. Foust<sup>2</sup>, 1. *New York University, New York, New York*, 2. *University of Massachusetts Boston, Boston, Massachusetts*

Studies of potential medication problems among older adults have focused on English-speaking populations in a single health care setting or a single potential medication problem. The aims of this study were to examine, in older Chinese-Americans: 1) the prevalence of both potential inappropriate medications (PIMs; 2002 diagnosis-independent Beers Criteria) and medication discrepancies (MDs); 2) the relationship between PIMs and MDs; and 3) the patient and hospitalization characteristics associated with them during the care transitions from hospital discharge to home care. This cross-sectional, retrospective study was conducted with a sample of 82 older Chinese-Americans admitted to a large home care agency following a hospital discharge. Twenty (24.3%) study participants had at least one PIM at hospital discharge. Fifty-one (67.1%) study participants had at least one MD. A positive correlation was found between the occurrence of a PIM and the occurrence of a MD ( $r=.22$ ,  $p=.05$ ), which supports evaluating the appropriateness of medications while reconciling inconsistencies in medication regimens. Logistic regression demonstrated that the number of medications was

the only significant factor associated with the occurrence of a PIM and a MD underscoring the need to address polypharmacy as a multifaceted safety threat. In addition, older age and longer length of hospital stay were associated with the occurrence of a PIM demonstrating the advisability of frequent, consistent medication reviews during the acute care stay and post-acute period. Future research should examine older Chinese-Americans' unique medication management problems, as well as potential barriers for medication reconciliation during care transitions.

#### **TYPES OF POTENTIALLY INAPPROPRIATE MEDICATIONS (PIMS) AND MEDICATION DISCREPANCIES (MDs) IDENTIFIED DURING MEDICATION RECONCILIATION AMONG OLDER**

S.H. Hu<sup>1</sup>, E. Capezuti<sup>1</sup>, M. Boltz<sup>1</sup>, J.B. Foust<sup>2</sup>, 1. *New York University, New York, New York*, 2. *University of Massachusetts Boston, Boston, Massachusetts*

Chinese-Americans are one of the fastest growing populations in the US; however little is known about the types of potential medication problems and potential barriers they experience when managing their medication during care transitions from hospital to home care. This cross-sectional retrospective study was conducted with a sample of older Chinese-Americans admitted to a large, urban home care agency after a hospitalization. Potentially inappropriate medications (PIMs) were identified by using 2002 diagnosis-independent Beers criteria. Medication discrepancies (MDs) were identified by comparing the differences between hospital discharge medication orders and home care admission medication orders. Eighty-two (34.7%) eligible older Chinese-Americans were enrolled; more than 80% of them reported low formal education levels (less than high school) and limited English proficiency. The majority of them (70%) lived with family members. The four most common PIMs are the long-term use of stimulant laxatives, overuse of ferrous sulfate, amiodarone use, and cyproheptadine use. The most common MD was a medication listed on home care admission orders but not listed at hospital discharge medication. Findings indicate that older Chinese-Americans are at risks for PIMs and MDs during care transitions. It is important to reconcile medications for their consistencies and appropriateness for the patient. The consideration of cultural and language support and the role of family members during care transitions should be emphasized in this population.

#### **LANGUAGE AND AGE EQUIVALENCE IN THE PATIENT-REPORTED OUTCOMES INFORMATION SYSTEM (PROMIS®) PHYSICAL FUNCTIONING ITEMS**

S.H. Paz<sup>1</sup>, K. Spritzer<sup>1</sup>, L. Morales<sup>2</sup>, R.D. Hays<sup>1</sup>, 1. *Medicine, UCLA, Los Angeles, California*, 2. *Group Health Research, Seattle, Washington*

**Objective** To evaluate the equivalence of the PROMIS® physical functioning item bank by language of administration (English versus Spanish) and age (50 or older versus younger). **Methods** The PROMIS® wave 1 English-language physical functioning bank consists of 124 items and 114 of these were translated into Spanish. The items were administered to 640 adult Spanish-speaking Latinos. Results Item means ranged from 2.53 (SD=1.36) to 4.62 (SD=0.82). Coefficient alpha was 0.99 and item-rest correlations ranged from 0.41 to 0.89. A one-factor model fit the data well (CFI=0.971, TLI=0.970, and RMSEA=0.052). IRT parameters ranged from "Are you able to run 10 miles?" (lowest slope) to "Are you able to put on a shirt or blouse?" (largest slope); and "How much do physical health problems now limit your usual physical activities?" (smallest category threshold) to "Are you able to run ten miles (16 km)?" (largest category threshold). Fifty of the 114 items were flagged for language DIF and 30 for age DIF based on an R-squared of 0.02 or above criterion. The expected total score was higher for Spanish than English-language respondents, and for those under 50 than for those 50 or older. Limiting the analysis to items without language DIF, revealed no items flagged for age DIF either. Conclusions English versus Spanish-speaking subjects and those 50 or older versus younger,

with the same level of physical function, respond differently to the PROMIS® physical function items. This study yields essential information about the equivalence of the physical functioning items in Spanish versus English as well as older versus younger individuals.

#### **SOCIAL SUPPORT, ACTIVITIES OF DAILY LIVING (ADL), AND DEPRESSION AMONG OLDER CHINESE IMMIGRANTS**

B. Kim<sup>1</sup>, L.B. Maradik Harris<sup>2</sup>, A. Liu<sup>2</sup>, 1. *School of Social Work, University of Hawaii at Manoa, Honolulu, Hawaii*, 2. *UCLA, LA, California*

**BACKGROUND:** Previous studies identified that the interrelation of social support and depression appears to be particularly relevant in older persons suffering impairment in ADLs. A theoretical model that specifies relationships among social support, depression, and ADL impairment components was examined. **METHODS:** Data from 187 Chinese elders, aged 60 years and over and lived in the Los Angeles County were analyzed for this purpose. Depression was measured by the GDS (Geriatric Depression Scale-Chinese Version) and socio-demographic characteristics were measured. Social support was measured by the Lubben Social Network Scale (LSNS). Also, the study used the Katz Index of ADL to measure ADL performance. **RESULTS:** The cross-sectional data were analyzed using covariance structure modeling techniques. Consistent with an initially theorized structural model, the number of close network members seen regularly was associated with perceived adequacy of support. In turn, perceived adequacy of support predicted less depression and less ADL impairment. The number of close network members seen regularly was also directly associated with less ADL impairment. **IMPLICATIONS:** The results of this study indicate the importance of the perceived adequacy of social support for health outcomes among older Chinese immigrants. Also, the study provides substantial empirical support for the design of social support interventions for older Chinese immigrants.

#### **THE INTERRELATIONSHIPS OF HEALTH LITERACY, PATIENT TRUST, AND PATIENT-PROVIDER COMMUNICATION AMONG OLDER ADULTS**

L.C. Gary<sup>1</sup>, R. Weech-Maldonado<sup>1</sup>, M.J. Miller<sup>2</sup>, L. Chen<sup>1</sup>, R.C. Outman<sup>1</sup>, M.N. Ray<sup>1</sup>, H. Coley<sup>1</sup>, K.G. Saag<sup>1</sup>, 1. *University of Alabama at Birmingham, Birmingham, Alabama*, 2. *University of Oklahoma, Tulsa, Oklahoma*

According to the Institute of Medicine, high quality health care should be safe, effective, timely, efficient, equitable and patient-centered care (PCC). One proposed factor in being an empowered patient who participates in PCC is health literacy. Research literature suggests that health literacy is necessary for understanding written medical information and engaging in successful disease management by the patient. In this study, we assess the role of patient health literacy in promoting PCC via communication and patient trust for older adults. Data (N=260) are from the Alabama NSAID Patient Safety Survey, Phase II: Disparities in Risk Awareness and Communication project. Data were collected via telephone survey of adults from 36 primary care practices. The dependent variables were perceived quality of patient-physician communication and patient trust using CAHPS measures. The primary independent variables were two standardized health literacy measures. Control variables included race, gender, and other variables. Generalized linear models were estimated that accounted for clustering of patients within physician practices using SAS 9.2. After multivariable adjustment, patient health literacy was associated with patient trust (B= -5.65; p<.05). Thus, lower health literacy is associated with lower patient trust (reverse coded). Non-Hispanic black race and advanced age (over 75 years) were also significantly associated with patient trust (B=5.46; p<.05 and B=7.01; p<.05). For the communication models, health literacy (confi-

dence completing medical forms) was associated with provider communication ( $B = -6.22$ ;  $p < .10$ ). Our findings on the impact of health literacy on communication and trust are important additions to the aging and health literacy research literature.

### **STUDYING OLDER AFRICAN-AMERICANS' PAIN PERCEPTIONS: THE CREATIVE ART OF A PHILOSOPHICAL FRAMEWORK**

S. Booker, *The Pennsylvania State University, State College, Pennsylvania*

Under-management of pain in African-Americans is well-documented, and growing evidence suggests that lack of knowledge and understanding of cultural and ethnic differences in perceptions of and beliefs about pain has led to disparate quality pain care in African-Americans. Although health literature has documented under-management of pain, nursing research has yet to comprehensively capture the continuum of cultural perceptions of pain or how this influences effective pain assessment and management. With the ever-increasing population of older minority patients, it is paramount that socio-cultural perceptions of pain are explored in order to reduce disparities and public health economic costs. Because older African-Americans describe, react to, cope with, and treat pain differently than other races, studying pain in older African-Americans requires an examination of their cultural history, teachings, and life experiences. A secondary analysis of a systematic literature review performed by the author on African-Americans' perceptions of pain and pain management revealed many theoretical gaps. Many older African-Americans have not been asked key questions into their beliefs of pain and pain management. It is evident that achieving optimal pain management is contingent upon thorough understanding on how older African-Americans perceive and treat the phenomenon of pain. To study the comprehensive realm of older African-Americans' pain perceptions, a philosophical approach to guide future pain science studies is proposed. This poster 1) presents known pain perceptions and beliefs held by African-Americans as identified by the literature review and 2) proposes an innovative philosophical framework for future study integrating aspects of anthropology, epidemiology, pathology, and genealogy.

### **RISK FACTORS OF HEARING LOSS AMONG MEXICAN AMERICANS AGED 65 TO 74 YEARS OLD**

Y. Joo, O. Hong, M.N. Haan, *UCSF, San Francisco, California*

**Introduction:** Hearing impairment with aging can be delayed, if we identify risk factors of hearing loss and provide early intervention. **Purpose:** To determine risk factors of hearing loss among Mexican American elderly population. **Methods:** A cross-sectional secondary data analysis was conducted using selected variables extracted from the large dataset of the Sacramento Area Latino Study on Aging (SALSA) dataset. A total of 476 aged 65-74 years who completed hearing tests were included in the analysis. Hearing measurement was done with pure-tone audiometry at frequencies between 250 Hz and 8000 Hz. Several factors including demographics, medical history, taking ototoxic medication, and occupational exposures were considered as risk factors of hearing loss. **Results:** The mean age of the participants was 70.7 years ( $SD = 2.7$ ) and more of participants were women (57.7%). Prevalence of hearing loss at low frequencies (.5-3kHz) and high frequencies (4-8kHz) were 78.9% and 97%, respectively. Male gender ( $\beta = -6.99$ ,  $p < .05$ ) and stroke ( $\beta = 4.27$ ,  $p = .011$ ) significantly predicted mean hearing thresholds at low frequencies (.5-3kHz), controlling for hypertension, diabetes, age, solvent exposure, noise exposure, history of taking any ototoxic medications. Male gender ( $\beta = -12.74$ ,  $p < .05$ ), diabetes ( $\beta = 3.12$ ,  $p = .043$ ), and age ( $\beta = .948$ ,  $p = .001$ ) significantly predicted mean hear-

ing thresholds at high frequencies (4-8kHz), controlling for other factors. **Conclusion:** Several factors were related to hearing loss. Further study with a large sample size of Mexican Americans is needed to validate the study findings. It is also important to incorporate these factors into interventions to reduce hearing loss.

### **EVALUATING THE EFFICACY OF VISUAL AIDS IN A Hmong HEALTH EDUCATION PROGRAM FOR BREAST AND CERVICAL CANCER SCREENING**

M. Lor, K. Moua, P. Khang, P. Xiong, *Nursing, University of Wisconsin-Madison, Madison, Wisconsin*

**Background:** Low education, low income, and limited English proficiency all contribute to low health literacy. Each of these health literacy risks applies to the Hmong population, particularly older Hmong, putting them at high risk for low health literacy and poorer health outcomes. Not surprisingly, older Hmong women have low rates of breast and cervical cancer screening. **Purpose:** To evaluate health education workshops guided by the Cuidandome model; use of visual aids (photographs, video clips) and hands-on models to promote understanding of the importance of breast and cervical cancer screening among older Hmong. **Method:** A total of six breast ( $n = 3$ ) and cervical ( $n = 3$ ) cancer screening educational workshops were conducted at three Midwestern community centers. Participants included 150 Hmong. Post workshop evaluations were conducted using focus groups and content analysis. **Results:** Healthcare education using visual aids and hands-on models were effective in improving understanding about breast and cervical cancer screening for low-literacy Hmong adults. Participants requested additional workshops and enjoyed learning about screenings. **Conclusion:** The study supports the use of visual aids and hands on models to improve health education for older Hmong and has implications for health education programs with other immigrant groups.

### **INTERDISCIPLINARY HEALTH CARE FACULTY DEVELOPMENT IN HEALTH LITERACY AND ETHNOGERIATRICS**

G. Yeo, M. Grudzen, N. Hikoyeda, M. Tzuang, C. Braddock, S. Berekyei, K. Hooper, *Stanford University School of Medicine, Stanford, California*

To assist health care faculty prepare students to meet the needs of increasingly diverse elders, funded by the Bureau of Health Professions, Stanford Geriatric Education Center trained 34 multiethnic faculty from 10 health-related disciplines in 19 universities from 12 states in an intense program in health literacy and ethnogeriatrics (HLE). In the summers of 2008 through 2010, between 8 and 12 faculty members a year participated in a 34 hour course over five days on the Stanford campus and then applied the knowledge, skills, and attitudes to develop new curriculum and research projects in their own training programs and communities. The eight module core curriculum was presented by a nine member multiethnic interdisciplinary faculty in a train-the-trainer format, supplemented by daily resource sessions and trainee led sessions. Evaluation by trainees included ratings before and after training as well as retrospective ratings after training of their pretraining knowledge, skills, and attitudes. For each of the eight modules, the change in self-rated knowledge, skills, and attitudes from both pre to post training and from retrospective pre to post training were all statistically significant at the  $p < .05$  level. With 5 being the highest, the post test ratings of all modules were over 4. Health Belief Attitudes also showed significant improvement. Mean ratings of usefulness for all modules were over 4.5. Trainee follow-up confirmed new HLE curriculum in 12 training programs, and 8 community-based ethnogeriatric projects.

## A COMMUNITY-ACADEMIC PARTNERSHIP PROGRAM ADDRESSING DISPARITIES IN MOBILITY AND DIABETES

G. Pariser, P. Gillette, K.K. Hager, *Bellarmine University, Louisville, Kentucky*

Current evidence suggests that much of the morbidity secondary to type 2 diabetes (T2DM) can be prevented by engagement in diabetes self-management behaviors, including exercise. Unfortunately, many aging adults with T2DM have co-existing chronic health conditions that affect their mobility and limit their capacity to exercise. The prevalence of co-existing chronic illnesses and mobility impairments is higher in African Americans with diabetes compared to whites; contributing to the complexity of promoting exercise and managing diabetes in this population. Most diabetes self-management education (DSME) programs rely on standardized exercise guidelines and do not include exercise or recommendations addressing participants' mobility and exercise limitations. Active Steps for Diabetes is a DSME and exercise program created to address this problem. It is a collaborative partnership between a city public health department, a university, a community health clinic, and involves various disciplines. Physical therapy, nursing, dietary, and clinical laboratory science faculty, clinicians, and students developed and delivered the program and conducted a clinical trial evaluating its effectiveness. The clinical trial included forty-seven African American subjects (62.6 + 10.5 yrs of age) who completed Active Steps for Diabetes and thirty-six subjects (20 African Americans and 16 Caucasians; 62.0 + 9.7 yrs) who completed a standard DSME program. Active Steps for Diabetes was more effective than the standard DSME program in increasing participants' exercise, cardiovascular fitness, balance and mobility, and improving their blood glucose control. This model program may be an effective method to improve health in medically complex minorities with T2DM.

## NURSING CARE MANAGEMENT OF BOSTON'S, ELDER HOMELESS WOMEN: CURRENT INSIGHTS AND FUTURE PLANS

M. Tanur<sup>1,2</sup>, R. Means<sup>1,3</sup>, J. Seaman<sup>1</sup>, B. Vitale<sup>1</sup>, N. DeFilippis<sup>1</sup>, K. Mills-Dick<sup>4</sup>, 1. *Women of Means, Wellesley, Massachusetts*, 2. *Boston University School of Medicine, Boston, Massachusetts*, 3. *Harvard University School of Medicine, Boston, Massachusetts*, 4. *Boston University School of Social Work, Boston, Massachusetts*

Although Bostonians founded the first Committee to End Elder Homelessness in 1991, homeless elderly women here are still the invisible, the most underprivileged of the underserved. "A risky game of musical chairs" is how some homeless women have described approaching the (re)housing search. Disrespect and red tape are significant barriers for homeless people of both genders seeking medical care. The Aging in Shelter Collaboration (ASC) serves to bridge the gaps between housing advocates, social workers, medical providers, shelter managers, discharge planners, mental health professionals, benefit managers, and (rarely) financial planners. As an integrative program, ASC coordinates the medical needs arising from chronic illness with housing searches and housing stabilization of this target population. With the encouragement of a "conierge" geriatric RN care manager, these marginally housed and previously housed women navigate through two complex systems – health care and urban housing. While this ASC has devised many conduits into sound medical care and some doors into long-term shelter options, the project still uncovers far too many duplications of pivotal services and resulting confusion. Eliminating these redundancies would result in better service to the target population at lower cost. This program has recently established a longitudinal registry which collects survival ADLs (activities of daily living), (re)housing markers, and progress of chronic diseases of participating elders. Given initial program outcomes and markers of success, ASC is embarking on a mixed methods formative evaluation to assess program effectiveness and service utilization, and enhance the transition of participating homeless elders to geriatric services once housed.

## SESSION 1355 (POSTER)

### NUTRITION, OBESITY, EATING DISORDERS & CALORIC RESTRICTION

#### NORMAL WEIGHT OBESITY AND CARDIOMETABOLIC RISK IN THE ELDERLY: DATA FROM NHANES III

J.A. Batsis<sup>1,2,3</sup>, K.R. Sahakyan<sup>4</sup>, V. Somers<sup>4</sup>, F. Lopez-Jimenez<sup>4</sup>, 1. *General Internal Medicine, Dartmouth-Hitchcock Medical Center, Lebanon, New Hampshire*, 2. *Dartmouth College, Hanover, New Hampshire*, 3. *Center for Health + Aging, Dartmouth College, Hanover, New Hampshire*, 4. *Mayo Clinic, Rochester, Minnesota*

Background: Current body mass index (BMI) strata likely misrepresent the accuracy of true adiposity in elders. Subjects with normal BMI with elevated body fat may metabolically have higher cardiovascular (CV) and overall mortality risk than previously suspected. Methods: Subjects aged  $\geq 60$  years with a BMI 18.5-25 kg/m<sup>2</sup> with anthropometric and bioelectrical impedance measures from National Health and Nutrition Examination Surveys III (1988-1994) and mortality data linked to the National Death Index were included. Normal weight obesity was classified in two ways: creation of tertiles with the highest %body fat; and using body fat cutoffs of  $>25\%$  in males and  $>35\%$  in females. We compared mortality rates with Cox-proportional hazard models. Base modeling adjusted for age, gender, smoking, race, diabetes, and BMI. Results were weighted using NHANES methodologies. Results: The final sample included 1,528 subjects, mean age 71  $\pm$  0.2 yr, median (IQR) follow-up was 12.9 yr (7.5, 15.3) with 859 deaths (47% CV). Subjects with normal BMI but high %body fat [n=368 (24%)] were classified as normal weight obesity and had higher hypertension rates (61 vs 49%; p<0.001), dyslipidemia (60 vs 45%; p<0.001), but not diabetes (10 vs 10%; p>0.05), than persons with normal BMI/normal body fat. Mean leptin (11 vs. 7 fg/L; p<0.001) and C-reactive protein (0.50 vs 0.40 mg/dL; p=0.02) were higher among those with normal weight obesity. Mortality was higher in normal weight obesity. By tertiles, normal weight obesity had higher risk of CV and overall mortality (HR 1.47 [95% CI 1.47:1.48] and 1.50 [95% CI 1.50:1.51]; both p<0.001). Results were unaltered after adjusting for waist circumference. Using pre-defined cutoffs, normal weight obesity portended a higher CV and overall mortality risk (HR 1.33 [95% CI 1.32:1.33] and 1.25 [95% CI 1.25:1.26]; both p<0.001). Conclusions: Normal weight obesity in the elderly is associated with cardiometabolic dysregulation and is a risk for CV and overall mortality independent of BMI and central distribution of fat. Our results highlight the importance of stratifying elders with normal weight according to fat content.

#### NUTRITIONAL STATUS IN OLDER MEXICAN AMERICANS AGED 75 YEARS AND OLDER

S. Al Snih, R. Samper-Ternent, T. Reistetter, M. Raji, K. Markides, K. Ottenbacher, *Division of Rehabilitation Sciences/Sealy Center on Aging, University of Texas Medical Branch, Galveston, Texas*

Objective: To examine the prevalence and factors associated with malnutrition among older Mexican Americans. Methods: 579 Mexican Americans aged 75 years and older from the Hispanic Established Population for the Epidemiologic Study of the Elderly interviewed in 2008. Measures included: sociodemographic, medical conditions, depressive symptoms, cognitive function, body mass index (BMI), muscle strength, short physical performance battery (SPPB), activities of daily living (ADLs), and the Mini Nutritional Assessment (MNA) Short Form. Results: Mean score of the MNA was 10.8 (SD=2.3). Eleven percent of the participants were classified as malnourished (MNA score < 8), 43.7 % were at risk for malnutrition (MNA score of 8 to < 12), and 45.0 % had normal nutrition status (MNA score  $\geq 12$ ). Multiple regression analysis showed that being female (OR=1.93; 95% CI=1.27-2.95), reporting some or great financial strain (OR=1.49; 95% CI=1.03-2.14), cardiovascular disease (OR=3.37; 95% CI=1.15-9.85), and ADL limi-

tations (OR=1.70; 95% CI=1.04-2.77), were associated with risk of malnutrition. Additionally, participants with high level of education and high performance scores for muscle strength and physical function were less likely to be at risk of malnutrition. Of the six components of the MNA, decline in food intake, weight loss during the last three months, psychological stress, and neuropsychological problems were the items that correlated best with the total MNA score. Conclusions: Risk of malnutrition is prevalent among older Mexican Americans and is higher among women than men. Financial strain, cardiovascular disease, and ADL disability were associated with risk of malnutrition.

### NEUROCOGNITIVE CONSEQUENCES OF GREEN TEA CONSUMPTION: A SYSTEMATIC REVIEW OF THE LITERATURE

J. Konopack, *Department of Health and Physical Education, Monmouth University, West Long Branch, New Jersey*

The protection derived from the consumption of non-oxidized *Camellia sinensis* (i.e., green tea) on cardiovascular disease is now widely recognized, and a growing body of literature further supports green tea consumption as protective against the formation and proliferation of various cancer types. Less well defined, however, is the extent to which green tea consumption by older adults confers any neurocognitive benefit, despite ample anecdotal support. To summarize the brain-specific benefits of green tea consumption relevant to an aging population, the current study involved a systematic review of original research published in English-language peer-reviewed journals between 2007 and 2012. To be considered for inclusion, articles must have been specific to *Camellia sinensis* (i.e., teas excluding herbal tisanes) and must have reported empirical data pertaining to brain structure or cognitive function (e.g., learning, executive control function, neurodegenerative disease, and changes to central nervous system morphology). Results yielded a robust and growing body of evidence for widespread neurocognitive benefits derived from green tea consumption in animal models – frequently attributed to exposure to epigallocatechin-3-gallate (EGCG) – but a paucity of research in humans, which has heretofore been generally limited to epidemiological studies. Implications for successful aging in humans abound but still require empirical support. This study provides a summary of the neurocognitive benefits of green tea consumption and underscores the need for methodologically sound investigations in humans, particularly randomized controlled trials among older adults.

### CHEWING AND SWALLOWING DIFFICULTIES AND THEIR RELATIONSHIP TO DEPRESSION IN RURAL OLDER ADULTS

R.A. Heuberger, T. Mann, *Central Michigan University, Mt. Pleasant, Michigan*

The objective of this study was to investigate the associations of chewing and swallowing dysfunction to nutritional status in depressed versus non-depressed older adults. In this cross-sectional study, a convenience sample of 1065 community-dwelling older adults was recruited in the rural Midwestern United States. Trained interviewers collected information on demographics, daily living, and diet. Classification of depression was determined by diagnosis of depression from chart review. In our sample, 141 were diagnosed with depression, 113 possessed chewing difficulties, and 51 had swallowing complications. Compared to the Dietary Reference Intakes, the study population was deficient in several nutrients. Significant associations were observed between nutrients and the co-morbidities examined. In depressed versus non depressed subjects, protein, carbohydrate, vitamin E, biotin, phosphorous, copper, manganese and fiber were significantly different between groups ( $p < .05$ ). In individuals reporting chewing difficulties, vitamins A and E, manganese and fluoride were significantly different from those without complaints ( $p < .05$ ) and for those with swallowing issues, vitamin K and zinc were significantly different ( $p < .05$ ). These results emphasize the importance of depression and chewing/swallowing difficulties

in modulating nutritional status in older adults. Practitioners working with this population should monitor these co-morbid conditions and suggest increased intakes of appropriate, nutrient dense foods to individuals at risk.

### INFLUENCE OF PROTEIN AND ENERGY INTAKE ON THE PREVALENCE OF SARCOPENIA: AN INVESTIGATION WITHIN THE BERLIN AGING STUDY-II (BASE-II)

J. Nikolov, E. Steinhagen-Thiessen, I. Demuth, M. Heinig, J. Sasse, N. Bucholtz, R. Eckardt, *Charité - Universitätsmedizin Berlin, Geriatrics Research Group, Berlin, Germany*

Introduction: Optimal protein supply evenly distributed over the day, positive energy balance and physical activity are the premise of an effective conservation or rise of skeletal muscles in adults and prevention of sarcopenia. The data were collected within BASE-II and included subjects of an older and younger cohort. Aim of the study was to determine the protein and energy intake, as well as the prevalence of sarcopenia of community-dwelling elderly people. Method: A total of 1002 subjects were analyzed ( $f = 73\%$ ,  $m = 36\%$ ) including 229 in the young cohort (20-35y) and 759 in the old cohort (60-83y). For the diagnosis of sarcopenia we used dual-energy X-ray absorptiometry (DXA) in order to determine the appendicular skeletal muscle mass. Macronutrients and energy intake were determined with the EPIC-FFQ questionnaire. Results: Prevalence of sarcopenia within the older group was 19.6% (females) and 24.6% (men). The BMI of sarcopenic subjects was significantly lower whereas protein intake was significantly higher. Also the energy intake of these subjects was obviously increased. For the skeletal muscle mass index (SMI) no significant difference between younger and older subjects could be observed. However, on average younger subjects took in more protein and energy than older ones. Conclusion: The seniors within this study have insufficient protein and energy intake. Sarcopenic subjects have an even higher intake. This leads to the conclusion that nutritional aspects may not prevent sarcopenia alone. Factors such as physical activity and timing of protein and energy intake should be considered additionally during further progress of the study.

### ASSOCIATION BETWEEN SNACKING AND GAIT SPEED AMONG OLDER AMERICANS

B. Xu<sup>1</sup>, C. Zizza<sup>2</sup>, *1. Peking University, Beijing, China, 2. Auburn University, Auburn, Alabama*

Few studies have studied the relationship between snack patterns and physical performance among older adults. This study examined the associations of snacking with physical performance among adults aged  $\geq 50$  y. Data was from National Health and Nutrition Examination Survey (NHANES) 1999-2002. Participants were classified by snacking frequency (0, 1, 2, 3,  $\geq 4$  snacks/d) and by the percentage of energy from snacking (0% to  $<10\%$ , 10% to  $<20\%$ , 20 to  $<30\%$ , 30% to  $<40\%$ ,  $\geq 40\%$ ). Physical performance was assessed by gait speed over 20-foot and knee extensor power. Multiple regression models controlling for potential confounders were used to assess the associations between snacking and physical performance. After adjusting for age, gender, race/ethnicity, education and smoking status, snacking frequency was positively associated with both gait speed ( $p$  for trend = 0.02) and knee extensor power ( $p$  for trend = 0.05). Those with higher snacking frequency had a faster gait speed ( $p = 0.03$  for both quartile three and quartile four versus quartile one) compared to nonsnackers. Those with HEI-2005 scores in quartile four had a greater knee extensor power compared to nonsnackers ( $p = 0.04$ ). The associations between snacking frequency and physical performance remained after further adjustment for co-morbidities, medication use, cognitive function and BMI. Both snacking frequency and percentage of energy from snacking are positively associated with physical performance among older adults.

## ASSOCIATION OF BODY MASS INDEX WITH QUALITY OF LIFE IN ELDERLY OVER 60

S. Oh<sup>1</sup>, W. Bae<sup>2</sup>, 1. *Seoul National University Hospital Gangnam Center, Seoul, Republic of Korea*, 2. *Seoul National University Bundang Hospital, Seoul, Republic of Korea*

**Background:** As the Korean population ages rapidly, more elderly are faced with health threats. The elderly obese population is also increasing. This study evaluates the relationship between body mass index (BMI) and health-related quality of life (HRQoL) in elderly. **Methods:** A total of 641 elderly over 60 randomly selected from welfare centers, health centers and university-based hospitals completed the questionnaires including the Korean version Medical Outcomes Study short-Form 36-Item Health Survey (SF-36) and social-demographic information. Height and weight were also measured. **Results:** Some scales of SF-36 of were lower in women and older age group. SF-36 scores by BMI quartiles; Q1 (15.4-22.4 kg/m<sup>2</sup>), Q2 (22.4-24.4 kg/m<sup>2</sup>), Q3 (24.4-26.2 kg/m<sup>2</sup>), and Q4 (26.2-39.8 kg/m<sup>2</sup>), showed difference in the physical function (PF) scale ( $P < 0.045$ ). The scores Q1 group and Q4 group were lower than the scores of other groups. **Conclusions:** BMI of elderly people was associated with Health-related quality of life (HRQoL) measured by SF-36.

## COMPARISON OF BODY FAT MEASUREMENTS BY BODY IMPEDANCE ANALYSIS (BIA) AND DUAL ENERGY X-RAY ABSORPTIOMETRY (DEXA) IN SUBJECTS OF THE BERLIN AGING STUDY II (BASE-II)

K. Wirth, D. Spira, V. Acker, N. Bucholtz, E. Steinhagen-Thiessen, R. Eckardt, *Charité Berlin, Berlin, Germany*

Obesity and visceral adiposity have become an increasing problem. In old people body fat is often underestimated because of weight loss due to malnutrition and sarcopenia. BIA and DEXA are popular methods in estimating body composition and are well investigated in middle-aged people but not in the elderly. The aim of the study is to examine the quality of these two methods in a sample of older subjects compared to young adults within the BASE-II-study. A total of 498 subjects were analyzed ( $w=331$ ;  $m=167$ ) including 114 ( $w=67$ ;  $m=47$ ) in the young cohort (22-35 y) and 384 ( $w=264$ ;  $m=120$ ) in the old cohort (62-83 y). BIA measuring was performed by multifrequent tetrapolar Nutriguard M-2000 from Data Input. DEXA was done by using Discovery from Hologic. Besides these two methods of body fat measuring anthropological data (weight, height, body circumferences) were taken. The body fat results measured by BIA and DEXA correlated highly ( $r=0.85$ ,  $p < .001$ ) but the results differ significantly. The discrepancy of the two measurements decreased in women with increasing body fat ( $p < .001$ ). The correlation of body fat measured by BIA or DEXA with BMI was higher in women than in men. Additionally the BIA measured body fat results correlated stronger with BMI and with WC than the DEXA measured body fat results. Neither BIA nor DEXA should be seen as gold standard method in measuring body fat yet because of a great difference in the measured values. Further research as well as age and gender specific reference data are necessary.

## THE RELATIONSHIP BETWEEN BODY WEIGHT AND QUALITY OF LIFE IN OLDER ADULTS WITH MEDICARE SUPPLEMENT INSURANCE

K. Hawkins<sup>1</sup>, F.G. Bottone<sup>1</sup>, S. Musich<sup>1</sup>, R.J. Ozminkowski<sup>1,2</sup>, Y. Cheng<sup>1</sup>, R.J. Migliori<sup>2</sup>, C.S. Yeh<sup>3</sup>, 1. *Analytics and Data Management, OptumInsight, Ann Arbor, Michigan*, 2. *UnitedHealth Group Alliances, Minnetonka, Minnesota*, 3. *AARP Services, Inc., Washington, District of Columbia*

**Research Objective:** To estimate the relative impact that each body mass index (BMI) category has on health-related quality of life. **Study Design:** The Medicare Health Outcomes Survey instrument was used, but renamed the Health Update Survey. **Population Studies:** A mail survey was sent to 60,000 adults with an AARP®-branded Medicare Supplement Insurance (i.e. Medigap) plan provided by UnitedHealthcare

Insurance Company (for New York residents, UnitedHealthcare Insurance Company of New York) in 10 states. **Principle Findings:** Casemix-adjusted comparisons were made between each BMI category versus those with normal BMI. 22,827 (38%) eligible sample members responded to the survey. Of those, 2.2% were underweight, 37.0% were overweight, 18.5% were obese, 1.9% were morbidly obese, 38.5% had a normal BMI. Factors associated with being underweight or overweight were generally consistent with past reports. Quality of life was assessed using the average physical component scores (PCS) and mental component scores (MCS) obtained from the VR-12 health status tool. Respondents' PCS values were 5.01, 0.16, 3.60 and 9.50 points lower on average, respectively, for the underweight, overweight, obese and morbidly obese BMI categories, compared to the normal BMI group. Respondents' MCS values were 3.28, +0.52, 0.32 and 1.39 points lower on average, respectively for the underweight, overweight, obese and morbidly obese BMI categories, compared to the normal weight group. **Conclusions:** The greatest impact on quality of life was on those in the underweight and morbidly obese categories, with the greater negative impacts were on the physical rather than mental aspects of quality of life.

## MALNUTRITION IN A SAMPLE OF COMMUNITY-DWELLING OLDER PENNSYLVANIANS

R. DiMariaGhalili, Y.L. Michael, A.L. Rosso, *Drexel University, Philadelphia, Pennsylvania*

**Objectives:** To evaluate the prevalence of malnutrition among community-dwelling older adults in southeastern Pennsylvania using the Mini Nutritional Assessment-short form (MNA-SF) and to analyze the distribution of nutritional status according to socio-demographic factors and participation in community-based programs. **Methods:** Telephone interviews were conducted using random digit dial with households in five counties in southeastern Pennsylvania. Older adults were over sampled and interviews were conducted in English and Spanish. 2932 adults (949 men and 1983 women) aged 60 years or older (mean age  $71.1 \pm 8.3$  years) were included in analyses. **Results:** 184 (6.3%) participants were malnourished, 1632 (55.6%) at risk, and 1116 (38.1%) normal based on the MNA-SF score. Compared to those with normal nutritional status, malnourished seniors were more likely to live in an urban setting (51.6% v 37.7%) and live below poverty level (14.1% v 3.6%) ( $p < 0.05$ ). 65.6% of malnourished participants reported difficulty with housing costs compared to 23.2% of normal participants ( $p < 0.05$ ). Malnourished older adults were as likely as normal older adults to report use of local senior nutrition programs (9.8% v 7.0%,  $p=0.4$ ). **Conclusions:** Female gender, living in an urban area, and lower socioeconomic status were associated with higher rates of malnutrition among community-dwelling older adults in southeast Pennsylvania. Prevalence of malnutrition was similar to other population-based samples of older adults. Interventions are needed to connect high-risk older adults with nutrition services.

## RELATIONSHIPS BETWEEN MOTIVATION FOR WEIGHT LOSS AND COGNITIVE-BEHAVIORAL INFLUENCES AMONG MIDLIFE AND OLDER RURAL WOMEN ENROLLED IN A WEB-BASED CLINICAL TRIAL FOR WEIGHT LOSS AND WEIGHT MAINTENANCE

P.A. Hageman<sup>1</sup>, J.R. Reed<sup>1</sup>, C. Pullen<sup>1</sup>, L.S. Boeckner<sup>2</sup>, P. Dizon<sup>1</sup>, B.C. Yates<sup>1</sup>, 1. *University of Nebraska Medical Center, Omaha, Nebraska*, 2. *University of Nebraska-Lincoln, Scottsbluff, Nebraska*

Assessing motivation for weight loss may identify those truly ready to make lifestyle changes. This study investigated the motivation for weight loss among rural women who committed to a 30-month web-based weight management clinical trial and examined the relationships between women's weight-loss motivations with 4 behavioral-specific cognitions (perceived benefits and barriers of action, self-efficacy and interpersonal support) supported by Pender's Health Promotion Model.

Baseline data were analyzed from 118 women (40-69 years; BMI 28.5 to 45) enrolled in a community-based randomized clinical trial, the Women Weigh-In for Wellness study. Women completed the Motivation for Weight Loss Scale (Meyer et al 2010), which rates 3 subscales (greater health benefits, appearance to others and appearance to self) from 1-4 with 4 indicating a higher level of motivation. Pearson correlations were calculated between motivational subscales and responses to validated surveys of perceived healthy eating and exercise benefits/barriers to action, self-efficacy, and social support (Sallis et al 1987, 1988; Walker et al 2006). Motivation for weight loss ranked highest for greater health benefits (M=3.7), and lower for improving appearance to self (M=2.9) or to others (M=1.7). Motivation to achieve health benefits was related to perceived benefits of and self-efficacy for healthy eating and exercise (all  $p < .007$ ); whereas the other subscales were related to benefits and barriers to action but not self-efficacy. Interpersonal support was not correlated with any of the weight loss motivational subscales. This information may prove helpful in informing the intervention adherence and outcomes for this population.

### **PAIN AND PAIN MANAGEMENT**

#### **PAIN AND DISRUPTIVE BEHAVIORS IN NURSING HOME RESIDENTS WITH DEMENTIA**

H. Ahn, A. Horgas, *University of Florida, Gainesville, Florida*

Approximately 40 – 80% of nursing home (NH) residents with dementia exhibit disruptive behaviors. Currently, psychoactive medications and physical restraints are the primary treatment modalities, but these treatments are associated with many side effects. Thus, alternative treatment approaches are needed. The purpose of this study was to determine if pain, as a potentially modifiable factor, contributed to disruptive behaviors in NH residents with dementia. Minimum Data Set (MDS) assessments from Florida NH residents (N = 56,577) were used to address this question. Participants had a mean age of 84 years (SD =  $\pm 7$  years), and the majority were female (67.7%), widowed (53.7%), high school graduates or less (72.4%), Caucasian (78.7%), and mildly or moderately cognitively impaired (54.8%). About 1/3 (36.9%) of the sample had pain and 9 – 30% had disruptive behaviors (wandering: 9%; aggression: 24%; and agitation: 30%). Pain was significantly negatively associated with all three disruptive behaviors. However, in the multivariate analyses controlling for cognition, health factors, and demographic variables, pain was negatively related to disruptive behaviors that were locomotion-based (e.g., wandering), but positively related with non-locomotive disruptive behaviors (e.g., aggression and agitation). The negative relationship between pain and wandering may reflect the fact that residents are reluctant to wander or move around when they have pain. In contrast, pain exacerbated aggression and agitation, and may reflect a means of expressing physical discomfort. These results suggest that effective pain management may help to reduce aggressive or agitated behaviors among nursing home residents with dementia, and may improve mobility.

#### **INFLUENCING FACTORS OF PAIN IN THE ELDERLY WOMEN**

Y. Lee<sup>1</sup>, S. Chang<sup>2</sup>, G. Kim<sup>3</sup>, *1. Nursing, Kangwon National University, Chuncheon, Kangwon-do, Republic of Korea, 2. Korea University, Seoul, Republic of Korea, 3. Seoul Women's College of Nursing, Seoul, Republic of Korea*

Purpose : The purpose of this study was to identify the factors that influenced the pain such as pain disability, depression, perceived stress, fatigue and social support in the elderly women. Method: Participants in the study were 208 elderly women at community settings in Korea. The data were collected by personal interviews using questionnaires and were analyzed using Pearson correlation coefficients, t-test, ANOVA,

and stepwise multiple regression with the SPSS/WIN 17.0 were used to analyze the data from survey questionnaires. Result: Pain in the elderly women showed a positive correlation with pain disability ( $r=.59$ ,  $p<.001$ ), depression ( $r=.49$ ,  $p<.001$ ) and fatigue ( $r=.48$ ,  $p<.001$ ), but a negative correlation with social support ( $r=-.28$ ,  $p<.001$ ). In addition, variables that predicted pain were pain disability, fatigue and social support (41.3%), especially pain disability was found to be a significant predictor of pain (34.5%) in the elderly women. Conclusion: The results of this study show that psycho-social factors like fatigue, depression and social support have the relationship and impact on pain in the elderly women. Therefore, it is important to consider psych-social factors as well as the pain itself in order to efficiently control the pain. in the elderly women.

#### **PAIN AND WORKING MEMORY: HOW FACTORS OTHER THAN AGE IMPACT COGNITIVE DECLINE**

J. Katschke, B. Follick, S.S. Ahmadpanah, K. Decollibus, M. Chaker, B.J. Cherry, *California State University, Fullerton, Fullerton, California*

Experienced physical pain is often thought of as only having corporal consequences. Contrary to this idea, research is beginning to explore other negative consequences of experienced pain. One area of interest is working memory, a domain of cognitive functioning responsible for short term storage and processing of information (Becker & Morris, 1999). While a decline in cognitive faculties has been associated with aging, some research suggests that pain might also play a vital role. A previous longitudinal study indicated that semantic and episodic memory performance was related to experienced chronic pain (Soderfjell, Molander, Johansson, Barnekow-bergkvist & Nilsson, 2006). Another study found that individuals experiencing chronic pain performed poorly on tests of processing speed which can be related to cognitive performance (Moriarty et al., 2011). Additional research has shown that pain experienced during performance on working memory tasks can impact encoding (Sanchez, 2011). The goal of this study was to explore the relationship between pain, age, and working memory performance. Participants consisted of younger adults (n =84), healthy older adults (n =48), and older adults diagnosed with fibromyalgia (n =61) who were administered a variety of cognitive assessments and a general health survey. Stepwise regression found that pain was the best predictor of cognitive performance, and once entered, age predicted no additional unique variance. These findings suggest that irrespective of age, higher levels of experienced pain can be indicative of cognitive decline. This identified relationship could provide additional information illustrative of the cognitive decline experienced in many chronic pain disorders.

## **SESSION 1365 (POSTER)**

### **DEATH, DYING, AND END OF LIFE CARE**

#### **HOW WE DIE: MEXICAN AMERICAN HOSPICE STANDPOINTS**

A.M. Gonzales, *Sociology, CSU-San Marcos, San Marcos, California*

There are currently 50 million Latinos in the United States who now comprise 16% of the American Population. Although Hospice care can alleviate suffering, it remains underutilized by Latino populations. Compared to the general American population, Latinos are especially less likely to use hospice despite evidence that they may actually have greater need for services. Compassionate care options are greatly needed, as race and ethnicity have been identified as important factors affecting end-of-life care and dying and how we die is a major public health issue. This ethnographic project is aimed to uncover Mexican American Hospice Standpoints on "How do we die?". The goal of this project is to reveal a richer understanding of the ground level, end-of-life experiences, standpoints, conditions, concerns, and needs of Latino families,

with emphasis on caregivers. I use a systematic participant observation methodology to uncover empirical knowledge centered in the “lived experiences” of Latino/Mexican families. Centering our understanding on the authentic experiences of Mexican families can give us valuable insights for knowing how to: target the needs and concerns of families, increase positive experiences with hospice, and expand future utilization by these and other Latino families.

### **STRATEGIES TO ENHANCE PARTNERSHIPS BETWEEN HOSPICE/PALLIATIVE CARE AND RESIDENTIAL PROVIDERS OF SERVICES TO OLDER PEOPLE WITH INTELLECTUAL DISABILITIES**

A.M. Kirkendall, *Social Work, University of Nevada Las Vegas, Las Vegas, Nevada*

Increasing development of partnerships between providers of service for people with Intellectual disabilities (IDs) and hospice and palliative care are occurring in an effort to respond to the needs of older people with IDs. There is a lack of clarity about how these organizations work together on shared staff roles, organizational philosophies, and policies. To provide effective care at life’s end for people who live in residential facilities an effective partnership between hospice/palliative care services and providers of residential services to people with IDs is essential. Utilizing qualitative methods (e.g. focus groups with providers) the purpose of this study was to identify next steps in building an effective partnership between a hospice and palliative care provider and a provider of services to people with IDs. Observations were made on the following: the intensity of the discussion, willingness of members to disclose information, and future points to follow up on. Codes were organized into the following areas: educational needs for staff, available and desired resources, and potential challenges. The data depicted the following strategies for enhancing the partnership between service providers for older people with IDs and hospice and palliative care specialists: 1) increasing an emphasis on relationship building, and 2) increasing the depth and frequency of educational trainings. Enhancing this partnership is the first step in providing hospice and palliative care to this population. Future research will evaluate the impact of hospice and palliative services on the quality of life for older people with IDs.

### **EXERCISING AUTONOMY AT THE END OF LIFE: DECISION-MAKING IN ASSISTED LIVING**

D. Dobbs<sup>1</sup>, A. Frankowski<sup>2,3</sup>, S. Zimmerman<sup>4,5</sup>, R. Perez<sup>2,3</sup>, M.C. Neme<sup>2,3</sup>, *1. University of South Florida, Tampa, Florida, 2. Center for Aging Studies, Baltimore, Maryland, 3. University of Maryland Baltimore County, Baltimore, Maryland, 4. University of North Carolina, Chapel Hill, North Carolina, 5. Sheps Center for Health Services Research, Chapel Hill, North Carolina*

One of the purported goals of assisted living (AL) is to encourage resident autonomy. The ability for AL residents to exercise choice related to their end of life health and long-term care decisions is central to that goal. This qualitative analysis examines end of life health and long-term decision-making among AL residents participating in either of two multi-year ethnographic studies where the combined samples consist of seven sites and over 600 coded documents. Using Atlas.ti version 6, an open coding strategy was used followed by axial coding to develop themes and subthemes. Four themes related to decision-making emerged from the data: 1) making end-of-life preferences known (e.g., advance care planning with family, completion of advance directives); 2) the decision to use aggressive treatments (e.g., chemotherapy) vs. comfort care (e.g., hospice) at the end of life; 3) proactive vs. crisis mode planning for long-term care transitions; and 4) the lack of autonomy in decision-making (subthemes of which were AL administrators as the decision-makers for who remains in the setting and family members as decision-makers for resident relocation). Although there were some data to indicate residents themselves are involved and planful about their end

of life health care and transitions, the data overwhelming support the fact that many residents and their families resorted to crisis mode planning because of an acute care episode. As the number of people dying in AL increases, these findings can promote proactive decision-making at the end of life.

### **CHRONIC ILLNESS, PALLIATIVE CARE AND PROBLEMATIC NATURE OF DYING IN INSTITUTIONAL SETTINGS**

K.I. Stajduhar<sup>1</sup>, G.H. Doane<sup>2</sup>, D. Bidgood<sup>3</sup>, E. Causton<sup>4</sup>, *1. University of Victoria - School of Nursing & Centre on Aging, Victoria, British Columbia, Canada, 2. University of Victoria - School of Nursing, Victoria, British Columbia, Canada, 3. University of Victoria - Centre on Aging, Victoria, British Columbia, Canada, 4. University of Victoria - Centre on Aging, Victoria, British Columbia, Canada*

Within Canada, and in much of the western world, dying from advancing chronic life-limiting illness is largely an institutional experience. Research has shown that there is much room for improvement in end-of-life care for older adults in acute care and residential settings, and yet after several years of education directed to improving quality end-of-life care, problems persist. We conducted a participatory action research study to gain a better understanding of the contextual and organizational factors that are influencing the provision of end-of-life care in various health care settings. Interviews with 65 health care professionals and intensive field work in acute and residential care revealed that current models of end-of-life care, based on cancer illness trajectories, may not be consistent with what is required to provide quality end-of-life care for those with advancing chronic life-limiting conditions. Reliance on traditional models of hospice palliative care by professionals in acute and residential care settings can create tensions between what is ideal and what can realistically be provided within the context of a generalist practice model. Conflicting perspectives of how and when to provide end-of-life care for this population and within these settings predominate, creating a sense that these settings are the “last best place to die”. Findings suggest that new models of care need to be considered to ensure that quality end-of-life care is provided, regardless of where people are dying in the healthcare system.

### **CHANGING THE CULTURE OF DYING IN LONG TERM CARE: HELPING FAMILIES COPE**

D. Waldrop, N. Kusmaul, *University at Buffalo, Buffalo, New York*

Losing a loved one is a life changing experience in any environment. The family members of nursing home residents often function as continuing caregivers, becoming “hidden patients” who experience reciprocal suffering as a loved one is dying. However, because nursing home care has historically been focused on residents, there is often a lack of recognition of and attention to family caregivers’ needs while a resident is dying. The purpose of this study was to explore caregivers’ views about what was most helpful and to describe what facilitated their coping with a loved one’s death. Caregivers received a letter inviting their study participation, two months after the resident’s death. In-depth interviews were conducted with caregivers from 25 families. Interviews involved open ended questions, were audiotaped with permission, transcribed and entered into Atlas ti software for qualitative data analysis. Transcripts were submitted to both open and systematic coding. A typology of factors emerged including those that helped and hindered coping. Helpful factors were: environmental, physical, medical, and psychosocial interventions. Hindering factors were: end-of-life indecision, routinized management of dying, limited knowledge of symptom management, and lack of awareness of terminality. The findings illuminate the importance of nursing home-based palliative care which focuses on the patient and family as a unit and aims to match care to patient goals. Moreover, they suggest the importance of palliative care in the nursing home culture change movement which focuses on the delivery of person-centered care, embraces flexibility, self-determination and uses the environment to its full potential.

## USING COMFORT CARE ROUNDS TO BUILD CAPACITY IN LONG-TERM CARE: AN EVALUATION

S. Kaasalainen<sup>1</sup>, K. Brazil<sup>1</sup>, M. Kelley<sup>2</sup>, 1. *McMaster University, Hamilton, Ontario, Canada*, 2. *Lakehead University, Thunder Bay, Ontario, Canada*

**Objective:** Comfort Care Rounds (CCRs) were initiated at two LTC homes in Ontario, Canada. CCRs are organized meetings of an interdisciplinary team that are held once a month for one hour in the early afternoon. They are case based and involve a review of the previous month's deaths and/or current residents who are dying with a particular focus on education and peer support for staff. The objective of this study was to conduct a process evaluation of the CCRs with the goal of assessing how they are currently being implemented, perceived outcomes, and barriers and facilitators to their implementation. **Methods:** This study used a qualitative descriptive design. Five focus groups were held with LTC staff (licensed nurses, personal support workers) and 10 interviews with other health care providers and administration. Data were analyzed using thematic content analysis. **Findings:** The overall impression was that the CCRs were helpful, beneficial, and educational with a perceived positive impact on resident care. Participants found the CCRs enhanced cross-disciplinary learning, increased team knowledge about palliative care strategies and resources. The challenges included issues related to taking the time to attend the meetings due to time constraints and difficulty accommodating various schedules. The need for more advertisement of the CCRs and continued support from management were recommended. **Conclusions:** This study highlights an innovative strategy to build capacity within LTC staff to improve the quality of care for residents who are dying. Future work is needed to evaluate the program using a more rigorous design with a focus on resident and family member outcomes.

## THE CULTURAL BIAS AGAINST LESS AGGRESSIVE PALLIATIVE CARE: CONSULTS VS. UNIT ADMISSIONS

L. Waters, C.L. Coogle, L.J. Lyckholm, J.B. Cassel, S.C. Hong, J. Cotter, *Virginia Center on Aging, Virginia Commonwealth University, Richmond, Virginia*

This presentation provides initial results from a study of decedents ( $n = 4327$ ) over a five-year period (January 2006 – August 2011) at a large public urban teaching hospital with a mixed patient population. Decedents from culturally diverse backgrounds (25.9%, 576/2228) were equally likely to be admitted to the Palliative Care Unit as White non-Hispanic decedents (28.2%, 591/2099),  $\chi^2(1) = 2.91$ ,  $p = .09$ . However, they were less likely to receive a palliative care consult (26.7% 595/2228) than White non-Hispanic decedents (30.3%, 637/2099),  $\chi^2(1) = 7.040$ ,  $p = .008$ ). The results of logistic regression analysis indicate that White non-Hispanics were 1.3 times more likely to receive a palliative care consult than decedents from culturally diverse backgrounds (OR = 0.79,  $p = .018$ ). While palliative care admissions are driven by the needs of patients with fewer resources and more complex family dynamics, consults are driven by patient advocacy. These results help illuminate the cultural bias against less aggressive care and suggest a greater need for cultural competence among patients, as well as providers. Access to community resources as a contributing factor to these results will be discussed.

## SESSION 1370 (POSTER)

### FRIENDSHIP, SOCIAL NETWORKS, AND SOCIAL SUPPORT

#### DEVELOPMENT OF A COMMUNITY COMMITMENT SCALE TO PREVENT ELDERLY SOCIAL ISOLATION IN URBAN AREAS

A. Kono<sup>1</sup>, Y. Kanaya<sup>1</sup>, E. Tada<sup>2</sup>, Y. Dai<sup>2</sup>, W. Itoi<sup>2</sup>, 1. *School of Nursing, Osaka City University, Osaka, Japan*, 2. *School of Nursing, Yokohama City University, Yokohama, Kanagawa, Japan*

The aim of the present study was to develop a community commitment scale (CCS) to prevent social isolation of elderly local volunteers

and general residents living in urban areas. A pilot test of 266 Japanese residents conducted to examine face validity identified 24 items, of which 12 items were selected for the CCS, based on a 4-point Likert-type scale. The CCS was developed via self-reported questionnaires to randomly sampled 859 local volunteers and 3484 general residents aged 55 years and above living in the urban areas of Japan. To assess criterion-related validity, data was collected using the Brief Sense of Community Index (BSCI; Peterson 2008) and two single questions on self-efficacy of caring for elderly neighbors. Item analysis, factor analysis, and Cronbach's alpha assessment identified the 8 items, which were classified under the domains "sense of belonging" and "sense of relationships" in the volunteers (cumulative contribution 0.54: alpha 0.75) and the residents (cumulative contribution 0.54: alpha 0.78). The correlation coefficients between the scores of CCS and BSCI were 0.54 for local volunteers and 0.62 for general residents. ANOVA analysis comparing the CCS between the confidence levels of the two types of self-efficacy questions on caring for elderly neighbors showed a large effect size (eta squared, 0.11–0.15) in the volunteers and residents. These results demonstrate the acceptable internal consistency and criterion-related validity of the CCS among the local volunteers and general residents in urban areas, and establish a relationship between community commitment and prevention of elderly social isolation.

## MUTUAL SUPPORT AMONG OLDER NEIGHBORS: DOES WHERE YOU LIVE MAKE A DIFFERENCE?

A.P. Glass, *University of Georgia Institute of Gerontology, Athens, Georgia*

Elder cohousing has recently emerged in the United States as an alternative housing option. Borrowing from the long history of such communities in Europe, elder cohousing communities are self-directed and purposefully designed to promote mutual support. In an effort to evaluate whether living in an elder cohousing community makes a difference in terms of mutual support, respondents in two different elder cohousing (COHO) communities were grouped together as one sample ( $n = 41$ ), and compared to a sample of elders living in a naturally occurring retirement community (NORC) in a large urban area ( $n = 34$ ). Both groups were predominantly female. The COHO sample was significantly younger than the NORC sample (mean ages of 71.8 and 78.2, respectively), and less likely to be widowed and to have children. Seven variables were examined, representing likelihood of giving to, receiving from, and asking for help from neighbors, based on a mutual support model. Significant differences (ranging from  $p = 0.000$  to  $p = 0.022$ ) were demonstrated on six items and on the scale mean scores (11.1 for COHO, 7.4 for NORC), with the COHO sample reporting greater likelihood. Regarding frequency of giving/receiving nine specific types of neighborly help, COHO respondents reported significantly more frequent help, ranging from  $p = 0.000$  for both lending and borrowing, to  $p = 0.047$  for receiving support with a personal problem. Results indicate that living in intentional communities, as represented by the COHO sample, can encourage mutual support. Implications for application and future research will be discussed.

## INTERGENERATIONAL RELATIONS AND LIFE SATISFACTION AMONG THE ELDERLY: A COMPARATIVE STUDY OF EAST ASIAN SOCIETIES

J. Lin, C. Huang, *Human Development and Family Studies, National Taiwan Normal University, Taipei, Taiwan*

Although there is abundant research on life satisfaction among older people, analysis of how social contexts, economic structures, and social policies affect the level of such satisfaction is insufficient, despite the importance of these factors. With a shared cultural background of strong filial piety, this study aimed to compare the changing intergenerational relations and examine the association between intergenerational relations and life satisfaction among the elderly in China, Japan, Korea and Taiwan as rapid populations aging is taken place in the region.

Inspired by the solidarity model, intergenerational relations are dictated by various components: living arrangements, intergenerational support exchange, and intergenerational filial norms. Data were derived from the 2006 East Asian Social Survey. Results show that in four East Asian societies, contemporary intergenerational relations reveal both the continuity and the change aspects. The co-residence between generations is clearly patriarchal and the main flow of intergenerational support remains to be from adult children to parents. The findings also show that the relations with adult children have effect on life satisfaction that depends on the aspect of the intergenerational relationship. Western studies have found that playing the giver's role increases life satisfaction of older people. However, the present study found that being mainly a recipient of support from adult children is related a higher level of life satisfaction among the elderly in East Asia. In addition, although extended family is culturally dominant in East Asia, the effect of co-residence with children on life satisfaction is not found except Korean elderly.

### **REDUCING ISOLATION AND LONELINESS IN VULNERABLE OLDER ADULTS: FINDINGS FROM A FRIENDLY VISITING PROGRAM EVALUATION**

L.A. Martin<sup>1,2</sup>, T.L. Nelson<sup>2</sup>, C. Coyle<sup>1</sup>, *J. Gerontology, Univ Mass Boston, Boston, Massachusetts, 2. FriendshipWorks, Inc., Boston, Massachusetts*

Literature suggests social isolation and loneliness endanger the psychological and physical well-being of older adults. Senior companion or "friendly visiting" programs seek to ease the isolation and loneliness often experienced by elders living in the community. Our evaluation of a Boston-based, volunteer-driven friendly visiting service sought to understand how this program alleviates isolation and loneliness among service recipients. Surveys administered to volunteers (n=66) and recipients (n=37) shed light on who participates in these types of programs and what benefits elders gain from their involvement. Program volunteers are assisting older adults who are living alone (95%), low-income (90%), and disabled (62%). The volunteers' support helps these elders remain independent: volunteers assist elders with errands outside the home (58%), support their medical needs (39%), help with home maintenance (33%), and advocate for elders when necessary (30%). Similar reports from the elders validate our finding that volunteers provide more than companionship to the older adult. The majority of volunteers and elders, however, consider the psychological and emotional benefits of the program to be the most important. Most volunteers (74%) believe the greatest support they provide for recipients is friendship/socialization. Every elderly respondent associated some positive life change to their program involvement. For example, they now have someone in their life they can count on (76%), they feel less lonely (62%), and they feel more connected to the outside world (51%). Overall, the friendly visiting program is relieving loneliness, decreasing social isolation, and enhancing the quality of life for vulnerable, disadvantaged elders.

### **"MEN DON'T TALK": EXAMINING THE DYNAMICS OF MEN'S CORESIDENT RELATIONSHIPS IN ASSISTED LIVING**

Y.P. Paye, C.L. Kemp, M. Ball, M.M. Perkins, *Georgia State University, Atlanta, Georgia*

Women outnumber men in later life, especially in assisted living (AL), where the ratio is three to one. This gender imbalance often leads to the feminization of AL settings and affects men's social experiences, particularly their coresident relationships. AL research consistently demonstrates the significance of these peer connections to resident well-being and suggests that gender is highly influential. Yet few studies have specifically examined men's social experiences in these settings. The present analysis aims to: (1) learn how men experience coresident relationships in AL; and (2) identify the factors shaping these peer relationships. The analysis utilizes qualitative data collected between 2009

and 2010 in two AL settings differing in size, location, fees, and resident characteristic as part of a three-year, mixed-methods, NIA-funded project examining social relationships in AL. Data collection involved participant observation and informal and formal in-depth interviews with residents, care staff, and administrators. Analysis was informed by principles of Grounded Theory Method and shows men's coresident connections to be highly variable. Interactions occurred most with tablemates and activity "buddies", a few of whom were friends. A range of individual- and facility-level factors promoted or constrained relationship development. Men's health, marital status, and gendered beliefs (e.g., "Men don't talk"), for example, structured men's social engagement. At the facility-level, organized activities (e.g., their gendered-nature) and staff members' gendered assumptions (e.g., men prefer to sit together) often influenced men's social lives. Ultimately, coresident relationships are consequential for men in AL and we conclude by offering strategies to improve their social experiences.

### **LIFE SATISFACTION AND SOCIAL SUPPORT FROM MIGRATED AND NON-MIGRATED ADULT CHILDREN IN RURAL CHINA**

J. Sun, A. Mui, *Institute of Gerontology, Renmin University of China, Beijing, China*

According to China's national statistics, there are over 200 million workers migrating from rural to urban areas in China, leaving behind large numbers of aging parents in their rural hometowns. Based on the survey of older parents conducted in Henan and Guizhou provinces of China in 2009 (n = 653), the aim of this study is to explore the differences between support (financial, instrumental and emotional) from adult migrated children and non-migrated children as well as the effect of adult children's support on aging parents' life satisfaction. Findings show that the non-migrated adult children, especially sons and daughters-in-law, play the primary roles as caregivers for their older parents in daily life. Results indicate that life satisfaction of aging parents improved significantly after their adult children's migration from their hometowns although they received a lower level of instrumental and emotional support from these children. Regression results show that higher financial support from migrated children is an important factor in explaining the higher level of life satisfaction of their parents when compared to life satisfaction levels of the aging parents of non-migrated children. The findings indicate that the older Chinese whose adult children have migrated out from rural areas felt more satisfied in life because of their improved financial well-being. As for the aging parents of non-migrated children, their higher level of life satisfaction is associated with higher level of instrumental and emotional supports from their non-migrated children. Implications for life satisfaction research and practice for elders in China will be discussed.

### **COMPARISON OF THE DIFFERENCES IN INTERGENERATIONAL SUPPORT OF MARRIED CHILDREN IN TAIWAN FOR THEIR AGED PARENTS AND PARENTS-IN-LAW**

C. Huang, J. Lin, *Human Development & Family Studies, National Taiwan Normal University, Taipei, Taiwan*

The traditional Chinese family has long been characterized as patrilineal. It means that sons are expected to provide financial support to elderly parents and married daughters should take care of their husbands and families. However, is the relationship of married daughters with their parents changing in an era nowadays in which the educational level of women is increasing, the employment rate is improving and possess more personal resources? This study takes married children as the subject to analyze the difference in their intergenerational support for their aged parents and parents-in-law. This study uses data from the "2007 Panel Study of Family Dynamics". In this study, only married children who have at least one parent and one parent-in-law of 60 years old or more were analyzed (N=666, married sons=379, married daugh-

ters=287). The result of the study shows that in terms of intergenerational financial support flow directions, adult married children are still more likely to offer support to their parents and parents-in-law. More than half of the married adult children provide financial support to their parents and parents-in-law. The study also finds that the similarity factors affect the married sons and daughters in the provision of financial support for their parents and parents-in-law. Generally, the personal resources that a married child possesses are the major factor that affects the determination of giving support to aged parents and parents-in-law.

### **THE SOCIAL RELATIONSHIPS OF AGING MOTHERS OF DAUGHTERS WITH SEVERE MENTAL ILLNESS**

J. Balestrey, L.A. Chadiha, R. Dunkle, B. Ingersoll-Dayton, *University of Michigan, Ann Arbor, Michigan*

Purpose: Supportive social relationships are critical to an aging mother when she faces challenges associated with her own care needs and with assisting an adult child who has severe mental illness. This study explored the supportive relationships among aging mothers of severe mentally ill adult daughters. Design and methods: We used both qualitative and quantitative data obtained in personal interviews with a purposive sample of 22 aging mothers (52-90 years old) assisting severe mentally ill adult daughters. Quantitative methods were used to describe attributes of support network size and composition. Drawing upon Miles and Huberman's (1994) work, we used a single-case and a cross-case content analysis approach to analyze qualitative data on social relationships between mothers and network members. Findings: All aging mothers reported close social relationships with support network members; 18 of 22 mothers reported severe mentally ill adult daughters as network members; networks' size ranged from 2-14 members; kin predominated over non-kin as network members. Mothers reported receiving and giving both emotional and instrumental support to network members; support exchange patterns included mothers giving and receiving network support (bidirectional exchanges) and mothers giving more support than receiving support from network members (reciprocal asymmetrical exchanges). Implications: Findings suggest that interventionists working with aging mothers who assist adult daughters with a severe mental illness should assess for the mothers' supportive social relationships as a resource; interventionists should also attend to the mothers' reciprocal asymmetrical support exchanges with network members because they may engender feelings of network burden.

### **EXPLORING MEANINGS AND EFFECTS OF OLDER KOREAN PARENTS' TEMPORARY VISIT TO THEIR ADULT CHILD AND HIS OR HER FAMILY LIVING IN THE UNITED STATES**

S. Jin, *University of Minnesota, Twin Cities, Falcon Heights, Minnesota*

Studies have consistently shown that an increasing number of older parents are asked to visit their child and child's family living in the U.S. and suffering from psychological stress. However, research that directly explores the meanings and effects of these visits is sparse. Addressing that gap, this study examines the meanings and effects of the visit on improved mental health among older parents, child, and child's family. To investigate the visit's meanings and effects, the qualitative study utilized face-to-face, in-depth interviews with Korean older parent visitors and their families: 12 older parents living in their home country and visiting their child in the U.S. and 11 adult children and 8 adult spouses living in Minnesota. Each interview was digitally audio-recorded and transcribed verbatim in Korean. Grounded theory was employed to analyze the data. Analysis of the interviews revealed two primary meanings of the visit by Korean older parents to their child and child's family: (1) cares for family and (2) extension of the meaning of family. Moreover, the analysis revealed two primary effects of the visit on older parents, child, and child's family: (1) improvement in relationships among parents, child, and child's spouse and (2) increase

in emotional stability. These findings suggest that intervention programs aimed at coping with acculturative stress among immigrant families should consider mobilizing visits of older parents to their families. Further, specialized programs or policies should consider assistance in stays of older parents during their visit.

### **THE GETTING ILLINOIS LOW INCOME SENIORS AND PEOPLE WITH DISABILITIES ONLINE SUSTAINABLE BROADBAND DEMONSTRATION PROJECT: EVALUATION FINDINGS**

J.R. Ciesla, P. Yao, S.F. Spear, A. Yusiphov, *School of Nursing and Health Studies, Northern Illinois University, DeKalb, Illinois*

It is generally accepted that computer and Internet use have great potential to enhance access to important information and reduce social isolation among older adults. The digital divide is particularly deep and wide among low income, less well-educated, and minority seniors. The purpose of this research is to present the findings of an evaluation of a National Telecommunication and Information Agency (NTIA) Sustainable Broadband Adoption (SBA) Broadband Technology Opportunity Project (BTOP). The project targeted approximately 3,000 Northern Illinois residents in a network of 23 low-income multi-family senior housing facilities. The goal was to get the residents engaged in regular and sustained computer and Internet use. The project provided the residents with a comprehensive program for computer engagement which included: individualized computer training, permanent access to subsidized computers, technical support, and free Internet access. The project was evaluated by independent university-based researchers. A broad set of measures were put in place to track project outcomes. This research presents the pre-post changes in several of those outcomes including: computer skills, interest in Internet applications, frequency of Internet use and social isolation as measured by the Lubben Social Network Scale (LSNS). Findings include increases in a wide-range of skills and interests (via standardized Wilcoxon coefficients ranging from 2.07-5.13;  $p \leq .05$ ), increased computer use frequency, and an increase in LSNS scores (24.9 percent,  $t=80.18$ ;  $p=.000$ ).

### **LIVING ALONE IN KOREA: THE EFFECT OF SOCIAL SUPPORT ON ALCOHOL CONSUMPTION AND DEPRESSION**

S. Kim<sup>1</sup>, H. Jun<sup>1</sup>, J.I. Wassel<sup>2</sup>, *1. Yonsei University, Seoul, Republic of Korea, 2. The University of North Carolina Greensboro, Greensboro, North Carolina*

As a super-ageing society, Korea faces challenges with increasing number of Korea elders who reside alone. Changes in Korean culture have resulted in producing a new high-risk group, the elderly Korean as the sole household member. Specifically, Korean elders living alone tend to have fewer social supports and higher levels of depression. Reduced level of social support may lead to alcohol consumption to relieve depressive symptoms and combat feelings of isolation. However, the long-term relationship of social support, depression, and alcohol use by Korean elderly residing alone is not well understood. This study examines the effect of social support on Korean elder's alcohol use and depression using longitudinal data from Korean Welfare Panel Study, 2006-2009 (N=649 single household adults, aged 65+). Using parallel process Latent Growth Model, we find that elderly Koreans, living alone with higher levels of tangible support reported higher initial levels of depression, but across time decreased alcohol use. However, elderly Koreans living alone with strong social networks (size) were found to have lower initial levels of depression and across the 4-year period steeper decreases in depression. The findings support the necessity to understand the influence of social support for elderly Koreans residing alone in a super-ageing society that is experiencing rapidly changing social and family norms. This study will offer the potential to identify elderly Koreans who are at risk and in the development

of preventive measures against alcohol abuse, and thus improve social resources for older Koreans who live alone.

### THE IMPACT OF FAMILY NETWORK ON MENTAL HEALTH AMONG ELDERLY WIDOWS IN TAIWANESE

C. Chen, J. Lin, *National Taiwan Normal University, Taipei, Taiwan*

In the past few decades, Taiwan had experienced steadily declining fertility and increased longevity expectation. Social relations affect the ability of individual to age well, and western researchers have proposed a number of explanations for how social network helps elderly widows cope with bereavement. However; just like most Chinese; Taiwanese who hold the idea “Chinese Familism “ prioritizing family over the social relationships is especially noticeable. Therefore, this paper examines the impact of family network in mental health among the elderly widows in Taiwan. The data come from the longitudinal Survey of Health and Living Status of the Elderly in Taiwan. The analysis is based on 371 widows who have at least one child, were in their first to third year of widowhood and aged 60 or above at the time of their first interview. Findings of the study indicate: 1. Using multiple dimensions of network in a latent transition analysis, family network among the elderly widows comprise four distinct patterns: daughters-dependend family network, relatives-connected family network, son-dependend family network, and family-detached family network. 2. The four family networks among the elderly widows are quite stable pre- and post-bereavement. 3. Depressive symptoms were found more among the elderly widows in the family-detached family network or son-dependend family network than in the relatives-connected family network. Results suggest that the connection of relatives is one mechanism through which family network types affect mental health. Suggestions have also been given to compare earlier findings in Western and Taiwanese families.

## SESSION 1375 (POSTER)

### HEALTH CARE AND THE ELDERLY

#### SHORT-TERM SELF-RATED HEALTH CHANGES AND MORTALITY AMONG THE OLDEST-OLD

E.M. Vogelsang, *Center of Demography and Ecology, University of Wisconsin Madison, Madison, Wisconsin*

Existing research that controls for or examines associations between self-rated health (SRH) and mortality often operationalizes SRH as a simple two- or five-category indicator of general health status. This may be problematic since there are strong theoretical reasons to believe that both observed and perceived SRH changes may help explain or modify associations between SRH and death. For example, elderly who report “poor” health and have experienced or report a health decline may be at a higher risk of mortality than those experiencing more consistent morbidity. This study examines whether two measures of short-term SRH change have relationships with elderly mortality. I estimate mortality using Gompertz proportional hazard models and data from the oldest-old portion of the Health and Retirement Study over 13 years. I found that a retrospectively reported decline in health independently increased the hazard of mortality. I also found that those who reported “excellent”, “very good”, or “good” self-rated health and displayed a SRH improvement since the prior wave had a greater hazard of dying than those in the same categories that did not improve. Lastly, this study indicates that elderly reporting “poor” health and also showing a SRH deterioration had a greater hazard of death than those that were consistently “poor”. These findings imply that omitting measures of SRH change may result in spurious associations between SRH and mortality. In addition, the results indicate that seniors with more volatile health may be at a greater risk of death than those whose health remains relatively stable.

### EXAMINING PAIN AND MENTAL DURESS AMONG OLDER ADULTS IN PRISON: INTERDISCIPLINARY INFORMED RESPONSES

M.E. Morrissey<sup>1</sup>, T.M. Maschi<sup>1</sup>, K. Morgen<sup>2</sup>, *1. Fordham Graduate School of Social Service, West Harrison, New York, 2. Centenary College, Hackettstown, New Jersey*

Background: The literature on aging prisoners has documented serious physical and mental health problems among this population. However, a largely overlooked area is aging prisoners’ experiences of multidimensional pain and mental duress, and what role if any coping resources play in mitigating them. Therefore, the purpose of this study was to build on the existing literature examining the relationship between pain, coping resources, and mental duress from life course, social ecological and public health perspectives among a sample of older adult prisoners. Methods and Findings: This study used a cross-sectional correlational design and anonymous mailed survey administered to a sample of 632 New Jersey state prisoners aged 50 and older. Path analysis was used to determine the relationship between pain (# pain days per past month), coping resources (Coping Resources Inventory), and mental duress (Brief Symptom Inventory-Global Severity Index). The hypothesized path model (with all parameters freely estimating) adequately fit the data, ( $\chi^2=20.75, df=4, p=.00, CFI=.98, RMSEA=.08(.05-.12)$ ). Pain significantly influenced coping resources ( $\beta=-0.44, p<.001$ ) indicating an inverse relationship between pain and coping resources, and coping resources significantly influenced mental duress ( $\beta=-0.80, p<.001$ ) indicating an inverse relationship between coping resources and mental duress. Implications. The complex physical and mental health needs of older prisoners present unique challenges that demand public health strategies that will reduce pain levels, and prevent and relieve types of pain that lead to persistent suffering among older prisoners. Interdisciplinary, informed responses will help to improve access to critical assessment and intervention services for these most vulnerable older adults.

### DETERMINANTS OF THE AVAILABILITY OF SOCIAL SUPPORT FROM FAMILY, NEIGHBORS, AND FRIENDS AMONG OLDER PATIENTS

J. Ha<sup>1</sup>, G.W. Hougham<sup>2</sup>, K. Cagney<sup>2</sup>, D. Meltzer<sup>2</sup>, *1. Seoul National University, Seoul, Republic of Korea, 2. University of Chicago, Chicago, Illinois*

Objectives: Gerontologists have long been interested in the ways that the composition of social network changes as people age. One of the key propositions of socioemotional selectivity theory is that as people age, they tend to focus on closer relationship to fulfill their emotional needs. However, little is known about the determinants of the availability of social support from different sources among older adults suffering from health problems. This study examined the effects of age, gender, race, and previous history of hospitalization on the availability of support from family, neighbors, and friends. Methods: Analyses are based on a sample of 137 older patients (aged 65+) admitted to an academic medical center hospital. A 9-item version of Lubben’s Social Network Scale was developed and used to assess the availability of support from different sources. Results: Preliminary results suggest that old-old respondents report marginally lower levels of available support from family and significantly higher levels of support from neighbors than young-old respondents, although total levels of support are not markedly different by age. White respondents reported significantly higher levels of support from friends than other racial minorities. Conclusions: Findings suggest that neighbors may be more salient than other sources of support among the oldest-old patients, possibly indicating a “support substitution” process is operative. In light of well-documented older adults’ preferences for aging in place, this finding may have relevance when designing new community-based support programs for older adults.

## BEING A STANDARDIZED TEST ADMINISTRATOR IN AN ACUTE GERIATRIC SETTING

K. Krohne<sup>1</sup>, S. Torres<sup>2,1</sup>, ÅSHILD. Slettebø<sup>3,1</sup>, A. Bergland<sup>1</sup>, 1. *Oslo and Akershus University College of Applied Sciences, Oslo, Norway*, 2. *Uppsala University, Uppsala, Sweden*, 3. *University of Agder, Grimstad, Norway*

In assessing geriatric patients' functional status, health care professionals use a number of standardized tests. The validity and diagnostics of such tests have been subjected to comprehensive research, but qualitative research illuminating the perspective of the standardized test administrator is lacking at present. The administering of a standardized test may influence test results – results which may have an impact on the level of care provided to the older patient. The objective of this study was to explore the experiences of occupational therapists and physiotherapists administering standardized tests. Drawing on seven months of fieldwork and observations of 26 test situations, interviews were performed with 14 physiotherapists and occupational therapists administering standardized tests on two acute geriatric hospital wards in Norway. Interview data were analysed with Systematic Text Condensation and supported with theory on relational competence. The analysis illustrates (i) how physiotherapists and occupational therapists decide which patients to test, (ii) what strategies they use for promoting a sense of security in the test situation, (iii) how patient stress is avoided, and (iv) how the patient's test performance is contextualized after the test. Our findings suggest that the test situation generates a tension between what standardization demands and what individualization requires. In handling this tension the health care professionals use their relational competence to reach and maintain individualization. This study illustrates how individualized adjustments are implemented. We suggest that these findings should be explored in future research because it has implications for the delivery of high-quality and user-friendly geriatric care.

## UNINSURANCE AMONG PRERETIREMENT ASIAN AMERICANS: IDENTIFYING THE ROLE OF SOCIAL AND CULTURAL CONTRIBUTORS

D. Nguyen<sup>1</sup>, S. Choi<sup>2</sup>, S. Park<sup>1</sup>, 1. *New York University, New York, New York*, 2. *University of Tennessee, Knoxville, Tennessee*

**Study Aim:** The United States demographic profile is changing rapidly due: an aging society, and the growth of racial/ethnic minority populations. Social policies ensure near universal insurance coverage for Americans over 65, but the pre-retirement age cohort is susceptible to gaps in coverage. This is especially true for Asian American pre-retirees who are constrained by social and cultural forces, yet are underrepresented in the empirical literature. This study investigates the effects of Asian ethnicity and type of employment on the insurance status among pre-retirement Asian Americans. **Methods:** Data from the 2007 California Health Interview Survey (CHIS) on Chinese, Filipino, Korean, and Vietnamese, aged 50-64 were analyzed. Any period of uninsurance in the previous year was used as the outcome variable in the weighted logistic regression models, while Asian ethnicity, employment type, and percent life in the U.S. were key independent variables. **Results:** This study found that ethnicity, employment type, and length of residence in the U.S. are significantly associated with being uninsured among pre-retirement Asian Americans. Separate logistic regression model specific to employment type (unemployed, self-employed, employed by public/private firms) revealed a moderating relationship between ethnicity and employment type. Even though Koreans were more likely to be uninsured across employment domains, the difference was greatest among people who were employed at public/private sectors. **Conclusion:** Intergroup variations and the differential effects of time in the United States on insurance status have broad implications within an evolving health care environment. Implications for addressing health disparities and social stratification are discussed.

## BENEFICIARY-CENTERED ASSIGNMENT FOR DUALY ELIGIBLE MEDICARE BENEFICIARIES ENROLLING IN PART D PRESCRIPTION DRUG PLANS: IMPACT AND IMPLICATIONS

C.E. Bishop, C. Thomas, *Heller School for Social Policy and Management, Brandeis University, Waltham, Massachusetts*

Health outcomes for older adults dually eligible for both Medicare and Medicaid can depend on the match between their prescription drug needs and the formularies of the low-income subsidy (LIS) Part D prescription drug plans they enroll in. Alone of all the states, Maine dual beneficiaries are initially assigned to Part D LIS plans based on the prescription drugs they are taking. Like all duals, they may then choose to switch plans. We analyzed Medicare Part D enrollment data, beneficiary characteristics including diagnoses derived from claims data, and outcomes measured using claims for the New England States. We compared plan of initial enrollment, enrollment after plans moved above benchmark, switching behavior and hospitalization outcomes for dually eligible beneficiaries in Maine and New Hampshire, where the same LIS plans are offered. Beneficiaries with lipid disorders, depression, hypertension and arthritis were differentially enrolled in certain LIS plans as Part D began, and were less likely to switch out of them over the course of the first year. Maine duals were more likely to switch when their plan lost benchmark status. New Hampshire beneficiaries also sorted themselves differentially into plans according to diagnoses, so the impact of beneficiary-centered assignment may be marginal. Implications for health status including hospitalization are difficult to observe over a relatively short time frame.

## PATIENT KNOWLEDGE OF PATIENT CENTERED MEDICATION LABEL AMONG OLDER ADULTS

S. Hong, *Pharmaceutical Sciences, University of Tennessee Health Science Center, Memphis, Tennessee*

**Objectives:** Inadequate knowledge of medication use leads to inappropriate medication use that greatly compromises quality of life among older adults. This study aims to determine the extent of patient knowledge concerning patient-centered contents of medication labels (PCCML) and whether the level of patient knowledge is associated with health outcomes. **Methods:** A survey was administered to members of 6 senior centers in Memphis, TN. Surveys from older adults (65 or older) who were taking at least one medication were included in the current analyses (N=287). Patient knowledge of PCCML was measured on a set of 4 Likert-type scale items. Quality of life was measured using EQ-5D and Visual Analogue Scale (EQ-VAS). **Results:** Study participants scored on average 16.20 (SD=3.41) for knowledge of PCCMLs. Patient knowledge of PCCML was associated with age ( $r = -0.146$ ,  $P=0.012$ ), race/ethnicity ( $F=4.40$ ,  $P=0.013$ ), education ( $r=0.198$ ,  $P=0.001$ ), and household income ( $r=0.153$ ,  $P=0.015$ ). Study participants had an average EQ-5D score of 0.821 (SD=0.162) and EQ VAS score of 77.80 (SD=15.07). One unit increase in patient knowledge resulted in 0.62 unit increase in quality of life ( $P=0.017$ ) in terms of EQ-VAS score after adjusting for the impact of other variables. **Conclusion:** Patient knowledge of medication use was associated with quality of life among older adults. New standardized labels should be designed to emphasize the patient-centered label content. Further, providers of medication therapy management should ensure that older adults have a complete knowledge of the patient-centered medication label information.

## PREDICTORS AND OUTCOMES FOR REHOSPITALIZATIONS TO THE SAME OR DIFFERENT HOSPITALS

H. Kim, *Seoul National University, Seoul, Republic of Korea*

This study examined the impacts of patient, hospital, and community factors on and outcomes of rehospitalizations to a different facility. Using the 2006 California State Inpatient Dataset, we identified 509,775 patients aged 50 or older who had been discharged alive from

acute care hospitals between April and September 2006, and examined their rehospitalizations within 1 month of their index discharge. We categorized patients by whether or not they were rehospitalized at the same hospital from which they had been discharged. Descriptive statistics and multi-level, multivariate logistic regressions models were used. Among a total of 509,775 patients discharged alive from their index hospitalization, 13.6% (n=69,220) were rehospitalized, 22.1% of whom comprise the different-hospital-readmission group (n=15,180). Compared to the patients rehospitalized at the same facility, those rehospitalized to a different facility were more likely to be non-white and low-income patients; and the hospitals of their index admissions were more likely to be profit hospitals and those located in communities with fewer primary care providers. The different-hospital-readmission group was more likely to have in-hospital death and another readmission within 1 month of the first readmission. This study shows that index-hospital and community as well as patient characteristics affect rehospitalization to a different facility, which was associated with negative patient outcomes. Rehospitalization to a different facility may imply more fragmented care than rehospitalization to the same facility, about which further research is needed.

### **CHRONIC DISEASE AND DISABILITY: LONGITUDINAL ANALYSIS OF MCBS DATA**

H.B. Degenholtz, S.E. Hardy, Y. Kang, *University of Pittsburgh, Pittsburgh, Pennsylvania*

The impact of population aging will be felt by society in the increased number of elderly with chronic disease and physical disability. While recent policy changes that emphasize Accountable Care Organizations and Patient-Centered Medical Homes hold out the promise of improving the management of chronic disease, the impetus of these programs is mainly to prevent expensive hospitalizations. Although a worthy goal, the link between chronic disease and disablement holds important promise for reducing the demand for long-term care services and supports. Previous studies have examined the association between various chronic conditions and disablement in terms of basic and instrumental activities of daily living. We sought to examine whether people with chronic disease in a given year have a higher burden of disability during the following calendar year. In addition to IADL and ADL, we constructed a measure of general difficulty in walking, bending and lifting that has been found to be predictive of higher health care expenditures and mortality. Our data are from the Medicare Current Beneficiary Study, a nationally representative longitudinal panel survey conducted by the Centers for Medicare and Medicaid Services. Analysis of data from the Cost and Use files from years 2005 and 2006 revealed a higher burden of disability among elderly Medicare Beneficiaries who had chronic kidney disease, chronic obstructive lung disease, diabetes, and depression. We conclude that efforts to improve chronic disease management may prevent or delay disability.

### **SESSION 1380 (POSTER)**

#### **HEALTH PROMOTION**

#### **THE RE-AIM ASSESSMENT OF A TRANSLATIONAL PROGRAM OF SQUARE-STEPPING EXERCISE BY VOLUNTEERS**

R. Shigematsu<sup>1</sup>, T. Okura<sup>2</sup>, M. Nakagaichi<sup>3</sup>, *1. Faculty of Education, Mie University, Tsu, Mie, Japan, 2. University of Tsukuba, Tsukuba, Ibaraki, Japan, 3. Nagasaki University, Nagasaki, Nagasaki, Japan*

There are very few researches trying to translate an exercise intervention program developed in the laboratory setting into a community setting. We had developed a new exercise program named Square-Stepping Exercise (SSE) for elderly persons. The aim of this study was to translate SSE in a community setting and to evaluate its external validity. Study participants were 101 (experimental group: EG) and 27 (cross-

validation group: CG) SSE leaders living in Shima and Tsu cities (Japan), respectively. EG had a two-year experience or more in providing SSE for community elderly dwellings. In contrast, CG had only a one-year experience. Questionnaire was provided each participant and they reported their volunteer activities performed in a previous year. Among 1,646 (Shima city) and 864 (Tsu city) elderly dwellings who had been provided SSE, 90.2% (Shima) and 99.9% (Tsu) of them could perform the SSE program (P = 0.09). The major SSE efficacies were "fitness improvement," "communication," and "brain cognition" in both groups. The adoption in a setting level was considered 100%. About the adoption in an agent level, many groups consisting elderly dwellings accepted SSE (90.0% vs. 95.5%, P = 0.99). Nineteen long-term SSE classes were held in Shima city and 3 classes in Tsu city. Participants in the classes got much efficacy such as "fitness improvement," "brain cognition", and "fall prevention." It could be implicated that SSE and its efficacies are robustness and high translatability and provide significant public health impact in a community setting.

#### **TRENDS IN THE CANADIAN INDEX OF WELLBEING FOR OLDER ADULTS FROM 1994 TO 2010**

B. Smale, *Leisure Studies, University of Waterloo, Waterloo, Ontario, Canada*

The Canadian Index of Wellbeing (CIW) provides unique insights into the quality of life of Canadians, both overall and in eight specific domains that matter to wellbeing: our standard of living, the quality of our environment, our health, our, the way we use our time, the vitality of our communities, our participation in the democratic process, and our leisure and culture. Unlike GDP which only measures economic progress, the CIW is designed to measure and compare wellbeing across a wide spectrum of life domains and for a variety of subgroups within the population, including older adults. The purpose of this paper is to report on trends in the wellbeing of older adults in Canada between 1994 and 2010, and compare them to national trends to identify gaps and illustrative patterns. Following a comprehensive review of literature on the relationships between aspects of each domain and wellbeing, a conceptual framework was developed to guide selection of valid and reliable indicators reflecting the degree to which each contributed to Canadians' wellbeing. Drawing on over 15 years of national survey data, trends in each domain and in overall wellbeing were tracked to illustrate where Canadians 65 years of age and older are making progress or falling behind. These trends were then compared to national trends in wellbeing. Results indicate how the CIW can assist in the development of social policies that ensure older citizens have equal access to opportunities and experiences that enrich and contribute to their health and wellbeing.

#### **NUTRITIONAL STATUS OF CARE-DEPENDENT PEOPLE WITH DEMENTIA IN SHARED-HOUSING ARRANGEMENTS - RESULTS FROM A ONE-YEAR FOLLOW-UP STUDY IN GERMANY**

S. Meyer, J. Grä s ke, A. Worch, K. Wolf-Ostermann, *Alice Salomon University of Applied Science, Berlin, Germany*

Objectives: People in elderly care and/or people with dementia often have a high risk of malnutrition. They can no longer use the cutlery or often forget to eat. The concept of shared-housing arrangements (SHA) addresses this dilemma. The nursing concept is organized around doing household tasks like preparing meals together. But there is a lack on findings concerning a possible positive impact on residents' nutritional status. Methods: In a longitudinal study with a one year follow-up the nutritional status as well as health outcomes of residents of SHA were evaluated. Standardized face-to-face interviews were conducted concerning the nutritional status (BMI, MUST and MNA), activities of daily living (Extended Barthel Index), cognitive impairment (MMSE), and quality of life (ADRQL) as well as other socio-demographic characteristics of 104 residents from 36 SHA in Berlin/Germany. Results: Res-

idents are mostly female (73.1%) and have an average age of 79.0 years. The majority has a dementia syndrome (87.0%) and shows a low to moderate cognitive functioning (mean MMSE 11.5) According to MNA, 16.4% have an adequate nutritional status, 14.5% are malnourished and 69.1% show a risk of malnutrition. According to MUST, 2.4% of all residents have a high risk, 9.6% a medium risk and 88.0% a low risk of malnutrition. Nutritional status, cognitive impairment and activities of daily living from the residents decrease within one year. Conclusion: The prevalence of malnutrition in SHA is slightly lower than in traditional residential care facilities. Nevertheless a constant supervision of residents nutritional status is essential.

### **BODYWEIGHT, LIFESTYLE BEHAVIORS, TYPE 2 DIABETES AND HEART DISEASE AMONG FOREIGN BORN OLDER ADULT VIETNAMESE AMERICANS**

T. Nguyen, T. Tran, N.A. Allen, K.T. Chan, H. Lee, *Boston College, Chestnut Hill, Massachusetts*

**Objective.** This study used data from the 2009 California Health Interview Survey (CHIS) to examine the associations of bodyweight, lifestyles, and demographic variables with self-reported type 2 diabetes and self-reported heart disease among foreign-born adult Vietnamese aged 50 and older. **Method.** The 2009 CHIS consisted of 709 foreign-born older adult Vietnamese Americans aged 50 to 85. Logistic regression analysis via Stata 12.0 was performed to examine the associations of the selected variables with type 2 diabetes and heart disease. Two-way interaction effects were examined with alcohol consumption, vegetable consumption, psychological distress, poverty, and length of living in the US with type 2 diabetes and heart disease. **Results.** Analysis revealed that 13% of respondents had type 2 diabetes and 11% had heart disease. Body Mass Index (BMI)  $\geq 24$ , age  $\geq 65$  and female gender were significantly associated with type 2 diabetes. The interaction effect of alcohol consumption and psychological distress with type 2 diabetes was also significant. Finally, the interaction of vegetable consumption, poverty, and length of living in the US were observed to have significant associations with heart disease. **Conclusion.** The results highlight the impact of BMI, age, sex, alcohol consumption, vegetable consumption, psychological distress, poverty and length of on type 2 diabetes and heart disease among older Vietnamese Americans. Future research can target the development of culturally-specific interventions for this population.

### **MID-LIFE AND OLDER AFRICAN AMERICAN "HEALTH CHAMPIONS": AN IDENTIFICATION PROCESS**

J. Lemacks<sup>1</sup>, P.A. Ralston<sup>1</sup>, I. Young-Clark<sup>1</sup>, C. Coccia<sup>3</sup>, J. Ilich-Ernst<sup>1</sup>, K.K. Wickrama<sup>2</sup>, C.M. Harris<sup>4</sup>, C.W. O'Neal<sup>2</sup>, *1. Center on Better Health and Life for Underserved Populations, Florida State University, Tallahassee, Florida, 2. University of Georgia, Athens, Georgia, 3. Texas A&M University, Kingsville, Kingsville, Texas, 4. Florida A&M University, Tallahassee, Florida*

Midlife and older African Americans (AA) have the highest prevalence for cardiovascular disease (CVD) which can be modified with lifestyle changes including improving diet, increasing physical activity (PA) and decreasing stress. Although there is a wealth of literature on community-based approaches to improve health in AAs, sustainability of health programs and adherence to health behavior change are ongoing issues. Health Champions (HCs) or participants who enter (StartChamps) or achieve (ChangeChamps) desired behavioral and clinical outcomes could serve as health models and advocates within community-based settings. The purpose of this pilot study was to identify HCs in a study examining the effectiveness of a church-based intervention to reduce CVD risk in mid-life and older AAs. The sample included 72 participants (including 28 in clinical subsample) who completed at least one of two data collection phases (baseline/6 months). HCs were selected using a systematic methodology. Selection criteria included at least 30 minutes/day of PA and top percentiles for fruit/veg-

etable servings  $\geq 3$  (25th percentile), stress score  $\geq 20$  (50th percentile), and low/medium dietary fat perception (25th percentile) or fat habit score  $\geq 0.8$  (25th percentile). Of the 72 participants, 7 met selection criteria at baseline (StartChamps) and 11 others met criteria at 6 months (ChangeChamps). Six HCs from the clinical subsample were used to cross reference behavioral data with Framingham Risk Scores. This study highlights a process to identify mid-life and older AAs with desired behavioral and clinical outcomes. Implications for future research and use of HCs in intervention development will be provided. Funded by NIH Award 5R24MD002807.

### **AWARENESS ABOUT HIV/AIDS AMONG OLDER AFRICAN-AMERICAN MALES**

O. Macklin, C. Corley, *School of Social Work, California State University Los Angeles, Los Angeles, California*

This study examined male African-American older adults' perceptions of HIV/AIDS and their susceptibility. It further identified their lack of awareness of HIV/AIDS prevention services that may be exacerbating the pandemic. A qualitative study of 27 men in Los Angeles primarily over the age of 45, who reported being in committed relationships, was conducted in 2010. Results indicate that the participants are generally aware of what HIV/AIDS is and how it is transmitted. Participants largely were able to identify high-risk groups as LGBTs, substance users, and younger people. Yet most were not getting tested for HIV/AIDS, did not practice "safe sex", and felt being excluded from one of the high risk groups mentioned previously reduced their risk of contracting it. Additionally, being religious and in a committed relationship were also factors which influenced participants' perceptions about their reduced vulnerability. Implications for education and sensitivity to diversity are addressed.

### **A VIRTUOUS CYCLE OF HEALTH MAINTENANCE AND RESILIENCE OF LOW INCOME ASIAN FEMALE OLDER ADULTS: FOCUSING ON THE TAILORED HEALTH MAINTENANCE PROGRAM PARTICIPANTS**

B. Hwang, *Social Welfare, Pusan National University, Busan, Republic of Korea*

Ageism, sexism, and poverty have continued to be three big challenges to Asian old women, particularly those who depend their living expenses on their adult children. And the concept of active aging or the behavior of pursuing good health status is neither feasible nor sustainable to many Asian poor old women. The purpose of this study is to explore what factors enable those people to pursue to improve their health status under the negative social cultural economic circumstances, and to expand the theory and concept of active aging, which reflects both the cultural and gender issues. 300 "Tailored Health Maintenance program" participants and 200 non-participants were surveyed and those data were analyzed based on Propensity Score Matching analysis (PSM). In-depth interview with 10 participants was also conducted to enquire into the details. The findings are as follows: firstly, those with high level of resilience, particularly with strong motivation part, tend to pursue to maintain their health, secondly, group support among participants reinforces the behavior of health maintenance; lastly, the program participants tend to address more actively not only their health needs but also social and economic needs.

### **THE EFFECTS OF RELIGION ON MORTALITY AMONG OLDER ADULTS IN WIDOWHOOD**

H. Kim, *College of Social Work, Florida State University, Tallahassee, Florida*

<Purpose> Recent studies showed that religiousness could decrease negative effects of widowhood on the well-being of older adults. Available studies, however, rarely consider the interaction effects between religion and widowhood on older adults' health. Therefore, this study

examines the effects of religion on mortality among older adults in widowhood, especially focusing on the interaction effects of religion. <Methods> This study used the HRS RAND dataset. The study sample was limited to 9,956 older adults age 65 and over who provided available information. Mortality is a dependent variable. Widowhood was measured by marital status. Religion was measured by religious participation and importance. Models controlled for demographic and socioeconomic factors. The binary logistic regression analysis was performed. <Results> The odds ratio of widowhood was 1.97, that is, the widowed older adults tend to be 1.97 times more likely to die than the married older adults. Older adults who were more often participated in religious services had lower risk of mortality (odds ratio .862). Older adults who considered religion more important had higher risk of mortality (odds ratio 1.17). The moderating effects of participation in religious services between widowhood and mortality were significant. Female respondents with higher levels of health status had lower risk of mortality. <Implications> The significant interaction effects between widowhood and religion could suggest that the widowed elderly can more effectively lower their risk of death through religious activities than married ones. This also implies that geriatric care and church-based social services need to focus more on widowed older adults.

## SESSION 1385 (POSTER)

### HOUSING AND TRANSPORTATION

#### PROVIDING LEADERSHIP IN THE NONPROFIT SECTOR WHILE BUILDING COMMUNITY CAPACITY IN RURAL SETTINGS: THE BENNETT VILLAGE EXPERIENCE

B.M. Elias, *Family and Community Social Services, University of Guelph/Humber, Caledon, Ontario, Canada*

The changing nature of volunteerism is having a dramatic impact on the non profit sector. It is generally understood that communities are strengthened when volunteers give time and money to organizations. Many nonprofits are struggling to attract highly skilled board members to maximize social impact. This leadership challenge will only become more acute in the coming years. (Tierney, T. 2010) Bennett Village Board members have a vision to expand services for an older and increasingly frail population and this paper will explore how they approached capacity building in their rural community. Methods Quantitative and qualitative methods were adopted by the Board of Directors who carried out an environmental scan, literature review, and numerous site visits to learn about promising programs. Highlights will be shared with conference participants along with a communications package that includes: questions for interviews and focus groups, consent forms and a facilitator's guide for the community consultations. Interviews with various stakeholders and six focus groups were conducted, data collected and analysed. Social accounting methods will be explained to calculate the economic value of the volunteer time committed. (Mook, L. & Quarter, J. 2004) Findings This paper shows how capacity is enhanced by the contribution of about 8,000 volunteer hours as a social output or about \$160,000 towards the design of an integrated service model. Conclusion The relevance of this research relates to the ongoing training and support necessary for Boards to lead the non profit sector.

#### AN ANALYSIS OF STAKEHOLDER PERCEPTIONS OF OLDER ADULT IMPAIRED DRIVING IN RURAL COMMUNITIES

D.C. Wihry, L.W. Kaye, J. Crittenden, *University of Maine, Orono, Maine*

Access to transportation is critical in supporting mobility and quality of life in older adults. In rural areas where transit options for older adults are limited, it is particularly important to explore community-driven solutions to address the issue of safe driving among older adults.

This presentation examines perceptions of a convenience sample of community members (N=30) on the issue of impaired driving gained through focus groups and surveys conducted in a rural county in the state of Maine: a state that is 9th in the nation in percentage of drivers over the age of 65 and 4th in the nation in percentage of fatalities involving 65+ drivers. Among key findings, respondents primarily perceived impaired driving as resulting from physical impairments (46%), chemically induced impairments (43%), cognitive impairments (29%), and unsafe behaviors (14%). Respondents perceived desired methods of intervention for impaired drivers centering on increased vision, hearing, and cognitive screening as well as written and road testing for older drivers (52%). Respondents assigned responsibility for addressing impaired driving among older adults to government (74%), health care workers (52%), as well as friends, family and neighbors (56%). Research will highlight respondent recommendations for particular targeted interventions, as well as preferred forms of stakeholder involvement, education, and supports for older drivers. Recommendations for stakeholder-driven solutions for addressing older adult impaired driving in rural areas will also be synthesized from a national comparative analysis of existing qualitative and quantitative research on the topic.

#### FATAL ACCIDENTS DESCRIBED BY AGE, GENDER, AND PHYSICAL ENVIRONMENTS IN CALIFORNIA, 2010

C. Lee, E. Dugan, *University of Massachusetts Boston, Boston, Massachusetts*

Background: Older drivers tend to be safe drivers, however when in a crash the risk for serious injury or death is elevated. The purpose of this study is to determine what individuals' characteristics (i.e., gender and age) and physical environments (i.e., road type) are related to fatal car accidents among older people in California (CA), 2010. Methods: The Fatality Analysis Reporting System (FARS) dataset, administered by National Highway Traffic Safety Administration (NHTSA), was used to analyze fatal accidents in CA, 2010. Fatal accidents involving older people age 65 and older was selected. Descriptive statistics were conducted to identify the frequency of fatal accidents. Results: There were 415 fatal accidents among older people and 531 older people involved those fatal accidents in CA, 2010. From those fatal accidents, there were 378 (71.2%) drivers and 153 (28.8%) non-drivers. Older male drivers (70.6%) involved much greater fatal accidents than older female drivers. Older drivers (65 to 74) were involved in a greater number of fatal accidents than other age groups (75 to 84; 85+) (51.6%, 35.7%, and 12.7% respectively). About 60.6% of fatal accidents happened on major highways or state highways. Also, the majority (96%) of fatal accidents occurred at an intersection. Discussion: Results showed that older male drivers are more likely than older women to be involved in fatal accidents and most fatal accidents occurred at intersections. Interestingly, fatal accidents appear to happen more on major highways than local streets in CA. Further research is needed.

#### MESO- AND MACRO-LEVEL SOCIAL PREDICTORS OF DRIVING BEHAVIOR AMONG OLDER ADULTS

K. Barton, E. Dugan, *Gerontology Department, McCormack Graduate School of Policy and Global Studies, University of Massachusetts Boston, Boston, Massachusetts*

Older drivers take more trips and drive more miles than previous cohorts of older adults, estimated to drastically increase in the coming years. Although older drivers, on average, are safe drivers, fatal crash rates increase starting at age 75—substantially increasing after age 80 (per mile traveled). Several sociodemographic and mental and physical health variables have been identified as predictors of altered driving behavior among older adults; however, fewer studies have comprehensively explored social factors that may influence driving behavior. The purpose of this paper is to explore the impact of both meso- and macro- level social factors on driving behavior—guided by the Ecological Model. This study uses 2006 data from the Health and Retirement

ment Study (HRS)—a longitudinal, nationally representative survey conducted biannually. The analytic sample included N=3909 adults (55.9% female) age 65 or older (M=74.1). Current driving behavior was defined as whether respondents had driven in the past month. Logistic regression analyses revealed that—controlling for selected sociodemographic and mental and physical health variables—greater neighborhood physical disorder (i.e. vandalism/graffiti, rubbish/litter, crime, vacant/deserted houses) predicted increased likelihood of current driving activity (OR=1.12, p=.02). Additionally, social integration (degree of embeddedness in social networks) was significantly related to driving activity, where attending meetings or programs of groups/organizations two or three times per month (compared to never) was associated with an increased likelihood of recent driving behavior (OR=1.53, p=.05). Findings from this research can be used to better understand ways to promote continued safe driving or cessation from unsafe driving.

### THE DESIGN OF A GRAPHIC REPRESENTATION OF BUS ROUTE INFORMATION

W. Chen, S. Chang, *Department of Transportation Management, Tamkang University, New Taipei, Taiwan*

The bus information sign at a bus stop is a basic and important means for providing bus users with necessary transportation information (e.g., bus route information). If bus route information at a bus stop is insufficient, bus passengers may have problems finding the bus route(s) and bus stop(s) required to reach their destination(s). In contrast, if too much information is provided in a disorganized manner, bus users will have difficulty selecting the correct bus route among many confusing options. A well-designed multi-route bus map is therefore an important factor in helping users navigate the transportation system. In this study we presented and evaluated multi-route bus information in different design formats. Because older adults often rely on buses for transportation, and they may have age-related physical limitations, their feedback in relation to the newly-designed route information and information services was considered. Several design suggestions for a multi-route bus map were generated on the basis of the survey and test results.

### UNDERSTANDING THE FACTORS THAT IMPACT THE PLANNING AND DEVELOPMENT OF SUSTAINABLE HOUSING AND COMMUNITIES FOR OUR AGING SOCIETY

A. DeLaTorre, *Institute on Aging, Portland State University, Portland, Oregon*

This poster will detail the findings from a case study in Portland, Oregon that sought to understand how and why various factors impacted the planning and development of sustainable, affordable housing for older adults. The findings are based on primary data collected for a dissertation that included 31 key-informant interviews with experts in fields connected to the planning and development of housing for older adults. A framework for sustainable development for an aging society will be presented, which includes: (1) connecting appropriate housing, transportation and land uses; (2) expanding green building practices to include variations across age and ability; (3) focusing on social equity; (4) creating long-term economic strategies; (5) valuing community assets throughout the life course; and (6) fostering access to community and health services. This framework will be used to explore policies that affect the planning and development of sustainable housing and the communities to which they are inextricably linked. More specifically, policies and practices at the federal (e.g., Low Income Housing Tax Credit program), regional (e.g., growth strategies, transportation systems), and local levels (e.g., zoning, tax abatement programs) will be detailed to provide participants with a better understanding of the myriad tools and barriers that exist in creating sustainable housing and communities for older adults. In addition to a review of pertinent policies currently in place, policy rec-

ommendations will be detailed for improving their outcomes in a manner that will contribute to the creation of sustainable communities for an aging society.

### DRIVING EXPERTS ADDRESS EXPANDING ACCESS THROUGH PATHWAYS TO OLDER DRIVER REHABILITATION SERVICES: MEETING RESULTS AND IMPLICATIONS

A. Dickerson<sup>1</sup>, E. Schold-Davis<sup>2</sup>, *1. Occupational Therapy, East Carolina University, Greenville, North Carolina, 2. American Occupational Therapy Association, Bethesda, Maryland*

When you consider the stakeholders who directly address the issue of older drivers, the stakeholders can be grouped into four categories according to their essential function: consumers who are older drivers and families; researchers who provide the research evidence, entities that make decisions about licensing (state licensing), and practitioners who do expert evaluation and recommendations. A consensus meeting of driving experts was convened in March 2012 with the goal of identifying gaps in service and expanding access to services for consumers by addressing the gaps in the “practitioner” category. The priority of the meeting was to develop criteria for referral to specialists to serve as guidance for program development, specifically identifying general practice occupational therapists that can provide services in the IADL of driving and community mobility in general rehabilitation, hospital, or other clinical settings. The specific objective is to develop pathways assuring a continuum of service for clients across diverse settings. This session will 1) outline the results of the meeting, 2) discuss the implications for other stakeholders and consumers, and 3) highlight needed research and implementation projects. Terminology was identified as a barrier as a consensus of terminology is critical for stakeholders to understand the types and level of services offered, required, or provided by the diverse driver rehabilitation program models. Consensus statements about client diagnostic categories were established as well as screening and assessment tool use and interpretation. Driving simulation and education for practitioners was also addressed. The consensus statements will be shared for use by practitioners in building services and programs.

### A DAY OR A PHASE: MOVING EXPERIENCES OF OLDER ADULTS

T. Pery, *University of Michigan, Ann Arbor, Michigan*

Scholars have long argued that moving for older adults takes many forms (Rowles, 1983; Litwak and Longino, 1987). This study of older adults, their family members and supportive professionals highlights the experiences of older adults and their network as they embark on relocation from their homes located in the mid-western United States. To complete this project, I conducted interviews, participant observation of the moving process (packing, garage sales, moving day, adjustment) and document review with over 35 older adults, members of their kin and supportive professionals in three stages: pre-move planning, move in-process, and post-move adjustment. Given the varied patterns of moving witnessed in this project including moving first and selling later, selling first and moving later, and moving into interim housing. Interim housing arose, when despite all the anxiety about the housing market, some study participants sold faster than expected. This paper examines the experiences of moving in terms of how older adults patterned their moves using case studies to highlight the complexity of the moving process. These varied moving experiences impacted the emotional, physical and financial concerns of older adults. By concluding with the methodological challenges of studying relocation as a process, this paper argues for re-examination of research design for the relocation literature.

## LONG TERM CARE; SESSION 1

**MANAGEMENT OF SEXUALITY IN RESIDENTIAL CARE SETTINGS: AN OMBUDSMEN'S PERSPECTIVE**

L.J. Cornelison, G. Doll, S. Gfeller, *Center on Aging, Kansas State University, Manhattan, Kansas*

**Purpose:** This study investigates how sexual expression is managed in residential care settings (i.e. nursing homes, assisted living facilities, and personal care homes) based on cases that require intervention from long-term care ombudsmen. Though sexuality and intimacy are universal human needs, residential care settings are less than supportive of the expression of these needs. The lack of policies governing sexual expression in these settings is frequently mentioned in the literature and there is little information available on how situations are managed when they do occur. This study addresses these missing elements, through an unexplored perspective of resident advocates, the ombudsmen. **Design and Methods:** Thirty-one in-depth phone interviews were conducted with long-term care ombudsmen in six states. For comparison, three direct care staff from a continuing care retirement community (CCRC) were interviewed. A thematic analysis was performed on the interview transcripts. **Results:** Cases requiring Ombudsmen intervention involved conflict between opposing forces. The roots of the conflicting forces clustered around five themes; risk, risk associated with dementing illnesses, limited knowledge, lack of privacy, and values. Comparative interviews revealed parallel results. The theoretical frameworks of the total institution, paternalism, and ageism were utilized to interpret the results. **Implications:** The results underscore the importance of providing staff guidance when the expression of sexuality within residential care settings is complicated by conflicting forces. Guidance may come in the form of more information, workforce training, interdisciplinary development of standardized ethical decision-making guidelines for use in applied settings, and written policies.

**PARTICIPANT-DIRECTED SERVICES WITH AWC FMS: KEY OPERATIONS, QUALITY ASSURANCE AND LIABILITY ISSUES**

S.A. Flanagan, *Westchester Consulting Group, Washington, DC, District of Columbia*

Participant-directed services (PDS) implemented using the joint employer, Agency with Choice (AwC) Financial Management Services (FMS) model represents a major paradigm shift in the delivery of home and community-based long-term care services (HBC-LTC). The model transfers decision-making and managerial authority from professionals to individuals and their families while providing them with employer supports that can extend to the worker. PDS using AwC FMS has been reported in 23 states and in conjunction with 56 PDS programs (Selkow, 2011) and can be beneficial for elders who wish to self-direct their HCB-LTC services. This study addressed the key operations, quality assurance and liability issues related to implementing PDS using AwC FMS and the experiences of 13 state PDS programs in eight states and nine AwC FMS organizations. Analysis included a review of state PDS program rules and Medicaid waivers, Federal and state wage and hour rules, the Family Medical Leave Act of 1993, Title VII of the Civil Rights Act of 1964, Americans with Disability Act of 1990, Immigration and Reform Act of 1985, Occupational Safety and Health Act of 1970, Employee Retirement Income Security Act of 1974, Affordable Care Act of 2010, state workers' compensation laws and related legal cases; and conducting telephone interviews with state PDS program and AwC FMS organization staff in 13 states. Key findings were summarized and promising practices and recommendations were identified/made.

**THE DEPICTION OF NURSING HOMES IN THE NATIONAL MEDIA: TONE OF COVERAGE AND ITS CORRELATES**

E.A. Miller<sup>1</sup>, D. Tyler<sup>2</sup>, V. Mor<sup>2</sup>, 1. *Gerontology, Univ Mass Boston, Boston, Massachusetts*, 2. *Brown University, Providence, Rhode Island*

This study characterizes the tone of nursing home coverage in the national media. Keyword searches of the LexusNexus database were used to identify 1,704 articles published in four national newspapers—The New York Times, The Washington Post, Chicago Tribune, and The Los Angeles Times—from 1999 to 2008. Article content was abstracted and multinomial logit used to examine the correlates of tone—positive and negative versus neutral. Most articles were negative (45.1%) or neutral (37.0%) in tone; comparatively few were positive (9.6%) or mixed (9.3%). Positive and negative articles were more than ten times more likely than neutral articles to be an editorial, column, or letter (Odds Ratios (OR)=14.1,  $p<.001$ ; OR=11.6,  $p<.001$ ). Negative articles were three-quarters more likely to be on the front page and two-thirds more likely to focus on industry actors (OR=1.73,  $p<.05$ ; OR=1.69,  $p<.01$ ). Positive articles were ten times more likely to be about community actors and two and three-quarters likely to be about local issues (OR=10.3,  $p<.001$ ; OR=2.8,  $p<.001$ ). Positive articles were considerably more likely to be about quality (OR=19.3,  $p<.01$ ); negative articles about negligence/fraud and natural disasters (OR=8.0,  $p<.001$ ; OR=5.9,  $p<.001$ ). This study supports widespread anecdotal claims that coverage of the nursing home sector is rarely positive, most often negative and, at a minimum, neutral. It also suggests that impact of negative reporting may be reinforced by other aspects of the articles reported. This includes a disproportionate focus on industry interests and prominent display on front pages and in opinion pieces.

**MAPPING A PARTICIPATORY CULTURE CHANGE PROCESS IN DEMENTIA CARE**

S. Dupuis<sup>1</sup>, C. McAiney<sup>2</sup>, J. Carson<sup>1</sup>, L. De Witt<sup>3</sup>, J. Gillies<sup>1</sup>, L. Meschino<sup>1</sup>, J. Ploeg<sup>2</sup>, Z. Rafferty<sup>1</sup>, 1. *Murray Alzheimer Research and Education Program, University of Waterloo, Waterloo, Ontario, Canada*, 2. *McMaster University, Hamilton, Ontario, Canada*, 3. *University of Windsor, Windsor, Ontario, Canada*

The Partnerships in Dementia Care (PiDC) Alliance is a collaborative research initiative in Canada that brings together over 50 individuals and organisations working in dementia and long-term care (LTC) to improve the dementia care experience for all in those settings. The purposes of the Alliance are to: (1) facilitate sustainable culture change where all voices in LTC settings, including residents/clients, family members and staff, are heard and included in decision-making; (2) use a participatory action research and appreciative inquiry approach to identify existing strengths and aspirations and use those strengths to achieve desired goals; and (3) ultimately, enhance the care experience of residents/clients, family members, and staff. To this end, Alliance researchers have been working with Culture Change Coalitions (CCC), made up of persons with dementia, family members, and staff across a range of positions, in four different LTC settings and systematically documenting the culture change process within those settings. The purpose of this paper is to provide a detailed description and analysis of our culture change process thus far, identifying the speed bumps experienced and the ramps to opportunities that helped us in maneuvering over, or around, the speed bumps. All CCCs faced personal (e.g., competing demands, assumptions), social (e.g., power dynamics, changes in group structure), and systemic (e.g., competing CCC and organizational priorities, regulations and policies) speed bumps. Regularly connecting and committing, valuing diverse voices, creating safe spaces, maintaining open communication, and conducting critical reflection and

dialogue supported us in addressing and overcoming speed bumps along the journey.

### **SENSE OF CONTROL IN ASSISTED LIVING: INFLUENCES OF SOCIAL RELATIONSHIPS, RESIDENTIAL CONTEXT, AND HEALTH**

S.W. Burge, D. Street, *Sociology, University of Oklahoma, Norman, Oklahoma*

Having a sense of control over one's life is an important social-psychological resource that helps individuals navigate life's adversities. Research shows that individuals with a greater sense of control over their lives reap numerous benefits, including better educational and career outcomes, enhanced physical health and superior subjective wellbeing. As important as sense of control is for adult outcomes, research has also shown that the sense of control over one's life tends to diminish in old age, partly because later life is often accompanied by physical frailty and functional limitation. While sense of control may decline with age, its benefits do not. Individuals who maintain a sense of control in their elder years continue to have better mental and physical health outcomes than counterparts with a lower sense of control. We investigate elders' sense of control in the context of assisted living (AL), an increasingly important residential setting for older individuals. Although the transition to AL may be associated with a loss of control for some, elders who maintain their sense of control likely have better adjustment to new residential settings. Using data from the Florida Study of Assisted Living, we examine how residents' internal and external social relationships, the AL residential context, and objective health conditions shape AL residents' sense of control. We find that social relationships are strongly associated with residents' sense of control. In particular, residents who maintain strong external ties with family and develop new ties with co-residents tend to feel more in control of their lives.

### **EXAMINING MEDICAID HOME- AND COMMUNITY-BASED LONG-TERM CARE SERVICES IN THE AGE OF OLMSTEAD**

G. Boyer, *UNC, Chapel Hill, North Carolina*

Demand for long-term care (LTC) will continue to grow as the American population ages. The Patient Protection and Affordable Care Act of 2010 and the 1999 U.S. Supreme Court *Olmstead vs. L.C.* ruling spur inquiry regarding home- and community-based Medicaid long-term care services (HCBS). This study examines the political, socio-demographic, policy, and supply influences on Home Health, 1915(c) waiver, Personal Care Services, and total Medicaid HCBS. Years 1996-2008 were used to study HCBS expenditures per capita, while years 1999-2007 were used to study recipients per capita and expenditures per recipient. State-level trend analyses using fixed effects regressions provide interesting results. Democratic governors have a positive relationship with most HCBS programs, while more Democratic legislatures have a mixed relationship. A more liberal state ideology tends to have a positive relationship with spending per recipient, but negative relationships with spending per capita. Larger Hispanic populations are linked to more home health recipients per capita but less home health spending per recipient. Larger African American populations tend to have a positive relationship with HCBS. More urban states and more Medicare home health users per capita tend to have positive relationships with HCBS programs. Nursing home supply, average Medicaid reimbursement rates, and state home health certificate of need tend to be negative and the most robust predictors of HCBS. While several factors are associated with HCBS growth, the most robust are supply factors, indicating a need to further examine individual and person-specific drivers of HCBS as states pursue LTC rebalancing efforts.

### **WHAT DETERMINES AN OLDER PERSON'S MOVE INTO SHELTERED ACCOMMODATION AND RESIDENTIAL CARE?**

M. Evandrou<sup>1,2,3</sup>, J.C. Falkingham<sup>1,2,3</sup>, O. Maslovskaya<sup>3</sup>, A. Vlachantoni<sup>1,2,3</sup>, *1. Centre for Research on Ageing, University of Southampton, Southampton, United Kingdom, 2. ESRC Centre for Population Change, University of Southampton, Southampton, United Kingdom, 3. EPSRC The Care Life Cycle, University of Southampton, Southampton, United Kingdom*

The UK's population is ageing, and understanding the dynamics of living arrangements in later life and the implications for the provision and funding of appropriate housing and long-term care is critical given the current economic climate which can have an adverse impact on state support for older people. This paper investigates the dynamics of living arrangements amongst people aged 65 years old and over between 1991 and 2008, focussing on the two key housing and care pathways in later life: moving into sheltered accommodation and moving into residential care. The empirical research examines the rates of moving into sheltered accommodation and institutional care and investigates the determinants and probabilities of these transitions in the UK. The paper employs all 18 waves of the British Household Panel Survey (1991-2008) and uses a discrete-time logistic regression model in order to model the probability of entering sheltered accommodation and residential care. After reading this poster, participants will be able to associate specific factors with each of the two transitions in later life. For example age, health and marital status are significant determinants of a move into residential care, while the move into sheltered accommodation is also associated with housing tenure and education. After reading this poster, participants will be able to discuss the prevalence of each the two kinds of transition at different stages of the latter part of the life course, and to understand the crucial implications for the design of social care provision for older people in the future.

### **WHAT DETERMINES THE RECEIPT OF FORMAL PAID, FORMAL STATE OR INFORMAL SOCIAL SUPPORT IN LATER LIFE?**

A. Vlachantoni<sup>1,2,3</sup>, J.C. Falkingham<sup>2,1,3</sup>, M. Evandrou<sup>1,2,3</sup>, R. Shaw<sup>3</sup>, *1. Centre for Research on Ageing, University of Southampton, Southampton, United Kingdom, 2. ESRC Centre for Population Change, University of Southampton, Southampton, United Kingdom, 3. EPSRC The Care Life Cycle, University of Southampton, Southampton, United Kingdom*

In the current economic circumstances and political climate, older people may be increasingly dependent on their own social and financial resources in order to obtain care and assistance with daily activities. However, the support received in later life may consist of a mixture between formal paid, formal state and informal support, and understanding the determinants of receiving support from different sources is an essential part of policy-making for the future. This paper draws from data from the English Longitudinal Study of Ageing (ELSA) in order to investigate the key determinants of receiving support from different sources. After reading this poster, participants will be able to distinguish between the determinants of receiving formal paid, formal state or informal support, which include demographic factors and living arrangements; measures of health, including disability and disease; socio-economic measures, including education and income; technological assistance and home adaptations. The results show that the strongest determinants of receipt of both informal and paid for support are health and demographic characteristics, while health is more strongly associated with informal care and demographic factors are most strongly associated with the receipt of paid for support. Finally, this poster also facilitates participants to understand the policy implications of the results for the design of social care, and to contextualise these results in patterns of population ageing.

## EVALUATION BY CLIENTS AND CASE MANAGERS ON CHANGES OF QOL INDICATORS IN THE FRAIL ELDERLY DURING ONE-YEAR CASE MANAGEMENT

M. Shirasawa<sup>1</sup>, S. Yoshie<sup>2</sup>, D. Hata<sup>3</sup>, H. Shiraki<sup>4</sup>, K. Yamada<sup>5</sup>, Y. Takasuna<sup>6</sup>, A. Yonezawa<sup>7</sup>, K. Masuda<sup>8</sup>, 1. *J.F.Oberlin University, Nabari, Mie, Japan*, 2. *Tokyo university, Bunkyo, Tokyo, Japan*, 3. *Japan Science Technology Agency, Chiyodaku, Tokyo, Japan*, 4. *Fuji Care Corporation, Kitakyuusu, Fukuoka, Japan*, 5. *Maebashi-shi Comprehensive Community Support Center, Maebashi, Gunma, Japan*, 6. *Minamiku Visiting Nurse Center, Yokohama, Kanagawa, Japan*, 7. *NTT Data Institute of Management Consulting, Chiyodaku, Tokyo, Japan*, 8. *Waseda University, Tokorozawa, Saitama, Japan*

A research panel attempted to clarify changes of QOL evaluation indicators in the frail elderly between 6 months and 1 and half year after beginning case management, where the elderly were paired with case managers with over 5-years experience. This study analyzed the answers obtained from 201 clients and 199 case managers who answered both times. QOL evaluation indicators for case management included 13 terms relating to physical (ADL, health problems, meals, bathing, toileting, household affairs), psychological (dementia care, motivation for living, communication, social participation), and social (family care burden, living environment, economic situation) aspects. Changes after 1 year were analyzed using a nonparametric test, and terms with a  $P < .05$  were considered to be significant. Results from clients showed a significant decrease in ADL, meals, toileting, dementia care, motivation for living, communication, social participation, family care burden, and living environment, while health problems, bathing, household affairs, and economic situation remained stable. At the same time, with care managers, ADL, meals, bathing, toileting, motivation for living, and family care burden were significantly decreased, while health problems, household affairs, dementia care, communication, social participation, living environment, and economic situation remained stable. Thus, although results differed for some terms, many in the physical aspect category decreased between 6 months and 1 and half year after beginning case management; however, psycho-social aspects tended to maintain their previous state. It is considered that psychological and social aspects are important as evaluation indicators for case management of the frail elderly.

## AN UPDATED PROFILE OF THE DIRECT CARE WORKFORCE IN THE UNITED STATES: WHAT HAS CHANGED SINCE 2000?

C.M. Kelly<sup>1</sup>, J. Deichert<sup>2</sup>, L. Holley<sup>2</sup>, K. Kosloski<sup>2</sup>, 1. *Gerontology, University of Nebraska, Lincoln, Nebraska*, 2. *University of Nebraska at Omaha, Omaha, Nebraska*

Purpose: The goal of our study was to track changes in the direct care workforce between 2000 and 2010 by generating profiles of workers in several settings (i.e., nursing homes, home health agencies), with a special focus on home care workers. Design and Methods: Data were taken from the Public Use Microdata Sample (PUMS) from the 2010 American Community Survey (ACS) and compared to profiles presented by Montgomery, et al. (2005). Variable coding in ACS data allows for a more detailed identification of direct care workers than that which is available from other data sources (e.g., Bureau of Labor Statistics). On the basis of our current sample of 2010 ACS data, we find continued growth across a direct care workforce that now totals over 3.06 million, particularly among home care workers (who at nearly 1.42 million now represent the largest segment within this workforce). Home care workers are unique in several ways within the direct care workforce. Among demographic trends of note, home care workers are more likely to be female, Hispanic, non-native born, and more likely to be 65 years of age and older. We further report that, during the past decade, several changes across the entire direct care workforce (including home care workers) have occurred. Specifically, in 2010 greater proportions of direct care workers were younger than 25, male, Hispanic, non-native

born, and college-educated. Other changes since 2000 were unique to home care workers. For example, increases during the past decade in direct care workers who work full-time and for a for-profit employer have been greatest among home care workers. Implications: Given the increased use of home care as an alternative to institutional care, it is increasingly important to understand its unique workforce, particularly with efforts to recruit, retain, and ensure the quality of these workers already underway (Kelly, et al., 2012). The current study facilitates continued development of these efforts.

## VETERANS HOME AND COMMUNITY-BASED SERVICES: LESSONS LEARNED FROM A SUSTAINABILITY STUDY

E.K. Mahoney<sup>1</sup>, D. Schoeps<sup>3</sup>, D. Kayala<sup>2</sup>, N. Foxe<sup>2</sup>, P. O'Keefe<sup>2</sup>, K.J. Mahoney<sup>2</sup>, 1. *Boston College, Connell School of Nursing, Chestnut Hill, Massachusetts*, 2. *Boston College, Graduate School of Social Work, National Resource Center for Participant-Directed Services, Chestnut Hill, Massachusetts*, 3. *Veterans Health Administration, Washington, DC, District of Columbia*

The primary purpose of this mixed methods evaluation was to review three years of national experience with the Veteran-Directed Home and Community-Based Services (VDHCBS) program in order to inform sustainability and future planning for rebalancing long term care options for Veterans. A second purpose was to identify proximal outcomes and benchmarks valued by stakeholders that could be linked to VDHCBS program components now and to longer term quality and cost outcomes in the future. Sources of data included a survey of Veterans Administration Coordinators of VDHCBS programs ( $n=27$ ), VA/Minnesota Long-Term Care Assessments, service plans and invoices for Veterans enrolled in VDHCBS ( $n=247$ ) and traditional home care ( $n=260$ ). Data were analyzed quantitatively to describe and compare case mix, cost and types of services and goods invoiced between the groups and to assess outcomes of VDHCBS reported by Coordinators. Qualitative description was used to identify themes in Coordinators' experiences and perceptions about the VDHCBS program, the Veterans enrolled and services they receive, outcomes attributable to the program and how, and to further inform quantitative findings. While the self-directed population generally had higher acuity than the comparison group and were nursing home eligible, the vast majority of Coordinators perceived VDHCBS to significantly improve the ability of Veterans to have their needs met, remain at home, be satisfied, and access services. The use of cash allowances and trends for growth and long term system rebalancing will also be covered.

## CHANGES IN CAREGIVER BURDEN AFTER THE IMPLEMENTATION OF THE LONG-TERM CARE INSURANCE SYSTEM IN JAPAN

Y. Sugihara<sup>1</sup>, H. Sugisawa<sup>2</sup>, Y. Nakatani<sup>3</sup>, M. Shimmei<sup>1</sup>, H. Kodama<sup>1</sup>, Y. Watanabe<sup>4</sup>, 1. *Human Care Research Team, Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan*, 2. *J.F.Oberlin University, Tokyo, Japan*, 3. *Japan Women's University, Tokyo, Japan*, 4. *Musashino University, Tokyo, Japan*

The Japanese government started the public long-term care insurance (LTCI) system in 2000, and major reforms were undertaken in 2006. This study examined, first, possible effects of the implementation and the consecutive reform on the caregivers' burden and second, possible reasons for an increase in psychological burden even after the implementation of the system. Five repeated cross-sectional surveys were conducted in 1996, 1998, 2002 and 2010 with a probability sample of community-dwelling caregivers of frail elderly people living in a suburb of Tokyo metropolis. Data were analyzed in two steps. First, we analyzed changes in service use and caregiver burden by using GLM. Second, we examined whether the increase in caregivers' psychological burden over time might be explained by (1) decreases in informal support network, (2) increases in social/economic problems, and (3) increases in demand level for service use, by using Structural Equation

Modeling. The results showed that the utilization of in-home care services increased after the implementation of the LTCI. However, their utilization decreased, or remained unchanged after the reform. In terms of caregiver burden, psychological burden increased over time even after the implementation of the LTCI. The increase in psychological burden was explained partly by increases in social/economic problems and increases in demand level for service use. These results suggest that the levels of existing service benefits are insufficient to improve caregivers' psychological burden. In addition, deteriorating economic conditions and discrepancies between demands and real service use among caregivers may impose psychological strain on caregivers.

#### **TAKING CAREER DEVELOPMENT TO THE NEXT LEVEL: EVALUATING THE GERIATRIC NURSING ASSISTANT CAREER LADDER PROGRAM**

R. Meador, *Gerontology Institute, Ithaca College, Ithaca, New York*

For some time now, nursing homes have been staggering under the high cost of turnover, especially among CNAs. Career development programs for CNAs have been proven to improve staff turnover and reduce burnout. Therefore, a greater understanding of how to implement innovative career development programs like career ladders in nursing homes and other long-term care institutions is needed. This presentation will report the results of an evaluation that documents the outcomes resulting from the successful adoption of a career ladder program for certified nursing assistants in 77 participating long-term care facilities. The Geriatric Nursing Assistant Career Development (GNACD) program provides a model for redesign of the system for advancement of front-line nursing assistants working in the field of long term care by creating clearly defined pathways and rewards for advancement within the CNA vocation. The GNACD was implemented across New York State in 77 long-term care facilities over a three-year period, during which 340 CNAs participated in the program. This poster presentation will provide participants with timely information from the evaluation that documented specific outcomes that occurred in the participating facilities as they undertook implementation of this staff development innovation in their nursing homes. In addition, qualitative data from GNACD graduates tell the story of how participation in the program enhanced their career paths and, in turn, improved their perception of the quality of care in their facilities.

### **SESSION 1395 (SYMPOSIUM)**

#### **GSA-SFRBM JOINT SYMPOSIUM: OXIDATIVE STRESS FOR THE NON-BIOLOGIST**

Chair: *K.J. Davies, University of Southern California, Los Angeles, California*

Co-Chair: *K.J. Davies, University of Southern California, Los Angeles, California*

Since its original articulation by Denham Harman in the 1950s, the free radical or oxidative stress theory of aging has been one of the most cogent explanations for aging at the molecular and cellular levels. The theory proposes that free radicals formed endogenously from normal metabolic processes have a role in aging as a result of increases in oxidative damage to macromolecules. The imbalance between oxidative stress and cellular macromolecules designed to reduce oxidative stress leads to an accumulation of damage in a variety of cells and tissues with age resulting in a loss of cellular function and the genesis of the aging phenotype. This joint symposium sponsored by GSA and the Society for Free Radical Biology and Medicine reviews the causes of oxidative stress and the implications of increased oxidative stress for cellular and tissue function. The session is designed to provide a basic underpinning for the oxidative stress theory of aging and review data that support or refute this hypothesis.

#### **IS THE FREE RADICAL (OXIDATIVE STRESS) THEORY OF AGING DEAD?**

A. Richardson, *1. Barshop Institute for Longevity and Aging Studies, University of Texas at San Antonio and the Audie Murphy VA Center, San Antonio, Texas, 2. Barshop Institute for Longevity and Aging Studies, University of Texas Health Science Center at San Antonio, San Antonio, Texas*

Currently, the Oxidative Stress (or Free Radical) Theory of Aging is the most popular explanation of how aging occurs at the molecular level. Because the gold standard for determining whether aging is altered is lifespan, investigators have studied the effect of altering oxidative stress/damage on lifespan. In an exhaustive study, my laboratory showed that under- or overexpressing a large number and wide variety of genes coding for antioxidant enzymes had no effect on lifespan. However, when these transgenic/knockout mice are tested using models that develop various types of age-related pathology, they show alteration in progression/severity of pathology as predicted by the oxidative stress theory; increased oxidative stress accelerates pathology and reduced oxidative stress retards pathology. These contradictory observations suggest that (1) oxidative stress plays a limited, if any, role in aging but a major role in healthspan or (2) the role oxidative stress plays in aging depends on the environment.

#### **OXIDATIVE DAMAGE: CELLULAR DAMAGE RESPONSES LINK AGING, AGE-RELATED DISEASE, AND INFLAMMATION**

J. Campisi, *1. Buck Institute for Research on Aging, Novato, California, 2. Lawrence Berkeley National Laboratory, Berkeley, California*

Oxidative stress damages cellular constituents, including DNA, thereby putting cells, tissues and organisms at risk for developing aging phenotypes and age-related pathology. Two important cellular damage responses are apoptosis and cellular senescence – both of which are crucial for preventing the development of cancer. Apoptosis, also known as programmed cell death, is an orderly program by which cells die in a manner that is designed to prevent inflammation. Cellular senescence, by contrast, permanently prevents cells from dividing. Senescent cells do not die; rather, they remain alive, metabolically active and secrete numerous pro-inflammatory mediators, a property known as the senescence-associated secretory phenotype (SASP). The most highly conserved feature of the SASP – among different cell types and between mouse and human species – is its pro-inflammatory nature. Because inflammation causes or contributes to virtually every major age-related disease, the SASP of senescent cells might link damage response to a basic aging process that drives age-associated pathology and limits longevity.

#### **FREE RADICALS, ANTIOXIDANTS, AND CHRONIC DISEASE**

M.G. Traber, *Oregon State University, Corvallis, Oregon*

The body generates free radicals as by-products during the conversion of food to energy. When exposed to oxygen, these free radicals can form various reactive species, which damage proteins, carbohydrates, DNA, and fats. To protect itself, the body uses a variety of mechanisms, involving enzymes, signaling pathways, and small molecules. As we learn more about radicals, damage and defense mechanisms, it has become clear that it is an over-simplification to expect that oxidative stress can be balanced by antioxidants. There are elaborate regulatory mechanisms that keep cellular and organ systems under close control; there are repair mechanisms to remove damage, signaling pathways that are dependent upon nuances in oxidant tone, as well as dietary factors that modulate chronic disease risk. Thus, a high intake of fruits and vegetables is associated with decreased risk, while a high saturated fat diet increases risk. Consuming large numbers of phytochemicals and

antioxidants, up-regulates the body's detoxifying systems and potentiates the ability to defend against radicals. Antioxidant supplements, however, are not the same as a consistent consumption of a plant-rich diet. Remarkably, we are just beginning to understand the roles of antioxidant vitamins, E and C. Vitamin C is necessary for a variety of enzymatic reactions, but vitamin E is apparently necessary to protect critical sites, such as the brain and the artery wall. After attending this talk, participants will be able to define what are free radicals and antioxidants. They will be able to cite good dietary habits to decrease risk of chronic diseases.

#### ADAPTATION TO OXIDATIVE STRESS IN AGING

K.J. Davies, 1. *Davis School of Gerontology, University of Southern California, Los Angeles, California*, 2. *Division of Molecular & Computational Biology, Department of Biological Sciences of the Dornsife College of Letters, Arts & Sciences, the University of Southern California, Los Angeles, California*

Environmental levels of free radicals and related oxidants change frequently, as does their production by metabolic and inflammatory processes. To cope with varying stress, cells, whole organisms, even human beings, must modulate their levels of defense and repair systems. Thus, after cells or organisms are exposed to mild oxidative stress they undergo a two-stage response consisting of immediate enzyme activations, followed by altered levels and patterns of gene expression. Levels of key antioxidant, and damage removal and repair enzymes are upregulated. These responses significantly increase the stress-resistance of cells or organisms. If the stress abates, both the adaptations and increased stress-resistance will be transient. If the stress becomes chronic, however, or if it is repeated too frequently, adaptive responses begin to fail. New evidence suggests that such adaptive responses decline with chronic disease, age and senescence. It is proposed that deteriorating adaptive responses may actually contribute to the aging phenotype.

### SESSION 1400 (PAPER)

#### BASIC SCIENCE AND CLINICAL STUDIES OF MILD COGNITIVE IMPAIRMENT

##### IMPACT OF TESTOSTERONE ON THE MIDDLE-AGED CENTRAL NERVOUS SYSTEM: EFFECTS ON COGNITION AND BRAIN STRUCTURE

M.S. Panizzon<sup>1</sup>, R.L. Hauger<sup>1,2</sup>, C.E. Franz<sup>1</sup>, K.C. Jacobson<sup>3</sup>, M. Grant<sup>4</sup>, S.P. Mendoza<sup>5</sup>, M.J. Lyons<sup>4</sup>, W.S. Kremen<sup>1,2</sup>, 1. *Psychiatry, University of California San Diego, La Jolla, California*, 2. *San Diego VA Health Care System, San Diego, California*, 3. *University of Chicago, Chicago, Illinois*, 4. *Boston University, Boston, Massachusetts*, 5. *University of California Davis, Davis, California*

Brain regions such as the hippocampus, the prefrontal cortex, and the white matter possess large concentrations of androgen receptors, making them sensitive to the effects of the hormone testosterone. These brain regions are integral to cognitive and brain aging; thus, individual differences in testosterone level are likely relevant to the processes that contribute to age-related changes in cognition and brain in men. We examined the effects of testosterone on cognition and brain structure in a sample of middle-aged male twins. Data were collected as part of the ongoing Vietnam Era Twin Study of Aging (VETSA). The average age of participants was 55.9 years (range: 51 to 60). Testosterone levels were obtained via 15 saliva samples collected on 3 non-consecutive days. A detailed cognitive assessment covering multiple domains of functioning was performed for all participants. A subset of the sample also underwent structural MRI scans. Significant positive effects of testosterone were observed for verbal ability, episodic memory, and processing speed. Results remained significant after controlling for age 20 general cognitive ability and multiple health-related covariates. Within the brain,

significant effects were observed between testosterone and hippocampal volume. Although there was no direct effect on the size of the hippocampus, the heritability of hippocampal volume varied substantially as a function of testosterone. That is, when testosterone levels were higher, variation in hippocampal volume was determined more by genetic influences. Combined with testosterone's well-known decline with age, these results support the role of testosterone as a valuable biomarker for cognitive and brain aging.

#### EFFECT OF ANTIHYPERTENSIVE THERAPY ON THE BRAIN IN EXECUTIVE MILD COGNITIVE IMPAIRMENT: A DOUBLE-BLIND RANDOMIZED CLINICAL TRIAL

I. Hajjar<sup>1</sup>, M. Hart<sup>2</sup>, Y. Chen<sup>1</sup>, W. Mack<sup>1</sup>, W. Milberg<sup>3</sup>, H. Chui<sup>1</sup>, L. Lipsitz<sup>3,2</sup>, 1. *University of Southern California, Los Angeles, California*, 2. *Institute for Aging Research, Hebrew Senior Life, Boston, Massachusetts*, 3. *Harvard Medical School, Boston, Massachusetts*

Background: Hypertension is frequently associated with executive function decline, commonly termed executive mild cognitive impairment, and both are associated with cerebral blood flow changes. However, the effect of antihypertensive therapy on executive function is unknown. Methods: We conducted a double-blind randomized clinical trial of candesartan, lisinopril, or hydrochlorothiazide in hypertensive individuals with executive dysfunction (N=53, mean age=71 years; 64% white and 28% African Americans; 58% women) with outcomes being executive function and cerebral hemodynamics. Executive function (Trail Making Test, parts A and B), memory (Hopkins Verbal Learning Test-Revised), and attention (forward and backward digit span) were assessed at baseline, 6 and 12 months as well as cerebral blood flow velocity (Transcranial Doppler ultrasonography in the middle cerebral artery during rest, hypercapnia, and hypocapnia). Linear mixed models were used to compare the change in outcomes. Results: The candesartan group had the greatest improvement in executive function (Trail Making Test, part B improved by 17.1 seconds vs HCTZ improved by 4.2 seconds and lisinopril worsened by 14.4 seconds,  $p=0.008$ ). Similar finding was noted for the adjusted Trail Making Test (Part B-A;  $p=0.012$ ) and the Hopkins Verbal Learning Test recognition subtest ( $p=0.034$ ). The candesartan group showed increased blood flow velocity that was significant in the subgroup with low baseline velocity ( $n=23$ ;  $p=0.04$ ). Vasoreactivity to CO<sub>2</sub> declined in the HCTZ ( $p=0.06$ ) and lisinopril ( $p=0.0006$ ) groups but not in the candesartan group ( $p=0.14$ ). Conclusion: This first study suggests that angiotensin receptor blockers may have superior effects on the brain in executive mild cognitive impairment.

#### THE RELATIONSHIP OF MULTIMORBIDITY WITH SUBJECTIVE AND OBJECTIVE COGNITIVE IMPAIRMENT: A POPULATION-BASED TWIN STUDY

B. Caracciolo<sup>1</sup>, M. Gatz<sup>2,4</sup>, W. Xu<sup>1</sup>, A. Marengoni<sup>3</sup>, N.L. Pedersen<sup>4,2</sup>, L. Fratiglioni<sup>1</sup>, 1. *Aging Research Center, NVS, Karolinska Institutet, Stockholm, Sweden*, 2. *Department of Psychology, University of Southern California, Los Angeles, California*, 3. *Department of Medical and Surgery Sciences, University of Brescia, Brescia, Italy*, 4. *Department of Medical Epidemiology and Biostatistics, Karolinska Institutet, Stockholm, Sweden*

Objectives: To examine the association of common chronic disease and multimorbidity with subjective cognitive impairment (SCI) and cognitive impairment no-dementia (CIND), and to explore the contribution of genetic background and shared familial environment to these associations. Methods: The study included 11,379 dementia-free community-dwellers from the nation-wide Swedish Twin Registry, who were aged  $\geq 65$  at the time of HARMONY survey (1998-2001). SCI was defined as subjective complaint of cognitive change without objective cognitive impairment, and CIND was ascertained according to the standard definition. Chronic diseases were classified based on international criteria, and multimorbidity was assessed as the co-occurrence of at least

two chronic diseases in the same individual. Results: In unmatched, fully-adjusted regression models, musculoskeletal, respiratory, and urological diseases were significantly associated with increased odds ratios (ORs) of both SCI and CIND. Circulatory and gastrointestinal disorders were related to SCI, while endocrine diseases were associated with CIND. The adjusted ORs of multimorbidity were 2.1 [95% Confidence Intervals (95% CI): 1.8-2.3] for SCI and 1.5 for CIND (95% CI: 1.3-1.8). There was a significant dose-dependent relationship between number of chronic diseases and ORs for SCI but not for CIND. In co-twin control analyses, the chronic diseases-SCI association remained significant but the association with CIND was no longer statistically significant. Conclusions: Chronic diseases are associated with both SCI and CIND and the association is stronger when there is multimorbidity. Genetic and shared environmental factors may partially explain the association of CIND but not that of SCI with chronic diseases.

### **INCREASED EXPRESSION OF NMDA RECEPTOR GLUN2B SUBUNIT WITHIN CNS REGIONS ENHANCES MEMORY IN AGED MICE**

K. Magnusson<sup>1</sup>, B. Brim<sup>1</sup>, R. Haskell<sup>2</sup>, R.S. Awedikian<sup>3</sup>, M. Ellinwood<sup>3</sup>, L. Jin<sup>1</sup>, 1. *Oregon State University, Corvallis, Oregon*, 2. *ViraQuest, Inc., North Liberty, Iowa*, 3. *Iowa State University, Ames, Iowa*

The GluN2B subunit of the N-methyl-D-aspartate (NMDA) receptor shows age-related declines in expression across the frontal cortex and within the hippocampus. This decline is strongly correlated to the memory declines observed in aging. However, a subset of these aged mice express higher levels of the GluN2B subunit within the hippocampus than their aged counterparts and exhibit worse long-term spatial memory. This study was designed to determine if increasing the expression of the GluN2B subunit in the frontal lobe or the hippocampus would improve or further impair memory in aged mice. Both young (3 month-old) and aged (22-26 month-old) C57BL/6 mice were injected bilaterally with either the GluN2B vector, containing cDNA specific for the GluN2B subunit and enhanced Green Fluorescent Protein (eGFP); a control vector, containing only eGFP cDNA; or vehicle alone. Mice were tested for their performance in spatial long- and delayed short-term memory, cognitive flexibility and associative memory tasks using the Morris water maze. Aged mice, with increased GluN2B subunit expression within their frontal lobe or hippocampus, exhibited improved long-term spatial memory, comparable to young mice. However, memory was rescued at different learning phases; early for hippocampal GluN2B subunit enrichment and later for the frontal lobe. A higher concentration of the GluN2B antagonist, Ro 25-6981, was required to impair long-term spatial memory in aged mice with enhanced GluN2B expression, as compared to aged controls. These results suggest that therapies that increase the expression of the GluN2B subunit within the aged brain could rescue memory loss in aged individuals.

### **INCREASED CNS NGR1 SIGNALING AS A POTENTIAL MECHANISM OF AGE-RELATED COGNITIVE DECLINE**

H. VanGuilder Starkey<sup>1</sup>, D. Masser<sup>1</sup>, J.A. Farley<sup>2</sup>, W.E. Sonntag<sup>2</sup>, W. Freeman<sup>1</sup>, 1. *Pharmacology, Penn State College of Medicine, Hershey, Pennsylvania*, 2. *University of Oklahoma Health Sciences Center, Oklahoma City, Oklahoma*

With advancing age, the CNS undergoes numerous physiological and biochemical changes that, in more than half of the population, culminate in cognitive deficits. Spatial learning and memory is commonly, and often severely, impaired with advancing age. Using the F344xBN rat model of human aging, we have previously demonstrated hippocampus-wide upregulation of the myelin-associated inhibitors (MAIs) MAG, OMgp and Nogo-A, and their common receptor, NgR1, specifically in cognitively impaired rats compared to their cognitively intact, age-matched counterparts and mature adults. MAI/NgR1 action suppresses synaptic plasticity in CNS injury models, and antagonism of NgR1 signaling is associated with improved cognitive function. The

goal of our current work is to determine whether hippocampal induction of NgR1 and its ligands results in increased downstream signaling, and ultimately, in decreased plasticity-associated mechanisms of spatial learning and memory in aged rats with inferior Morris water maze performance. We have identified cognitive decline-specific protein-level upregulation of co-receptors critical for NgR1 signal transduction, including p75NTR, TROY, and LINGO-1. Hippocampal induction of downstream signaling effectors (e.g., RhoA) was also observed, while proteins associated with activity-dependent synaptic plasticity (CaMKII $\alpha$ , PSD-95, NMDA receptor subunit 2A) were significantly decreased. Additionally, expression of MAI/NgR1 signaling pathway components correlated with water maze performance, with higher protein levels associated with inferior spatial learning and memory. Interestingly, expression PirB, an alternate MAI receptor, was increased with advanced aging but was not associated with cognitive function. These data suggest that NgR1 signaling contributes to deficits of hippocampal synaptic plasticity that may underlie age-related cognitive decline.

### **SESSION 1405 (SYMPOSIUM)**

#### **CHARTING NEW FRONTIERS IN FUNCTION AND AGING: A MULTI-DISCIPLINARY PERSPECTIVE**

Chair: *K.S. Hall, Geriatric Research, Education, and Clinical Center, Veterans Affairs Medical Center, Durham, North Carolina, Duke University, Durham, North Carolina*

Co-Chair: *C.A. Mingo, University of North Carolina, Chapel Hill, North Carolina*

Discussant: *K.E. Whitfield, Duke University, Durham, North Carolina*

This Presidential Symposium, sponsored by The Emerging Scholars and Professional Organization (ESPO), is designed to bring a multi-disciplinary perspective to the topic of function in aging and aged adults. Function has evolved to encompass a variety of outcomes spanning physiological, psychosocial, and environmental domains. Although broadly conceived, function and its various components have implications for quality of life, functional independence, social engagement, and healthcare utilization/costs. In keeping with the meeting theme of 'Charting New Frontiers,' ESPO members representing the four sections of GSA will present their research examining various facets of function. Topics to be highlighted include a pharmacological approach to muscle atrophy, trajectories of stress and associated determinants in older Taiwanese adults, wisdom development and successful aging, sexual interest and health outcomes, and the complex interplay between dementia diagnosis and level of institutional care. Closing discussion will consider future directions stemming from the research presented as well as other emerging frontiers in the areas of function and aging.

#### **TRAJECTORIES OF PERCEIVED STRESS AND EXPERIENCED STRESSORS AMONG OLDER ADULTS**

S. Vasunilashorn<sup>1</sup>, S.M. Lynch<sup>1</sup>, D. Gleit<sup>2</sup>, M. Weinstein<sup>2</sup>, N. Goldman<sup>1</sup>, 1. *Population Studies, Princeton University, Princeton, New Jersey*, 2. *Georgetown University, Washington, District of Columbia*

Models of the stress process incorporate both environmental demands experienced by individuals (stressors) and the appraisal of these life events (perceptions). Although some studies have measured both of these components of the stress process, little is known about the extent to which experience and perceptions are related, especially in later life. Using growth models applied to data from three waves of the Survey of Living Status of the Elderly in Taiwan, we: 1) examine change in experienced stressors and perceived stress across several domains; and 2) investigate whether change in experienced stressors influence change in perceived stress. Our results indicate that (1) incidence of some types of stressors increases over time, while incidence for others decreases, (2) perceived stress tends to increase across time for all domains, and (3) there is no relationship between change in experienced stressors and perceived stress over time.

## THE IMPACT OF SEXUAL INTEREST ON HEALTH OUTCOMES IN OLDER ADULTS

C. Sharpe, S.S. Reynolds, *USF School of Aging Studies, University of South Florida, Tampa, Florida*

The literature on sexuality in older adults suggests that a healthy sex life is an important component of successful aging, including maintenance of physical health. In this cross-sectional study of 3800 men and women age 39-85, we use the US National Health Measurement Study to examine the effect of sexual interest on older adults' health. Health outcomes include arthritis, back pain, coronary heart disease, depression, diabetes, and sleep disorders. Independent variables include sexual interest, socio-demographics, medications and self-reported health and disability factors. Logistic regression results indicate that low sexual interest is associated with increased risk of back pain, coronary heart disease, depression, and sleep disorders, but not arthritis or diabetes. The most consistent other factors were fatigue, black race, medications, and ADL impairment. Further research on other measures of sexual desire, activity, and satisfaction are needed to fully understand the importance of sexuality for older adults' health.

## LONG-TERM ADMINISTRATION OF LOSARTAN INDUCES AN ENDURANCE EXERCISE PHENOTYPE IN MICE WITH SARCOPENIA

T.N. Burks<sup>1</sup>, E. Andres-Mateos<sup>1</sup>, R. Marx<sup>1</sup>, C.W. Ward<sup>2</sup>, J.D. Walston<sup>1</sup>, R.D. Cohn<sup>1</sup>, *1. Johns Hopkins University School of Medicine, Baltimore, Maryland, 2. University of Maryland School of Nursing, Baltimore, Maryland*

Sarcopenia, the critical loss of muscle mass and function due to the physiological process of aging, contributes to disability and mortality in older adults. The molecular mechanisms underlying sarcopenia are poorly understood, but recent evidence suggests that increased transforming growth factor- $\beta$  (TGF- $\beta$ ) signaling contributes to the muscle phenotype. We therefore evaluated whether antagonism of TGF- $\beta$  signaling via losartan, an angiotensin II type I (ATI) receptor antagonist commonly used to treat hypertension, has a beneficial impact on sarcopenia. Long-term administration of losartan caused an increased resistance to fatigue in sarcopenic muscle by inducing an endurance exercise phenotype. Losartan induced PGC-1 $\alpha$  expression and caused a fiber type conversion toward type 1 "slow" fibers. Recent evidence suggests that a low aerobic/endurance exercise capacity is a predictor for increased morbidity and mortality in older adults. Thus, losartan, an FDA-approved drug, may prove to have clinical benefits for older adults by enhancing their endurance capacity.

## DO YOU WANT TO AGE SUCCESSFULLY OR WISELY? A SOCIOLOGICAL APPROACH IN A SEARCH FOR THE UNIVERSAL ROOTS OF POSITIVE HUMAN DEVELOPMENT

H. Oh, *University of Florida, Gainesville, Florida*

What is wise aging? How and to what extent can wisdom add a new level of understanding to successful aging? The purpose of this study was to examine (1) how wisdom is perceived in different cultures, (2) what contributes/deters the cultivation of wisdom over the life course, and (3) how important wisdom is in aging well. In-depth interviews and survey data (n=600) collected from six countries (the U.S., Canada, Ukraine, Serbia, India, and China) were used. A mixed-method design adopted nonparametric, content, and social network analyses for quantitative configuration and qualitative confirmation. The results showed that culture played a significant role in wisdom understandings and a triadic tie among wisdom components was a best fit in wisdom development across cultures. A higher wisdom score group had higher life satisfaction with greater appreciation of perspective-taking and learning from others and experiences as prerequisites for wisdom development than the lower group.

## IMPACT OF NURSING HOME PROFIT STATUS ON PERCENTAGE OF RESIDENTS WITH DEMENTIA AND QUALITY OF CARE

K. Hansen, S. Hendrix-Buxton, H. Meng, K. Hyer, *School of Aging Studies, University of South Florida, Tampa, Florida*

This study examined whether profit status of nursing homes predicted the number of residents with dementia, and whether these residents were admitted into facilities with higher numbers of deficiency citations. We analyzed nursing homes in 2008 (N = 14,554) using the Online Survey Certification and Reporting (OSCAR) data, conducting a linear regression to measure impact of profit status. Covariates included total deficiencies per facility, facility chain membership, reimbursement by Medicaid and Medicare, and percentage of residents by facility with behavioral symptoms. Correlations of variables and covariates were significant ( $p < .001$ ), and linear regressions evaluated predictive contributions of each covariate. Results showed a 2.4% and 1.3% decrease in the proportion of residents with dementia according to for-profit status and chain membership, respectively. Residents with dementia were admitted to facilities with higher quality of care (measured by fewer deficiencies), and to those with greater percentages of residents with behavioral symptoms.

## SESSION 1410 (SYMPOSIUM)

### CLINICAL, RESEARCH, AND SERVICE WITH DIVERSE ELDERLY: WHAT STUDENTS SHOULD KNOW

Chair: *J.M. Dzierzewski, Clinical & Health Psychology, University of Florida, Gainesville, Florida*

Co-Chair: *J.J. Gregg, West Virginia University, Morgantown, West Virginia*

Discussant: *D. Gallagher-Thompson, Stanford University School of Medicine, Stanford, California*

The growing Gerontological explosion, along with the diversity among adults, makes it imperative that doctoral students are provided with training in clinical, research, and service work with diverse elders. Increased diversity of the aging population reflects the increased proportion and longevity of ethnic and racial minorities, the migration of elders to rural retirement areas augmenting those growing older in place, increased visibility and acceptance of sexual minority elders, and the significance of disabilities among the elderly. Along with general trends for America's population, minority populations are living longer, getting older, and becoming more racially diverse. Their rates of growth are expected to exceed those of Caucasians over the next 50 years. Additionally, the number of lesbian/gay/bisexual/transgender (LGBT) and disabled older adults is increasing. Trend data suggests that disabilities increase with age and people are living longer, the number of individuals with activity, work or functional limitations is increasing. The statistics regarding the diversity within the aging population all suggest a need to provide information to emerging scholars and clinicians about geropsychology competencies and resources to work with diverse elders in clinical, research, and service capacities. This symposium is geared toward doctoral students in geropsychology and early-career geropsychologists. National leaders in psychology and aging will describe the diversity within the aging population and provide information regarding geropsychology competencies and resources that doctoral students can use to prepare themselves for clinical, research, and educational activities with diverse elders including LGBT, rural, ethnic minority, and disabled seniors.

### COMMUNITY ENGAGEMENT WITH URBAN AFRICAN AMERICAN ELDERLY

P.A. Lichtenberg, *Wayne State University, Detroit, Michigan*

Older African Americans, like many ethnic minorities, suffer greater morbidities and earlier mortality than do older European Americans. Health disparities in older African Americans are found across health

conditions and preventive health behaviors. The links between mental and physical health are strong in older African Americans. The University of Michigan and Wayne State University, through an NIA minority aging center, have created the Healthier Black Elders (HBE) Center to help reduce health disparities through education and outreach. Issues such as depression, memory problems, pain control have been highlighted along with those of cancer screening, and chronic disease self-management. Each year, nearly 1500 older African Americans have been involved with HBE. The methods used to establish the credibility of HBE and outcomes among black elders related to trust and satisfaction will be discussed, as will general lessons that can be generalized to clinical, research, and service work with diverse ethnic elders.

#### **CLINICAL, RESEARCH, AND SERVICE WITH DIVERSE ELDERS: UNDERSTANDING DISABILITY**

J. Reinhardt, *Research Institute on Aging, Jewish Home Lifecare, New York, New York*

With advancing old age comes the increased likelihood of chronic, co-morbid physical and psychological illnesses and accompanying levels of disability. A challenge for geropsychologists is to understand and distinguish normal aging from disease to facilitate assessment and treatment that will promote improved health and functioning for older adults. This presentation will identify and discuss issues around dealing with disability and functional impairment in varied settings including the community (independent living, homecare) and institutional settings (assisted living, skilled nursing facility, subacute rehabilitation). Topics include understanding: issues around diagnosis and prognosis and trajectories of disease and disability; palliative and end of life care with a focus on advance directives and symptom management (pain, depression); working as part of an interdisciplinary team; knowing when and how to work with families; and being aware of differences in rates of disease and disability in late life by racial and ethnic status, and socioeconomic status variables.

#### **LESBIAN, GAY, BISEXUAL, AND TRANSGENDER AGING CONCERNS**

D. Kimmel, *Independent Practice, Hancock, Maine*

Recognition of same-sex relationships and of lesbian, gay, bisexual, and transgender adults has grown dramatically in recent years. Much of the focus has been on older persons, many in long-term relationships who lack the standard protections of marriage such as spousal social security or health care coverage. Older bisexual and transgender adults, persons aging with HIV, and gay and lesbian adults aging alone have generally received less media attention. All of these groups are themselves diverse with regard to each of the characteristics of aged populations. A few organizations and resources are available for providing gerontology services regarding these special concerns in many urban areas and some are developing in rural states. This presentation will focus on the unique aspects of aging and service needs for these sexual and gender minority populations. It will also discuss the importance of including gerontological competence in courses focused on sexual and gender diversity.

#### **CLINICAL GEROPSYCHOLOGY WITH RURAL OLDER ADULTS: CHALLENGES AND INNOVATIONS**

N.D. Dautovich, K. Douglas, *Psychology, University of Alabama, Tuscaloosa, Alabama*

Despite recognition at the federal level of the unique physical and mental health needs of rural Americans, older adults living in rural settings continue to be underserved. The needs of older adults are becoming ever more salient, as the proportion of older adults in rural settings increases due to the outward migration of younger adults and the inward migration of retiring older adults. Many barriers to treating rural older adults exist including: a dearth of trained personnel, high personnel turnover, transportation issues, literacy, stigma, reduced anonymity, and

poverty. In addition, barriers to involving older rural adults in research also exist. The objective of this presentation is to review factors specific to the treatment and involvement of rural older adults in research. Skills from the competencies of the Pikes Peak Model of Geropsychology will be emphasized. Innovative approaches from treatment and research conducted in rural Alabama will also be presented.

### **SESSION 1415 (SYMPOSIUM)**

#### **COUNT US IN: LESBIAN, GAY, BISEXUAL AND TRANSGENDER OLDER ADULTS IN SURVEY RESEARCH**

Chair: M. Brown, *School of Social Work, Syracuse University, Syracuse, New York*

Co-Chair: B.R. Grossman, *San Jose State University, San Jose, California*

Lesbian, gay, bisexual, and transgender older adults have unique experiences and specific cultural needs. In many national surveys of health in later life, there is a missed opportunity to collect data on gender identity and/or sexual orientation. In this symposium, Rainbow Research group members will address this gap by exploring original studies of LGBT older adults' experiences of religiosity and unmet service needs, and by examining how respondents with a history of same-sex relationships remain under-analyzed in one of the few surveys that captures this data. Brennan-Ing, Seidel, Larson, and Karpiak will present original data from a survey of older LGBT adults on unmet service needs and implications for LGBT and mainstream senior service providers. Porter and Oala will present data from the Trans Metropolitan Life Survey, a survey of 289 transgender older adults, on the topics of religious affiliation and participation and their relationship to successful aging. The remaining papers are based on the National Social Life, Health, and Aging Project, a 2004 national survey of 3005 older adults, 4% of whom reported at least one same-sex relationship during their lifetime. Grossman will present a content analysis of how the data on respondents with a history of same-sex relationships has been treated across the universe of publications produced on the NSHAP data. Brown will present a secondary analysis of the data exploring disparities among respondents with and without a history of same-sex relationships in terms of feelings of loneliness and isolation, self-esteem, and physical and mental health.

#### **UNEARTHING DIFFERENCE IN THE NSHAP SEXUAL HISTORY DATA**

M. Brown<sup>1</sup>, B.R. Grossman<sup>2</sup>, 1. *School of Social Work, Syracuse University, Syracuse, New York*, 2. *San Jose State University, San Jose, California*

The 2004 National Social Life, Health, and Aging Project (NSHAP) collected data from 3005 adults aged 57 to 85 on sexual behaviors, physical and mental health, and social networks. Although only a small proportion of respondents (about 4%) report any history of same-sex sexual relationships, the NSHAP is one of the few national datasets that enable us to compare these older adults to their heterosexual peers in terms of social support and physical and mental health. To date, very little has been published comparing NSHAP respondents based on reported sexual histories. Preliminary analyses reveal relationships between mental and physical health in this sample. Respondents with a history of only same-sex relationships are more likely to report lacking companionship and feeling isolated. Women are more likely to report poor self-esteem and physical and mental health, and these negative effects increase when controlling for same-sex relationship history.

## RELIGIOUS AFFILIATION & SUCCESSFUL AGING AMONG TRANSGENDER OLDER ADULTS

K. Porter, C.R. Oala, *UMASS Boston, Boston, Massachusetts*

Religion may enhance successful aging by reducing stress, improving well-being, and augmenting social engagement. Transgender-identified persons show higher levels of religiosity than their lesbian, gay or bisexual counterparts. Yet, little is known about the religious affiliation and successful aging association in transgender older adults. Generally, successful aging is grossly under-researched in the lesbian, gay, bisexual, and transgender (LGBT) populations. This exploratory study (based on the Trans Metropolitan Life Survey of 289 transgender adults age 51+) describes the demographics and religious affiliations of the sample. The majority (73.4%) self-report aging successfully, although 29.4% are disabled. Ninety-three percent are out about their gender identity; however, only 22.8% are out at their religious organization. Four logit models were run; religious affiliation did not significantly predict successful aging, although income and social support did. Transgender respondents showed greater participation in LGBT-affirming religions (conceptual model to be presented) than the normative sex and gender population.

## FALLING THROUGH THE CRACKS: UNMET NEED FOR SERVICES AMONG LGBT OLDER ADULTS

M. Brennan-Ing<sup>1,2</sup>, L. Seidel<sup>1</sup>, B. Larson<sup>3</sup>, S.E. Karpiak<sup>1,2</sup>, *1. Center on HIV and Aging, AIDS Community Research Initiative of America, New York, New York, 2. New York University College of Nursing, New York, New York, 3. Center on Halsted, Chicago, Illinois*

Research on service needs among older adults rarely addresses the special circumstances of LGBT individuals, such as their reliance on friend-centered social networks or the experience of discrimination from providers. Limited existing data suggests that older LGBT adults underutilize health and social services that are important in maintaining independence and quality of life. The present study explored unmet need for services in this population using a qualitative, grounded-theory approach. Data were obtained from 211 LGBT adults age 50 and older. Seventy-one percent identified as male, 24% as female, and 5% as transgender/intersex. One-third was Black and 62% were Caucasian. Content analysis revealed unmet needs for basic supports, namely housing, economic security (e.g., employment, financial assistance), and help with entitlements. Barriers included poor referrals and lack of timely follow-up. Limited opportunities for socialization were expressed, particularly among older lesbians. Implications for both LGBT and mainstream senior service providers will be discussed.

## WHAT CAN THE NSHAP TELL US ABOUT LESBIAN, GAY, BISEXUAL, AND TRANSGENDER AGING (AND VICE VERSA)?

B.R. Grossman<sup>1</sup>, M. Brown<sup>2</sup>, *1. San Jose State University, San Jose, California, 2. Syracuse University, Syracuse, New York*

The National Social Life, Health, and Aging Project (NSHAP) is the only nationally representative dataset on the sexual behaviors and practices of older adults in the U.S. Although this dataset includes information on respondents' lifelong history of sexual and social relationships, research on the sample reporting a history of same-sex relationships has been minimal. We will present the results of a content analysis of how the data on respondents with a history of same-sex relationships has been treated or ignored across the universe of publications produced on the NSHAP data. Our analysis highlights a series of missed opportunities to explore the differences between those with a history of same-sex relationship and those without, as well as the ways in which the literature on LGBT aging has the potential to inform the NSHAP and other national survey projects to gather data that will lead to meaningful comparative analyses.

## SESSION 1420 (SYMPOSIUM)

### EMOTION REGULATION AND AGING: DIVERSE METHODS FOR STUDYING REGULATORY PROCESSES AND OUTCOMES

Chair: *D. Isaacowitz, Northeastern University, Boston, Massachusetts*  
Discussant: *S.T. Charles, University of California at Irvine, Irvine, California*

Emotion regulation is a hot topic in the study of socioemotional aging, though many studies that are framed as involving emotion regulation do not have direct measures of affect or its regulation (see Isaacowitz & Blanchard-Fields, 2012). A basic criteria, then, for studies of emotion regulation in the context of aging is that they feature some direct assessment of regulatory processes and regulatory outcomes. This symposium features four papers, with diverse methodologies, that nonetheless directly investigate emotion-regulatory processes and outcomes in the context of aging. Isaacowitz and colleagues consider age differences in how different cognitive reappraisal strategies lead to attentional processes and self-reported affective outcomes among individuals viewing negative videos. Hoppmann and colleagues consider how goal problems relate to cortisol and self-reported mood, and how this varies not only by age but also for discrete emotional experiences. Riediger et al. consider how different goals lead younger and older adults to choose to listen to different musical pieces in support of affect regulation. Cheng and Grün investigate age differences in regulating emotions in the face of social rejection by another person. Finally, discussant Susan Charles will consider strengths and weaknesses of these approaches and will connect them to different conceptual frameworks for the study of aging and emotion regulation.

### AGING AND DIFFERENT FORMS OF REAPPRAISAL: EFFECTS ON EYE FIXATION AND MOOD

D. Isaacowitz<sup>1</sup>, C. Platzek<sup>2</sup>, J. Harris<sup>1</sup>, *1. Northeastern University, Boston, Massachusetts, 2. Brandeis University, Waltham, Massachusetts*

Attentional deployment and reappraisal are considered distinct emotion regulation strategies. Numerous studies have found that older adults use attentional deployment as a strategy, though questions remain about age and reappraisal: different age patterns have emerged for different forms of reappraisal. Moreover, recent studies with younger adults have found that reappraisal may sometimes be associated with more attention toward negative stimuli. We used a within-subjects design to assess the fixations and mood responses of younger (N=23) and older (N=20) adults as they viewed emotional images while instructed to view freely, positively reappraise, and use detached reappraisal. Both reappraisal conditions led to better self-reported mood than just viewing; this did not vary by age. While older adults looked less at negative overall, both age groups looked more at the negative aspects in positive reappraisal than the other conditions. This suggests that positive looking and positive reappraisal are distinct regulatory strategies across age.

### TUNING YOURSELF IN: MUSIC PREFERENCE, INTERPERSONAL GOALS, AND AFFECT REGULATION FROM YOUTH TO OLD AGE

M. Riediger, C. Wrzus, S. Frisch, *Max Planck Research Group "Affect Across the Lifespan", Max Planck Institute for Human Development, Berlin, Germany*

Age differences in affect regulation are a popular research topic. Evidence regarding age differences in what people do to regulate their affect, and in how effective they are in this respect, however, is scarce. To investigate these questions, we developed a paradigm that records affect-regulatory behavior with regard to people's listening choices for music varying in valence and arousal. Using this paradigm, we investigated the prediction that age differences in affect regulation are associated with differences in interpersonal goals. Adolescent, young, middle-aged,

and older adult participants (N = 150) expected to discuss a difference of opinion with a stranger. Interpersonal goals for the discussion were experimentally varied (activation of affiliation versus separation goals, control group) before participants completed the music-browsing task. Results support the idea that people are occasionally strategic in seeking affective states that are instrumental for their goals, and that this contributes to age differences in affect regulation.

### **DAILY GOAL-RELATED PROBLEMS ARE ASSOCIATED WITH DIFFERENT EMOTIONAL EXPERIENCES AND PHYSIOLOGICAL STRESS ACROSS THE ADULT LIFESPAN**

C.A. Hoppmann<sup>1</sup>, L. Slade<sup>1</sup>, S. Scott<sup>2</sup>, F. Blanchard-Fields<sup>3</sup>, 1. *Univ. of British Columbia, Vancouver, British Columbia, Canada*, 2. *Penn State, State College, Pennsylvania*, 3. *Georgia Institute of Technology, Atlanta, Georgia*

Daily problems are particularly stressful if they curtail progress on goals. We examined if older adults would show reduced negative emotions (sadness, anger) and physiological arousal (cortisol) when encountering goal-related problems. Data are based on 10-day time-sampling information from a lifespan sample (18-81 years). Participants rated their current emotional experiences 5 times daily and provided concurrent saliva samples for cortisol estimation. Findings show that, indeed, older adults reported less sadness on days when they experienced goal-related problems than young adults. However, this effect did not extend to anger. Importantly, daily anger was more powerful in eliciting high cortisol outputs than daily sadness across the lifespan. Hence, older adults seem to be advantaged when it comes to regulating low arousal negative emotions such as sadness but they are just as vulnerable to anger experiences as younger adults. Importantly, anger may have downstream consequences for physiological stress and increase disease risk.

### **AGE DIFFERENCES IN EMOTIONAL REACTIONS TO SOCIAL REJECTION**

Y. Cheng, D. Grün, *Department of Psychology, NC State University, Raleigh, North Carolina*

Social rejection is a common aspect of social interaction demanding emotion regulation skills of the rejected person. In the present study, we investigated age differences in emotional reactions to social rejection in a laboratory experiment. Young and older adults were given positive (acceptance condition) or negative feedback (rejection condition) by a confederate during an online interview. Interviews were videotaped and participants' facial expressions were coded. In addition, participants completed self-reported affect measures before and after the interview. Although older adults were generally in a more positive mood than younger adults, older adults seem to be more negatively influenced by the social rejection than younger adults. The results largely support the idea that older adults' emotion regulation skills are more challenged by actual rejection.

## **SESSION 1425 (SYMPOSIUM)**

### **EMPOWERING PROFESSIONALS, PROVIDERS, AND COMMUNITIES TO REDUCE FALLS**

Chair: *M. Kullman, Archstone Foundation, Los Angeles, California*  
Discussant: *D. Rose, California State University, Fullerton, Fullerton, California*

This symposium will analyze continuing efforts by the Fall Prevention Center of Excellence (FPCE) and its partners to develop evidence-based programs that increase the capacity of professionals, providers, and communities to reduce falls among older adults. It will present findings from: 1) a continuing education in-service (Pills & Spills) for direct care workers on medical and environmental fall risks; 2) FP Connect, a pilot project to develop tools that enable Emergency Medical Services and fire personnel to identify environmental risk factors; 3) the compilation and application of falls "hotspot" data that pin-

point local areas with high rates of falls among older adults; 4) a systematic review that provides recommendations to successfully implement exercise programs in medical settings; and 5) a pilot program to increase mobility and balance awareness at affordable senior communities. FPCE is a collaboration of the University of Southern California's Andrus Gerontology Center, the Center for Successful Aging at California State University, Fullerton; with partners; the VA Greater Los Angeles Healthcare System Geriatric Research, Education and Clinical Center and David Geffen School of Medicine at UCLA; the USC School of Pharmacy; and the California Department of Public Health.

### **PILLS & SPILLS: THE ROLE OF DIRECT CARE WORKERS IN REDUCING FALLS**

B. Williams<sup>2</sup>, A. Quyen Do Nguyen<sup>1</sup>, 1. *Gerontology, University of Southern California, Los Angeles, California*, 2. *University of Southern California, School of Pharmacy, Los Angeles, California*

Pills & Spills, funded by The SCAN Foundation, is a case-based, interactive continuing education program developed to help direct care workers in nursing homes and older adults' homes reduce falls through medication and environmental interventions. Six 1-hour in-service sessions include video segments of didactic material and corresponding case studies. The curriculum was developed to be "plug-and-play" on a standard DVD player, with accompanying Facilitator's Guide, pre- and post-tests, and evaluation instruments. With 3 pilot sites, 3 focus groups with 22 direct care workers and 6 interviews with staff were conducted to determine curricular needs, presentation format, and content. Eighty-five participants completed the entire series. This presentation will discuss the curriculum development including needs assessment, learning objectives, content production, and evaluation of format and content. Findings on how the in-services contributed to changes in knowledge, both overall and in specific content areas will also be discussed.

### **DEVELOPING AN EMS ASSESSMENT TOOL: THE FP CONNECT PROJECT**

G. Misiasek, P. Beck, *Gerontology, University of Southern California, Los Angeles, California*

Emergency Medical Services (EMS) personnel are often the first to arrive at the scene of a fall. FP Connect, funded by the Archstone Foundation, aims to enhance the capacity of Los Angeles EMS/fire personnel to address fall risks and reduce repeat falls. This presentation will describe findings from 6 'ride alongs' in the cities of Los Angeles, West Hollywood, and Inglewood and 4 pre- and post-focus groups with EMS/fire personnel used to inform the development of assessments and the dissemination of Fall Prevention (FP) material. Fall "hotspots" in LA County were utilized to maximize the impact of the intervention for those who need it most. Using a mixed-methods approach, the presentation will critically review the outcomes of the home assessment and dissemination of FP information. Next steps to facilitate the adoption of FP Connect in EMS operations throughout LA will also be discussed.

### **USING FALLS DATA TO TARGET LIMITED RESOURCES: PUBLIC HEALTH AND FALL HOTSPOTS**

E. Nabors, J. Pynoos, *Gerontology, University of Southern California, Los Angeles, California*

Coalitions can be an effective strategy in Fall Prevention (FP), identifying local needs and building community capacity to address them. The Fall Prevention Coalition – LA (FPC-LA), with 35 members from public, private, and non-profit organizations, reduces fall risk among older adults through education, advocacy, and community action. To help local agencies and organizations direct available FP resources to areas with the highest fall rates, the LA County Public Health Department compiled fall "hotspots" by mapping fall non-fatal hospitalization and fall death rates per 100,000 population among adults age 65 and over for each zip code in LA County. Tables were created to highlight

the 20 zip codes and service planning areas with the highest fall death and fall hospitalization rates. The presentation will include an analysis of how hotspots were compiled and applied to community settings to direct new projects, and opportunities for use in other communities.

### **A QUALITATIVE REVIEW OF EXERCISE PROGRAMS TO REDUCE FALLS IN OLDER ADULTS**

V. Shier, *Pardee RAND Graduate School, Santa Monica, California*

Systematic reviews demonstrate that exercise programs are effective in reducing falls in community-dwelling elders. However, how best to implement an exercise program in a medical setting remains unclear. Two reviewers screened 114 full text articles of randomized, controlled trials (RCTs) to prevent falls. We identified related articles providing insight into each included RCT by searching the references in, and articles citing, the RCT. Two reviewers independently abstracted data from the twenty-seven reviewed RCTs and their related articles. Data on participant adherence, attitudes, and implementation successes, difficulties, and facilitators were coded using qualitative data analysis software to identify cross-cutting themes. We combined qualitative data with descriptive data on program characteristics (e.g., exercise intensity, setting, target population) to better understand factors for successful implementation of exercise programs. Preliminary results suggest that program facilitators include involvement of health practitioners in the recruitment process, supervision of exercise, opportunity for social interaction, and convenience.

### **MOBILITY AND BALANCE AWARENESS: SUSTAINABLE WELLNESS PROGRAMS FOR AFFORDABLE SENIOR COMMUNITIES**

S. Castle, 1. *VA Greater Los Angeles GRECC, Los Angeles, California*, 2. *University of California, Los Angeles School of Medicine, Los Angeles, California*

Mobility and Balance Awareness for Affordable Senior Communities, pilot funded by The Be.Group Foundation, Good Family Foundation and Pasadena Foundation combines staff training, a community awareness health fair with a targeted combination of a 12 week exercise intervention (with fidelity checks/pre-post assessment) and medical workshops (with guided choices) on treatable risk factors. Training Resident Service Coordinators in the exercise intervention and residents' use of tools to monitor/interact with primary care providers on relevant health parameters/medication use supports sustainability. The first community program (n=12) showed a mean 50% improvement in FAB- SF scores, and an 80% increase from usual to maximal gait velocity in thirty foot walk measures, 6/7 workshop participants said they benefited from discussion of medications, 4/7 said they made an appointment to check vision and 3/7 took in med/BP logs to review with physician. Implementation lessons, including communities with a significant number of ESL residents, will be discussed.

## **SESSION 1430 (SYMPOSIUM)**

### **LIFECOURSE INFLUENCES ON LATER LIFE HEALTH: WHAT ADDITIONAL INSIGHTS ARE GAINED FROM USING BIOMARKERS?**

Chair: *E. Grundy, Centre for Population Studies, London School of Hygiene & Tropical Medicine, London, United Kingdom, University of Cambridge, Cambridge, United Kingdom*

Discussant: *D.J. Deeg, Free University of Amsterdam, Amsterdam, Netherlands*

The objective of this session is to demonstrate how use of data on biomarkers may advance our understanding of life course influences on later life health. Use of biomarkers offers opportunities for extending our understanding for several reasons. Firstly data on biological indicators are less susceptible to subjective reporting factors. Secondly, use of data on biological indicators may allow identification of differ-

entials in health relevant outcomes at an earlier stage of the life course than measures based on reporting of clinical conditions or disability with important potential value for public health. Thirdly, and most importantly, biomarker data may be used to elucidate the pathways whereby life course events and circumstances are manifested in later life health advantage and disadvantage. The papers included illustrate these approaches using longitudinal data from studies of English, Australian and Swedish populations. Ploubidis et al examine different hypotheses about effects of socio-economic position at various life stages on later life health contrasting results using fibrinogen level and a physical health indicator. Read et al examine how a composite measure of allostatic load is associated with individuals' earlier fertility histories and the extent to which this mediates and predicts subsequent health status and disability. Using data from a Swedish twin study, Pedersen et al investigate the extent to which psychosocial stress modifies the relationship between telomere length and cognitive decline. Anstey and Cherbuin also focus on cognitive ageing and find that three functional biomarkers predict decline in memory and processing speed in two Australian cohorts.

### **LIFELONG SOCIO ECONOMIC POSITION AND BIOMARKERS OF LATER LIFE HEALTH: A FORMAL COMPARISON OF THE CRITICAL PERIOD, ACCUMULATION AND CHAINS OF RISK HYPOTHESES**

G.B. Ploubidis, E. Grundy, L. Benova, B.L. DeStavola, *Department of Population Studies, London School of Hygiene and Tropical Medicine, London, United Kingdom*

The relative contribution of early and mid or later life socio-economic position to later life health is not fully understood and there are alternative hypotheses about the importance of different pathways. In this paper we use data from the English Longitudinal Study of Ageing to investigate the influences of life course socio-economic pathways to later life health, employing methods described in the causal mediation literature. We use two outcome measures, a latent summary of physical health derived from observer measured and self reported indicators and a biomarker – fibrinogen. We found that the effect of early life SEP (measured at age 10) is associated with physical health and fibrinogen levels at least 65 years later. However, a more complicated pattern of associations than implied by previous findings was observed with some age group specific effects and no clear superiority of the accumulation hypothesis in explaining later life health inequalities.

### **FERTILITY HISTORY, ALLOSTATIC LOAD AND HEALTH IN OLD AGE**

S. Read<sup>1</sup>, E. Grundy<sup>1,2</sup>, 1. *London School of Hygiene and Tropical Medicine, London, United Kingdom*, 2. *University of Cambridge, Cambridge, United Kingdom*

An increasing number of studies indicate associations between fertility histories and later life health but the underlying mechanisms are poorly understood. This paper examines whether allostatic load, a multistep dysregulation state resulting from accumulated physiological 'wear and tear', mediates the association between parenthood history (number of natural children, timing of maternity/paternity, and parenthood of foster, step or adopted children) and later indicators of health. We use a longitudinal sample of English men and women (n = 5611) aged 50+. In women, a higher number of children, and having experienced an early birth were associated with higher allostatic load and later poorer health. Childlessness in women and having adopted child in men and women was associated with allostatic load, but not later health. The path models suggested that allostatic load mediates the association between fertility history and health in women, but in men the associations are mediated by other factors.

## PSYCHOSOCIAL STRESS, TELOMERE LENGTH AND COGNITIVE DECLINE

N.L. Pedersen<sup>1,2</sup>, L. Gerritsen<sup>1</sup>, C.A. Reynolds<sup>3</sup>, *1. Medical Epidemiology and Biostatistics, Karolinska Institutet, Stockholm, Sweden, 2. University of Southern California, Los Angeles, California, 3. UC Riverside, Riverside, California*

Exposure to psychosocial stress has consistently been associated with cognitive decline. Telomere shortening is considered a marker of biological aging and has previously been shown to be affected by psychosocial stress. We investigated whether psychological stress modifies the relation between telomere length and cognitive decline in a cohort of elderly twins. We found that psychosocial stress modifies the relation between telomere length and cognitive decline. Participants with shorter telomere length and psychosocial stress start with lower memory functioning. However with increasing age, psychosocial stress predicts less memory decline and shorter telomeres predict steeper memory decline. For perceptual speed, shorter telomeres predicts steeper decline only in participants with psychosocial stress.

## LONGITUDINAL CHANGE IN FUNCTIONAL BIOMARKERS CORRELATES WITH COGNITIVE DECLINE IN MID- AND LATE-LIFE

K.J. Anstey, N. Cherbuin, *Centre for Research on Ageing, Health and Wellbeing, The Australian National University, Canberra, Australian Capital Territory, Australia*

We tested the hypothesis that cognitive ageing correlates with functional biomarkers from mid to late adulthood using longitudinal data from the PATH Through Life Project. Cohorts aged 40-44 and 60-64 were followed for 8 years and were assessed on grip strength, forced expiratory volume (FEV) and visual acuity as well as measures of memory and processing speed on three occasions, 4 years apart. Linear mixed models with random effects were used to evaluate the association of change in biomarkers and cognitive decline. We found that the three functional biomarkers predicted decline in memory and processing speed (fixed effects were significant) in both cohorts. Additionally, random effects of the three biomarkers were significant in the 40s for memory and speed. In the 60s cohort, decline in the the three biomarkers was associated with decline in speed. Decline in FEV and vision were associated with decline in memory.

## SESSION 1435 (SYMPOSIUM)

### PARADIGM SHIFTS IN THE EPIDEMIOLOGY OF AGING: ADDING NATURE TO NURTURE

Chair: *L. Barry, UConn Center on Aging, Farmington, Connecticut*  
Co-Chair: *D.K. Miller, Indiana University, Indianapolis, Indiana*  
Discussant: *K. Yaffe, University of California San Francisco School of Medicine, San Francisco, California*

Our symposium highlights current epidemiologic research that evaluates the inter-relationship between “nature” (physiologic/biologic) and “nurture” (social-behavioral/environmental) factors and explores their effects on cognitive function, physical function, and mortality in older persons. Nature and nurture effects on cognitive function are addressed using three different approaches. Dr. Watts presents findings regarding the relationship between metabolic syndrome, assessed using risk factors such as hypertension and dyslipidemia, and change in cognitive performance in persons with mild Alzheimer’s disease (cases) as compared with healthy controls. Dr. Rosano’s research defines brain resilience using repeated brain magnetic resonance imaging of participants in the Cardiovascular Health Study and in the Health, Aging, and Body Composition Study. She shares her findings indicating that faster processing speed lowers risk of dementia over time in persons with small vessel disease. Using data from the Chicago Health and Aging Project, Dr. Mendes de Leon discusses how the relationship between APOE e4 and age-related cognitive decline differs according to perceived neigh-

borhood social conditions (i.e., social disorder). Dr. Kositsawat uses data from the National Health and Nutrition Examination Survey and evaluates the potentially synergistic effects of Vitamin D deficiency and C-reactive protein on slow gait speed, an important frailty indicator. Finally, Dr. Melzer shares findings from the Health and Retirement Study regarding the association between parental age and offspring disease and mortality risk. The discussion will focus on the necessity (or not) of shifting the paradigm of epidemiologic research in aging towards the inter-relationship between nature and nurture variables to explain health outcomes.

## METABOLIC SYNDROME AND COGNITIVE DECLINE IN OLDER ADULTS WITH AND WITHOUT ALZHEIMER’S DISEASE

A. Watts<sup>1</sup>, N. Loskutova<sup>2</sup>, D.K. Johnson<sup>1</sup>, J.M. Burns<sup>2</sup>, *1. Lifespan Institute, University of Kansas, Lawrence, Kansas, 2. University of Kansas Medical Center, Lawrence, Kansas*

Metabolic Syndrome (MetS) is a cluster of risk factors (i.e., abdominal obesity, hypertension, dyslipidemia, glucose/insulin dysregulation) that is associated with cardiovascular disease, diabetes, and dementia. We assessed the effect of MetS on cognitive decline over two years in 58 cases of mild Alzheimer’s disease (AD) and 64 healthy older adult controls in the Brain Aging Project. Using structural equation modeling, we estimated the effect of MetS on change in verbal memory, working memory, and mental status. In healthy controls, MetS did not significantly predict change in cognitive performance. In the AD group, lower BMI at baseline predicted greater declines on verbal memory and working memory, while higher waist circumference predicted poorer verbal memory performance. Higher blood pressure predicted poorer working memory performance. The dysregulation of these biological systems is highly influenced by lifestyle factors including diet and exercise. Thus, research is increasingly focused on prevention including modifiable lifestyle risk factors for cognitive decline and dementia.

## BRAIN RESILIENCE AND RISK OF NEGATIVE HEALTH OUTCOMES

C. Rosano<sup>1</sup>, A.B. Newman<sup>1</sup>, J.M. Guralnik<sup>2</sup>, L.H. Kuller<sup>1</sup>, H. Aizenstein<sup>1</sup>, *1. University of Pittsburgh, Pittsburgh, Pennsylvania, 2. University of Maryland School of Medicine, Baltimore, Maryland*

One hypothesis to explain why older people remain high functioning late in life is that they have a greater “brain reserve”. However, brain reserve has not been objectively quantified, as it has mostly relied on gross measures of whole-brain abnormalities that are largely non-specific manifestation of brain aging. Additionally, the determinants of brain reserve have not been characterized systematically in relation to objective measures of brain integrity. We define brain reserve using objective quantitative measures based on brain magnetic resonance imaging in participants from the Cardiovascular Health Study and the Health, Aging and Body Composition Study. Preliminary results indicate that faster processing speed predicts lower risk of mortality and dementia risks over a long period among those with small vessel disease (SVD). Between-group differences in various factors did not explain this apparent “resilience.” These findings urge exploration of mechanisms underlying faster processing speed in very old adults with SVD.

## SLOW GAIT SPEED AND POTENTIAL SYNERGISM OF INFLAMMATION AND VITAMIN D DEFICIENCY

J. Kositsawat, L. Barry, G.A. Kuchel, *Center on Aging, UConn Health Center, Farmington, Connecticut*

High IL-6 and low IGF-1 contribute synergistically to disability (Cappola et al 2003). We explored whether such risk factor synergisms are generalizable to other mutually-inhibitory risk factor pathways. While chronic inflammatory states contribute to and are worsened by vitamin D deficiency, the relationship between these known risk factors and slow gait speed (GS < 0.8 m/sec) remains unknown. Among

1,826 community-dwelling participants age  $\geq 50$  years in the National Health and Nutrition Examination Study (NHANES 2001-2002), having high CRP ( $> 0.2$  mg/dL) and vitamin D deficiency ( $< 20$  ng/mL), as compared with having neither risk factor, was associated with slow gait speed (OR 2.40; 95%CI, 1.28-4.49;  $p=0.006$ ). The likelihood of having slow gait speed increased among those with either, but not both, risk factors, yet this finding was non-significant (OR 1.53; 95%CI, 0.86-2.71;  $p=0.15$ ). Such risk factor synergisms may deserve consideration in future interventions to prevent frailty and mobility disability.

### **SOCIAL DISORDER, APOE-E4 GENOTYPE, AND CHANGE IN COGNITIVE FUNCTION AMONG OLDER ADULTS**

J.D. Boardman<sup>1</sup>, L.L. Barnes<sup>2</sup>, R.S. Wilson<sup>2</sup>, D.A. Evans<sup>2</sup>, C. Mendes De Leon<sup>3</sup>, 1. *University of Colorado Boulder, Boulder, Colorado*, 2. *Rush University Medical Branch, Chicago, Illinois*, 3. *University of Michigan, Ann Arbor, Michigan*

This study examines whether neighborhood social conditions modify the association between APOE e4 genotype and age-related cognitive decline. Data came from a longitudinal study of older adults (age 65+), the Chicago Health and Aging Project (n=1730), living in an urban area of 20 adjacent census tracts. We constructed a summary measure of neighborhood social disorder based on census tract-level averages of perceived neighborhood social conditions. In a multilevel analysis controlling for age, sex, race, and other covariates, the e4 allele and social disorder were significantly ( $p<.001$ ) associated with cognitive decline. There was a significant APOE e4 by disorder interaction ( $p<.01$ ), indicating a stronger effect of the e4 allele on cognitive decline among older adults in neighborhoods with less disorder.

### **MIDDLE-AGED OFFSPRING OF LONG LIVED PARENTS IN HRS**

D. Melzer<sup>1</sup>, A. Dutta<sup>1</sup>, W. Henley<sup>1</sup>, K. Langa<sup>2</sup>, R.B. Wallace<sup>3</sup>, J. Robine<sup>4</sup>, 1. *Epidemiology and Public Health, University of Exeter, Exeter, United Kingdom*, 2. *University of Michigan, Ann Arbor, Michigan*, 3. *University of Iowa, Iowa City, Iowa*, 4. *INSERM, Montpellier, France*

Background The children of long-lived parents live longer. We aimed to examine parental attained age associations with offspring disease and risk in middle aged groups in a prospective study. Methods Health and Retirement Study offspring of longer-lived parents (OLLPs) had parents attaining  $>90$  or one attaining 75-89. Offspring of shorter-lived parents (OSLPs) had parents attaining  $<75$  or one 75-89. We included offspring aged 51-61 years (n=7332) at baseline and followed-up for 16 years. Full adjustment included smoking, wealth, income, education, and BMI. Results OLLPs continued to experience lower incidence of heart disease (hazard ratio: 0.69, 95% CI: 0.56-0.84) and stroke (0.75, 0.61-0.90) and mortality from all causes (0.55, 0.44-0.68); but not cancer (0.88, 0.72-1.07) and arthritis (1.1, 0.97-1.28) during follow-up. Adjustment for 'classical' risk factors had little effect. Conclusions Parental attained age is associated with better cardiovascular disease and lower mortality, with a relatively small mediation by environmental advantages.

## **SESSION 1440 (SYMPOSIUM)**

### **PATTERNS AND SIGNIFICANCE OF SIBLING RELATIONSHIPS IN ADULTHOOD**

Chair: J. Suito, *Purdue University, West Lafayette, Indiana*

Co-Chair: M.M. Gilligan, *Purdue University, West Lafayette, Indiana*

Discussant: D. Carr, *Rutgers University, New Brunswick, New Jersey*

The sibling relationship has the potential to be one of the most enduring and consequential in individuals' lives. Yet remarkably little is known about sibling relations in adulthood, particularly regarding factors predicting relationship quality and the consequences of this tie for social and psychological well-being. In this symposium, we hope to shed new

light on these processes by exploring four related research questions. In the first paper, Gilligan, Suito and Pillemer use data from the second wave of the Within-Family Differences Study to explore the effects of tension in sibling relationships in midlife on positive and negative dimensions of psychological well-being. The second and third papers explore the ways in which parents' differential treatment of their offspring (PDT) affect sibling well-being and relationship quality. Jensen, Whiteman, and Fingerman examine the consequences of PDT in early adulthood on depressive symptoms, life satisfaction, and sibling intimacy; Suito, Gilligan, and Pillemer investigate whether the detrimental effects of maternal favoritism on well-being and sibling relations are cumulative, as well as whether they vary by the specific patterns of differentiation. Last, Bedford and Avioli provide a review of the literature on twins, with a focus on the social advantages of monozygotic (identical) relationships compared to dizygotic (fraternal) and nontwin sibling relationships. Deborah Carr and the other panelists will discuss how the collective findings shed light on the role of sibling relations on social and psychological well-being in adulthood, and the implications of these patterns for theory and practice.

### **SIBLING TENSION AND PSYCHOLOGICAL WELL-BEING IN ADULTHOOD**

M. Gilligan<sup>1</sup>, J. Suito<sup>1</sup>, S. Kim<sup>1</sup>, K. Pillemer<sup>2</sup>, 1. *Purdue University, West Lafayette, Indiana*, 2. *Cornell University, Ithaca, New York*

Theory and research have highlighted the importance of kin relations on well-being. However, despite the fact that the sibling relationship may be one of the most enduring kin relations across the life course, limited attention has been directed toward understanding the consequences of this tie on well-being in adulthood. In this paper, we use two-wave panel data collected from 514 adult children nested within 240 families to examine how tension with siblings affects depressive symptoms. Clustered regression analyses revealed that individuals experiencing greater sibling tension at T2 reported higher depressive symptoms, controlling on depressive symptoms and relationship quality reported seven years earlier. These findings highlight the importance of the quality of relationships with siblings on individuals' well being, and call for an increased emphasis on understanding the consequences of this understudied kin relationship in contemporary society.

### **THE IMPLICATIONS OF MATERNAL AND PATERNAL DIFFERENTIAL TREATMENT IN YOUNG ADULTHOOD**

A.C. Jensen<sup>1</sup>, S.D. Whiteman<sup>1</sup>, K. Fingerman<sup>2</sup>, 1. *Purdue University, West Lafayette, Indiana*, 2. *University of Texas, Austin, Texas*

Parents' differential treatment (PDT) of offspring has been studied extensively in childhood, adolescence, and even middle adulthood. Despite connections with individual and relational functioning across developmental periods, few studies have considered the implications of PDT in young adulthood. The present study addressed this gap utilizing data from young adult siblings from 151 families (N = 302, Mean age = 23.90, SD = 5.02). Participants reported on support received from mothers and fathers, their relationships with siblings, and their individual mental health. Using multi-level modeling, analyses examined the correlates of PDT from both mothers and fathers. Maternal and paternal differential treatment were consistently linked to young adults' depressive symptoms, life satisfaction, and sibling intimacy; however, the implications often varied as a function parent gender as well as the gender composition of the sibling dyad. Overall, results suggest that both maternal and paternal PDT are salient family processes in young adulthood.

### **EFFECTS OF PERCEIVED MATERNAL FAVORITISM ON WELL-BEING AND SIBLING RELATIONS IN MIDLIFE: DOES STABILITY OF PERCEPTIONS MATTER?**

J. Suito<sup>1</sup>, M.M. Gilligan<sup>1</sup>, K. Pillemer<sup>2</sup>, 1. *Purdue University, West Lafayette, Indiana*, 2. *Cornell University, Ithaca, New York*

Perceived parental favoritism has been found to predict depressive symptoms and sibling conflict in childhood and adulthood. In this paper,

we explore whether the detrimental effects of mothers' favoritism are stronger when they are cumulative, or whether favoritism at any single point has consequences. We address this question using data collected from 483 adult children at two points seven years apart. Clustered regression analyses revealed no greater effects of a history of favoritism than current favoritism on either depressive symptoms or sibling tension. Further, effects of current differential treatment were specific to which child was favored. Depressive symptoms were higher when children perceived themselves as their mothers' primary confidants; however, there were no effects of favoritism regarding emotional closeness. For daughters, but not sons, tension with siblings was higher when respondents were perceived as mothers' preferred confidants and when mothers were emotionally closer to other offspring.

#### **NEW FRONTIERS IN SIBLING RELATIONSHIPS: CHALLENGES FROM TWIN RESEARCH**

V.H. Bedford<sup>1</sup>, P.S. Avioli<sup>2</sup>, 1. *University of Indianapolis, Indianapolis, Indiana*, 2. *Kean University, Union, New Jersey*

Twins have been essentially excluded from sibling research with a few recent exceptions (e.g., Tancredy & Fraley, 2006), despite the fact that twins are siblings. As a result, little is known in adult sibling research about relationships between twins and, consequently, the knowledge base about siblings in general has been truncated. Recently, however, twins (and multiple-births generally) have become more visible, both from media attention and a dramatic increase in number due to both to the popularity of fertility treatments and the older ages at which women are bearing children (Segal, 2011). The present study addresses this omission in two ways. First, it reviews the twin literature, mostly found in behavioral genetics, comparing MZ and DZ twins. Next, it explores the social advantages of MZ relationships relative to DZ and nontwins, and what seems to account for these differences. Recommendations are made for applications of these advantages to other relationships.

#### **SESSION 1445 (SYMPOSIUM)**

##### **PERSONALIZING CANCER SCREENING FOR THE OLDER ADULT**

Chair: *E.S. Breslau, National Cancer Institute, Bethesda, Maryland*  
Co-Chair: *S. Sheinfeld Gorin, Columbia University, New York, New York*

Discussant: *M.A. Schonberg, Beth Israel Deaconess Medical Center, Boston, Massachusetts*

Cancer is the second leading cause of deaths in the US among those aged 65 and older. Yet, considerable uncertainty exists about the use of cancer screening tests in older people. Because cancer screening efficacy varies by age and organ site, the decision to screen older individuals should be personalized, that is, based on the evidence for positive outcomes, individual health status and genetic profile, the specific benefits and harms of the test, patient preferences, rather than solely the age of the patient. The aims of this symposium are to: (1) describe frameworks for personalizing cancer screening; (2) explore the evidence for personalizing cancer screening; (3) explore decision making approaches, and (4) discuss implementation strategies for personalized cancer screening in practice. Louise Walter will propose a framework for decision-making that is personalized to the older adult by weighing quantitative information, such as risk of cancer death and likelihood of beneficial and adverse screening outcomes, as well as qualitative factors, such as individual patients' values and preferences. Maren Scheuner will examine the limited evidence for personalizing cancer screening in genetics and genomics. Ellen M. Peters will share the findings from studies of decision-making among older adults to personalizing cancer care. Sherri Sheinfeld Gorin will describe implementation approaches, including academic detailing and practice facilitation, to disseminate the evidence for personalized medicine to clinical practices serving older adults. In addition to summarizing the points raised by the presenters, Mara A.

Schonberg, discussant, will also propose recommendations for future research in this area.

##### **APPLICATION OF GENOMIC MEDICINE IN SCREENING DECISIONS FOR OLDER ADULTS**

E.S. Breslau<sup>1</sup>, M.T. Scheuner<sup>2</sup>, 1. *Division of Cancer Control and Population Sciences, National Cancer Institute, Bethesda, Maryland*, 2. *Rand Corporation, Santa Monica, California*

Genomic medicine is used across the cancer care continuum, from genetic tests that convey information about cancer risk to the use of targeted treatments for individuals who are diagnosed with cancer. This presentation focuses on the application of genetic information in cancer screening for older adults, including risk assessment that may suggest an inherited cancer syndrome and optimal screening frequency and modalities. First, the history of genomic discoveries will be reviewed along with a framework for the evaluation of genetic testing applications. Then, the clinical implications of genetic information will be discussed, including how providers and older patients communicate about and use genetics in screening decisions.

##### **DECISION MAKING AMONG OLDER ADULTS**

E.S. Breslau<sup>1</sup>, E.M. Peters<sup>2</sup>, 1. *Division of Cancer Control and Population Sciences, National Cancer Institute, Bethesda, Maryland*, 2. *Ohio State University, Columbus, Ohio*

Although research indicates that provider recommendation is a key factor in a patient's decision to be screened for cancer, a shared decision making process is important. The ethical ideal is to encourage patients to make health decisions that are consistent with their desires and preferences. More contemporary generations approaching older age may prefer such an active role in their health management. It is critical that we understand persons of differing older ages make health decisions so we can prepare for these interactions. This presentation will explore such topics as information-processing models, emotional goals, and related components of decision making in older adults.

##### **IMPLEMENTING PERSONALIZED MEDICINE IN PRIMARY CARE**

E.S. Breslau<sup>1</sup>, S. Sheinfeld Gorin<sup>2</sup>, 1. *Division of Cancer Control and Population Sciences, National Cancer Institute, Bethesda, Maryland*, 2. *Columbia University, New York, New York*

Implementing personalized medicine for cancer screening among older adults requires practice redesign. Two redesign approaches—Academic Detailing (AD), and Practice Facilitation (PF)—have been empirically tested. Across 13 studies, AD, involving a brief and focused intervention, has demonstrated change in physician breast, colorectal, and cervical cancer screening behaviors over time. PF, through capacity enhancement, has increased the adoption of evidence-based guidelines in intervention practices three-fold over controls, raising the rates of preventive services, according to a review and 2010 National Demonstration Project. We will apply AD and PF approaches to implementing personalized medicine among primary care practices serving older adults.

##### **FRAMEWORK FOR SCREENING DECISION MAKING**

E.S. Breslau<sup>1</sup>, L.C. Walter<sup>2</sup>, 1. *Division of Cancer Control and Population Sciences, National Cancer Institute, Bethesda, Maryland*, 2. *University of California, San Francisco, California*

The complexity of screening decisions necessitates a framework for designing a screening approach that will minimize risk and maximize benefits for older people. Although evidence-based guidelines provide information about screening-related mortality reduction on a population level, these guidelines stress that individual patient factors such as health status must be taken into account when making screening decisions. This presentation explores factors to consider when providers and patients make decisions about cancer screening. The presentation serves

as a foundation for the subsequent presentations that will explore, in more depth, some of the important components of the framework.

## SESSION 1450 (SYMPOSIUM)

### PLACE ATTACHMENT IN LATER LIFE: CROSS-NATIONAL PERSPECTIVES

Chair: *C. Phillipson, Keele University, Keele, Staffordshire, United Kingdom*

Discussant: *H. Chaudhury, Simon Fraser University, Vancouver, British Columbia, Canada*

The meaning of, and attachment to, place are considered especially significant for older people. This reflects: first, the greater time spent at home and in the neighborhood; second, increased reliance upon the immediate community for support in old age; and, third, the significance of place and attachment to place in preserving a sense of identity and wellbeing in old age. This symposium explores conceptual and empirical aspects of the processes underlying place attachment in old age. Graham Rowles presents a longitudinal experiential perspective on relocation, with particular focus on a model of processes of 'making' and 'remaking' place in old age. Amber McIlwain presents findings from an ethnographic-based study among older Irish immigrants living in Boston, USA. Her research demonstrates the complex ways in which older immigrants develop a sense of home from multi-scale attachments to artifacts, including place. Tine Buffel et al. present findings from a mixed-method study on place attachment in Belgium. The study focuses on two contextual factors that explain variation in place attachment among older people living in different types of locations: the physical-spatial environment and population turnover. Finally, Elena Portacolone presents data from an ethnography of people aged 75 and over living alone in San Francisco, USA. Her paper discusses a number of factors that hinder the individual's ability to live alone and develop a sense of place in urban settings. The four papers will provide an opportunity to explore cross-national continuities and contrasts in the experience of aging in place.

### PLACE ATTACHMENT AMONG OLDER ADULTS LIVING IN FOUR COMMUNITIES IN FLANDERS, BELGIUM

T. Buffel<sup>1</sup>, L. De Donder<sup>1</sup>, C. Phillipson<sup>2</sup>, N. De Witte<sup>3,1</sup>, S. Dury<sup>1</sup>, D. Verté<sup>1</sup>,  
1. *Adult Educational Sciences, Vrije Universiteit Brussel, Brussels, Belgium*,  
2. *Keele University, Keele, Staffordshire, United Kingdom*,  
3. *University College Ghent, Ghent, Belgium*

There is strong evidence that age brings an increasing attachment to social and physical environments. However, the extent to which the experience of place attachment may vary between different types of locations remains under-explored in ageing research. Using a mixed-method approach, this contribution aims to identify contextual factors that either promote or impede older people's attachments to place. Quantitative data from the Belgian Ageing Studies were used to purposively select four municipalities: two with relatively strong, and two with relatively weak place attachments among the older population. In the qualitative phase, two focus groups with local stakeholders and 20 semi-structured interviews with older residents were conducted in each of the four case study areas. The findings focus on two contextual factors that have been linked to place attachment: the physical-spatial environment and population turnover. The paper concludes by discussing practical and policy issues raised by the research.

### RELOCATION TRAJECTORIES AND THE MAKING AND REMAKING OF PLACE

G.D. Rowles, *Univ of Kentucky, Lexington, Kentucky*

Each of the 10.3 (average) relocations Americans make during their life entail recreating a new sense of place in a destination environment. Over the life course, individuals develop competence in making and remaking place. As one moves toward old age, remaking place becomes

more consciously related to maintaining identity. Blending 32 years of ethnographic research in urban, rural and long-term care environments with an autoethnography, I propose a dynamic model of transition in attachment to place during late life relocation. Dimensions of abandonment, transference, and creation are documented in relation to social context and evolving knowledge over the second half of life. Progressively increasing individual proactivity in creating and recreating place gives way, during the final phases of life, to a pattern of reactivity as the process of making place gradually slips from individual control. Implications for interventions to maximize retention of autonomy in making and remaking place are described.

### "GOING SOLO" IN OLDER AGE IN URBAN AMERICA: A GARGANTUAN ENTERPRISE?

E. Portacolone, *San Jose State University, Berkeley, California*

Living solo is one of the "ideas that are changing life" declared the cover of *The Time*. Living alone is a platform for self-realization and engagement writes sociologist Klinenberg in his book *Going Solo*; living alone gets easier with robust welfare policies and among younger generations, he adds. Drawing from a two-year ethnography of 47 adults 75+ living alone in San Francisco, I argue that living alone in older age in urban America can often become an unsustainable enterprise constellated by unnecessary suffering. The lack of social policies supporting the condition of living alone in older age makes the condition unsustainable. The absence of public coverage of long-term care, the limited number of public social workers, and the shortage of affordable housing hinder one's ability to live alone. Given the number of solo dwellers, it is time to create social policies allowing them to successfully "stay" solo in older age.

### THE LIFE COURSE PROCESS OF HOME AMONG OLDER IRISH IMMIGRANTS

A.S. McIlwain, *Graduate Center for Gerontology, University of Kentucky, Lexington, Kentucky*

Although aging studies take particular interest in understanding the meaning of home for older adults, questions of home for older immigrants remain unanswered. This ethnographic-based study examines the process whereby older Irish immigrants develop, maintain, and communicate their sense of home over the life course and across generations. Study participants left Ireland post-WWII through the 1960s and were recruited from the Boston area; this group was chosen because of their shared experiences of migration and the period specific discursive elements that structured them. Data were collected from participant observation, secondary texts, and deep narrative interviews and analyzed using a grounded theory approach. The process of home was found to be a product of the life course and context dynamics. Older immigrants develop their sense of home through multi-scale attachments to artifacts, including temporal and spatial memories, personal expressions of identity, such as self and place, and activities and behaviors.

## SESSION 1455 (SYMPOSIUM)

### PLANNING FOR THE FUTURE IN CLINICAL GEROPSYCHOLOGY: AVENUES FOR SUCCESS

Chair: *J.J. Gregg, Psychology, West Virginia University, Morgantown, West Virginia*

Co-Chair: *J.M. Dzierzewski, University of Florida, Gainesville, Florida*

Discussant: *M. Gatz, University of Southern California, Los Angeles, California*

By the year 2030, it is estimated that the number of older adults (age > 65) in the U.S. will double to exceed 70 million. Moreover, there are currently fewer clinical geropsychologists than are needed to serve older adults through research, advocacy, and the delivery of clin-

ical services. It is likely that the coming demographic changes in the U.S. population will only exacerbate this shortfall. Thus, the training of new clinical geropsychologists with proficiency in each of these roles is a high priority. However, the emphasis placed on each responsibility (e.g., research, advocacy, administration, clinical service) varies widely across settings. The purpose of the present symposium is to inform students and early-career geropsychologists about the exciting opportunities available through various career avenues. Speakers are comprised of leaders in the field of clinical aging who have achieved success in diverse capacities. First, Dr. Sara Qualls will discuss her experience in a department of psychology, with an emphasis on forging university-community partnerships. Next, Dr. Rachel Rodriguez will describe her work in the VA health system and the opportunities available for future geropsychologists. Dr. Patricia Areán will then present on her role as a clinical geropsychologist working in an academic medical setting. Fourth, Dr. Gregory Hinrichsen will elaborate on his many experiences related to aging policy and will discuss future pathways for involvement. Finally, Dr. Margaret Gatz, a pioneer in models of training clinical geropsychologists, will synthesize across topics and provide a discussion for charting new frontiers in clinical aging.

### **COMMUNITY PARTNERSHIPS IN INTEGRATED CARE FOR GEROPSYCHOLOGY TRAINEES**

S. Qualls, *University of Colorado Colorado Springs, Colorado Springs, Colorado*

University based training programs in geropsychology can partner with community service providers to broaden the range of clinical practice. The Pikes Peak Model of Professional Geropsychology Training emphasizes the importance of training to deliver services in settings where older adults already seek services. Community partnerships offer opportunities to build training experiences in housing, social services and health care. Psychologists have an important role to play in developing and fostering integrated care across this wide range of settings. Practicum training opportunities can be built across a range of such settings as a powerful way to socialize professional psychologists in the knowledge and skills needed to succeed. Early training experiences in integrated care settings also builds the expectation that psychologists are key members of teams, valued consultants to direct care staff as well as management, and professionals with a range of assessment and intervention tools that can be selected for particular settings.

### **CLINICAL GEROPSYCHOLOGY IN THE VA MEDICAL SETTING**

R.L. Rodriguez, *Psychology Service, VA Palo Alto Health Care System, Palo Alto, California*

The vast majority of Veterans receiving services within the Veterans' Affairs Health Care System are over the age of 60. Due to VA's dedication to caring for both the physical and psychosocial needs of Veterans, there is great value placed on the role of psychology within VA. As such, working as a clinical geropsychologist within VA provides unique opportunities to serve older Veterans in a wide array of settings, including inpatient settings, outpatient clinics, and in their home environments. Dr. Rodriguez will focus this presentation on the multiple roles she holds as a clinical psychologist for the Home Based Primary Care Program within VA Palo Alto Health Care System. The strong emphasis on interprofessional teams and the role that psychologists play in supporting these teams and interdisciplinary staff will be highlighted. Additionally, the important role that psychologists have in the training of mental health and medical fellows will be discussed.

### **CAREERS FOR PSYCHOLOGISTS IN ACADEMIC MEDICINE/PSYCHIATRY**

P.A. Arean, *Psychiatry, UCSF, San Francisco, California*

This presentation will focus on the important role psychologists play in academic medical centers. Dr. Patricia Arean will talk about her 25+

year experience in departments of psychiatry, general internal medicine and rehabilitative medicine, from clinical practicum to professor. In particular, she will talk about clinical roles she and her psychologist colleagues have held in medicine as a therapist, consultant, mental health expert, researcher and educator to medical students, psychiatry and internal medicine residents, psychology interns and post doctoral fellows. Dr. Arean is currently a professor with tenure in the department of psychiatry at UCSF, a position she has held since 1994. She is the training director for the NIMH funded Clinical Services Research Training Program, faculty in the school of medicine, psychiatry residency, and clinical psychology training program. She is an actively funded researcher in geriatric mental health from NIMH and NIDDK.

### **PUBLIC POLICY CAREER OPTIONS**

G.A. Hinrichsen, *Albert Einstein College of Medicine, New York, New York*

Public policy shapes health and mental health care practice in powerful ways. Aging of the baby boomer generation will require many critical policy decisions now and in the future. Gerontologists have much to contribute to shaping public policy and aging yet the path to making a contribution often is not apparent. The presenter will broadly outline some critical public policy issues related to the delivery of mental health services to older adults. He will describe the evolution of his own interest and involvement in public policy issues including participation in the American Psychological Association Congressional Fellowship Program and the Health and Aging Policy Fellows Program. Potential pathways for involvement in public policy and aging issues for both graduate students and established professionals also will be discussed.

## **SESSION 1460 (SYMPOSIUM)**

### **TWO NATIONS GROWING OLDER: THE UNITED STATES AND MEXICO**

Chair: *J.L. Angel, University of Texas at Austin, Austin, Texas*

Discussant: *J. Treas, University of California at Irvine, Irvine, California*

Discussant: *K. Markides, University of Texas at Galveston, Galveston, Texas*

The Hispanic population is aging rapidly, with the number of older Latinos expected to increase by more than six times by 2050 to 17.5 million. Similarly, Mexico's population is aging swiftly and will increase by 227 percent over the next 25 years. The coming nexus of aging and diversity faced by the United States will require a greater level of scrutiny and analysis if we are to provide policy solutions to aging and health care issues in the United States and, by example, in Mexico and throughout Latin America. This symposium will focus on the consequences of the rising longevity for Hispanics in the U.S. and Mexico. Because a greater proportion of older adults will be from a large immigrant population, providing cost-effective and appropriate services to aging Hispanics will require a clear understanding of the inter- and intra-diversity of needs among this group in different social circumstances. Five paper presentations and two discussants will examine several thematic issues, including: 1) the effects of immigration-related factors on financial security and healthful aging; 2) the impact for family and economic resources on long-term care 3) health and long-term care services for older people of Mexican ancestry and other ethnic minorities. The resulting discussion will provide new empirical and theoretical insights on the determinants of successful aging for these groups. It will also inform policy debates and aid in implementing innovative strategies and concrete solutions to improve the health and social welfare of two nations growing older: Mexico and the United States.

## THE NEXUS OF AGING AND DIVERSITY IN THE UNITED STATES AND MEXICO: IMPLICATIONS FOR SOCIAL POLICY AND PRACTICE

F. Torres-Gil, K. Spencer Suarez, *University of California at Los Angeles, Los Angeles, California*

This presentation examines twin bilateral developments affecting the United States and Mexico, and the aging of both nations and cross-national migration patterns. As Mexico must prepare for a dramatic increase in their elderly population, the United States also debates the sustainability of public benefits for the elderly. Mexico currently has approximately one million expatriates from the United States that have chosen to retire in Mexico and in particular regions of that country. While Mexico continues to send young nationals to the United States, the demographic is beginning to change; undocumented flows from Mexico is decreasing and drug violence appears to draw affluent Mexicans to U.S. Border cities. This presentation will examine the complexities of these dynamic and interrelated trends and propose a new conceptual framework of what these mean for present and future aging in the United States and Mexico.

## RACE/ETHNIC AND NATIVITY DIFFERENTIALS IN LATE-LIFE DISABILITY IN THE UNITED STATES

J. Melvin, R.A. Hummer, *LBJ School of Public Affairs, University of Texas at Austin, Austin, Texas*

This study examines nativity differences in functional disability during middle and late life across racial and ethnic groups, with a special emphasis on Hispanic origin. We also assess the extent to which and how gender differentiates these groups and education explains group differences in disability. We combine data from the 1999-2009 National Health Interview Survey to make these detailed comparisons. Results indicate that middle-aged foreign-born individuals in every sub-group and Mexicans in particular experience relatively low rates of disability; however, this pattern reverses in late life. Moreover, most U.S. born minority women have significantly higher disability relative to non-Hispanic whites throughout life course. The crossover effect has important implications for the health and well-being for older persons of Mexican-origin, and especially for women.

## DOES FRAILTY HAVE THE SAME IMPLICATIONS FOR OLDER ADULTS IN MEXICO AND THE UNITED STATES?

R. Samper-Ternent<sup>1</sup>, K.G. Emerson<sup>2</sup>, A. Michaels-Obregon<sup>1</sup>, *1. University of Texas Medical Branch at Galveston, Galveston, Texas, 2. University of Georgia, Athens, Georgia*

Frailty increases the risk of adverse events including hospitalization, disability, and mortality. Given the cultural, social, and health differences between older adults in Mexico and the U.S., we analyze factors that determine how frailty impacts elders in each country. We apply Rockwood's Accumulation of Deficit Frailty Model using the Mexican Health and Aging Study and the Health and Retirement Study. The results here reveal higher rates of frailty among older Mexican adults than in the U.S. We further examine whether the consequences of frailty differ by modeling predicted probability of mortality, disability and hospitalization across the two countries. Implications of the different predicted probabilities and the consequences of frailty are discussed in light of aging policies in the U.S. and Mexico.

## HOW DO HISPANIC ETHNICITY, RACE, AND RESOURCES IMPACT NURSING HOME USE? EVIDENCE FROM THE HRS

J. Angel, M. Thomeer, S. Mudrazija, *LBJ School of Public Affairs, University of Texas at Austin, Austin, Texas*

Older Hispanics are less likely to enter nursing homes than non-Hispanics and their duration of stay is often short, despite their high rates of chronic conditions and disability. The reasons for these racial and ethnic-based differences in long-term care are complex and poorly under-

stood. In this study, we seek to understand the many ways in which family and economic resources impact the risk of nursing home admission and duration of stay for Hispanics and non-Hispanics. Employing data from the HRS (1998-2010), we estimate the hazard of nursing home admission and the duration of stay. Preliminary results show that Hispanics underutilize nursing home services. Our findings suggest these ethnic-based disparities in nursing home use become more pronounced when health, socioeconomic status, family reliance, and access to health care are taken into account. Policy implications will be considered in light of the Affordable Care Act.

## LIFE COURSE STAGE AT MIGRATION AND FINANCIAL STRAIN IN THE OLDER MEXICAN-ORIGIN POPULATION

K. Eschbach<sup>2</sup>, C. Diaz-Venegas<sup>1</sup>, J.L. Angel<sup>1</sup>, *1. LBJ School of Public Affairs, University of Texas at Austin, Austin, Texas, 2. University of Texas Medical Branch at Galveston, Galveston, Texas*

In this study, we investigate demographic, family structure, social support, financial, health and neighborhood correlates of financial strain among older community-dwelling Mexican Americans. Our methods incorporate a complete-case, mixed-model analysis (individuals in census tracts) of dichotomized self-reports of financial strain by respondents to the Hispanic EPESE. Our results find the strongest bivariate correlates of financial strain are Spanish language, immigration as an older adult, residence in an immigrant barrio, CES-D score, and having few financial resources. After multivariate adjustment, we found that Spanish use, living alone, depression score, and rural or immigrant barrio residences remain the strongest predictors of strain net of income and assets. Our findings point strongly to immigrant status, cultural characteristics, family structure, and neighborhood context as powerful influences on the experience of financial strain among older Mexican Americans.

## SESSION 1465 (PAPER)

### DISPARITIES IN HEALTH AND HEALTH CARE

#### PROJECTING HEALTH INEQUALITIES AMONG OLDER ADULTS: BAYESIAN HIERARCHICAL AGE-PERIOD-COHORT ANALYSIS

A. Zajacova, S. Huzarbazar, *University of Wyoming, Laramie, Wyoming*

A recent study by Zajacova et al. showed that health inequalities around the age of retirement translated into more than 30-year gap in age equivalents: older adults with less than high school had worse health at age 40 than the advantaged groups at 70. The previous result was obtained by pooling repeated-cross-section data, obfuscating potentially important age, period, and birth cohort (APC) influences. Here we disentangle the influences of these three time dimensions in order to project the inequality trends into the near future. We use National Health Interview Survey 1986-2010 data on adults age 40-70 to analyze the effect of education (less than HS, HS and some college, and BA or more) on health (self-rated health and activity limitations). We estimate the models using Hierarchical APC approach described by Yang (2006) but estimate the posterior distributions of parameters using a new approach, integrated nested Laplace approximations. Preliminary results indicate that the education inequalities are increasing for more recent birth cohorts, especially between older adults with high school and some college versus BA or more. The results suggest that the current health gaps at older ages will likely grow in the near future. The health disparities have strong implications for the debate on raising the retirement age beyond 67 if less advantaged workers' poor health does not permit them to remain in the work force.

## EXPLAINING DISPARITIES IN HIP FRACTURE CARE: THE ROLE OF PATIENT FACTORS

M.D. Neuman<sup>1</sup>, S. Ibrahim<sup>1</sup>, C. Osigwe<sup>2</sup>, J. Karlawish<sup>1</sup>, 1. *University of Pennsylvania School of Medicine, Philadelphia, Pennsylvania*, 2. *Louisiana State University School of Medicine, New Orleans*

**Background:** Prior research suggests that black patients receive operative treatment for hip fracture at lower rates than do whites. We hypothesized that black and white patients at risk for hip fracture would differ in their attitudes and beliefs related to hip fracture surgery. **Methods:** We conducted a cross-sectional survey in a sample of adults without prior hip fracture recruited from one urban geriatric medicine practice. Our questionnaire assessed attitudes and beliefs about hip fracture surgery, as well as demographics, medical history, expectations regarding aging, health-related quality-of-life, and health care system distrust. **Results:** Of 66 participants, 30 were white and 36 were black; the median age was 76 years (IQR 69, 82). Compared to whites, blacks reported fewer past surgeries, a greater number of comorbidities, lower levels of education, and greater healthcare system distrust ( $p < 0.05$  for all). 12 of 36 (36.3%) black patients would “definitely” or “probably” not be willing to undergo surgery for a hip fracture if recommended to them by a physician, compared to 1 of 30 white patients (3.5%,  $p = 0.001$ ). While beliefs regarding the likelihood of severe pain or death due to hip fracture surgery did not differ by race, more blacks than whites believed that recovery after hip fracture surgery would take longer than 6 months (60.7% vs. 31.0%,  $p = 0.025$ ). **Conclusions:** At-risk black and white patients differ in their stated attitudes and beliefs related to hip fracture surgery. Such differences may contribute to racial variations in receipt of surgery for hip fracture.

## RACE/ETHNIC DIFFERENCES IN LIFE COURSE ACCUMULATIVE PROCESSES LEADING TO LATE-LIFE FUNCTIONAL LIMITATIONS: TEST OF A CONCEPTUAL MODEL

J. Kelley-Moore, D. Dannefer, J. Lin, T. Bhatta, *Sociology, Case Western Reserve University, Cleveland, Ohio*

Drawing from the conceptual frames of cumulative dis/advantage and the disablement process, we articulate the likely accumulative life course mechanisms whereby pathology and impairment appear in mid-life, increasing risk of functional limitations in later life. We further hypothesize race/ethnic differences both in specific social and health circumstances that influence functional limitations and in the accumulative processes over the life course. Given the vast late-life health disparities observed between race/ethnic groups, this is an important but understudied line of inquiry. Using six waves of the Health and Retirement Study, we test our hypothesized accumulative processes by combining endogenous treatment and latent growth curve models to estimate trajectories of late-life functional limitations. We estimated mid-life morbidity using best-fitting combinations of early- and mid-life circumstances for Black, White, and Hispanic older adults. We then entered this instrumented morbidity risk variable into the substantive growth curve models (which also adjusted for selective mortality). Childhood health and SSDI/SSI application are significant predictors of mid-life morbidity for all three groups. Consistent with our conceptual model, each ethnic group had a unique set of predictors, and the accumulative pathways to functional limitations differed significantly. Further, accounting for the group-specific accumulative processes substantially reduced the systematic relationship between late-life functional limitations and unobserved heterogeneity generated when the endogenous relationships between early-, mid-, and late-life circumstances are ignored. These findings underscore the importance of (1) specifying accumulative life course processes in models of late-life health; (2) accounting for race/ethnic differences in those accumulative processes.

## RACIAL/ETHNIC DIFFERENCES IN THE RELATION BETWEEN BODY MASS INDEX AND SELF-RATED MENTAL HEALTH AMONG OLDER ADULTS

G. Kim<sup>1</sup>, P.A. Parmelee<sup>1</sup>, J. DeCoster<sup>2</sup>, A.N. Bryant<sup>1</sup>, D.A. Chiriboga<sup>3</sup>, 1. *Center for Mental Health and Aging / Department of Psychology, University of Alabama, Tuscaloosa, Alabama*, 2. *University of Virginia, Charlottesville, Virginia*, 3. *University of South Florida, Tampa, Florida*

**Objectives:** The present study examined racial/ethnic differences in the relation between body mass index (BMI) and self-rated mental health (SRMH) among community-dwelling older adults. **Methods:** Drawn from the Collaborative Psychiatric Epidemiology Surveys, adults aged 60 or older from diverse racial/ethnic backgrounds were analyzed. Data were analyzed using chi-square tests, ANOVA, two-way ANOVA, and linear contrasts. **Results:** After controlling for covariates, there was a significant main effect of race/ethnicity ( $p < .001$ ) on SRMH, but the main effect of BMI was not significant ( $p = .362$ ). A significant interaction between BMI and race/ethnicity on SRMH was found ( $p < .05$ ). The linear contrasts showed that Whites had a significant trend ( $p = .02$ ) showing poorer SRMH with increases in BMI, whereas Blacks had a significant trend ( $p = .04$ ) showing better SRMH with increases in BMI. The linear trends for Hispanics ( $p = .10$ ) and Asians ( $p = .76$ ) were not significant. **Conclusions:** Significant racial/ethnic differences existed in the relation between BMI and SRMH. Understanding the role of race/ethnicity as a moderator of the relation between BMI and mental health may help improve the treatment for older adults with unhealthy weights. Clinical implications are also discussed.

## ASSOCIATION BETWEEN RACE, POVERTY STATUS AND GRIP STRENGTH IN MIDDLE TO OLD AGE ADULTS

R. Thorpe<sup>1</sup>, E.M. Simonsick<sup>2</sup>, A.B. Zonderman<sup>2</sup>, M.K. Evans<sup>2</sup>, 1. *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland*, 2. *National Institute on Aging, Baltimore, Maryland*

Although poor grip strength, an indicator of frailty and precursor to functional limitations and disability, is more prevalent in older disabled black women, little is known about the effects of race and poverty-related disparities in grip strength in men or women in early late life. We examined the cross-sectional relationship between race, poverty status, and hand grip strength in men and women aged 50 years and older in the Healthy Aging in Neighborhoods of Diversity across the Life Span study. General linear models were used to estimate grip strength (maximum of two trials on both sides) by race/poverty status adjusted for age, weight, height, hand pain, education, insurance status, family income, and number of chronic conditions. Of 929 adults, 422 (45.4%) were male, 509 (54.8%) were black, and 320 (34.5%) were living below 125% of the federal poverty level (low SES). In adjusted models, black women had greater grip strength than white women (low SES: 29.3 vs. 26.9 kg and high SES: 30.5 vs. 28.3kg;  $p < 0.05$  for all). Among men, high SES blacks had better grip strength than high SES whites (46.3 vs. 43.2;  $p < 0.05$ ). No other race or poverty differences were observed for men. In women, the low SES had lower grip strength than high SES; blacks had higher grip strength than whites. However in men, high SES blacks had greater grip strength than high SES whites. Efforts to develop interventions and health promoting strategies to maintain hand grip strength should be targeted to middle age women and high SES men.

## SESSION 1470 (PAPER)

### PARENT-ADULT CHILD RELATIONS

#### EMBEDDED IN FAMILIES: INTERGENERATIONAL AND SIBLING TIES OF GAY AND LESBIAN ADULTS

I.A. Connidis, *Sociology, University of Western Ontario, London, Ontario, Canada*

Too often studies of the family relationships of gay and lesbian adults are studies of ‘their’ families rather than of ‘our’ families. This paper

seeks to redress the focus on the unique experiences of gay and lesbian adults in same-sex partnerships and as same-sex parents by considering the ongoing negotiation of their relationships with parents and siblings. The analysis is based on qualitative data from a study of 10 multi-generational families that includes a total of 49 participants, 14 of whom are gay or lesbian, aged 22–88 years. The initial contact was a gay or lesbian adult. Interviews with family members did not identify sexual orientation as a point of interest. Conversational interviews were used to obtain multiple perspectives on the constellation of relationships that comprise these families. The paper considers the observations of the gay or lesbian subject and his or her parent/s and sibling/s regarding the place of the gay or lesbian family member in ties with members of the family of origin. Particular attention is paid to expressed sentiments, contact, support exchanges, and family involvement as reported by both gay and lesbian adults and their parents and siblings. This multi-voice perspective identifies multiple ways in which gay and lesbian adults are embedded in the web of family relations that catches us all.

### PERCEPTIONS OF EQUITY AND BALANCED SUPPORT EXCHANGE IN MOTHER-ADULT CHILD RELATIONS

J. Sechrist<sup>1</sup>, A. Howard<sup>2</sup>, J. Sutor<sup>2</sup>, K. Pillemer<sup>3</sup>, 1. *Sociology, University of Texas-Pan American, Edinburg, Texas*, 2. *Purdue University, West Lafayette, Indiana*, 3. *Cornell University, Ithaca, New York*

Classic theories of social exchange suggest that relationships are more harmonious when members of dyads believe that their exchanges are fair. However, the level and frequency of exchange, rather than perceptions of equity, have been the focus of most research on support and the quality of intergenerational relations. Using data from both waves of the Within-family Differences Study on 1,463 mother-child dyads nested within 413 families, we explore the degree to which perceptions of equity reflect mother's reports of exchange with their adult children and whether mothers' perceptions of equity are better predictors of closeness and relationship strain than are mothers' reports of balanced exchanges of support. Preliminary analyses showed that in three-quarters of the dyads, mothers reported equitable relationships with their adult children. In contrast, across four exchange domains, balanced exchange was reported in as many as 37% of the dyads in the case of comfort for a personal problem and in as few as 8% of the dyads in the case of care when sick. Cross-sectional analyses revealed that mothers' perceptions of equity were more consistent predictors of relationship quality than were their reports of actual support exchanges. Longitudinal analyses showed similar patterns, but only in the case of relationship strain. These findings contribute to a growing body of research demonstrating that the psychological processes that shape intergenerational relationships mirror those of other ties.

### CHANGING CONTEXTS OF FAMILY AND INTRA-FAMILY INTERGENERATIONAL SUPPORT IN SWEDEN

C. Lennartsson<sup>1</sup>, J. Fritzell<sup>2</sup>, M. Silverstein<sup>3</sup>, 1. *Aging Research Center, Karolinska Institutet/Stockholm University, Stockholm, Sweden*, 2. *Center for Health Equity Studies, Stockholm University/Karolinska Institutet, Stockholm, Sweden*, 3. *USC Davis School of Gerontology, Los Angeles, California*

In spite of the advancement of the Swedish welfare state, family solidarity remains strong and mutual intergenerational support is a central part of many families. However, the question of whether the shifting context of modern family life has brought about changes in intergenerational support late in life is of increasing interest. This study examines intergenerational intra-family financial and social support, in the form of financial transactions/gifts and instrumental support. We will address whether there is a difference in intergenerational support between stable and disrupted families and whether there is any genetic basis for differences in intergenerational intra-family financial and social support. Based on data from nationally representative surveys results indicate that as yet family disruptions do not affect the giving of financial sup-

port to adult children. Divorce is still uncommon among the oldest old, however the increasing divorce rates among upcoming elderly cohorts might lead to a different picture of transfer behavior, since findings among younger cohorts show that transfers are less common in disrupted families. As regards instrumental support married couples and divorcees seldom report receiving help from their children (widowed parents are frequently helped by their children). In addition divorcees also lack the support most commonly given by a spouse. The increasing number of divorcees can pose a challenge for future care provision. The consequences of the changes in family structures on later intergenerational intra-family support will be discussed and a gender perspective will be used to examine the findings in the context of the Swedish welfare state.

### PARENTAL ADAPTATIONS TO THE MILITARY DEPLOYMENT CYCLE

D. Myers, J. Crow, J. Ellor, *School of Social Work, Baylor University, Waco, Texas*

Military service members are deployed, some repeatedly, to Operations Enduring Freedom and/or Iraqi Freedom. DOD classifies these as tours to a combat zone, communicating an inherent danger. Parents of these service members are affected due to their long-term attachment, the adult child's impact on the well-being of the parent, and persistent parental worry. The loss of access and added stress of a dangerous mission further attenuates the inherent concerns that parents have for their adult offspring. Very little attention has been paid to the experiences of these parents in military family research. In this session, participants reflect on an analysis of parental narratives around coping and supporting within each phase of the deployment cycle. Findings are based upon in-depth, semi-structured interviews of thirteen parents of deployed service members. Parents participated in one of four focus groups conducted in 2011 as Phase I of a DOD-funded comprehensive study of service member, spouse, and parent responses to the deployment experience. The 90 minute sessions were recorded and transcribed for qualitative analysis of the deployment cycle by the research team using Atlas ti software. Findings revealed a wide variety of emotions ranging from pride to deep fear for the adult child's safety and ruminations about the consequences of their loved one's untimely demise. Parents' coping strategies within each phase of the deployment cycle and the responses of the relational and community support systems in which they embedded are reported. Implications for theory-development, research, and intervention related to parent-adult child relationship are provided.

### SESSION 1475 (SYMPOSIUM)

#### GERIATRIC ED CARE: AN UNCHARTED FRONTIER

Chair: *M. Cadogan, UCLA School of Nursing, Los Angeles, California*

Discussant: *H. Aronow, Cedars-Sinai Medical Center, Los Angeles, California*

Although awareness of U.S. population aging continues to increase, the magnitude and impact of these demographic changes is less well understood. Accumulating evidence points to higher demand for and use of emergency department (ED) services among older adults with a new recognition of the challenges for meeting the needs of older adults and their caregivers within existing ED care models. One recent estimate suggests that by 2030, one in four ED patients will be aged 65+ (Wilber, 2006). The aim of this symposium is to expand the boundary of current geriatric ED research through presentation of some rarely studied aspects of geriatric ED care. The first paper describes the geriatric syndromes present at the time of discharge among older adults seen in the ED who are discharged home without a hospital admission. The second paper explores the impact of geriatric syndromes such as falls, on both the frequency of ED readmissions and the length of intervals between ED visits. The third paper uses a group-based trajectory model

(GBTM) to identify different trajectories of ED use among older adults who make repeated ED visits. The final paper presents trajectories of centenarians seen in the ED, a unique group not previously described. Our overall goal is to develop better understanding of some distinct subsets of older adult ED users in order to develop targeted ED-based interventions that are responsive to their needs.

### **GOING HOME TO WHAT? PROBLEMS OF OLDER ED USERS WHO GO HOME**

L.R. Phillips, M. Cadogan, J. Mentis, D.L. Woods, *Nursing, UCLA, Los Angeles, California*

Despite popular beliefs, national data show most older individuals who visit the ED are not admitted. This paper focuses on the problems that bring older individuals to the ED who are then discharged to home and the geriatric syndromes present at the time of discharge. Data were derived from an administrative data set containing 18,468 patients between the ages of 65 and 108 years. Although individuals 75+ tended to be admitted (63% admission rate) and those ages 65 and 74 tended to return to their original place of residence (49% admission rate), a substantial portion were not admitted. Discriminant analysis showed the geriatric syndromes strongly associated with not being admitted were: anorexia, falls, urinary incontinence, constipation, syncope/dizziness and malaise. For those with heart failure, adverse drug events were also associated with being discharged. Findings have important implications for transitional care planning and for ED educational programs.

### **ARE CERTAIN GERIATRIC SYNDROMES INDICATORS FOR REPEATED ED USE?**

J. Mentis, M. Cadogan, L.R. Phillips, D.L. Woods, *Center for the Advancement of Gerontological Nursing Science University of California Los Angeles, Los Angeles, California*

In analyses of an administrative database of ED contacts for an urban medical center, we identified symptoms in older ED users, indicative of geriatric syndromes, such as delirium, depression, dementia, dehydration, falls, urinary incontinence, malaise, dizziness to name a few. Patterns for admission or no admission emerged based on the presence of a geriatric syndrome for the contact. Discriminant analysis of repeat users of the ED without chronic kidney disease or congestive heart failure who had geriatric syndromes of falls (2.026), syncope/dizziness (1.141), malaise (1.818) and anorexia (1.492) were more likely not to be admitted. This paper will characterize the discharge disposition recommended for these older patients and whether the presence of those four common syndromes results in a shortened time interval for repeat visits, with intent to develop a risk assessment based on the presence of these geriatric syndromes.

D.L. Woods<sup>1</sup>, M. Yefimova<sup>1</sup>, L.R. Phillips<sup>1</sup>, M. Cadogan<sup>1</sup>, J. Mentis<sup>1</sup>, H. Aronow<sup>2</sup>, 1. *Center for the Advancement of Gerontological Nursing Science, School of Nursing, University of California, Los Angeles, Los Angeles, California*, 2. *Cedars Sinai Medical Center, Los Angeles, California*

Understanding the patterns of older adults who make repeated visits to the ED is challenging. This paper focuses on describing the trajectories of 6579 the older adults over 65 who made repeated visits to the ED over 2 years. Of those, 3415 (52%) had only 2 visits. Using Group Based Trajectory Modeling 5 distinct trajectories were identified for 3164 (48%) persons with > 2 visits. Data was aggregated into 3 month periods. Trajectory patterns are distinctly different with distinctly different characteristics for each group. For example, there were significant differences between groups in age, geriatric syndromes, number of co-morbidities, and medical diagnosis with the youngest having the most co-morbidities, geriatric syndromes, ED visits and fewest hospital admissions. Identifying specific trajectories and geriatric syndromes

that contribute to these trajectories is critical predicting persons who are at risk and timing interventions such that the trajectory may be altered.

### **UNANTICIPATED VISITORS: CENTENARIANS IN THE EMERGENCY DEPARTMENT**

M. Cadogan, L.R. Phillips, J. Mentis, D.L. Woods, S. Takayanagi, *UCLA School of Nursing, Los Angeles, California*

According to the U.S. Census Bureau, there were 71,991 centenarians in the United States in 2010. This number is expected to increase to 601,000 by 2050. Little is known about use of health services among this unique group. This presentation will focus on 156 visits to an urban emergency department (ED) made over a two year period by 82 adults age 100 and older. The relationships among demographics, symptoms and diagnoses, and discharge disposition from the ED will be compared between those with single ED visits (n= 49) and those with repeat visits (n = 33). ED visit patterns for those with multiple visits will be discussed. Understanding the unique patterns of ED use and needs of centenarians is urgent in order to develop appropriate care strategies for this rapidly increasing subset of older adults.

### **SESSION 1480 (SYMPOSIUM)**

#### **INTEGRATING FRAILTY CARE INTO ACUTE HOSPITAL WORKFLOW**

Chair: H. Aronow, *Nursing Research & Development, Cedars-Sinai Medical Center, Los Angeles, California*

Discussant: M. Mezey, *New York University, New York, New York*

Fraillty often triggers a cascade of events leading to functional decline, exacerbation of chronic illness, and hospital admission. A multidimensional health problem, frailty is not amenable to a "single bullet" treatment plan. While a hospital episode is a significant health event, it also presents an opportunity for the care team to identify frailty and attenuate adverse outcomes with prompt, individualized care plans. Acute hospitals have typically implemented one of two general approaches to improving care of frail adults: specialized geriatric care (units or mobile consulting teams); or nurse-led organizational change (NICHE). Each approach has its strengths and limitations. We developed both strategies with the goal of integrating interdisciplinary geriatric care into the usual work flow of nursing units. A three-step program was developed: 1) Early recognition of frailty during hospitalization; 2) Comprehensive multidisciplinary assessment and coordination of care throughout the hospital stay; and 3) Creation of a standardized discharge plan that outlines on-going patient needs. This symposium will prompt discussion on the integration of geriatric care into acute hospitals and suggest guidelines for the development and evaluation of a hospital-based multidisciplinary intervention. The first paper will frame the issue of integrating geriatric knowledge into general acute care. The second paper presents the epidemiology of frailty and association with adverse hospital outcomes. The third paper reports findings from an interdisciplinary test of change. The final paper suggests strategies for activating the continuum of post-discharge care and future steps in building organizational infrastructure to support improved outcomes for frail adults.

#### **EPIDEMIOLOGY OF FRAILTY IN ACUTE HOSPITAL CARE – PATIENT RISKS AND ADVERSE OUTCOMES**

H. Aronow<sup>1</sup>, J. Borenstein<sup>2</sup>, 1. *Nursing Research & Development, Cedars-Sinai Medical Center, Los Angeles, California*, 2. *Cedars-Sinai Medical Center - Department of Medicine, Los Angeles, California*

To guide timely, effective interventions, we evaluated the association of evidence-based frailty risk factors to adverse hospital outcomes (AHO). Method. Convenience sample of 214 Medicare patients assessed with a standardized interview within 48 hours of admission; charts abstracted for additional medical and pharmacy risks and for AHO and readmissions. Results. Average age = 75 years. Patients averaged 3.4

+/- 2.1 risk factors (median = 3). AHO formed two distinct clusters; readmissions remaining an independent outcome. In adjusted regression models, recent weight loss and presence of high risk medications were associated with likelihood of one AHO cluster; cognitive impairment, anemia, and recent weight loss associated with a second cluster; and previous admission, hyponatremia, and impaired function associated with readmissions. Conclusion. Combined healthsystem trends of aging patients and increased burden of disease suggest that identifying high risk patients for targeted interventions is the first step to preventing adverse outcomes.

#### **FRAMING THE VALUE ISSUES OF INTEGRATING GERIATRIC KNOWLEDGE INTO GENERAL ACUTE CARE**

L. Burnes Bolton, G.D. Braunstein, *Cedars-Sinai Medical Center, Los Angeles, California*

Frailty cuts across principal reasons for inpatient admission and puts patients at risk for suboptimal outcomes. At one large urban medical center, 12% of adult non-OB discharges per year were 85+ years old. A multi-disciplinary workgroup was convened to improve effectiveness and efficiency of care to frail adults. In tandem, the hospital became NICHE designated. Nine nursing units, with a combined rate of admission of patients at risk for frailty of 23 per day, were identified to conduct a test of change. This paper presents the value case for integration of geriatric assessment and care plans into the usual workflow for interdisciplinary direct care team members. With increasing numbers of older adult inpatients, the attempt to isolate patients in special geriatric nursing units, or to provide sufficient consultative team interventions, is impractical. The alternative can prove to add value as well as improve outcomes for vulnerable older adults.

#### **NICHE AND INTEGRATION OF A MULTIDISCIPLINARY FRAILTY TEAM INTERVENTION INTO UNIT TEAM WORKFLOW**

J. Swanson, F. Haus, *Geri and Richard Brawerman Nursing Institute, Cedars-Sinai Medical Center, Los Angeles, California*

Recognition as a NICHE facility involves leadership and strong commitment from staff nurses. At our medical center, 1524 nurses participated in a NICHE organizational assessment, and geriatric education was initiated. In less than one year, 464 RNs registered for NICHE resources, 190 received their GRN, and 25 ANCC certification. In tandem, a multi-disciplinary workgroup has implemented a test of change. On one pilot nursing unit a core frailty team has developed processes and work flows evaluating patients screened at risk by the primary nurse. The team model is currently being integrated into the daily assessment and rounding by primary unit staff. A total of 165 patients have been screened and identified with frailty-related risks; with 72 provided interdisciplinary frailty risk assessment and recommendations for nursing, pharmacy, and social work actions and physician orders addressing individual risks. This paper reports preliminary outcomes from the pilot unit and planned roll out.

#### **ACTIVATING THE CONTINUUM OF CARE AND FUTURE STEPS IN BUILDING ORGANIZATIONAL INFRASTRUCTURE**

J. Borenstein, *Medicine, Cedars-Sinai Medical Center, Los Angeles, California*

Frailty remains a long-term management challenge for patients, families and providers. Hospital admission provides an opportunity to assess patients' risks and initiate interventions to prevent adverse hospital outcomes. We propose that the impact of the hospital intervention may be expanded by summarizing assessments, interventions and continuing recommendations in a discharge frailty care plan to address safe transitions and long-term outcomes. This paper presents a case study of the development and implementation of a frailty care process that spans the continuum of acute to community care settings; addressing

standardization of communication processes while maintaining individualized patient assessments and recommendations, provider preferences for hand offs, and features of the organizational and information infrastructures that either facilitate or create barriers to optimal outcomes for patients. The case study has broad applicability to other health systems serving older, vulnerable adults.

### **SESSION 1485 (SYMPOSIUM)**

#### **NURSING HOME MINIMUM DATA SET QUALITY MEASURES—THE MDS 3.0 GENERATION**

Chair: *K. Reilly, Aging, Disability & Long Term Care, RTI International, Waltham, Massachusetts*

Co-Chair: *L. Smith, Aging, Disability & Long Term Care, RTI International, Waltham, Massachusetts*

Discussant: *C.A. Wiseman, Centers for Medicare & Medicaid Services, HHS, Baltimore, Maryland*

Minimum Data Set (MDS) data are used nation-wide in Medicare and Medicaid certified nursing homes (NH) to clinically assess and care plan for residents, publicly report quality, and set reimbursement. The new MDS assessment was launched October 1, 2010 and in Spring 2012, CMS' Nursing Home Compare website will reflect new MDS 3.0-based quality measures (QMs), replacing the MDS 2.0-based QMs which have been publicly reported since 2002. Seventeen MDS 3.0 QMs were developed to include both resident interviews and staff assessment reflecting the "patient/resident voice," integrating the latest measurement instruments used in the MDS 3.0, and re-specifying the long-stay and short-stay definitions. In February 2011, ten QMs received National Quality Forum (NQF) endorsement; seven QMs received time-limited endorsement (TLE) (one QM was later withdrawn). MDS 3.0 QMs have undergone rigorous item- and facility-level analyses to ensure their reliability and validity, including revisions to address NQF panel issues. This symposium discusses CMS' new MDS 3.0 quality measures (QMs) vis-à-vis CMS' MDS 2.0 QMs. An overview of the QMs will be discussed along with analyses investigating reliability and validity of the MDS 3.0 QMs. Individual presentations will use key sections of CMS' QM Blue Print to focus validity and reliability discussions related to five TLE QMs: short-stay and long-stay pressure ulcers; long-stay falls; long-stay depression; and short-stay and long-stay pain.

#### **MDS 3.0 QUALITY MEASURES: SHORT-STAY AND LONG-STAY PRESSURE ULCERS**

L. Smith<sup>1</sup>, K. Reilly<sup>1</sup>, S. Kissam<sup>1</sup>, F.S. Rokoske<sup>1</sup>, N. Zheng<sup>1</sup>, C.A. Wiseman<sup>2</sup>, *1. RTI International, Waltham, Massachusetts, 2. Center for Medicare and Medicaid Services, Baltimore, Maryland*

Pressure ulcers (PUs) are high-volume, high-cost, yet preventable/treatable adverse events in nursing homes. There are two MDS 3.0 PU QMs—long-stay residents with one plus Stage 2-4 PU(s) and short-stay residents with new/worsening PUs since prior assessment. Analyses used national MDS 3.0 data from Q4/2010-Q3/2011 (~1,371,500 short-stay; ~800,000 long-stay resident-episodes). Risk adjustments applied: four resident-level covariates for SS PU QM and sample restriction for LS PU QM. Mean SS PU score was 2.1%; (SD 2.5%; IR 3.1%). Mean LS PU QM score was 7.0% (SD 4.7%; IR 6.1%). Both SS and LS PU QMs demonstrate reliability—on average ~17% and 22% of facilities' quarterly rate changed two SDs or less for the SS PU QM and the LS PU QM respectively. Approximately 60% of facilities' percentile ranking changed within one decile for SS PU QM and ~51% for LS PU QM. Results indicate the QMs are appropriate for public reporting.

### **MDS 3.0 QUALITY MEASURE (QM): FALLS WITH MAJOR INJURY (LONG-STAY (LS))**

F.S. Rokoske<sup>1</sup>, K. Reilly<sup>1</sup>, L. Smith<sup>1</sup>, S. Kissam<sup>1</sup>, N. Zheng<sup>1</sup>, C.A. Wiseman<sup>2</sup>,  
1. RTI International, Waltham, Massachusetts, 2. Center for Medicare and Medicaid Services, Baltimore, Maryland

Research indicates that 10%–25% of nursing home resident falls result in fractures and/or hospitalization. The MDS 3.0 QM captures the percent of LS residents with falls with major injury and, using the new MDS discharge assessment, also includes falls resulting in discharges to a hospital. Analyses used national MDS 3.0 data from Q4/2010–Q3/2011 (~1,200,000 LS resident-episodes). The mean score for the fall QM was 3.4% with a standard deviation of 2.7%. The interquartile range was 3.4%. On average, the majority (74.6%) of facilities' quarterly QM scores changed by no more than one standard deviation. The correlation between a facility's percentile rank on this QM and on QM #0688 (Percent of Residents Whose Need for Help with Activities of Daily Living Has Increased (LS)) was weak but statistically significant with a Pearson correlation coefficient of 0.1143 ( $p < 0.001$ ). Results indicate this QM is appropriate for public reporting.

### **MDS 3.0 QUALITY MEASURE: DEPRESSIVE SYMPTOMS (LONG-STAY)**

S. Kissam<sup>1</sup>, K. Reilly<sup>1</sup>, L. Smith<sup>1</sup>, F.S. Rokoske<sup>1</sup>, N. Zheng<sup>1</sup>, C.A. Wiseman<sup>2</sup>,  
1. RTI International, Waltham, Massachusetts, 2. Center for Medicare and Medicaid Services, Baltimore, Maryland

Depression among nursing home residents can be triggered by physical/cognitive change or environmental factors. Depression is often under-diagnosed and under-treated. The MDS 3.0 Depression QM contains both resident interview and staff assessment versions of the Patient Health Questionnaire (PHQ-9) depression instrument, which is based on diagnostic criteria for a major depressive disorder in the DSM-IV. Analyses used national MDS 3.0 data from Q4/2010–Q3/2011 (~1,200,000 LS resident-episodes). The Depressive Symptoms QM values were somewhat skewed: the mean score is 7.0% and the median score is 3.8% (SD 9.7%). The interquartile range was 8.5%; 23.9% of facilities had "perfect" scores. On average, the majority (~82%) of facilities' quarterly QM scores changed by no more than one standard deviation. Averaging across two pairs of quarters, 65.3% of facilities' percentile ranking changed within 1 decile. Results indicate this QM is appropriate for public reporting.

### **MDS 3.0 QUALITY MEASURES (QMS): SELF-REPORTED PAIN PREVALENCE (SHORT-STAY (SS) AND LONG-STAY (LS))**

N. Zheng<sup>1</sup>, K. Reilly<sup>1</sup>, L. Smith<sup>1</sup>, S. Kissam<sup>1</sup>, F.S. Rokoske<sup>1</sup>, C.A. Wiseman<sup>2</sup>,  
1. RTI International, Waltham, Massachusetts, 2. Center for Medicare and Medicaid Services, Baltimore, Maryland

40–85% of nursing home residents have pain; failure to identify pain can leave it untreated, with adverse physiological and psychological effects. Resident self-report on the MDS3.0 assessment is the sole source of information triggering both SS and LS Pain QMs. Residents who are rarely/never understood are excluded. The LS Pain QM is risk adjusted for cognitive status. Analyses used national MDS 3.0 data from Q4/2010–Q3/2011 (~962,000 short-stay resident-episodes; ~800,000 long-stay resident-episodes). The LS Pain QM mean score was 11.9% (SD 8.6%) with an interquartile range of 11.8%. The SS Pain QM mean score was 23.2% (SD 12.5%) with an interquartile range of 17.1%. For both SS and LS Pain QMs, on average, ~73% of facilities' quarterly QM score improved/declined within one SD. The facility percentile ranking correlation between SS and LS Pain QM was 0.55 ( $p < 0.001$ ). Results indicate both the LS and SS Pain QMs are appropriate for public reporting.

## **SESSION 1490 (SYMPOSIUM)**

### **PHENOTYPIC AND GENETIC SURVIVAL ADVANTAGES OF LONG LIFE FAMILY STUDY SUBJECTS**

Chair: T.T. Perls, Medicine & Geriatrics, Boston University School of Medicine, Boston, Massachusetts

Discussant: E. Hadley, National Institute on Aging, Bethesda, Maryland

The Long Life Family Study, now in its 7th year, is an NIA-sponsored study of families demonstrating clustering for exceptional survival. Three American and one Danish study site have enrolled and annually follow ~4800 family members from 2 generations (proband and offspring), belonging to ~500 families. A great deal of medical history and functional status data have been collected on these subjects and this year, genotype data (2 million SNPs) were generated on each subject. Thus, in addition to our ongoing analyses of phenotypic data, we are now in the process of conducting genome wide association studies. In this symposium, we will present some of our latest phenotypic and genetic findings: (1) Compared to a randomly selected sample of age, gender and geographically matched Medicare enrollees, LLFS subjects have a lower overall mortality rate and lower incidences of age-related diseases. (2) The SAVE scale, is a measure of vigor that includes grip strength, gait speed, physical activity, fatigue, and weight loss and we hypothesize that particularly in LLFS families this is a heritable trait. Using maximum likelihood methods, heritability of this trait was estimated for the entire LLFS cohort (age-adjusted  $h^2 = 0.33$ ,  $p = 6.3 \text{ E-}23$ ), in probands ( $h^2 = 0.26$ ,  $p = 5.0 \text{ E-}5$ ), and in offspring ( $h^2 = 0.44$ ,  $p = 1.4 \text{ E-}16$ ). These findings support further evaluation of the genetic and environmental factors contributing to this phenotype of vigor. (3) We have observed (a) lower neuroticism and (b) more favorable lipid profiles amongst LLFS subjects relative to published norms and present our GWAS findings for these traits.

### **COMPARING THE LONG LIFE FAMILY STUDY (LLFS) COHORT WITH MATCHED MEDICARE CONTROLS**

A.S. Ash<sup>1</sup>, H. Fang<sup>1</sup>, A. Kroll-Desrosiers<sup>1</sup>, T.T. Perls<sup>2</sup>, 1. *Universitii Massachusetts School of Medicine, Worcester, Massachusetts*, 2. *Boston University School of Medicine, Boston, Massachusetts*

Objective: To determine if LLFS participants in Medicare are healthier than demographically-similar Medicare enrollees. Methods: We compared the Medicare-covered, LLFS cohort ( $n = 1143$ ) with a 4:1 age-sex-zipcode match from Medicare's 2009 Beneficiary Annual Summary File. Results: Average age was 82 years and 50.6% were women. Both groups were predominantly White (LLFS 99%; Medicare 94%). The LLFS cohort had significantly lower mortality (4.9% vs. 10.0%) and 2009 incidence of Alzheimer's (2.6% vs. 8.7%), Dementia (9.3% vs. 18.8%), Kidney disease (11.3% vs. 14%), Obstructive Pulmonary Disease (6.6% vs. 8.7%), Diabetes (11.9% vs. 17.4%), Heart Failure (14.7% vs. 19.6%), and Ischemic Heart Disease (25.4% vs. 29.1%). However, it had higher rates of Cataracts (19.9% vs. 14.2%), Glaucoma (10.9% vs. 8.5%), Osteoporosis (12.1% vs. 9.9%), and arthritis (20% vs. 17.3%). Conclusions: LLFS subjects are substantially healthier than demographically-similar members of the general population. It is not clear how this familial survival advantage arises.

### **GENOME WIDE ASSOCIATION STUDY OF PERSONALITY TRAITS IN THE LLFS**

T.T. Perls<sup>1</sup>, P. Sebastiani<sup>2</sup>, J. Sun<sup>2</sup>, H. Bae<sup>2</sup>, S.L. Andersen<sup>1</sup>, T.M. Neary<sup>1</sup>, J.D. Gass<sup>1</sup>, L. Feldman<sup>1</sup>, 1. *Medicine & Geriatrics, Boston University School of Medicine, Boston, Massachusetts*, 2. *Boston University School of Public Health, Boston, Massachusetts*

Previous studies have shown that personality traits such as neuroticism and conscientiousness have strong heritability. Results from previous genome wide association studies support the hypothesis that the genetic bases of personality traits is highly complex and is determined by many genetic variants that individually explain a very small proportion of variability. We measured personality traits in ~4,900 subjects

of the Long Life Family Study (LLFS) using the NEO Five-Factor Inventory (NEO-FFI) by telephone interview. The data were analyzed to compute estimates of heritability and to conduct a genome wide association study of 5 personality traits using the Illumina 2.5 array. For replication, we used a small set of 250 offspring enrolled in the New England Centenarian Study. Preliminary analysis found several SNPs that were significantly associated with neuroticism level, although did not reach genome wide significance. Interestingly, some of these SNPs are in genes that were linked to stroke risk (eg NINJ2) and stroke genes were implicated with personality traits in previous candidate gene studies.

#### **HERITABILITY OF THE SCALE OF AGING VIGOR IN EPIDEMIOLOGY (SAVE) IN THE LONG LIFE FAMILY STUDY**

A.B. Newman<sup>1</sup>, J. Sanders<sup>1</sup>, J. Singh<sup>1</sup>, M.M. Barmada<sup>1</sup>, J.D. Walston<sup>2</sup>, I. University of Pittsburgh, Pittsburgh, Massachusetts, 2. Johns Hopkins University, Baltimore, Maryland

What is the genetic contribution to vigor in old age? The Long Life Family Study (LLFS) assessed heritability of vigor in long-lived sibships (n=1188, mean age 88.6) and their adult children (n=2077, mean age 60.4). To measure the spectrum of vigor in middle aged and older adults we used the SAVE scale, which is informative across the age range and has been shown to be associated with disease burden. Components included grip strength, gait speed, physical activity, fatigue, and weight loss; each scored 0, 1, or 2 using approximate tertiles; and summed from 0-10 to create a continuous, normal vigor distribution in both generations. Using maximum likelihood methods, heritability of this trait was estimated for the entire LLFS cohort (age-adjusted  $h^2=0.33$ ,  $p=6.3 \text{ E-}23$ ), in probands ( $h^2=0.26$ ,  $p=5.0 \text{ E-}5$ ), and in offspring ( $h^2=0.44$ ,  $p=1.4 \text{ E-}16$ ). These findings support further evaluation of the genetic and environmental factors contributing to this phenotype of vigor.

#### **GENOME-WIDE ASSOCIATION STUDY FOR BLOOD LIPID LEVELS IN THE LONG LIFE STUDY FAMILY**

M.F. Feitosa<sup>1</sup>, A.T. Kraja<sup>1</sup>, M.A. Province<sup>1</sup>, I. Borecki<sup>1</sup>, K. Christensen<sup>3</sup>, C.M. Kammerer<sup>4</sup>, J.H. Lee<sup>2</sup>, 1. Washington University, St. Louis, St. Louis, Missouri, 2. Columbia University, New York City, New York, 3. University Southern Denmark, Odense, Denmark, 4. University of Pittsburgh, Pittsburgh, Pennsylvania

Objective: To identify novel loci influencing lipid profile that may have protective effect on atherosclerotic disease in the Long Life Study Family (LLFS), which is a family-based cohort study designed to characterize exceptionally healthy elderly people. Methods: We performed genome-wide association scans on fasting levels of triglycerides (TG), high-density lipoprotein cholesterol (HDL) and low-density lipoprotein cholesterol (LDL) using a mixed model accounting for family structure with the kinship correlations using ~2.5 million SNPs (Illumina Omni chip). A total of 4114 subjects (480 families) from European-American descent were studied. Results: We identified novel associations near-NLRP1 (17p13) associated with HDL ( $p<3.2 \times 10^{-8}$ ). Additionally, we found several SNPs associated with HDL (CEPT), LDL (APOC1, APOE, PVRL2, COBL) and TG (APOA5, ZNF259, SIK3, BACE1, LPL, SLC18A1), at genome-wide significant levels ( $p<5.0 \times 10^{-8}$ ), that were previously reported. Conclusions: A possibly regulatory variant upstream of NLRP1 is associated with higher levels of HDL in this elderly sample, which may contribute to the longevity and health of these subjects. NLRP1 plays an important role in the induction of apoptosis and its inflammasome is critical for mediating innate immune responses. An NLRP1-variant has been reported to be more frequent in the long-lived than control samples (Flachs-

bart et al., 2010), however, the connection with HDL levels has not been described.

## **SESSION 1495 (SYMPOSIUM)**

### **PHYSICAL ACTIVITY AND INACTIVITY IN OLDER ADULT HEALTH: CUTTING-EDGE ACCELEROMETRY RESULTS FROM THE OSTEOPOROTIC FRACTURES IN MEN (MROS) STUDY**

Chair: D.C. Mackey, San Francisco Coordinating Center, California Pacific Medical Center, San Francisco, California, Simon Fraser University, Burnaby, British Columbia, Canada

Discussant: T.B. Harris, National Institute on Aging, Bethesda, Maryland

Objective methods of physical activity assessment promise to provide important additional information about physical activity over and above self-report methods, and it is now feasible to implement objective assessment of physical activity in large epidemiologic studies. The Osteoporotic Fractures in Men (MrOS) Study recently completed what we believe to be the first large-scale assessment of objective physical activity in a cohort of over 3000 well-characterized older men who continue to be followed prospectively for endpoints. During the study's third clinic examination between March 2007-March 2009, MrOS men reported their participation in physical activities on the Physical Activity Scale for the Elderly (PASE) and wore a multi-sensor armband (SenseWear Pro armband, BodyMedia, Pittsburgh, PA, v5.1) that monitored their activity for 5 days. This symposium will explore the relationships between self-reported and objective physical activity and will highlight novel associations between objective measures of physical activity and a wide range of health outcomes. The first presentation (Dr. Mackey) will show how objectively assessed physical activity compares to self-reported physical activity. The next presentation will illustrate cross-sectional associations between objective measures of physical activity and lean mass, muscle strength, and physical performance (Dr. Dam). The final three presentations will explore longitudinal associations between objective measures of physical activity, including daily minutes of sedentary activity, and functional limitations (Dr. Cawthon), falls (Dr. Cauley) and mortality (Dr. Ensrud). This symposium will provide cutting-edge results to enhance understanding of the role of activity and inactivity in health among older adults.

### **OBJECTIVE PHYSICAL ACTIVITY AND FALLS: INTERACTION WITH AGE**

J.A. Cauley<sup>1</sup>, S. Litwack Harrison<sup>2</sup>, P.M. Cawthon<sup>2</sup>, K. Ensrud<sup>3</sup>, M.E. Danielson<sup>1</sup>, E. Orwoll<sup>4</sup>, D.C. Mackey<sup>2</sup>, 1. University of Pittsburgh, Dept of Epidemiology, Pittsburgh, Pennsylvania, 2. California Pacific Medical Center Research Institute, San Francisco, California, 3. University of Minnesota, Minneapolis, Minnesota, 4. Oregon Health and Sciences University, Portland, Oregon

Observational studies have suggested that fall risk may be higher among the most active and the least active. We hypothesized that age may modify this U-shaped relationship. To determine if physical activity influenced fall risk differently by age, we studied 2918 men with objective measures of physical activity energy expenditure (EE) (kcal/d), (SenseWear Pro Armband worn >5 days). Falls were identified by self-report every 4 months over a 12 month period. Logistic regression was used to calculate odds ratio and p for trend across quintiles of total EE. In multivariate adjusted models (age, race,

clinic, season, health status, height, weight, smoking and diabetes), lower active EE was associated with a lower odds of falling among men <median age of 78, p trend=0.01. Among older men (>78yrs), lower active EE was associated with a higher odds of falling, p trend=0.007, p interaction <0.01. Age influences the association between PA and falls.

### PHYSICAL ACTIVITY ENERGY EXPENDITURE, SEDENTARY BEHAVIOR AND FUNCTIONAL LIMITATIONS IN OLDER MEN

P.M. Cawthon<sup>1</sup>, T. Blackwell<sup>1</sup>, J.A. Cauley<sup>2</sup>, K. Ensrud<sup>3</sup>, T.L. Dam<sup>4</sup>, S. Harrison<sup>1</sup>, K.W. Peters<sup>1</sup>, D.C. Mackey<sup>1</sup>, 1. *Research Institute, California Pacific Medical Center, San Francisco, California*, 2. *University of Pittsburgh, Pittsburgh, Pennsylvania*, 3. *University of Minnesota, Minneapolis, Minnesota*, 4. *Columbia University, New York, New York*

In MrOS men aged  $\geq 71$  yrs, average daily physical activity energy expenditure (PAEE) and minutes of sedentary activity (minSED, <1.5 METS) were assessed by accelerometer (SenseWearPro armband). Self-reported functional limitations included instrumental activities of daily living [(IADL): cannot manage money, medications, shopping, housework or meal preparation]; activities of daily living [(ADL): cannot climb stairs, walk 2-3 blocks, transfer or bathe] and were determined at accelerometry assessment and 2.2 years later. Among men initially free of limitations (N=1983), the multivariate model showed that each SD decrease in PAEE/day (-385 kcal/day) increased the odds of IADL limitation by 1.5-fold and ADL limitation by 1.4-fold. In a separate model, each SD increase in minSED (91 minutes/day) increased the odds of IADL limitation by 1.3-fold and ADL limitation by 1.2-fold (p<.05 for all results). This suggests that both physical activity and sedentary time are independently associated with the development of functional limitations.

### OBJECTIVE VERSUS SELF-REPORTED PHYSICAL ACTIVITY IN OLDER MEN

D.C. Mackey<sup>1,2</sup>, K.W. Peters<sup>1</sup>, P.M. Cawthon<sup>1</sup>, K. Ensrud<sup>3</sup>, T.L. Dam<sup>4</sup>, E. Barrett-Connor<sup>5</sup>, E. Orwoll<sup>6</sup>, J.A. Cauley<sup>7</sup>, 1. *California Pacific Medical Center Research Institute, San Francisco, California*, 2. *Simon Fraser University, Burnaby, British Columbia, Canada*, 3. *University of Minnesota, Minneapolis, Minnesota*, 4. *Columbia University, New York, New York*, 5. *University of California, San Diego, San Diego, California*, 6. *Oregon Health & Science University, Portland, Oregon*, 7. *University of Pittsburgh, Pittsburgh, Pennsylvania*

To examine the value of objective physical activity assessment, we compared self-reported physical activity from the Physical Activity Scale for the Elderly (PASE) to objective physical activity from the SenseWear Pro armband (BodyMedia, Pittsburgh, PA, v5.1, worn  $\geq 5$  days) in 2912 men aged 71-98 years from the MrOS Study. The overall PASE score (mean=135, SD=67) was moderately correlated with armband total energy expenditure (kcal/day) (Spearman  $\rho=0.345$ ), physical activity energy expenditure (kcal/day at MET $\geq 3$ ) ( $\rho=0.415$ ), and minutes per day of physical activity (MET $\geq 3$ ) ( $\rho=0.415$ ) (p<0.001 for all correlations). Correlations were stronger for the overall PASE score than for the leisure-time, household, and occupational sub-scores, and correlations were stronger among men aged > 78 vs.  $\leq 78$  years. PASE underestimated daily time in light and moderate intensity activities and overestimated time in vigorous activities compared to the armband (p<0.001). Objective assessment of physical activity provides valuable information beyond self-report.

### PHYSICAL ACTIVITY ENERGY EXPENDITURE, SEDENTARY ACTIVITY AND LEAN MASS AND OBJECTIVELY ASSESSED PHYSICAL PERFORMANCE IN OLDER MEN: THE MROS STUDY

T.L. Dam<sup>1</sup>, K.W. Peters<sup>2</sup>, P.M. Cawthon<sup>2</sup>, E. Barrett-Connor<sup>3</sup>, K. Ensrud<sup>4</sup>, J.A. Cauley<sup>5</sup>, E. Orwoll<sup>6</sup>, D.C. Mackey<sup>2</sup>, 1. *Medicine, Columbia University, New York, New York*, 2. *California Pacific Medical Center, San Francisco, California*, 3. *University of California San Diego, San Diego, California*, 4. *University of Minnesota, Minneapolis, Minnesota*, 5. *University of Pittsburgh, Pittsburgh, Pennsylvania*, 6. *Oregon Health and Sciences University, Portland, Oregon*

Self-reported sports/recreational activity is associated with lean mass and physical performance. The association with average daily physical activity energy expenditure (PAEE) and minutes of sedentary activity (minSED, <1.5 METS), assessed by accelerometer (SenseWearPro armband worn >5 days) with lean mass (whole body dual x-ray energy absorptiometry) and objectively-assessed physical performance is unknown. In 2868 men >71 years, decreasing PAEE was associated in a graded manner with lower appendicular lean mass (ALM), grip strength, leg power, slower gait speed and longer time to complete 5 chair stands (p-trend <0.0001 all) after adjusting for age, clinic, race and season. Conversely, increasing minSED was associated in a graded manner with lower grip strength, leg power, slower gait speed and longer time to complete chair stands, but not ALM (p-trend <0.001). This suggests that increasing sedentary activity and decreasing energy expenditure are strongly associated with decreased lean mass and physical function in older men.

### DAILY SEDENTARY ACTIVITY AND MORTALITY IN OLDER MEN

K. Ensrud<sup>1</sup>, T. Blackwell<sup>2</sup>, J.A. Cauley<sup>3</sup>, T.L. Dam<sup>4</sup>, P.M. Cawthon<sup>2</sup>, J. Schousboe<sup>5</sup>, E. Barrett-Connor<sup>6</sup>, D.C. Mackey<sup>2</sup>, 1. *VA Medical Center / University of Minnesota, Minneapolis, Minnesota*, 2. *California Pacific Medical Center Research Institute, San Francisco, California*, 3. *University of Pittsburgh, Pittsburgh, Pennsylvania*, 4. *Columbia University, New York, New York*, 5. *University of Minnesota / Park Nicollet, Minneapolis, Minnesota*, 6. *University of California - San Diego, La Jolla, California*

Higher energy expenditure is associated with a lower mortality risk in older adults, but the association of sedentary activity with mortality is uncertain. To determine whether daily sedentary activity predicts risk of death, we examined 2918 men  $\geq 71$  years with objective measures of energy expenditure (SenseWearPro armband worn  $\geq 5$  days) including minutes/day of sedentary ( $\leq 1.5$  METS) activity and ascertained vital status every 4 months over a 3.6-year period. Cause of death was adjudicated using death certificates/medical records. After multivariable adjustment including gait speed and self-reported physical activity, increasing sedentary activity was associated in a graded manner with higher risk of mortality (p-trend <0.001) with a 1.9-fold higher risk in men in Q4 vs. Q1 (referent group). This association was due to higher risks of cardiovascular and non-cancer non-cardiovascular deaths among sedentary men. Increasing objectively measured daily sedentary activity is strongly associated with a higher risk of mortality in older men.

### SESSION 1500 (SYMPOSIUM)

#### VA GRECC SYMPOSIUM - BRIDGING A FRAGMENTED SYSTEM: A HOLISTIC APPROACH TO TRANSITIONAL CARE

Chair: A. Kind, William S. Middleton VA Hospital GRECC, Madison, Wisconsin, University of Wisconsin School of Medicine and Public Health, Madison, Wisconsin

The transition from hospital to home can be treacherous for vulnerable patients. Poor quality transitions may result in medication errors, care-plan discontinuity, patient dissatisfaction, and likely contribute to

nearly 1 in 5 patients experiencing rehospitalization within 30 days of discharge. Studies of non-Veterans Affairs (VA) hospital settings have demonstrated that transitional care programs bring about improvements in patient safety and post-hospital outcomes. However, few existing transitional care programs target the high-rate of patient dispersion, cognitive impairment and vulnerability found in a VA setting. This symposium includes presentations about four VA Geriatric Research, Education and Clinical Center (GRECC) programs that offer practical approaches to enhancing hospital-to-home transitions in older veterans. The Bronx VA RHIO Intervention utilizes a regional electronic health information network to facilitate clinical data sharing across settings, enhancing transitions among veterans using multiple health systems. The Gainesville VA Home Assessments Utilizing a Video Camera Pilot represents a cost-effective means of identifying environmental hazards and equipment needs prior to discharge. The low-resource, telephone-based Madison VA Coordinated-Transitional Care (C-TraC) program uses a registered nurse to coordinate transitional care, reducing rehospitalization rates. The VA Ann Arbor Healthcare System (VAAHS) "Bridging the Gap" demonstration project uses medication reconciliation, social work consultation/intervention and behavior management to improve transitions for veterans with cognitive impairment. After attending this activity, participants will be able to: (1) identify patient and health care system characteristics that require non-traditional transitional care approaches, and (2) describe potential outcomes of novel transitional care programs including cost avoidance, rehospitalization rates and medication discrepancies.

#### **THE VA COORDINATED-TRANSITIONAL CARE (C-TRAC) PROGRAM: A REGISTERED NURSE TELEPHONE-BASED INITIATIVE TO IMPROVE TRANSITIONS FOR HOSPITALIZED VETERANS WITH DEMENTIA AND OTHER HIGH-RISK CONDITIONS**

Asthana<sup>1,2</sup>, 1. *Department of Medicine, Geriatrics Division, University of Wisconsin School of Medicine and Public Health, Madison, Wisconsin*, 2. *GRECC, William S. Middleton Hospital, United States Department of Veterans Affairs, Madison, Wisconsin*, 3. *William S. Middleton Hospital, United States Department of Veterans Affairs, Madison, Wisconsin*, 4. *Department of Populational Health Sciences, University of Wisconsin School of Medicine and Public Health, Madison, Wisconsin*, 5. *Department of Family Medicine, University of Wisconsin School of Medicine and Public Health, Madison, Wisconsin*, 6. *Department of Surgery, University of Wisconsin School of Medicine and Public Health, Madison, Wisconsin*

The Affordable Care Act encourages dissemination of evidence-based transitional care programs designed to improve patient safety and outcomes after hospital discharge, but no existing program fully addresses the challenges of distance, dementia and patient vulnerability common in a VA setting. We developed a low-resource, telephone-based VA Coordinated-Transitional Care (C-TraC) program to improve care coordination and outcomes in hospitalized veterans with dementia and other high-risk conditions discharged to community settings. Once fully established, C-TraC patients experienced 1/3 fewer rehospitalizations than a baseline comparison group, resulting in an estimated net savings (cost avoidance) of \$1,273/patient enrolled after accounting for all programmatic costs. C-TraC may represent a viable alternative for transitional care in VA, rural or other settings challenged by distance, constrained resources and patient vulnerability.

#### **A RHIO ENHANCED CARE TRANSITIONS INTERVENTION**

K. Boockvar, W.W. Hung, B. Morano, *GRECC, James J. Peters Veterans Affairs Medical Center, Bronx, New York*

Background: Older veterans who transition from acute care to home are at high risk for adverse outcomes. The Bronx RHIO, a regional electronic health information network, provides a platform

for sharing clinical data. We designed a care transitions intervention (CTI), supported by the use of RHIO for veterans discharged from VA and surrounding non-VA hospitals. Program Information: 205 CTIs were delivered via home visits and telephone calls by a CTI coach, and contained components of education, self-management and empowerment. After hospital discharge, the coach identified an average of 1 unmet need per patient including medication discrepancy or mishaps. At 30 days, 92% of patients had follow-up physician visits and readmission rate was lower among those served by CTI (19.5%) when compared to those referred but not served. Conclusion: This pilot program suggests that a low-cost intervention utilizing community resources may enhance care transitions among veterans who use multiple health systems.

#### **BRIDGING THE GAP: CARE MANAGEMENT TARGETING VETERANS WITH COGNITIVE IMPAIRMENT AT TIMES OF TRANSITION**

C. Cigolle<sup>1,2</sup>, P. Lee<sup>1,2</sup>, 1. *GRECC, Department of Veterans Affairs, Ann Arbor, Michigan*, 2. *Department of Family Medicine, University of Michigan Health System, Ann Arbor, Michigan*

Background Cognitive impairment is prevalent, under-diagnosed, and accompanied by complex care needs. It complicates veterans' care during healthcare transitions and predisposes veterans to transitions. The VA Ann Arbor Healthcare System (VAAHS) used support from the Transformation-21 initiative, Innovative Patient Centered Alternatives to Institutional Extended Care, to fund the "Bridging the Gap" demonstration project. Process Inclusion criteria: veterans  $\geq 60$  years with cognitive impairment and recent/anticipated transition in care. Interventions: medication reconciliation; social work consultation/intervention; behavior management. Outcomes Veterans enrolled: n=192; mean age, 83 years; mean number of medications, 9; Zarit Burden Scale, 7. Medication problems identified, 237, with 65% improved/resolved. Social service interventions, 533. Institutionalization, 11%. Mortality, 16%. Lessons Learned (1) Project resulted in case finding for institutionalization (need to intervene early in patients with dementia to delay/prevent institutionalization). (2) Prime opportunity to coordinate with Patient Aligned Care Team (PACT); project is a destination site on PACT Navigator Tool at VAAHS.

#### **HOME ASSESSMENTS UTILIZING A VIDEO CAMERA: A PILOT PROJECT**

C. Campbell<sup>1,2</sup>, J. Meuleman<sup>1,2</sup>, 1. *GRECC, Department of Veterans Affairs, Gainesville, Florida*, 2. *University of Florida, Gainesville, Florida*

The Home Assessments Utilizing a Video Camera: A pilot project was developed to improve the quality and cost-effectiveness of home safety assessments for older hospitalized veterans discharge to home. The aim of the assessments was to reduce environmental hazards and ensure appropriate home equipment provision. Homes were assessed by reviewing video recordings taken by patients' family members (N=29). Recordings were analyzed using measurement forms identifying the type of home and problem areas. Problem areas included mobility/seating, bathroom, bedroom, entry, and kitchen. Safety concerns were identified in each problem areas and suggest that video recording may be a useful tool for identifying environmental hazards and equipment needs. All 29 patients had bathroom safety issues and 7 required assistive devices for mobility. On average per patient, recording saved 3 Occupational Therapist work hours, totaling \$2,610. Results from this pilot suggest that this approach is cost-effective when partnering with patients' families is feasible.

## SESSION 1505 (SYMPOSIUM)

### EFFECTS OF COMMUNITY FACTORS ON SERVICES DELIVERY AND WELL-BEING OF OLDER PEOPLE IN CHINESE COMMUNITIES ACROSS CULTURES

Chair: *V. Lou, The University of Hong Kong, Hong Kong, Hong Kong, Sau Po Centre on Ageing, Hong Kong, Hong Kong*  
Co-Chair: *T.Y. Lum, The University of Hong Kong, Hong Kong, Hong Kong*

The objective of this symposium is to examine the effects of community-level factors on the delivery of aging services and well-being of older adults in Chinese communities across cultures. Based on data from different community surveys, Lai will discuss how the form of social capital and its effect on older people's health varied across Chinese communities in different cultures. Ye and Chen will discuss the role of community participation on the depressive symptoms of older people in Shanghai. They collected data from 936 older adults in 2011 and found that a sense of belonging to the neighborhood, volunteering in the neighborhood, and being pride of the neighborhood were positively associated with fewer depressive symptoms. However, giving only monetary donation to the neighborhood had no effect on depressive symptom. Lou, Lum and Nu will address the association between social capital and subjective well-being of older people in Hong Kong. They interviewed 408 older people in Hong Kong in 2011 and found that older people's life satisfaction and depressive symptoms were associated with their wealth, health, family capital, and community capital. Moreover, the effect of community capital was greater among those who had low family capital. Lum, Yang and Wang compared the dementia care system in four Chinese Cities: Guangzhou, Hong Kong, Shanghai and Taipei. They found that because of different funding modes and balance in residential and community care, there existed great disparities in how older people with dementia were cared in these Chinese cities.

### SOCIAL CAPITAL AND HEALTH OF AGING CHINESE: AN INTERNATIONAL PERSPECTIVE

D. Lai, *Faculty of Social Work, University of Calgary, Calgary, Alberta, Canada*

Social capital is an emerging theme connected with understanding of healthy aging. While social capital is a western construct, its manifestation and impact on health of older adults may vary in different socio-cultural-environmental contexts. Based upon quantitative and qualitative data from different research studies, social capital is examined in the context of aging Chinese in different countries. This presentation is based upon data from community surveys utilizing mixed sampling methods of 4,240 aging Chinese 55 years or older in China, Hong Kong, Taiwan, Canada, and the United States, as well as qualitative in-depth personal interview data from aging Chinese in Calgary, Canada), Nanjing, and Shanghai in China. The findings illustrate variables reflective of social capital; and their relationship with physical health and mental health is discussed. Forms of social capital from the perspective of the aging Chinese and their connection with healthy aging will also be examined.

### THE INFLUENCE OF NEIGHBOURHOOD IDENTITY ON CHINESE ELDERS' PSYCHOLOGICAL WELL-BEING

M. Ye<sup>1</sup>, Y. Chen<sup>2</sup>, *1. Department of Sociology, Bowling Green State University, Bowling Green, Ohio, 2. Department of Psychology, Bowling Green State University, Bowling Green, Ohio*

Although accumulated research discovered the effect of neighbourhood, little has been done on the relationship between elders' neighbourhood identity and their well-being. Guided by the social identity theory, this study investigates neighbourhoods identity in three dimensions: cognitive, emotional, and contributive components. The study uses a senior consumer satisfaction survey of community services in Shanghai, China, 2011, a randomly sample of 936 respondents aged 55

and above. Neighbourhood identities and the depressive symptom were the key variables. Other control variables were age, gender, education, income, marital status, and health. The Ordinary Least Squares (OLS) regression showed that after controlling demographic attributes, elders' feeling of belonging to the neighbourhood, doing volunteer works for the neighbourhood, and being pride of the neighbourhood had positive effects on their well-being. However, elders' charitable donation has no significant effect on their well-being. This study suggested that increasing elders' neighbourhood identity can facilitate their well-being.

### COMMUNITY CAPITAL AND WELL-BEING OF OLDER PEOPLE IN HONG KONG

V. Lou<sup>1,2</sup>, T.Y. Lum<sup>1,2</sup>, N. Lu<sup>1</sup>, T. Tong<sup>2</sup>, *1. Department of Social Work & Social Administration, The University of Hong Kong, Hong Kong, Hong Kong, 2. Sau Po Centre on Ageing, The University of Hong Kong, Hong Kong, Hong Kong*

Objective: This study examined the associations between social and family capitals and well-being of older people in Hong Kong. Particularly, we focused on how these two capitals affected the subjective life satisfaction and depressive symptoms among older people in Hong Kong. Method: We conducted face to face interviews with 408 older people (average age = 75 years) recruited from four communities (one old urban community with mixed public and private housings; one rural village, one old public household, and one new public housing community) in 2011. Subjective well-being was measured by the Geriatric Depression Scale and the Life Satisfaction Scale for Chinese older adults. Social and family capital were measured by parent-child relationship, reciprocity, community organization participation, and perceived community support. Findings: We found that older people's life satisfaction and depressive symptoms were associated with their wealth, health, family capital, and the community capital. Moreover, community capital complemented family capital. Older people with low family capital living in an area of high community capital had better well-being outcomes than those living in an area of low community capital.

### DEMENTIA CARE IN FOUR METROPOLITAN CITIES IN GREATER CHINA

T.Y. Lum<sup>1,2</sup>, P. Yang<sup>3</sup>, V. Lou<sup>1,2</sup>, J. Wang<sup>1,2</sup>, *1. Social Work and Social Administration, The University of Hong Kong, Pokfulam, Hong Kong, 2. Sau Po Center on Ageing, Pokfulam, Hong Kong, 3. National Taiwan University, Taipei, Taiwan*

The goal of this study is introduce and compare dementia care in four metropolitan cities in greater China: Hong Kong, Guangzhou, Shanghai, and Taipei. Methods: We reviewed publicly available information from governments and service providers and interviewed key stakeholders in these four cities. We did a content analysis of all data collected and compared our findings from four cities. Findings: There were few dementia specialized services in these four cities. Hong Kong and Taiwan have launched a few successful dementia service models. Guangzhou has just started to aware the issue of dementia, but specialize dementia care services are limited as Guangzhou has just begun to set up its long-term care system. In Shanghai, individual hospitals tried to provide services for those diagnosed patients. However, at the community level services are still not commonly developed. The future of dementia care in greater Chinese region will be discussed.

## SESSION 1510 (SYMPOSIUM)

### PRODUCTIVE ACTIVITIES: COMPETING AND COMPLEMENTARY ROLES

Chair: *C. Matz-Costa, Boston College, Chestnut Hill, Massachusetts, Sloan Center on Aging & Work, Chestnut Hill, Massachusetts*  
Discussant: *N. Morrow-Howell, Washington University, George Warren Brown School of Social Work, St. Louis, Missouri*

While productive activities have been central to theoretical discussions and empirical analysis of well-being in later life, the nature and

experience of older adults' participation is not well understood. Much of the research in this area considers a single activity at a time and fails to consider that these roles are not performed in isolation. Unlike other periods of life that tend to be characterized by a primary life role—for example work or school or child-rearing—it is far more likely that older adults are participating in a mix of work, leisure, family time, learning or giving back at any one time. Further, such simultaneous involvements are likely underreported, as many older adults perform significant amounts of unpaid productive work (e.g., caregiving, informal volunteering or helping) that they do not recognize as such. In this session, we will present empirical analyses that explore various ways in which productive roles complement and compete with each other in older adulthood. The first presentation will address the role of volunteering and caregiving as pathways to work after retirement. The second will explore the prevalence of productive activity within nursing homes. Next, findings on the effects of combining caregiving and paid work will be presented. And the final presentation will demonstrate linkages between the quality/quantity of productive activity and well-being. A discussant will reflect on the contributions of these works toward the development of scholarship, policies and programs that may be beneficial for older adults, families, and society.

#### **QUANTITY, QUALITY, OR NATURE OF PRODUCTIVE ACTIVITY IN LATER LIFE? EFFECTS ON SUBJECTIVE WELL-BEING**

C. Matz-Costa, J. James, E. Besen, *Boston College, Sloan Center on Aging & Work, Chestnut Hill, Massachusetts*

**Objective.** We seek to understand older adults' involvement in various combinations of paid work, volunteer work, caregiving, or educational activities and the effect of these involvements on well-being. **Methods.** Using data from the 2010 Life & Times in an Aging Society Study, this presentation explores the impact of extent of involvement (e.g., number of hours), type of involvement (e.g., caregiving for child vs. elder), and perceived quality of involvement (psychological engagement) on subjective well-being among adults age 50 to 64 (N=374) and age 65 and older (N=246). **Results.** Findings suggest that a perceived sense of excitement, dedication, and positive challenge regarding one's involvement in activities is more consequential to well-being among older adults than the extent or type of involvement in and of itself; this effect becomes stronger among the age 65 and older group. **Implications.** Recommendations for enhancing role quality to promote well-being in later life will be discussed.

#### **PATHWAYS TO WORK AFTER RETIREMENT: VOLUNTEERING AND CAREGIVING**

E. Gonzales, *Washington University, St. Louis, Missouri*

**OBJECTIVES:** I hypothesized that volunteering in later life maintains/enhances human and social capital and is a pathway to returning to work. I also examined how education and caregiving compete/complement returning to work. **METHODS:** A sample of fully retired respondents aged 62+ were drawn from the Health and Retirement Study in 1998 (n=8,332) and followed to 2008. Dependent variable: whether retiree returning to work or not. Bivariate analyses and logistic regressions were utilized. Controls: education, health, wealth, gender, race, marital status, number in household. **RESULTS:** No retiree sought educational classes/training for returning to work. Volunteer status significantly predicted returning to work in the subsequent wave (complement). If the respondent was caregiving, some volunteering complemented returning to work, while a lot of volunteering competed with it. **IMPLICATIONS:** Volunteering in later life is a pathway for retirees to return to work. Integrating and bolstering volunteer/caregiving policies can lead to longer working lives.

#### **PRODUCTIVE SOCIAL ENGAGEMENT IN NURSING HOMES: VOLUNTEERING & PROVIDING SUPPORT**

S.N. Leedahl, R.K. Chapin, *School of Social Welfare, University of Kansas, Lawrence, Kansas*

**Objective:** Little is known, even at the descriptive level, about the prevalence of productive activity within nursing homes. This study examined the extent to which older adults volunteer at the nursing home and provide support to others, and tested hypotheses about relationships between social engagement and mental health. **Methods:** We conducted a quantitative study of adults age 65+ (N=140; M=83.1 years) in 30 Kansas nursing homes. Using a standardized questionnaire, we interviewed older adults face-to-face. Bivariate analyses and structural equation modeling were used to answer research questions. **Results:** Analyses indicate that approximately 35% volunteer within the nursing home and 32% provide emotional support to staff and family on a regular basis. Findings suggest that volunteering is related to higher mental health scores. **Implications:** We will discuss potential policy implications and strategies for staff, family, and friends to help older adults identify productive activities when they are receiving long-term care services.

#### **COMBINING EMPLOYEE AND CAREGIVING ROLES: WHY WORK-FAMILY CONFLICT MATTERS**

M. Brown, *Social Work, Boston College, Chestnut Hill, Massachusetts*

**Objective.** I hypothesized that work-family conflict would mediate differences in psychological distress between employees caring for an older family member and employees without caregiving responsibilities. I also examined the workplace characteristics associated with decreased work-family conflict among caregivers. **Methods.** OLS regression analyses were conducted using a sample of employees from the National Study of the Changing Workforce (2008) (n=1,773). Control items included gender, race, marital status, and age. **Results.** Differences in psychological distress between caregivers (n=501) and non-caregivers (n=1,272) were partially explained by work-family conflict. Workplace characteristics associated with reduced work-family role conflict among caregivers include having a manageable workload, a supportive supervisor, and access to workplace flexibility. **Implications.** Combining work and caregiving roles becomes problematic when conflict between role responsibilities occurs. Alleviating work-family conflict will be critical to ensuring the well-being of family caregivers of older adults who are also working for pay.

#### **SESSION 1515 (PAPER)**

#### **DEPRESSION AND ANXIETY, DISPARITIES, MEDICATIONS, THERAPIES, AND PHYSICAL HEALTH**

#### **THE RECEIPT OF CARE, SELF-PERCEPTIONS OF AGING, AND DEPRESSION**

M. Kwak, *School of Social Work, Univ Michigan, Ann Arbor, Michigan*

Receiving care can be a source of support that buffers the adverse effects of stressful events, such as illness and disabilities; however, it can also trigger negative feelings about one's own aging. This study examines the extent to which self-perceptions of aging explain the relationships among functional impairment, the receipt of care, perceived loss of control, and depressive symptoms among older adults. The sample consists of older adults ages 50 and over from the 2006, 2008, and 2010 waves of the Health and Retirement Study (HRS) (n=6,180). Structural equation modeling was used to test an analytic model that focused on the mediated effects of self-perceptions. Demographic characteristics of the respondents were included as control variables. The model fit indices were acceptable (RMSEA=.049, CFI=.926). The results indi-

cate that self-perceptions of aging mediate the relationship between receipt of care and perceived loss of control as well as the relationship between receipt of care and depressive symptoms. That is, older adults who receive a greater amount of care are more likely to perceive their aging negatively, which, in turn, increases perceived loss of control and depressive symptoms. These findings suggest that the receipt of care may make frail older adults more vulnerable to negative self-perceptions. Discussions will include practice implications, including ways to minimize the negative repercussions of receiving care for older adults.

### **RACIAL DISPARITIES IN DEPRESSION DIAGNOSIS AND TREATMENT AMONG COMMUNITY-DWELLING ELDERLY**

K.A. Zurlo, A. Akincigil, *Rutgers University, New Brunswick, New Jersey*

**Objective:** To investigate racial/ethnic disparities in the diagnosis and treatment of depression among community dwelling elderly. **Methods:** Secondary analyses of Medicare Current Beneficiary Survey data (n=33,708) for 2001-2005. Logistic regression models were estimated to assess the association of race with the probability of being diagnosed and treated for depression with either antidepressant medication or psychotherapy. **Results:** Depression diagnosis rates were 6.4% for non-Hispanic whites, 4.2% for African Americans, 7.2% for Hispanics and 3.8% for others. After adjusting for a range of covariates including a two-item depression screener, African Americans were significantly less likely to receive a depression diagnosis from a health care provider (aOR=0.53, CI=0.41-0.69) than non-Hispanic whites; among those diagnosed, they were less likely to be treated for depression (aOR=0.45, CI=0.30-0.66). **Conclusions:** Among elderly Medicare beneficiaries, significant racial/ethnic differences exist in the diagnosis and treatment of depression. Vigorous clinical and public health initiatives are needed to address this persisting disparity in care.

### **INCREASED USE OF POTENTIALLY INAPPROPRIATE MEDICATIONS IN OLDER ADULTS WITH DEPRESSIVE AND ANXIETY SYMPTOMS**

H. Alfonso<sup>1,2</sup>, C. Beer<sup>1,3</sup>, J.J. Pfaff<sup>1,2</sup>, L. Flicker<sup>1,3,4</sup>, N. Stock<sup>6</sup>, N. Kerse<sup>7</sup>, B. Draper<sup>8</sup>, O. Almeida<sup>1,2,5</sup>, *1. WA Centre for Health and Ageing, Perth, Western Australia, Australia, 2. School of Psychiatry and Clinical Neurosciences, University of Western Australia, Perth, Western Australia, Australia, 3. School of Medicine and Pharmacology, University of Western Australia, Perth, Western Australia, Australia, 4. Department of Geriatric Medicine, Royal Perth Hospital, Perth, Western Australia, Australia, 5. Department of Psychiatry, Royal Perth Hospital, Perth, Western Australia, Australia, 6. Discipline of General Practice, The University of Adelaide, Adelaide, South Australia, Australia, 7. School of Population Health, University of Auckland, Auckland, Auckland, New Zealand, 8. School of Psychiatry, University of New South Wales, Sydney, New South Wales, Australia*

**Background:** Depression and anxiety are common and disabling disorders that affect about 10% of adults over the age of 60 years. People with depression have a higher prevalence of nonspecific medical complaints than non-depressed counterparts. They are also greater consumers of health resources, and may, consequently, be more often exposed to Potentially Inappropriate Medications (PIM) than people without mental health symptoms. **Aim:** To examine the use of PIM among older adults with and without clinically significant anxiety and depressive symptoms. **Methods:** We used the baseline data from the DEPS-GP study, which obtained health information from an Australian-wide sample. Depression and anxiety symptoms were assessed by the Hospital Anxiety and Depression Scale (HADS). PIM were identified following the consensus criteria of medications to avoid (independent of diagnosis) in older adults (Arch Inter Med 2003; 162:2716). Logistic regression was applied to examine the associations between PIM use and

outcomes variables, adjusting for potential confounders. **Results:** Of 17,240 participants aged 65 years and over, 25.0% reported using at least one PIM, mostly anxiolytic benzodiazepines, antihistamines and antidepressants. Those with depression or anxiety were more frequent users of PIM, after adjusting for potential confounders (OR 1.69, 95% CI 1.54, 1.86 for depression, OR 1.95, 95% CI 1.76, 2.16 for anxiety). The risk of PIM use increased progressively with the increasing severity of depression or anxiety symptoms. **Conclusions:** Older adults with clinically significant anxiety and depression are disproportionately exposed to the potentially negative consequences of PIM use and, as such, may benefit from safer alternatives of treatment.

### **ADAPTING MINDFULNESS-BASED COGNITIVE THERAPY (MBCT) FOR DEPRESSION IN LATER LIFE: MODIFICATIONS AND PRE/POST OUTCOMES**

M.A. Foulk<sup>1</sup>, B. Ingersoll-Dayton<sup>2</sup>, J. Kavanagh<sup>3</sup>, E.A. Robinson<sup>3</sup>, H. Kales<sup>3</sup>, *1. The University of Michigan Geriatrics Center, Ann Arbor, Michigan, 2. The University of Michigan School of Social Work, Ann Arbor, Michigan, 3. The University of Michigan Dept. of Psychiatry, Ann Arbor, Michigan*

Depression and anxiety are mental health conditions that compromise quality of life among older adults. Given that aging individuals often take multiple medications for their mental and physical health, identifying effective psychological interventions to decrease the need for poly-pharmacy is valuable. Mindfulness-based therapies show particular promise, as recent studies have demonstrated that mindfulness-based cognitive therapy (MBCT) for depression has equivalent effects to anti-depressant medication. However, to date there have been few attempts to apply mindfulness-based approaches to older adults. This paper describes an adaptation of MBCT for older adults (aged 60+) with depressive diagnoses, and examines quantitative changes in several outcome variables associated with their participation in the program. The content and structure of the 8-week program are described in detail, including exercises in class and at home, as well as follow-up sessions after the program's completion. The specific adaptations made to accommodate older adults (e.g., length of meditations, changes in mindful movement exercises) are also detailed. Pre-post pilot data for 4 MBCT groups (n = 22) found significant changes in anxiety (t= -3.18, p<.01) and ruminative thoughts (t= -4.00, p<.01), but only marginal ones in depression (t= -1.36, p=.10) and none for sleep (t= -.38, p=.66), although some individual sleep items did change significantly. Additional qualitative data and case examples are presented to illuminate these outcomes. Findings show that this non-pharmacological intervention is feasible for older adults and is associated with positive changes. Suggestions are provided both for clinical practice of MBCT and for future research on older populations.

### **RELATIONSHIP BETWEEN DEPRESSION AND DIABETES SELF-MANAGEMENT INTERVENTION OUTCOMES FOR ELDER LATINOS**

D.H. Sommerfeld, V. Cardenas, G.A. Aarons, *University of California, San Diego, La Jolla, California*

**Introduction:** Diabetes among elderly Latinos is a significant public health issue that is frequently comorbid with depression. Self-management programs represent one approach for addressing these concerns. This study examines the relationship between depression and multiple diabetes outcomes for elderly Spanish speakers following participation in an evidence-based diabetes self-management program. **Data & Methods:** Data come from a San Diego County study of elderly Latinos (age 60 and over) with diabetes and depression. Data were collected prior to participation in the intervention and again 4 months after completing the 6 weekly sessions (n=128). Depression was measured using the PHQ-9. Multiple indicators of diabetes self-management behaviors, self-efficacy, and symptoms were examined (5 indicators). We conducted separate linear regression analyses to predict each of the diabetes

outcome indicators at follow-up. For each analysis we included the baseline measurement of the dependent variable, gender, age, education, diabetes severity, family support, and baseline and follow-up measures of depression. Findings: Controlling for all measures indicated above, the results of the 5 analyses indicated that higher depression at follow-up was significantly related with lower nutritional (but not exercise) self-care, lower diabetes self-efficacy, and higher numbers of hypo- and hyperglycemia symptoms at follow-up. Baseline depression was not significant in any analysis. Conclusions: The findings indicated that depression at follow-up (but not baseline) was related to multiple diabetes outcomes and that low levels of depression following the completion of the intervention were associated with favorable diabetes outcomes. This suggests that further attention to reducing and maintaining low levels of depression is important for the success of diabetes self-management programs.

## SESSION 1520 (PAPER)

### NURSING HOME QUALITY OF CARE, ELECTRONIC RECORDS, MEDIA IMAGES, AND CHARACTERIZING OF RESIDENTS

#### ELECTRONIC HEALTH RECORDS ADOPTION AND USE IN SKILLED NURSING FACILITIES

A.A. Filipova, *Public Administration (mail code 449), University of Wisconsin Oshkosh, Oshkosh, Wisconsin*

**Purpose of the Study:** This study is the first to utilize a scientifically-based, comprehensive instrument to determine nursing home administrators' perceptions about level of automation of clinical/operational functions, the benefits of EHR use, and the barriers to EHR adoption in Wisconsin skilled nursing facilities. **Design and Methods:** A cross-sectional design was implemented. Data were collected from facility administrators utilizing a mail and online survey approach. A total of 156 usable questionnaires were returned of 397 distributed—a 39.30% response rate. **Results:** While many facilities reported fully automated Minimum Data Set assessments (69%), licensed nurse clinical notes (47%), and care plans (46%), there remains a predominant reliance on paper for functions, such as diagnostic tests (61%) and consults (63%). Automated clinical decision support was mostly used for clinical assessments (65%) and care plans (42%). Eighty-five percent reported using electronic systems to capture information relevant to healthcare quality. The majority of facilities had no telehealth/telemonitoring capabilities. The top three barriers included: the amount of capital (49%), cost for hardware/infrastructure (47%), and availability of subsidies (33%). The top three benefits were: quality monitoring (87%); management oversight (83%), and anywhere/anytime easier access to clinical data (83%). **Implications:** The predominant reliance on paper for a variety of clinical/operational functions, the lack of plans for future expansion of automated functions, as well as the barriers to EHR adoption suggest that Wisconsin SNFs will be further behind in EHR implementation in the future. Administrators should consider issues related to planning, software adaptation, collaborations with partners/vendors, and implementation.

#### THE PORTRAYAL OF THE NURSING HOME SECTOR IN 50 U.S. NEWSPAPERS, 1999-2008

E.A. Miller<sup>1</sup>, C.R. Oala<sup>1</sup>, B. McGonagle<sup>1</sup>, D. Tyler<sup>2</sup>, V. Mor<sup>2</sup>, *1. Gerontology, Univ Mass Boston, Boston, Massachusetts, 2. Brown University, Providence, Rhode Island*

This study identifies how U.S. newspapers depicted the nursing home sector from 1999 to 2008. Keyword searches of the Lexus Nexus database were used to identify more than 15,000 articles in 50 newspapers from 46 states plus the District of Columbia. The content of each article was analyzed and tone, themes, prominence, and other attributes assessed. Basic frequencies and descriptive statistics we used to exam-

ine article content, both cross-sectionally and over time. The majority of articles were published from 1999-2003 (60%); fewer during 2004-2008 (40%). Reporting was substantially more extensive in some newspapers (>10% of total coverage) than others (<1%). Most articles were news stories (87.9%), relatively few editorials (8.4%), columns (1.2%), or letters (3.6%). About one-third were located on the front page of the newspaper or section. Most focused on government (45.5%) or industry (37.3%) interests, very few on residents/family (12.2%) and community (4.9%) concerns. Most were negative (39.6%) or neutral (42.9%) in tone; very few were positive (10.7%) or mixed (6.7%). Common themes include quality (53.2%), financing (34.5%), and negligence/fraud (24.1%). Less common themes included costs (10.6%), rebalancing (8.7%), and property/business issues (10.6%). Natural disasters (2.7%), access (3.3%), and politics (3.3%) were rarely discussed. Both tone and themes varied across years and newspapers (e.g., national v. regional). Overall, findings highlight longitudinal variation in the framing of nursing home coverage in the U.S. Media, not only with respect to tone but also with respect to shifts in media attention from one aspect of this issue to another over time.

#### NURSE AIDE ABSENTEEISM IS NURSING HOMES

N. Castle<sup>1</sup>, J. Engberg<sup>2</sup>, J.C. Ferguson-Rome<sup>1</sup>, *1. University of Pittsburgh, Pittsburgh, Pennsylvania, 2. RAND, Pittsburgh, Pennsylvania*

Little research is available addressing absenteeism in nursing homes. However, Nurse Aide (NA) absenteeism may be a considerable staffing concern. High rates of NA absenteeism may influence resident care. In this research, the association of NA absenteeism with quality of care of nursing home residents is examined (using 14 indicators of care quality). Data used came from a survey of nursing home administrators (response rate = 65%), the Online Survey Certification and Reporting data, and the Area Resource File. The quality indicators came from Nursing Home Compare. The information including absenteeism and staffing variables of Registered Nurses, Licensed Practical Nurses, and NAs were measured in 2007, and came from 3,941 facilities. Multivariate regression models using GEE were used. An average of 4.4% of NAs were absent on any given day. However, this ranged from 0.5% to 12.3%. High NA absenteeism was associated with high turnover. In the multivariate analyses, controlling for turnover and staffing levels (along with 12 other facility and market characteristics), high absenteeism was associated with lower quality in 9 of the 14 quality indicators. High absenteeism was also associated with more deficiency citations. The findings provide tentative evidence that absenteeism may be an important staffing characteristic, and show that NA absenteeism may influence quality of care.

#### HOSPICE FOR NURSING HOME RESIDENTS: DOES OWNERSHIP TYPE MATTER?

M.E. Canavan<sup>1</sup>, M.D. Carlson<sup>2</sup>, H.L. Sipsma<sup>1</sup>, E. Bradley<sup>1</sup>, *1. Epidemiology and Public Health, Yale University, New Haven, Connecticut, 2. Department of Geriatrics and Palliative Medicine, Mount Sinai School of Medicine, New York, New York*

Currently, more than half of all nursing home residents use hospice at some point, a 4-fold increase since 1992. Studies have shown benefits to hospice enrollment for patients; however, the literature on ownership differences in hospice care in general has indicated that for-profit hospices offer a narrower scope of services and employ fewer professional staff. Although nursing home staffing patterns have been shown to be essential to quality of care, the literature has not explored differences in patient-to-staff ratios for hospice care within nursing homes. Using data from the National Hospice Survey, a random sample of all Medicare-certified hospices operating between September 2008 and November 2009, we identified 509 hospices that served nursing home residents. Based on financial incentives, we hypothesized that for-profit hospices would have higher patient-to-staff ratios for registered nurses, medical social workers and home health care workers and require less

training time for staff prior to working with nursing home residents. Adjusted analysis indicated a higher concentration of patients among for-profit hospices for each staff type; however, this relationship was only significant for home care workers with an additional 13 patients (p-value 0.003) for each worker. Moreover, compared with nonprofit hospices, for-profit hospices required significantly fewer hours of training for both registered nurses (37 p=0.046) and medical social workers (67 p=0.003) in their first year of employment. Since staffing is an important indicator of hospice quality, our findings can be useful for anticipating potential impacts of the growth in for-profit hospice on nursing home residents.

#### **CHARACTERIZING USERS OF VA OWNED AND OPERATED INSTITUTIONAL LONG-TERM CARE: SIMILARITIES AND DIFFERENCES TO OTHER NURSING HOME ENTRANTS**

S. Cai<sup>1</sup>, O. Intrator<sup>1,4</sup>, E.A. Miller<sup>2</sup>, B. Kinoshian<sup>3</sup>, S. Hyde<sup>4</sup>, S.C. Miller<sup>1</sup>, 1. *Brown University, Providence, Rhode Island*, 2. *University of Massachusetts, Boston, Rhode Island*, 3. *University of Pennsylvania, Philadelphia, Pennsylvania*, 4. *Providence VA Medical Center, Providence, Rhode Island*

The Veterans Health Administration (VHA) provides nursing home (NH) level care in VHA owned and operated Community Living Centers (CLCs). Other Veterans can receive VHA-paid or non-VHA-paid NH care in community NHs. This study compared the characteristics of CLC Veterans to Veterans using other NHs and all male NH residents. The cohort was derived from the first CLC/NH admission Minimum Data Set assessment for all males in 2009. Significant differences in socio-demographic characteristics, health conditions, and other known correlates of NH admission were identified. The cohort included 32,035 CLC Veterans, 95,887 Veterans in other NHs, and 800,527 men admitted to NHs. CLC Veterans were considerably younger (37% aged under 65) than Veterans admitted to NHs (8%), and all men admitted to NHs (19%). CLCs also had a higher proportion of African American residents than the other settings (17%, 10%, and 12%, respectively). CLC Veterans were less physically impaired but more cognitively impaired than their community NH counterparts. While CLC Veterans were more frequently admitted from home, the other two groups were more frequently admitted from hospitals. CLC Veterans were less likely than Veteran or NH residents in the other two groups to have a diagnosis of congestive heart failure, were more likely to have a cancer diagnosis, but were as likely to have a diagnosis of COPD or diabetes. Understanding the unique care needs of Veteran LTC users in various settings provides an opportunity to improve service delivery by better matching the resources allocated to the populations served.

#### **SESSION 1525 (SYMPOSIUM)**

##### **GSA-SFRBM JOINT SYMPOSIUM: THE FREE RADICAL THEORY OF AGING REVISITED**

Chair: *K.J. Davies, University of Southern California, Los Angeles, California*

Co-Chair: *K.J. Davies, University of Southern California, Los Angeles, California* Co-Chair: *M.E. Matzko, Geisinger Medical Institute, Danville, Pennsylvania*

This session represents a joint symposium with the Society for Free Radical Biology and Medicine (SFRBM). Previous research clearly indicates the importance of oxidative stress for aging at the molecular, cellular and tissue levels. Although there is much information on the specific factors that induce oxidative stress and the consequences of oxidative stress, new information is continuously evolving. The purpose of this session is to bring together investigators to discuss new concepts and ideas related to the mechanisms and consequences of oxidative stress.

#### **OXIDATIVE STRESS AND NEURODEGENERATION IN BRAIN OF SUBJECTS WITH ALZHEIMER'S DISEASE AND AMNESTIC MILD COGNITIVE IMPAIRMENT: CENTRAL ROLE OF AMYLOID $\beta$ -PEPTIDE (1-42) AND INSIGHTS FROM REDOX PROTEOMICS**

D. Butterfield, *Chemistry, Univ of Kentucky, Lexington, Kentucky*

D. Allan Butterfield, Ph.D. The UK Alumni Association Endowed Professor of Biological Chemistry; Director, Center of Membrane Sciences; and Faculty, Sanders-Brown Center on Aging, University of Kentucky, Lexington, KY 40506 USA. Our laboratory was among the first to demonstrate elevated oxidative stress in brains from subjects with Alzheimer's disease (AD) and amnesic mild cognitive impairment (MCI), arguably the earliest form of AD. We also showed that amyloid beta-peptide 1-42 (A $\beta$ 42) could induce oxidative stress in vitro and in brain in vivo. Our laboratory reported the first use of redox proteomics to identify oxidatively modified brain proteins in subjects with AD and MCI, several of which were found to be oxidatively modified in common in AD and MCI, implicating key pathways in progression of this neurodegenerative disorder. These results are consistent with the clinical presentation, pathology, and biochemical alterations in these disorders. A $\beta$ 42 in model systems in vitro and in vivo is able to replicate oxidative modification of many of these redox proteomics-identified proteins, implicating this peptide as a major contributor to the oxidative stress inherent in AD and MCI brain. Support: NIA/NIH.

#### **REVISITING THE ROLE OF FREE RADICALS IN THE ACTIONS OF CALORIC RESTRICTION**

R. Weindruch, 1. *University of Wisconsin, Madison, Wisconsin*, 2. *VA GRECC, Madison, Wisconsin*

A complex literature spanning ~35 years describes the role that free radicals may play in the retardation of aging and diseases by caloric restriction (CR). This body of knowledge is based on diverse types of experimental outcomes such as measure of oxidative damage, oxidant production, mitochondrial function and free radical mediated signaling. As has recently occurred in the general field of "free radicals and aging", it has been proposed that CR's actions occur by way of hormesis involving an increase in free radical production and an activation of stress response pathways. Evidence from studies of rodent skeletal muscle do not support this idea. Another possibility to be discussed is that increases with aging in free radicals associated with systemic inflammation are opposed by CR and contribute importantly to its phenotype.

#### **DIMINISHED PROTEOLYSIS AND OXIDATIVE STRESS ADAPTATION IN AGING**

K.J. Davies, 1. *Davis School of Gerontology, University of Southern California, Los Angeles, California*, 2. *Division of Molecular & Computational Biology, Dornsife College of Letters, Arts, and Sciences, the University of Southern California, Los Angeles, California*

Proteins are major targets for oxidative damage, and both intracellular and extracellular accumulation of oxidized proteins occurs in many ageing and disease models. In young, healthy individuals, moderately oxidized, soluble cell proteins are selectively and rapidly degraded by the Proteasome in the cell cytoplasm, nucleus, and endoplasmic reticulum. Inside mitochondria, the Lon matrix proteinase selectively degrades oxidized soluble proteins. 20S Proteasome and Proteasome regulators Pa28 $\alpha\beta$  (or 11S), Pa28 $\gamma$ , and Pa200 all exhibit direct activation and increased synthesis during cellular adaptation to oxidative stress (hormesis), in a process controlled by the Nrf2 signal transduction pathway. Immunoproteasome and Lon are also synthesized. Blocking 20S Proteasome, Immunoproteasome, Proteasome regulators, or Lon induction with relevant siRNA's also limits the adaptive response. Aged or senescent cells exhibit compromised induction of Proteasome and Lon,

and diminished adaptive capacity. I suggest this supports the hypothesis that diminished cellular adaptive capacities play a role in aging processes.

#### **EFFECTS OF REDUCED SUPEROXIDE DETOXIFICATION IN SKELETAL MUSCLE AND NEURONAL TISSUE ON MECHANISMS UNDERLYING SARCOPENIA**

H. Van Remmen<sup>2,3,1</sup>, Y. Zhang<sup>3,1</sup>, Y. Shi<sup>3,1</sup>, L.M. Larkin<sup>5</sup>, A. McArdle<sup>4</sup>, M. Jackson<sup>4</sup>, A. Richardson<sup>3,1,2</sup>, S. Brooks<sup>5</sup>, 1. *UTHSCSA, San Antonio, Texas*, 2. *STVHCS, San Antonio, Texas*, 3. *Barshop Institute, San Antonio, Texas*, 4. *University of Liverpool, Liverpool, United Kingdom*, 5. *University of Michigan, Ann Arbor, Michigan*

We asked whether oxidative stress in muscle or neurons is the primary driving force for age-related muscle atrophy using mice lacking CuZnSOD, an important scavenger of superoxide anion, specifically in skeletal muscle or in neurons. Muscle specific deletion of CuZnSOD (mKO mice) results in essentially a complete deletion of CuZnSOD protein expression in skeletal muscle, but not in other tissues. Oxidative damage and mitochondrial production of hydrogen peroxide and ATP are not altered in skeletal muscle from mKO mice. Furthermore, the adult mKO mice have no muscle atrophy compared to approximately 20% atrophy in age matched CuZnSod1<sup>-/-</sup> mice, yet function is altered in mKO mice as indicated by a decrease in maximum isometric force and the time to run mice to exhaustion on treadmill. In contrast, neuronal loss of CuZnSOD results in muscle atrophy in young mice, supporting a primary role for motorneuron oxidative stress in skeletal muscle atrophy.

#### **SESSION 1530 (PAPER)**

#### **ALZHEIMER'S DISEASE AND NEURODEGENERATION**

#### **IMPACT OF ANGIOTENSIN RECEPTOR BLOCKERS ON ALZHEIMER'S DISEASE NEUROPATHOLOGY IN A LARGE BRAIN AUTOPSY SERIES**

I. Hajjar, L. Brown, W. Mack, H. Chui, *Univeristy of Southern California, Los Angeles, California*

Background: Emerging evidence suggests that angiotensin II is involved in amyloid metabolism in the brain and that angiotensin receptor blockers (ARB) are superior to other antihypertensive classes in preventing cognitive decline. We evaluated the impact of ARBs on the neuropathological findings in a large autopsy series from the National Alzheimer's Coordinating Center (NACC) database. Methods: The NACC aggregated uniformly-collected data from 29 Alzheimer's Disease Centers throughout the United States. Participants were self or provider-referred and included those with and without cognitive disorders. Our analysis sample included only hypertensive participants and excluded cognitively and neuro-pathologically normal participants (n=890, mean (range) age at death 81 (39-107) years, 43% women, 94% white). Neuropathological data included neuritic plaque and neurofibrillary tangle densities assessed by NIA-Reagan criteria and vascular injury markers. Multiple logistic regression was used to compare the pathological findings in subjects on ARBs to other antihypertensive treatment and to those who did not receive antihypertensive medications. Results: Participants who were exposed to ARBs, with or without AD, showed less amyloid deposition markers compared to those treated with other antihypertensives (lower CERAD OR=0.47, 95% confidence interval =0.27 to 0.81; ADRDA OR=0.43, CI=0.21 to 0.91; BRAAK & BRAAK OR=0.52, CI= 0.31 to 0.85; neuritic plaques OR=0.59, CI=0.37 to 0.96). They also had less AD-related pathology compared to untreated hypertensives. Participants receiving ARBs were more likely to have had a stroke and hence had more frequent pathological evidence of large vessel infarct and hemorrhage. Conclusion: In hypertensive individuals, treatment with ARBs is associated with

lower evidence of amyloid deposition and AD-related pathology on autopsy evaluations. Investigation for the possible role of ARBs in the treatment of AD is urgently needed.

#### **EFFECT OF FOXO1 POLYMORPHISM ON EFFICACY OF ACETYLCHOLINESTERASE INHIBITORS IN ALZHEIMER PATIENTS**

G. Paroni<sup>1</sup>, D. Seripa<sup>1</sup>, G. D'Onofrio<sup>1</sup>, F. Ciccone<sup>1</sup>, M. Urbano<sup>1</sup>, C. Gravina<sup>1</sup>, F. Panza<sup>1</sup>, A. Pilotto<sup>1,2</sup>, 1. *I.R.C.C.S. Casa Sollievo della Sofferenza, San Giovanni Rotondo, Italy*, 2. *Azienda ULSS 16 Padova, S. Antonio Hospital, Padova, Italy*

Oxidative stress have been suggested as an important determinant in the pathogenesis of many human diseases, including sporadic Alzheimer's disease (AD). Foxo1 protein, encoded by the forkhead box O1 (FOXO1) gene at locus 13q14.1 is one of the main proteins involved in defence against oxidative stress. In the present study we evaluated the influence of the FOXO1 SNP rs7981045 on the efficacy of acetylcholinesterase inhibitors (AChEIs) in patients with sporadic AD. A total of 74 hospitalized elderly (22 males and 54 females, mean age 78.71±7.18 years) with a clinical diagnosis of sporadic AD according to the NINCDS-ADRDA criteria were investigated in blinded fashion. Patients were treated with AChEIs for 6-months. Briefly, Donepezil (5mg/die) and Rivastigmine patch (4.6mg/die) for a month and a double dosage for the remaining 5 months. Cognitive and functional status were evaluated at baseline and after 6-months of treatment. Response to therapy was defined according to the NICE criteria. Compliance and drug-related adverse events were also evaluated. At 6-months follow-up, 31 patients (41.9%) were responders and 43 patients (58.1%) were non-responders to AChEIs treatment. A significantly higher frequency of patients with the G/G genotype of rs7981045 was found in non-responder than in responder patients (p=0.045). These results suggest that the SNP rs7981045 of FOXO1 gene may influence the clinical efficacy of AChEI in patients with sporadic AD. The analysis of FOXO1 genotypes may be useful in identifying subgroups of patients with AD with different clinical response to AChEI.

#### **ASSOCIATION STUDY BETWEEN INTERLEUKIN-8 GENE POLYMORPHISM AND LATE-ONSET ALZHEIMER'S DISEASE IN POPULATION IN XINJIANG PROVINCE**

F. He, *Geriatrics, Xinjiang uygur autonomous region people's hospital, Urumqi, China*

Objective Interleukin-8 gene polymorphism has been associated with respiratory syncytial virus and gastric cancer, including late-onset Alzheimer's disease (LOAD) in Caucasian. However, the association of IL-8 polymorphism and Alzheimer's in Chinese population has not been well established. To explore the relationship between Interleukin-8 gene polymorphism and late-onset Alzheimer's disease in Chinese population, we studied -251A/T, 781C/T and 1633 C/T polymorphism in IL-8 gene. Methods Polymorphism distribution of interleukin-8 gene -251A/T and 781C/T in 80 LOAD and 80 normal controls were detected by polymerase chain reaction-restriction fragment length polymorphism (PCR-RFLP) analysis. Directly using method of counting to calculate of alleles and gene frequencies type. Type of gene proceeded Hardy-Weinberg balance estimates, other statistical analysis completed with SPSS13.0 software, comparing to genotype frequencies and allele frequencies made use of the chi-square test. Results (1) For IL-8 gene-215 A/T, frequencies distribution of every genotype and allele both had significant difference (P = 0.035 for genotype, P = 0.010 for alleles) in LOAD group and normal controls. Frequencies of AT and AA type (50.0%, 16.3%) in LOAD group were high than those in the control group (40.0%, 7.5%), and frequencies of TT genotype (52.5%) in normal controls was high than in LOAD group (33.7%). In LOAD group A allele (41.2%) was dominant, and in control group T allele (72.5%) was dominant. In LOAD patients A alleles more significantly

increased than in the control group ( $P = 0.010$ ), so it may be a LOAD risk factor ( $OR = 1.851$ ). In LOAD patients and controls AA genotype had significant difference ( $P = 0.023$ ), so it may increase the risk of LOAD ( $OR = 3.370$ ). In LOAD patients frequencies of AT genotype was higher than one in the control group, the difference was not statistically significant ( $P > 0.05$ ). (2) In IL-8 gene 781 C/T, the difference of genotype frequencies and allele frequencies between LOAD group and normal controls were not statistically significant ( $P > 0.05$ ). (3) In IL-8 gene 1633 C/T, the difference of genotype frequencies and allele frequencies between LOAD group and normal controls were not statistically significant ( $P > 0.05$ ). Conclusion IL-8 gene (-251A/T) polymorphism has some relation with risk of LOAD, the polymorphism of 781C/T and 1633 C/T probably has no relation with risk of LOAD.

### IS ALZHEIMER DISEASE-LIKE CNS DEGENERATION UNIQUE TO HUMANS?

S.N. Austad<sup>1</sup>, C. Finch<sup>2</sup>, 1. *Cellular & Structural Biology, University of Texas Health Science Center San Antonio, San Antonio, Texas*, 2. *University of Southern California, Los Angeles, California*

Recent studies suggest that great apes have minimal brain atrophy during normal aging and no neurodegenerative changes that would qualify as the earliest stages of Alzheimer disease (AD). In contrast, brain atrophy is definitive in humans by age 40, followed by a near-universal progressive increase in neurons with neurofibrils. AD increases exponentially after age 60 and may afflict up to 50% by age 90. Curiously prosimians and monkeys show more substantial brain aging changes than the great apes, but no primate has shown the drastic level of neuron loss present in early stages of AD. This extreme heterogeneity in brain aging will be discussed in terms of primate genome evolution and life history, from prosimian ancestors which were likely to have had short life expectancies, but which share identical amyloid beta-peptide sequence with humans. We acknowledge NIH grants: SA, R24 RR023344; CEF< P01 AG-026572 (R Brinton, PI), R21 AG-040683, and R21 AG-040753.

### DYSFUNCTIONAL CORTICOSTRIATAL COMMUNICATION IN A TRANSGENIC MOUSE MODEL OF AGE-RELATED NEURODEGENERATION

S.L. Hong, S.J. Barton, G.V. Rebec, *Indiana University, Bloomington, Indiana*

A hallmark of both normal and pathological aging as well as neurodegeneration is an increase in random brain activity known as "neural noise," which leads to a contaminated and unpredictable brain signals. We tested the hypothesis that dysfunctional transmission of neural information is responsible for behavioral deficits prior to the onset of rapid neurodegeneration. We measured cortical and striatal local field potentials (LFPs) in actively behaving transgenic R6/2 mice, which model Huntington's disease (HD), an age-related neurodegenerative condition, and wildtype (WT) controls. Our data showed that HD resulted in increased striatal LFP signal unpredictability, which in turn resulted in predictable and repetitive patterns of behavior. Across both cortex and striatum, HD resulted in an increased presence of 25-40Hz oscillations when the animals were resting. HD also completely altered the direction of corticostriatal synchrony as behavior increased from rest to grooming to exploration. While the WT mice exhibited spreading of corticostriatal synchrony to higher frequency ranges from rest to exploration, corticostriatal synchrony in HD mice became restricted to the lower frequencies. Our findings are evidence that aberrant patterns of communication that precede rapid neuron loss and could be an important diagnostic marker of pathological brain states prior to neuron loss.

## SESSION 1535 (SYMPOSIUM)

### CREATIVE APPROACHES TO INTEGRATING IDIOGRAPHIC AND NOMOTHEIC METHODS TO STUDY THE LIVED LIFE

Chair: J. Lodi-Smith, *Canisius College, Buffalo, New York*

Co-Chair: S.K. Whitbourne, *University of Massachusetts Amherst, Amherst, Massachusetts*

Understanding the lived life is historically grounded in idiographic approaches within social-psychological gerontology. Classic studies of life course trajectories focused on individual adaptation in relation to social-personal influences. Currently, the field of gerontology builds our understanding of aging through advances in statistical and quantitative techniques. Our symposium explores the reciprocal relationship between the historical idiographic approach with modern quantitative methods to suggest innovative approaches to a variety of types of data ranging from individual life stories to self-report inventories. Lodi-Smith uses computer text analysis to examine the relationship of word use in self-defining memories to healthy aging in a life span sample. Bauer shows how older adults emphasize personal growth in their life stories, with implications for eudaimonia across the life course. Whitbourne illustrates methods of using life history data combined with narrative analysis to track longitudinal growth of personality from college to midlife. All speakers specifically address the central theme of integrating idiographic techniques with quantitative sophistication. Through this symposium, attendees will gain insight into and practical knowledge of creative methodologies to enhance their own programs of research. Secondly, this symposium hopes to catalyze a resurgence of engagement in a method that has provided some of the most lasting contributions to social-psychological gerontology.

### WORD USE IN SELF-DEFINING MEMORIES PREDICTS HEALTHY AGING

J. Lodi-Smith<sup>1</sup>, B.W. Roberts<sup>2</sup>, 1. *Psychology, Canisius College, Buffalo, New York*, 2. *University of Illinois, Urbana-Champaign, Champaign, Illinois*

Self-defining memories are vivid memories central to individual identity (Singer & Moffitt, 1991). The present research addresses how self-defining memories relate to healthy aging in a life span sample. The research analyzes word use patterns in self-defining memories of 140 healthy adults ages 21 – 85 ( $M = 49.49$ ,  $SD = 15.57$ ) using the Linguistic Inquiry and Word Count Program (Pennebaker, Francis, & Booth, 2001). The current study addressed how patterns of emotion words, cognitive words, and words associated with time related to healthy aging across both physical and psychosocial definitions of healthy aging. Results suggest that individuals who narrate self-defining memories using positive emotion words and less time-related words report healthier aging. The present study examines the extent to which these effects are moderated by age and sets the findings in a context of theoretical frameworks for healthy aging while providing an innovative approach to qualitative data on aging.

### COMBINING NARRATIVE ANALYSIS WITH MODELING OF LONGITUDINAL DATA: YIN AND YANG IN THE STUDY OF LIVES

S.K. Whitbourne, *Psychology, Univ. of Mass. Amherst, Amherst, Massachusetts*

Longitudinal researchers face a number of challenges in trying to capture the complexity of the life patterns they investigate. In the present paper, quantitative data from a 40-year (and counting) sequential study are integrated with life history information obtained from a sample of 180 adults ranging from college through late midlife. Adding to previous longitudinal analyses from the present sample will be new results from younger cohorts who were followed at a later time point

through early midlife. The presentation will focus on practical strategies that researchers can adapt to using qualitative data to inform their statistical analyses and vice versa. I will also present innovative ways to enhance life history data through creative use of internet resources that can put into social and historical perspective the non-normative events that influence the life course of the individual

### **GROWTH IS NOT JUST FOR THE YOUNG: NARRATIVES OF THE AGING, TRANSFORMATIVE SELF**

J. Bauer, *University of Dayton, Dayton, Ohio*

Narrative research contradicts a popular view of aging in psychology that says, "Growth is for the young; decline is for the old" (Bauer & Park, 2010). While declines are inevitable with age, older adults are at least as likely as younger adults to look to personal growth as a source of personal meaning when interpreting the past (e.g., Pasupathi & Mansour, 2006). Even when looking to the future, older adults' goals focus at least as much on growth and gain as on decline and loss (e.g., Ebner et al., 2006). A transformative self—i.e., a life story emphasizing growth-mindedness—has been shown to account for ties between age and well-being. At the heart of a transformative self lies a pattern of subjective interpretation: Whether narrating high or low points in life, does the person construe the event as a catalyst for growth or for merely joy or pain?

## **SESSION 1540 (SYMPOSIUM)**

### **ENABLE-AGE REVISITED – FINDINGS FROM TEN YEARS OF RESEARCH ON AGING IN PLACE**

Chair: *S. Iwarsson, Department of Health Sciences & Centre for Ageing and Supportive Environments (CASE), Lund University, Lund, Sweden*

Co-Chair: *F. Oswald, Interdisciplinary Ageing Research, Faculty of Educational Sciences, Goethe University Frankfurt, Frankfurt, Germany*

Discussant: *M. Cutchin, Division of Occupational Science and Occupational Therapy, University of North Carolina at Chapel Hill, Chapel Hill, North Carolina*

We previously presented findings on the role of home environments in advanced old age from the European ENABLE-AGE Project. Three of the four talks from this symposium present empirical findings from the longitudinal follow-up of those surviving ten years after inclusion. Data were drawn from three national sub-samples that initially included 1,150 single-living and community-dwelling individuals 75-89 years-old, in urban regions in Sweden, Latvia and Germany. Preserving a core of identical variables in all three sub-samples over time, participants have been followed-up somewhat differently, applying qualitative in-depth interviews and observations as well as quantitative assessments during home visits. In this symposium, we will emphasize processes of aging in place and related outcomes with regard to aspects of health and competence loss in the sample from Latvia (Tomson et al.) and the struggle between staying put versus relocating in the German and Swedish sub-samples (Himmelsbach et al.). We will also present findings on the differentiated role of depression and affective aggravation, studied in the German participants as they are now approaching the end of life (Schilling et al.). In Sweden, a younger cohort was recently assessed with the quantitative ENABLE-AGE core methodology. As a first contribution from this new study, descriptive findings on their housing situation and accessibility problems will be presented (Haak et al.). The multi-dimensional findings from four different but related studies will be discussed, which will further our knowledge about multiple linkages between home and health along the process of aging and towards the end of life.

### **ASPECTS OF HOME AND HEALTH OVER A NINE-YEAR PERIOD AMONG VERY OLD PEOPLE IN LATVIA**

S. Tomson<sup>1,2</sup>, V. Horstmann<sup>2</sup>, C. Löfqvist<sup>2</sup>, M. Haak<sup>2</sup>, S. Iwarsson<sup>2</sup>, *1. Riga Stradins University, Riga, Latvia, 2. Lund University, Lund, Sweden*

The aim is to present the nine year follow-up results from the first longitudinal study on home and health among single-living very old people in Latvia. Data derived from the comprehensive interdisciplinary ENABLE-AGE Survey Study, which was designed to investigate how the home environment affects health trajectories along the process of aging. At baseline, 303 community-living people 75-85 years-old participated in Latvia. Nine years later, 59 were possible to follow-up. Interviews were conducted during home visits and contained questions and observations on person and environment. The findings highlight changes in home and health aspects along the later stages of the process of aging. Preliminary results show that life satisfaction and perceived health increased and symptoms of depression decreased during the study period. Participants perceived themselves as more dependent in daily activities compared to nine years earlier, and meaning of home changed to some extent in the Latvian context. Objective 1: After attending this activity, participants will have knowledge on changes of aspects of home and health among very old people in Latvia along the process of aging.

### **AGING IN PLACE VERSUS MOVING AT THE END OF LIFE – A QUALITATIVE STUDY AMONG MOVERS AND NON-MOVERS**

I. Himmelsbach<sup>1</sup>, M. Granbom<sup>2</sup>, M. Haak<sup>2</sup>, S. Iwarsson<sup>2</sup>, C. Löfqvist<sup>2</sup>, F. Oswald<sup>1</sup>, *1. Interdisciplinary Ageing Research, Goethe University Frankfurt, Frankfurt, Germany, 2. Department of Health Sciences & Centre for Ageing and Supportive Environments (CASE), Lund University, Lund, Sweden*

Introduction: Relocation studies often deal with decision-making and reasons to move in old age. Little is known, however, about individual changes of attitudes over time, which reflect the struggle for (re-)gaining normalcy at the end-of-life, either when staying put or after moving. Aim: To empirically reconstruct the struggle for normalcy and stability over time among movers and non-movers. Method: Data stem from 80 in-depth interviews from the Swedish and German sub-sample of the European ENABLE-AGE project, 80-89 years-old at baseline. Sixteen were visited twice, at baseline and nine year follow-up; 25% were movers. Results: Patterns of dealing with issues of maintaining or regaining normalcy and of change over time due to personal and ecological circumstances are depicted. Differences and similarities between movers and non-movers are shown. Conclusion: Qualitative follow-up data may enrich theoretical discussions on the impact of aging in place and relocation at the end of life.

### **TRAJECTORIES OF DEPRESSIVE SYMPTOMS AND AFFECT BALANCE IN LATE LIFE: ONE OUT OF THREE AT RISK?**

O.K. Schilling, H. Wahl, O. Reidick, *Department of Psychological Ageing Research, University of Heidelberg, Heidelberg, Germany*

Very old age goes with risks which may promote depressive mood and imbalance of positive versus negative affect. Such affective aggravation may not harm all but unfold among subgroups of maladapted very old individuals, generating a heterogeneity of "late-life-typical" trajectories. We analyzed a sample of German long-term survivors from the ENABLE-AGE Project, followed-up within the LateLine Project (N=113, born 1911-1921, measured 2002, 2003, 2009, 2010, 2011). Latent class growth models were used to detect prototypical trajectories in depressive symptoms and affect balance, and examine relationships with physical risk factors. The trajectories found indicate a substantial risk group developing depression (30-40%), besides groups with constant depression rates (>50% non-depressed; <10% highly depressive). Global health indicators and functional status predict affective aggravation, but do not account uniquely for risk group membership.

In conclusion, a large group of very old is under risk of affective aggravation, prompted by factors yet to be researched.

## EXTENSION OF ENABLE-AGE RESEARCH QUESTIONS AND METHODOLOGY TO A YOUNGER COHORT IN SWEDEN

M. Haak, C. Löfqvist, H. Ekström, S. Elmståhl, S. Iwarsson, *Health Sciences, Lund University, Sweden*

Knowledge about the physical environment aspects in the home for people in the third age is scarce. Thus, the aim is to present the most common environmental barriers and investigate the nature of accessibility problems among Swedish people, age 67-70. A sub-sample (n=371) of the population based longitudinal SNAC-GÅS study (N=2,931) is used. Following the ENABLE-AGE methodology, data related to home and health were collected through structured interviews and observations. Out of 161 assessed environmental barriers, the results show that environmental barriers were common (n=69), more prevalent in one-family than in multi-dwelling households and more often present indoors than outdoors/entrances. The 20 most common environmental barriers (e.g. different types of controls) were found in 46% of all dwellings investigated. After juxtaposing the prevalence of barriers with the functional profiles of the participants, accessibility problems were more prevalent in multi-dwelling households than in one-family houses.

## SESSION 1545 (SYMPOSIUM)

### FALLS AND FEAR OF FALLING: NEW FINDINGS ON DETERMINANTS AND CONSEQUENCES

Chair: *G. Zijlstra, Maastricht University, CAPHRI - Dept. of Health Services Research, Maastricht, Netherlands*

Discussant: *G.I. Kempen, Maastricht University, CAPHRI - Dept. of Health Services Research, Maastricht, Netherlands*

Falls and fear of falling are common in older populations. Falls are a determinant of fear of falling and vice versa. The prevalence of falls and fear of falling increases with factors such as age and frailty. Additionally falls and fear of falling can lead to reduced quality of life, reduced social and physical functioning and to increased costs in health care. In view of the increase in life expectancy and the commonness of (co)morbidity and frailty in older people, it is likely that falls and fear of falling and their consequences will be even more prevalent in the near future. This merits the development and implementation of (cost) effective programs. These programs obviously need to correspond to people's physical and cognitive abilities and thus different programs may be needed for different populations, e.g. in community or geriatric rehabilitation settings. During this symposium four researchers from the US, Germany and Switzerland will present new data on determinants of falls and fear of falling in different older populations. The presentations will focus on: 1) risk factors for falling among people with multiple sclerosis, 2) the relationship between nocturnal activity, urge incontinence and fear of falling in community-dwelling older people, 3) the role of fear of falling in functional recovery among hip fracture patients, and 4) the relationship between fear of and foot clearance in older people. Our discussant from the Netherlands will reflect on the presentations in view of GSA's theme 'Charting New Frontiers in Aging' and will facilitate a discussion on-site.

### RISK FACTORS FOR FALLING AMONG PEOPLE WITH MS: PHYSICAL AND PSYCHOLOGICAL VARIABLES NEED ATTENTION

E.W. Peterson<sup>1</sup>, U. Einarsson<sup>2</sup>, L. Widén Holmqvist<sup>2</sup>, C. Ytterberg<sup>2</sup>, *1. Univ of Illinois at Chicago, Chicago, Illinois, 2. Karolinska Institutet, Huddinge, Sweden*

Introduction: Falls among people with multiple sclerosis are common and often injurious. Research examining the unique fall risk fac-

tors for people with multiple sclerosis is in its infancy. Aim: To identify factors associated with increased likelihood of reporting a recent fall among people with multiple sclerosis. Methods: We conducted a cross-sectional study involving 164 people with multiple sclerosis aged 19-79. Data obtained in the context of a Stockholm population-based, cross-sectional study was utilized. A logistic regression model examined factors associated with reporting a fall in the past three months. Results: Of participants, 38% reported at least one fall in the past three months. Reduced walking speed, impaired balance, and weak sense of coherence were significantly associated with a recent fall. Conclusion: Findings suggest walking speed, balance and sense of coherence are important to address in clinical work intended to reduce fall risk among people with multiple sclerosis.

### MODIFIABLE FACTORS ARE ASSOCIATED WITH FEAR OF FALLING IN COMMUNITY DWELLING ELDERLY – THE ACTIFE ULM STUDY

M.D. Denkinger<sup>1</sup>, K. Rapp<sup>2</sup>, J. Klenk<sup>2</sup>, T. Nikolaus<sup>1</sup>, A. Lukas<sup>1</sup>, *1. Agaplesion Bethesda Hospital, Ulm, Germany, 2. Institute of Epidemiology and Medical Biometry, Ulm University, Germany*

Background: Modifiable risk factors (RF) for fear of falling (FOF) are needed. We studied urge incontinence (UI), bowel incontinence (BI), overactive bladder (OAB), walking activity (WA) and nocturnal activity (NA). Methods: ActiFE Ulm is a population-based observational study in 1506 community dwelling elderly (age 65-90). The Short FESI (dichotomized into fear versus no or little fear) was used as the outcome. Multiple logistic regression analyses were performed and controlled for age, sex and known RF. Activity was measured using accelerometers (ActivePAL) for one week (day and night). Above mentioned RF were entered separately. Results: OAB (OR 2.55, CI95% 1.16-5.59) and WA (activity per day in minutes; OR 0.990, CI95% 0.981-0.999) were associated with FOF. UI, BI and NA were not associated. Discussion: OAB and decreased daily walking activity were significantly associated with FOF.

### FEAR OF FALLING AND REHABILITATION OUTCOMES IN OLDER ADULTS RECOVERING FROM HIP FRACTURE

J. Wetherell<sup>1,2</sup>, A. Petkus<sup>3</sup>, E.J. Lenze<sup>4</sup>, *1. VA San Diego Healthcare System, San Diego, California, 2. University of California, San Diego, La Jolla, California, 3. SDSU/UCSD Joint Doctoral Program in Clinical Psychology, San Diego, California, 4. Washington University, St. Louis, Missouri*

We examined whether fear of falling predicted functional capacity and need for a higher level of care in a sample of 235 adults over age 60 who were undergoing inpatient rehabilitation following a hip fracture. We controlled for physical function 4 weeks after the fracture, other medical illness, depressive symptoms, and age. Fear of falling at week 4 predicted poorer physical function at week 12 (p<.05) and decline in physical function from prefracture levels to week 12 (p=.002), and week 26 (p=.02). Fear of falling at week 12 predicted needing a higher level of care at week 26 (p=.05). Overall, these results suggest that fear of falling is an independent predictor of poor physical function, functional decline, and need for a higher level of care in older adults recovering from hip fracture, even after controlling for other health and mental health variables.

### THE RELATIONSHIP BETWEEN FEAR OF FALLING AND FOOT CLEARANCE IN OLDER PEOPLE

S. Rochat<sup>1</sup>, B. Mariani<sup>4</sup>, C. Lenoble-Hoskovec<sup>1</sup>, F. Botrugno<sup>2</sup>, C. Piot-Ziegler<sup>3</sup>, K. Aminian<sup>4</sup>, B. Santos-Eggimann<sup>2</sup>, C. Bula<sup>1</sup>, *1. CHUV, Lausanne, Switzerland, 2. IUMSP, Lausanne, Switzerland, 3. UNIL, Lausanne, Switzerland, 4. EPFL, Lausanne, Switzerland*

Introduction : Fear of falling (FOF) is associated with falls and modifications in gait parameters. Foot clearance during walking is directly linked to tripping and falling. The relationship between FOF and foot

clearance has never been evaluated. Methods : Participants (N=568, aged 66 to 71 years, 57.2% women) underwent gait parameters measurements using footworn sensors. Specific foot clearance parameters evaluated included maximal and minimal heel and toe clearances and their variability. FOF was assessed using a single question. Results : Overall, 27.4% of the participants reported FOF. Compared to the others, participants with FOF had decreased maximal heel (28.9 vs 30.4 cm,  $p<.001$ ) and toe clearance (12.5 vs 13.8 cm,  $p<.001$ ), and decreased minimal toe clearance variability (SD 3.7 vs 4.0 cm,  $p<.001$ ). Conclusion : These preliminary results suggest a relationship between FOF and foot clearance parameters. Multivariate analyses are underway.

## SESSION 1550 (SYMPOSIUM)

### INNOVATIVE APPROACHES TO THE SYNTHESIS OF KNOWLEDGE IN GERONTOLOGY: INTEGRATIVE DATA ANALYSIS

Chair: *A.L. Gross, Institute for Aging Research, Harvard Medical School, Boston, Massachusetts*

Co-Chair: *Q. Xue, Center on Aging and Health, Johns Hopkins University, Baltimore, Maryland*

Discussant: *A.M. Piccinin, Department of Psychology, University of Victoria, Victoria, British Columbia, Canada*

A key challenge for gerontologic research is the synthesis of knowledge from multiple sources of information. Integrative data analysis (IDA) is the analysis of multiple observational datasets that have been pooled into a single dataset to address substantive research hypotheses. The presentations in this symposium describe and illustrate innovative applications of IDA in several aging-related areas of scientific inquiry and highlight the advantages and pitfalls of combining different datasets. The first presentation by VanNess focuses on hypothesis generation as an aspect of research design. This topic is especially important for IDA given its synthetic aspirations and wide range of questions. The presentation will highlight the role of statistics in hypothesis generation and provide examples relevant to gerontologists. Kern and colleagues integrated two studies to illustrate the potential for using archival longitudinal data to test complex lifespan theories of personality and health, while noting some limitations and issues they encountered. Gross and Jones combined neuropsychological data from 7 studies using a composite measure of cognition. The result is a standardized, adaptable tool that can provide a platform for harmonizing studies of cognitive aging. Using a bricolage approach to hypothesis generation, the study highlights heterogeneity in cognition in patients with Alzheimer's disease depending on diagnostic criteria used. Finally, Kennison and colleagues examined effects of physical and cognitive activity on measures of cognitive performance in data from four longitudinal studies. Among the multiple relationships detected, cognitive activity most consistently predicted semantic knowledge, while physical activity most consistently predicted fluency/speed and reasoning.

### HYPOTHESIS GENERATION: WHAT IT IS, HOW IT'S DONE, AND THE ROLE STATISTICS CAN PLAY

P.H. Van Ness, *Yale School of Medicine, New Haven, Connecticut*

The formulation of a scientific hypothesis is an important part of the design of a gerontologic research study and a crucial prerequisite for a successful grant application. It is especially important, and challenging, that a hypothesis be well formulated when study results are being synthesized in meta-analyses or integrative data analyses. In this symposium contribution practical insights about the process of hypothesis generation will be provided by describing the key properties of scientific hypotheses, i.e., that they be unambiguous, testable, consequential, and novel, and the major means by which they are generated, i.e., by mentoring, literature review, first-hand experience, bricolage, and by exploratory data analysis. Two models for the role that statistics can play in hypothesis generation will be described and illustrated:

Peirce's abduction model and Tukey's detection model. Very different examples from gerontologic research, involving small pilot samples and integrative data analyses, will be used to illustrate key points.

### USING INTEGRATIVE DATA ANALYSIS TO TEST COMPLEX LIFESPAN PERSONALITY AND HEALTH MODELS

M.L. Kern<sup>1</sup>, H.S. Friedman<sup>2</sup>, S.E. Hampson<sup>3</sup>, L.R. Goldberg<sup>3</sup>, *1. University of Pennsylvania, Philadelphia, Pennsylvania, 2. University of California, Riverside, Riverside, California, 3. Oregon Research Institute, Eugene, Oregon*

Personality predicts healthy aging, but pathways remain uncertain. Theoretical models with multifaceted explanatory processes have been developed, but lifespan models are difficult to test. Drawing on existing longitudinal studies and integrative techniques allows comprehensive analysis of lifespan personality-health mechanisms. Using data from the Terman Life Cycle Study (begun 1921, lifelong follow-up) and the Hawaii Personality and Health Study (begun 1959, data collection ongoing), we demonstrate integrative analyses studying long-term personality-health processes. Personality, health, and behavioral variables were aligned, data were combined, and structural models demonstrated acceptable fit. We then employed the parallel personality factors to predict outcomes unique to each sample. Conscientiousness predicted physiological regulation in the Hawaii study and longevity in the Terman study, but effects were attenuated by behaviors, supporting a combined behavioral-physiological pathway. We highlight the potential for integrating other longitudinal studies to analyze healthy aging theories, while noting limitations and issues to consider.

### INTEGRATIVE DATA ANALYSIS OF COGNITIVE FUNCTION IN OLDER ADULTS: IMPLICATIONS FOR DEMENTIA CRITERIA

A.L. Gross, R.N. Jones, *Harvard Medical School, Boston, Massachusetts*

Previous research has demonstrated severe lack of agreement among diagnostic criteria for Alzheimer's disease (AD). Disagreement leads to different prevalence estimates, but no study has objectively quantified differences in cognitive function using a common metric across datasets. The present integrative data analysis used item response theory to link general cognitive performance (GCP) from neuropsychological batteries administered in several diverse cognitive aging studies. The GCP was scaled to be representative of the US population over 70 using sampling weights from the Aging, Demographics, and Memory Study (ADAMS) study (n=308), which used DSM-IV criteria for AD. Mean cognitive function among patients with AD in ADAMS was 0.9 standard deviations (SD) below that of patients with AD in a sample (n=193) using McKhann (1984) criteria and 1.2SD below that of another sample using the same criteria (n=136). These findings affirm previously reported differences in prevalence estimates and suggest heterogeneity in the AD phenotype.

### BETWEEN AND WITHIN PERSON EFFECTS OF PHYSICAL AND COGNITIVE ACTIVITY ON COGNITION IN FOUR STUDIES

R. Kennison<sup>1</sup>, M. Lindwall<sup>2</sup>, M. Mitchell<sup>3</sup>, C. Cimino<sup>4</sup>, A. Benitez<sup>5</sup>, C. Brown<sup>7</sup>, L. Gibbons<sup>6</sup>, *1. California State University, Los Angeles, California, 2. Halmstad University, Halmstad, Sweden, 3. Harvard Medical School, Boston, Massachusetts, 4. University of South Florida, Tampa, Florida, 5. Medical University of South Carolina, Charleston, South Carolina, 6. University of Washington, Seattle, Washington, 7. University of Victoria, Victoria, British Columbia, Canada*

In a combined effort of the IALSA network (PI: Hofer/Piccinin) and Advanced Psychometric Methods Workshop (PI: Mungas), the effects of cognitive and physical activity and change in these activities on four

measures of cognition were studied in data sets from Long Beach, OCTO-Twin, Seattle, and Victoria Longitudinal Studies. Mixed models with fixed and time varying covariates were fit separately to each data set, cognitive outcome, and activity type. Baseline cognitive activity consistently predicted semantic knowledge, but also predicted fluency/speed, reasoning and memory, in descending order of consistency. Cognitive activity change consistently predicted semantic knowledge, but also predicted memory, fluency/speed, and reasoning. Baseline physical activity most consistently predicted change in fluency/speed, followed by reasoning, memory and semantic knowledge. Physical activity change most consistently predicted change in reasoning, followed by fluency/speed, memory, and semantic knowledge. Benefits of physical and cognitive activity for cognition and the advantages of coordinated analysis will be discussed.

## **SESSION 1555 (SYMPOSIUM)**

### **INTERDISCIPLINARY AND INTERNATIONAL APPROACHES TO NARRATIVE GERONTOLOGY: EXPANDING THE DISCOURSE ON AGING AND OLDER ADULTS**

Chair: *P. Clark, Gerontology, University of Rhode Island, Kingston, Rhode Island*

Discussant: *B. de Vries, San Francisco State University, San Francisco, California*

Narrative methods enhance our understanding of the aging experience and improve care and services to older adults. Biographical approaches exploring the personal, professional, and policy-related dimensions of aging have been developed, and their foundations in different disciplinary and national settings have been established. This symposium uses narrative methods provided by different disciplines, professions, cultures, and countries to expand the interdisciplinary and international discourse on aging. The first paper presents research on terminally ill residents in Norwegian care institutions, and suggests that the concept of narrative identity be used to understand the process and significance of storytelling as a reaffirmation of the individual in confronting death. The second paper examines narrative structures guiding autobiographies of caregivers of family members with Alzheimer's, especially pertaining to changes in identity, roles, and self-perception. Implications for understanding and constructing meaning in the caregiving experience are explored. Next, narrative frameworks—including stories, substories, and counterstories—in Norwegian governmental White Papers on geriatric care are analyzed. Conclusions for understanding the role of culture in framing public policy problems and formulating their solutions are summarized. The final paper in this symposium explores how professional self- and patient narratives affect patterns of collaboration and communication in teamwork practice settings, with implications for interprofessional education of health and social care providers in improving geriatric care. Overall, suggestions regarding the use of narrative methods to expand the interdisciplinary and international discourse on older adults are highlighted, and recommendations offered for new directions in narrative analyses involving aging in different contexts.

### **WHAT IS IMPORTANT TO TELL WHEN YOU KNOW THAT YOU ARE GOING TO DIE? NARRATIVE IDENTITY IN THE STORIES OF TERMINALLY ILL PATIENTS IN NORWEGIAN CARE INSTITUTIONS**

*O. Synnes, Betanien Diaconal University College, Bergen, Norway*

Narrative identity underpins the importance of stories as a way of grasping and understanding human life. A central notion is how stories can incorporate unexpected events into the ongoing story, a salient aspect in research on "illness narratives," in which stories are seen as a way of reinterpreting the new situation in a life confronting discontinuity. However, much of this research is primarily focused on the interpreta-

tion of illness. In this reported study on storytelling among terminally ill, this was only one of several topics, and for some the illness was not even thematized. To understand the narrative identity in these stories we must include other versions of reconfiguration. Additionally, just as vital as the contents are the act and process of storytelling as a reaffirmation of the narrator. The stories examined in this research relate not so much to concerns about aging as those experiences in confronting death.

### **"GOOD DAYS AND BAD DAYS": PUBLISHED CAREGIVER NARRATIVES AND THE STORY OF ALZHEIMER'S**

*S. Chivers, Trent University, Peterborough, Ontario, Canada*

This paper draws on published autobiographies by caregivers of family members with Alzheimer's. The goal is to examine how narrative structures guiding autobiography mesh and clash with narrative structures related to Alzheimer's, especially pertaining to identity, which Oliver Sacks (among others) claims consists of both narrative and memory. Much published work on Alzheimer's narratives focuses, understandably, on a loss of self—for the person with Alzheimer's and for his/her caregivers. A set of autobiographical accounts by family members and friends of people with Alzheimer's about the processes they go through when they decide to take on the role and identity of caregiver is chosen for this analysis. The purpose of this discussion is to focus on the gains in self-perception that accrue from the actions and decisions related to caring for someone. Implications for understanding the meaning of caregiving experience, and how meaning may be constructed, will be explored.

### **UNDERSTANDING PUBLIC POLICY IN NORWAY: A NARRATIVE ANALYSIS OF GOVERNMENTAL WHITE PAPERS**

*F.F. Jacobsen, Bergen University College, Bergen, Norway*

How the general public in Norway conceives being an older adult and the meaning of chronological age has changed over the last few decades. As narratives of aging may be identified in the Norwegian mass media and in the population at large, dominant narratives may also be identified in policy documents as well, such as governmental White Papers. This paper develops a narrative analytical framework based on stories, substories, and counterstories; and argues that such narratives are characterized as much by what is left unsaid as by what is said, and as much by choice of words and word combinations as by explicit messages. Culture strongly influences what will be and ought to be regarding aging and geriatric care in Norway as expressed in the White Papers. Three recent governmental White Papers dealing with professional geriatric care will serve as material for a narrative analysis with these points in mind.

### **PROFESSIONAL NARRATIVES AND INTERPROFESSIONAL EDUCATION: IMPLICATIONS OF UNDERSTANDING PROFESSIONAL BIOGRAPHIES FOR COLLABORATIVE PRACTICE WITH OLDER ADULTS**

*P. Clark, Gerontology, University of Rhode Island, Kingston, Rhode Island*

Recent workforce development reports and recommendations in geriatrics and gerontology have emphasized the importance of educating different health and social care professionals to work together on interdisciplinary teams. Effective education of practitioners and students for teamwork requires recognizing the different values and biographies of each profession. These include both self-narratives—the representation of the individual as a professional—and patient narratives—how the professional constructs the "story" of the patient and his or her problem. Different health and social care professionals develop a unique identity based on these two types of narratives. This paper (1) reviews the developmental process through which each geriatrics profession acquires its self-narrative, and (2) explores how the patient narrative

affects relationships with older adults. In particular, how self- and patient narratives influence interprofessional education and practice will be highlighted, and implications for training professionals to work together to provide improved geriatric care will be summarized.

## SESSION 1560 (SYMPOSIUM)

### MEASURING THE PREVALENCE OF ELDER ABUSE AND NEGLECT: USING THE NUMBERS TO EFFECT CHANGE

Chair: *G.M. Gutman, Simon Fraser University, Vancouver, British Columbia, Canada*

Discussant: *G. Anetzberger, Cleveland State University, Cleveland, Ohio*

In gaining policy attention, numbers are important. Resources are allocated on the basis of a disease, disability or social problem affecting a sizable segment of the population. Over the past 30 years, a small number of national studies of elder mistreatment have been conducted. While they suggest that the prevalence of elder abuse may parallel that of Alzheimer's disease or exceed it, key problems exist in comparing findings across studies. These include using different: inclusion criteria, sampling methods, abuse categories, definitions, and data collection methods. Questions also arise about the appropriateness of comparing across countries with very different social and political systems and income status. In this symposium R. Acierno and M. Hernandez-Tejeda will reflect on the methodology, findings and impact to date on policy and programs of the 2010 US National Elder Mistreatment Study. L. McDonald and S. Hirst will describe instrument development and validation in preparation for a Canadian national study of community and institutional abuse. G. Anetzberger, President of the National Committee for Prevention of Elder Abuse (NCPEA) and G. Gutman, President of the International Network for Prevention of Elder Abuse (INPEA), the two organizations sponsoring this symposium, will discuss North American prevalence and incidence studies from the perspective of the NGO community in the US, Canada and internationally and how, jointly with the national and international gerontological research community, the data can be used to move from awareness-raising to action.

### ELDER MISTREATMENT: NOW WHAT?

R. Acierno, M.A. Hernandez-Tejada, *psychiatry, medical university of south carolina, Charleston, South Carolina*

The US-based National Elder Mistreatment Study of over 5,500 individuals aged 60 and above will soon be followed by its counterpart in Canada. The US study gave us the first large scale epidemiological basis from which to estimate prevalence of elder mistreatment in community residing older adults in terms of physical, sexual, emotional abuse, and neglect. Fully 10% reported experiencing one of these forms of mistreatment since age 60. But now that we know a little about prevalence, what does it mean in terms of outcome and intervention? That is, what are the health and mental health effects of community-based elder mistreatment, and what are appropriate community-based responses to both the abuse and its effects. The National Elder Mistreatment Study gives us an indication of where to look and what to look for in terms of targets for preventive intervention. It also directs us to the next steps.

### MEASURING ELDER ABUSE AND NEGLECT IN THE INSTITUTION

L. McDonald<sup>1</sup>, S. Hirst<sup>2</sup>, *1. Institute for Life Course and Aging, University of Toronto, Toronto, Ontario, Canada, 2. Faculty of Nursing, University of Calgary, Calgary, Ontario, Canada*

This paper reports on a pilot project from a larger research program that examined the validity of a measurement tool developed for a national prevalence study in the community and institutions in Canada. The measurement instrument was drafted in a series of steps that included a review of the literature, a consensus panel to develop definitions, focus groups, cognitive interviews, dyadic interviews, and, finally large-scale pretest-

ing. The community survey was administered over the telephone (N=267); the institutional survey was conducted in person (N=40). The construct validity of the measurement instrument for the institutionalized older adults, whose abuse status was known prior to the interviews, was analyzed using a known groups approach to validity. The results provide evidence of the construct validity of the institutional survey.

## SESSION 1565 (SYMPOSIUM)

### MENTAL HEALTH DISPARITIES RESEARCH USING SECONDARY DATA SETS

Chair: *G. Kim, The University of Alabama, Tuscaloosa, Alabama*

Discussant: *K.E. Whitfield, Duke University, Durham, North Carolina*

As our nation becomes more racially and ethnically diverse, understanding mental health needs of diverse elderly groups becomes more important. The purpose of this symposium is to discuss current issues of racial and ethnic disparities in mental health and mental health care among older adults using existing secondary data sets. Given that there are more than sixty secondary data sets that are publicly available for aging research, it would be helpful to discuss different topics for mental health disparities research we can consider with those existing secondary data sets. Secondary data sets that the panel will discuss in individual presentations include (a) the Collaborative Psychiatric Epidemiology Surveys (CPES), (b) the California Health Interview Survey (CHIS), (c) the Health, Aging, Body Composition (Health ABC) Study; and (d) the Caring for Adults Recovering from Stroke (CARES). Many of these have been funded by National Institutes of Health. Using these secondary data sets, racial and ethnic minority elderly groups that will be discussed in this symposium are non-Hispanic Whites, African Americans/Blacks, Latinos/Hispanics, and Asians. Experts in the field will discuss various topics relating to aging and mental health disparities such as measurement issues of mental health screening tools, geographic correlates of racial disparities, and the effect of low literacy on racial differences in depression.

### LOW HEALTH LITERACY AND BLACK-WHITE DIFFERENCES IN DEPRESSION ONSET: FINDINGS FROM THE HEALTH, AGING, AND BODY COMPOSITION STUDY

L. Barry<sup>1</sup>, R. Thorpe<sup>2</sup>, K. Yaffe<sup>3</sup>, B. Penninx<sup>4</sup>, H.N. Ayanayon<sup>3</sup>, S. Satterfield<sup>5</sup>, A.B. Newman<sup>6</sup>, E.M. Simonsick<sup>7</sup>, *1. UConn Center on Aging, Farmington, Connecticut, 2. Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, 3. University of California San Francisco School of Medicine, San Francisco, California, 4. VU University Medical Center, Amsterdam, Netherlands, 5. University of Tennessee Health Science Center, Memphis, Tennessee, 6. University of Pittsburgh School of Medicine, Pittsburgh, Pennsylvania, 7. National Institute on Aging, Bethesda, Maryland*

We evaluated the association between low health literacy and Black-White differences in depression onset among 3,075 older persons with up to eight clinic visits over 11 years in the Health, Aging, and Body Composition study. Low health literacy, per REALM, was reading level below 9th grade. In multivariable analysis controlling for age, sex, perceived income inadequacy, CHD, stroke, and diabetes, 42% of blacks and 36% of whites had depression onset (OR=1.25; 95%CI 1.09, 1.43), yet the association became non-significant after controlling for low health literacy. In adjusted sex-stratified analyses, race was only significant among men (OR Blacks versus Whites=1.58; 95%CI 1.29, 1.93). Low health literacy was associated with higher likelihood of depression regardless of sex and attenuated the association between race and depression in men (OR=1.34; 95%CI 1.08, 1.66). Low literacy influences susceptibility to depression in men and women and partially explains higher risk of depression in black men.

## **GEOGRAPHIC VARIATION OF RACIAL DISPARITIES IN MENTAL HEALTH SERVICE USE AMONG OLDER ADULTS: RESULTS FROM THE COLLABORATIVE PSYCHIATRIC EPIDEMIOLOGY SURVEYS**

G. Kim<sup>1</sup>, J. Parton<sup>1</sup>, J. DeCoster<sup>2</sup>, A.N. Bryant<sup>1</sup>, K.L. Ford<sup>1</sup>, P.A. Parmelee<sup>1</sup>,  
1. *The University of Alabama, Tuscaloosa, Alabama*, 2. *University of Virginia, Charlottesville, Virginia*

Given the lack of research on the role of geography in mental health care, this study examined whether racial differences in mental health service use varied across geographic regions among Black and White elders. Drawn from the Collaborative Psychiatric Epidemiology Surveys, Blacks (n=1,008) and Whites (n=1,870) aged 60 and older were selected for analysis. Logistic regression analyses and geographic information systems (GIS) were employed. After controlling for covariates, no significant racial differences in mental health service use were found in the overall sample, but racial differences in mental health service use varied significantly by region. Black elders in the South were less likely than Whites to use mental health services. No significant racial differences were observed in Northeast, West, or Midwest. The findings suggest that to reduce disparities at the national level, improving the access to mental health care in certain areas, the South in particular, may be essential.

## **ASIAN-AMERICAN OLDER ADULTS AT RISK FOR POOR MENTAL HEALTH**

D. Sorokin<sup>1</sup>, H. Nguyen<sup>2</sup>, S. Mavandadi<sup>3</sup>, 1. *University of California, Irvine, Irvine, California*, 2. *University of California, Los Angeles, Los Angeles, California*, 3. *University of Pennsylvania, Philadelphia, Pennsylvania*

Asian-American older adults likely have unmet mental health needs due, in part, to poor access to mental health services. This study examined reasons that older adults from diverse racial/ethnic backgrounds both sought help for mental health concerns, as well as no longer received treatment, highlighting the unique experience of Asian/PI older adults. Data came from the 2007 and 2009 California Health Interview Survey, a cross-sectional, population-based sample of Californian adults (N=40,000). The findings suggested that Asian/PI older adults were less likely to receive treatment for a mental health problem compared to other racial/ethnic groups (p<0.001). They reported not seeking help because they felt uncomfortable talking with a health professional (52%) or were concerned about someone finding out (58%). Furthermore, Asian/PI respondents were less likely to complete the recommended course of treatment compared to other racial/ethnic groups (p<0.001). Analyses examining the role of language proficiency and insurance status will be presented.

## **RACE, STROKE, AND THE CES-D: CARING FOR ADULTS RECOVERING FROM THE EFFECTS OF STROKE (CARES) STUDY**

M.M. Perkins<sup>1</sup>, O.J. Clay<sup>1</sup>, W.E. Haley<sup>2</sup>, V.G. Wadley<sup>1</sup>, J.S. Grant<sup>1</sup>, L. Pulley<sup>4</sup>, D.L. Roth<sup>3</sup>, 1. *University of Alabama at Birmingham, Birmingham, Alabama*, 2. *University of South Florida, Tampa, Florida*, 3. *Johns Hopkins University, Baltimore, Maryland*, 4. *University of Arkansas for Medical Sciences, Little Rock, Arkansas*

Racial differences in depression have been studied among family caregivers and stroke survivors, but methodological issues remain in their interpretation. Instruments such as the Center for Epidemiological Studies Depression (CES-D) scale can be administered either in person or over the telephone, and the method of delivery may influence how participants respond. The CARES project consists of an epidemiologically drawn sample of stroke survivors and their family caregivers. A total of 302 participants (mean age stroke survivors = 74.18, mean age caregivers = 62.36, 43.4% African American) completed the CES-D during a baseline telephone interview and a subsequent in-home visit conducted 13.1 weeks later, on average. There were no significant racial

differences in depressive symptoms for stroke survivors or their family caregivers from either assessment mode, but significantly more depressive symptoms were reported during the in-home visit for both racial groups (ps < 0.05). Implications for future research will be discussed.

## **SESSION 1570 (SYMPOSIUM)**

### **OVERCOMING QUALITATIVE METHODS CHALLENGES WITH MINORITY OLDER MEN: IMPLICATIONS FOR GERONTOLOGICAL RESEARCH AND PRACTICE**

Chair: *T.M. Maschi, Graduate School of Social Service, Fordham University, New York, New Jersey*

Co-Chair: *I.V. Carrion, University of South Florida, Tampa, Florida*

Discussant: *T.M. Maschi, Graduate School of Social Service, Fordham University, New York, New Jersey*

This symposium presents new findings and practical information using qualitative methods with minority older men's experiences of cumulative risk-resilience from qualitative research experts. This includes qualitative research challenges on recruiting and engaging older Latino men with cancer in a community based qualitative study, conducting qualitative research on stress and coping with ethnically diverse older minority men in prison, and a case study engaging a Latino immigrant man in conversation about colorectal cancer, and a photovoice study with African American men with extended hotel stays. Practical information on overcoming methods challenges and infusing aging and qualitative methods with older minority men are delineated. Additionally, understanding the common obstacles can provide valuable information to the research-practice community. The panelists also delineate how these major findings and practical lessons can be infused in gerontological research and educational curriculum.

### **CONDUCTING QUALITATIVE RESEARCH ON STRESS AND COPING WITH ETHNICALLY DIVERSE OLDER MINORITY MEN IN PRISON**

*T.M. Maschi, M.E. Morrissey, Graduate School of Social Service, Fordham University, New York, New Jersey*

This presentation is on new research on older male minority prisoners (aged 55+) on stress and coping in prison. The study used a mixed methods design and a sample of New Jersey older prisoners (N=672) of which 220 provided qualitative responses. Qualitative data was gathered using an anonymous mailed questionnaire consisting of open ended questions about stress and coping in prison. Qualitative data was analyzed using a grounded theory approach (Strauss&Corbin, 1998). Preliminary results revealed that older male prisoners reported prison stress related to oppressive/abusive environment, unfair treatment from staff and younger prisoners, family separation, and situations of uncertainty, such as fear of death and reentry. Older male prisoners also reported coping resources that involved exercise, reading, and the arts. Methodological challenges overcome include using mixed methods to understand sensitive topics, such as trauma, maximizing response rate using mail methods, reaching Spanish-speaking persons, and qualitative data management for large samples.

### **CONDUCTING A QUALITATIVE STUDY WITH OLDER LATINO MEN WITH CANCER**

*I.V. Carrion<sup>1</sup>, F. Nedjat-Haiem<sup>2</sup>, 1. University of South Florida, Tampa, Florida, 2. VA Greater Los Angeles Healthcare System, Los Angeles, California*

Addressing the psycho-social, oncology needs of older foreign born (FB) Latino men diagnosed with cancer, residing in Central Florida, is essential given the increased population and the urgency to provide effective cancer care. This study explored treatment decisions of 15 (FB) Latino men from Cuba, Mexico, Colombia and Venezuela diagnosed

with cancer within the past five years. Data were collected using in-depth interviews, tape-recorded, transcribed in Spanish and translated into English. The median age of the participants was 55.4 years. Salient themes were derived using a grounded theoretical approach and constant comparison method. The findings support the role of culture and gender in guiding treatment decisions, changing family roles, declined health, unknown expectations of health providers and (ACP) advance care planning. Methodological challenges that were effectively confronted included recruiting (FB) Latino men undergoing role changes, declining health, and fears associated with sudden diagnosis.

#### **A PHOTOVOICE STUDY ON HEALTH OUTCOMES OF OLDER MEN IN EXTENDED STAY HOTELS**

T. Lewinson, *School of Social Work, Georgia State University, Atlanta, Georgia*

Extended stay hotels are housing solutions for some older adults on the fringe of street homelessness. Recent research indicates negative health outcomes for homeless older adults residing in hotel accommodations (Hwang, Wilkins, Tjepkema, O'Campo, & Dunn, 2009). The current study focused on health challenges for older men residing in hotels. Specifically, (1) older men's perceptions of the hotel as a suitable place to reside, (2) reported health challenges as a result of person-environment interactions, and (3) positive residential and community coping strategies that improve health outcomes. This two-phased qualitative study used in-depth interviews (15 men) and Photovoice (5 men) to explore health management in extended-stay hotels. Common residential stressors and coping strategies for improving health outcomes will be discussed along with challenges associated with recruiting participants and using phase 1 data in phase 2.

#### **A CASE STUDY: AN OLDER LATINO IMMIGRANT'S EXPERIENCE WITH COLORECTAL CANCER**

F. Nedjat-Haiem, *University of Southern California, Pacific Palisades, California*

Limited research explores the impact of cancer on the lives of Latino, immigrant men. This research utilized an ethnographic, single case study design to explore how one Latino man from El Salvador experienced being diagnosed and treated for colorectal cancer. This research followed the structure of Lincoln and Guba's (1985) case study to identify how cancer becomes problematic, the context within which problems emerge, related issues, and lessons learned. Data were collected using two in-depth interviews, tape-recorded and transcribed for analysis purposes. Thematic analysis was used to piece together identified patterns in the data and to form a comprehensive picture of the colorectal cancer experience. Findings identified the most difficult parts of the cancer diagnosis and treatment which include being misinformed about the extent of surgery, complications with the side-effects of treatment, worry about finances, and concern for family. Methods for conducting a rigorous case-study will be discussed.

### **SESSION 1575 (SYMPOSIUM)**

#### **POLICY AND ENVIRONMENTAL CHANGE TO SUPPORT OPTIMAL AGING: EXEMPLAR INITIATIVES IN PUBLIC HEALTH**

Chair: *S.M. Albert, Behavioral & Community Health Sciences, University of Pittsburgh, Pittsburgh, Pennsylvania*

Co-Chair: *B. Belza, University of Washington, Seattle, Washington*

Discussant: *L. Anderson, CDC, Atlanta, Georgia*

Health promotion interventions typically focus on changing individual behavior. Yet an increasing body of research suggests that factors outside the individual, in particular policies and environments that support unhealthy behaviors or make it difficult for people to reduce health risks, create barriers to healthy aging. Recognizing the critical role of policy (laws, regulations, and rules) and environment (economic,

social, or physical contexts) in healthy aging, the CDC Healthy Aging Research Network (HAN) has focused on the design, implementation, and evaluation of environmental and policy changes that promote healthy aging. Several CDC-HAN projects have focused attention on environmental changes and policies that support mobility, physical activity, cognitive health, and prevention of depression. In this symposium, CDC-HAN investigators will report on exemplars highlighting policy and environmental change at the local and state level. Presentations will examine successes in this area as well as challenges anticipated over the next decade. Research geared to policy and environmental change in the areas of medication management and mobility will be discussed, as well as the central role of community and state coalitions in promoting environment and policy change to support optimal aging.

#### **CDC HEALTHY AGING RESEARCH NETWORKS' APPROACH TO POLICY AND ENVIRONMENTAL CHANGE**

B. Belza<sup>1</sup>, R.H. Hunter<sup>2</sup>, *1. University of Washington, Seattle, Washington, 2. University of North Carolina, Chapel Hill, North Carolina*

There is growing evidence that environmental and policy change (EPC) is needed to support healthy aging and prevent and/or delay disease and disability. This session focuses on the outcomes and lessons learned from a series of national EPC initiatives developed and disseminated by the Centers for Disease Control and Prevention (CDC) Healthy Aging Research Network (HAN). We provide examples that highlight the importance of: 1) using a variety of dissemination channels, 2) building partnerships and cross-sector collaboration, and 3) incorporating research into one's efforts so to foster environmental and policy systems change for healthy aging. Our initiatives include the development of: an environmental audit tool, conference series, clearinghouse, action briefs, online conferences, and scholarly publications. Resources and strategies will be discussed to enable attendees to create environmental and policy change in their own spheres of influence.

#### **SUSTAINABLE MEDICATION REVIEW IN LOW-INCOME SENIOR HOUSING**

S.M. Albert, Y. Agimi, K.S. Pater, *Behavioral & Community Health Sciences, University of Pittsburgh, Pittsburgh, Pennsylvania*

In an effort to change the environment of medication use among residents of low-income senior housing, we developed a partnership between a school of pharmacy, a school of public health, and a county housing authority. Advanced pharmacy students, supervised by a clinical pharmacist, conducted medication reviews as part of their experiential learning requirement. In 2009-2011, 151 people aged 50+, from 15 different sites, completed medication reviews conducted by 70 pharmacy students. Suboptimal prescribing was common, including medications that increase the risk of falls in 33.7%, contraindicated medications in 20.5%, likely drug-drug interactions in 8.6%, and medication side effects in 15.9%. 22.5% of participants who made use of the review by taking it to their physician were admitted to the hospital in the 6 months after the review, compared to 35.3% of those who did not use the review. Medication review may reduce inappropriate prescribing and lower the risk of hospitalization.

#### **CREATING WALKABLE NEIGHBORHOODS FOR SENIORS**

S.P. Hooker, *Exercise and Wellness, Arizona State University, Phoenix, Arizona*

Ageing in place arises from an ecological perspective of aging assuming interplay between individual functional capacity, adaptation, and one's physical and social environment. This is linked to related concepts of urban design, accessibility, and walkable communities. This session will describe proven strategies that can be used by state- and community-level organizations to create walkable neighborhoods for seniors (WN4S). Case studies from relevant projects (Oakland, CA; Sacramento, CA; San Diego, CA) will be used to present a variety of

achievements, challenges, and lessons learned that can be applied to similar WN4S efforts to improve the physical and social environment to increase physical activity and maintain health and independence of older adults. Translation of science to practice is vital for success of these types of projects. Thus, current findings from scientific research will also be presented to guide the refinement of future endeavors by agencies, organizations, practitioners, and advocates to create WN4S.

#### **ROLE OF STATE AND COMMUNITY COALITIONS IN PROMOTING POLICY AND ENVIRONMENTAL CHANGE**

R.H. Hunter<sup>1,2</sup>, M. Altpeter<sup>1</sup>, E. Schneider<sup>1</sup>, 1. *UNC Institute on Aging, Chapel Hill, North Carolina*, 2. *UNC Center for Health Promotion and Disease Prevention, Chapel Hill, North Carolina*

Effective environmental and policy change to support healthy aging is facilitated by engagement of people from diverse sectors, including public health, planning, government, healthcare, recreation, business, engineering, architecture, and universal design, as well as older adult advocates. State, regional and community coalitions are practical ways to bring together people from diverse backgrounds and settings, and they can be highly instrumental in promoting policy and environmental change. This presentation will highlight exemplars from the work of the North Carolina Healthy Aging Research Network - a CDC-Healthy Aging Research Network member center - to build capacity and generate environmental and policy change. We will share roles, strategies and lessons learned from the NC Healthy Aging Coalition, NC Mental Health and Aging Coalition, NC Falls Prevention Coalition (state, regional and local affiliates) and a campus-community coalition for older pedestrian safety and walkability. Participants will have an opportunity to consider back-home coalition development.

#### **DISCUSSANT**

L. Anderson, *CDC, Atlanta, Georgia*

Perspectives on translating research into practice.

### **SESSION 1580 (SYMPOSIUM)**

#### **SUCCESSFUL AGING: PATTERNS OF HEALTH AND PERSONAL RESOURCES**

Chair: *A.M. Sherman, Oregon State University, Corvallis, Oregon*

Discussant: *J. Smith, The University of Michigan, Ann Arbor, Michigan*

Successful aging requires compensation strategies, management of symptoms, and maintenance of psychological well-being. Older adults engage personal resources to manage the challenges of aging, including their social context, health behaviors, and personality dimensions. This symposium presents four papers illuminating important aspects of successful aging. First, Choun et al. explore the role of personality in how older adults meet daily health goals over 100 days. These data show that individuals high in neuroticism experienced less progress with their health goals, while those high in conscientiousness experienced greater progress with their health goals. Further, high conscientiousness and increased positive affect were related to higher goal progress. Newton and Stewart discuss regrets for women at late-mid life, showing that regret is not related to life events alone, but involves patterns of individual differences in expressions of regrets experienced over the course of 20 years. Sherman discusses the joint contribution of personality and social relations in adaptation to Osteoarthritis. She reports that psychological well-being is associated with positive social relations and optimism while pain is associated with social strain only. Finally, Versey and Newton report on race-moderated mediation of the relationship between generativity and successful aging. Specifically, they found that generativity was associated with successful aging for the sample, but this relationship was mediated by religious/spiritual importance for White women, and paid work for African American women. Strengths of the papers together include both longitudinal and cross-sectional data,

multiple data collection methods, multiple outcomes assessing both physical and psychological health and diverse participants.

#### **DYNAMIC LINKAGES OF PERSONALITY AND HEALTH**

S. Choun<sup>1</sup>, S. Mejia<sup>1</sup>, K. Hooker<sup>1</sup>, T. Pham<sup>2</sup>, R. Metoyer<sup>2</sup>, 1. *Human Development and Family Sciences, Oregon State University, Corvallis, Oregon*, 2. *School of Electrical Engineering and Computer Sciences, Oregon State University, Corvallis, Oregon*

We examined short-term intraindividual variability and interindividual differences in the dynamic linkages of personality and health by examining how daily health-goal progress is associated with daily positive and negative affect as well as whether these associations can be explained by neuroticism and conscientiousness. The analyses utilized data from the Personal Understanding of Life and Social Experiences (PULSE) Project, a 100 day internet-based, microlongitudinal daily study. Multilevel models revealed that within-person variations in daily positive affect positively covaried with daily health-goal progress, and daily negative affect negatively covaried with daily health-goal progress (travel together over time). Individuals high in neuroticism experienced lower levels of progress with their health goals and those high in conscientiousness experienced higher levels of progress with their health goals. High conscientiousness with increased positive affect was significantly related to higher health goal progress. High conscientiousness marginally attenuated the link between daily negative affect and daily health-goal progress.

#### **“REGRETS? I’VE HAD A FEW”: A LONGITUDINAL STUDY OF REGRET PATTERNS IN LATE MIDLIFE**

N. Newton<sup>1</sup>, A. Stewart<sup>2</sup>, 1. *Youngstown State University, Youngstown, Ohio*, 2. *University of Michigan, Ann Arbor, Michigan*

Considerable research concerning regret has focused on its content and relationship to well-being. Additionally, cross-sectional studies have examined women’s regrets at different ages. However, few researchers have examined the link between regret and personality or taken a longitudinal view of regret. The current research uses a qualitative, longitudinal approach to examine the relationship between how individuals deal with life events and their experience of regret, and whether individuals alter the way they express their regrets over time. Using open-ended data spanning twenty years from 27 late midlife women of the Radcliffe Class of 1964 (mean age = 62), this study identifies four patterns of regret: continuous regret, never regret, increased regret, and decreased regret. Rather than solely relating to life events at various stages, these regret patterns reflect personality traits associated with responses to the events themselves, such as resilience or a lack of adaptation.

#### **CONTRIBUTION OF PERSONALITY AND SOCIAL RELATIONS TO WELL-BEING FOR OLDER ADULTS WITH OSTEOARTHRITIS**

A.M. Sherman, *Oregon State University, Corvallis, Oregon*

Successful aging in the context of chronic illness requires management of symptoms and maintenance of psychological well-being. Older adults draw on internal resources such as personality, and on external resources, such as the social context. Although several literatures have addressed the importance of social resources and personality dimensions individually, rarely have both internal and external resources been considered together. Older adults (N=160) with Osteoarthritis were assessed regarding pain symptoms and psychological well-being (CES-D and Self-Esteem). Social support and strain were used as external resources and optimism and pessimism as internal resources to explain variance in outcomes. Results of hierarchical regression analyses showed that both internal and external resources were significantly related to psychological well-being ( $R^2 = .49, .33$ ). However, only social strain was significantly associated with pain ( $R^2 = .47$ ). Discussion highlights

the importance of assessing both internal and external resources in models explaining successful adaptation to chronic illness.

### **GENERATIVITY, PRODUCTIVE ACTIVITIES AND SUCCESSFUL AGING IN MIDDLE-AGED AFRICAN AMERICAN AND WHITE WOMEN**

H. Versey<sup>1</sup>, N. Newton<sup>2</sup>, *1. Haverford College, Haverford, Pennsylvania, 2. Youngstown State University, Poland, Ohio*

Aging successfully can be approached in many ways; researchers continue to suggest further elements of, and expansions to, Rowe and Kahn's (1987; 1997) model. The current study also aims to expand the concept of successful aging, but at the same time situates the concept within the framework of midlife, and examines its relationship to generativity (Erikson, 1974). Furthermore, this research identifies productive activities (e.g., paid work, sports) and spiritual importance as mediators of the generativity/successful aging relationship and how these differ in a sample of 244 middle-aged African American and White women (mean age = 61). Results indicate that, whereas generativity and successful aging are related for both African American and White women, mediators of the relationship differ by race. This research highlights the importance of examining different pathways between giving back to the next generation and aging successfully.

## **SESSION 1585 (PAPER)**

### **DISCOVERY EXCHANGE: END-OF-LIFE ADJUSTMENT AND CARE**

#### **DEPRESSION AND WIDOWHOOD: NEW LIGHT ON GENDER DIFFERENCES, SELECTION, AND ADAPTATION**

I. Sasson, D. Umberson, *University of Texas at Austin, Austin, Texas*

Previous research has been inconclusive with respect to gender differences in depression following widowhood. Using nationally representative longitudinal data of older adults, followed over 16 years, the authors examine short and long term effects of widowhood on depression. This study design is superior to cross-sectional designs by facilitating a comparison of depression levels pre- and post-widowhood, thus controlling for individuals' baseline depressive symptoms. Consistent with previous findings, results show that regardless of widowhood women exhibit higher levels of depression on average compared to men, and that both men and women experience more depressive symptoms following a spouse's death. However, no gender differences are found in the amount of change in depressive symptoms associated with bereavement. Furthermore, men and women appear, on average, to regain baseline levels of depression within three years of the event. Results also indicate that depressive symptoms are higher for the surviving spouse when death is unexpected, and that early widowhood may be associated with longer term consequences compared to late widowhood. While establishing that men and women exhibit similar patterns of depression with bereavement, the authors point out that selection into widowhood is highly associated with race and gender. In the sample studied women were three times more likely than men to become widowed and black women more than twice as likely as white women to experience early widowhood. This suggests that although the adverse effects of widowhood on depression may be similar across race and gender groups, exposure to such effects is highly differential.

#### **WIDOWHOOD IN OLD AGE: VIEWED IN A FAMILY CONTEXT**

M.S. Moss, S. Moss, *Arcadia University, Glenside, Pennsylvania*

We have been afforded a rare opportunity to examine widowhood in a family context, in a study of family bereavement that includes interviews with 24 widows (mean age 80) as well as separate interviews with one or two of their adult children. The husband/father had died within the previous 6 months to about a year. Two lengthy qualitative

interviews with each widow explored the ways that she described her experience of the loss as she interfaced with her children. Five themes emerged from qualitative analyses: (1) a greater emphasis on the meaning of her personal loss of her husband than on the meaning for her children of the death of their father; (2) the importance of maintaining a sense of independence and not being a burden on the children; (3) a reticence to share feelings of sadness and loneliness with the children; her emotional upset is often expressed in privacy. (4) a recognition that generational and life situations of the children thwart their ability to understand the depth of the meaning of her loss; and (5) a strong appreciation for her children's concern about her wellbeing and about her future. Overall, there is an underlying pervasive sense of protection of one's self and one's children. These themes are explored in the light of the dual process model of coping with bereavement. The meaning of widowhood in a family context is thus enriched. (Funded by NIA R01AG031806)

#### **ASSESSING OVERCOMING AND PARTICIPATORY ORIENTATIONS TO DEATH AND DYING IN ADULTHOOD**

B. Hayslip, E. Petty, D. Caballero, *Psychology, University of North Texas, Denton, Texas*

Kastenbaum and Aisenberg (1976) suggested that persons can cope with the impact of death and dying by altering their understanding of what each means to them as well as by changing their behavioral responses to such experiences. The present study's purpose was to develop a reliable and valid scale for assessing an individual's particular death perspective based on Kastenbaum and Aisenberg's (1976) distinctions between overcomers and participators. The Death Perspective Scale (DPS) developed here assessed the extent to which individuals utilize either an overcoming or participating approach to: 1) assigning meaning to dying and death, and 2) behaviorally responding to death-related experiences. Based upon data collected from 168 adults varying by age and gender, findings suggested that both overcoming and participating could be reliably assessed, correlated with measures of death anxiety and orientation toward death, and varied reliably ( $p < .05$ ) by age and gender, though such relationships were contrary to predictions by Kastenbaum and Aisenberg. Findings suggested that overcomers reported less fear of death and dying and were more accepting in this respect, while participators reported greater death-related fears and were less accepting. Women and older adults were more overcoming, while men and younger adults were more participatory, though such effects varied depending upon whether meaning versus response to death was considered. The discrepancy between the present findings and the predictions of Kastenbaum and Aisenberg may lie in better understanding how our death system has shifted over time and the degree to which this system has become culturally embedded.

#### **EXPLORING THE RELATIONSHIP BETWEEN QOL TRAJECTORIES AND DEATH FOR ADVANCED-STAGE CANCER PATIENTS**

G. Kyriotakis<sup>1,2</sup>, J.H. Rose<sup>2</sup>, *1. Geriatric Research Education and Clinical Center (GRECC), Louis Stokes VAMC, Cleveland, Ohio, 2. Case Western Reserve University, Cleveland, Ohio*

Patients diagnosed with advanced stage cancer confront complex and unique challenges that threaten their physical, psychosocial and spiritual integrity. Despite recent interventions to improve well-being, little is known about the relationship between quality of life and death. In this study we applied a joint modeling framework to analyze longitudinal data on quality of life (FACT-G), and time to event on patients with advanced stage cancer in order to describe the interrelationship between quality of life and death. 576 at baseline were analyzed from two hospitals in Cleveland Ohio, who have data until death or for up to two years after a diagnosis of advanced stage cancer. The joint distribution of quality of life and time-to-death is modeled through a set of random effects that account for the association between levels of qual-

ity of life and death. We also performed a subgroup analysis to evaluate the association between quality of life and time to death between a middle-aged (MA) and a young-old (YO) group. The results indicate that: 1) there is a negative and significant relationship between level of quality of life and probability of death; 2) overall, there are not significant long-term differences in quality of life between MA and YO. However, differences exist at the early stages of treatment; 3) the probability of dying is higher for the YO throughout the 24 months of study; 4) the association between quality of life and probability of death is different between MA and YO. The implications for interventions are discussed.

#### **TERMINALLY ILL BLACK ELDERS: MAKING THE CHOICE TO RECEIVE HOSPICE CARE**

H. Noh, *University of Wisconsin-Madison, Madison, Wisconsin*

The racial and ethnic inequality in receiving hospice care has been witnessed for decades in the United States. Researchers have explored the barriers to minorities' accessing hospice care and their end-of-life healthcare preferences. Though knowledge from previous studies provides insight into why minority elders might not choose to use hospice care even when they have access to it, currently there appears to be no research that has explored why some minority elders do choose to receive such care. This study seeks to address this gap by interviewing terminally ill older minority hospice patients and gathering information regarding the following three research questions: why do terminally ill minority elders choose to use hospice care?; what structural barriers do they face when accessing hospice care, and how have they overcome them?; and what cultural preferences do they have in receiving hospice care and what is their experience in having their preferences respected? To gain such information, face-to-face interviews were conducted using a semi-structured survey with 31 older minority hospice patients in Georgia, the vast majority of whom were black. Participants' responses were analyzed using the content analysis. Themes that emerged include the importance of open communication between healthcare providers and patients, the sources of correct/incorrect information, family support/non-support in choosing to use hospice care, the role of spirituality/religiosity in making the choice, and important values in receiving hospice care. The findings of this study will provide end-of-life care providers with insights for strategies to promote the hospice use by minority communities.

#### **END-OF-LIFE CARE PREFERENCES AMONG OLDER COMMUNITY-DWELLING SINGAPOREANS: A CONJOINT ANALYSIS**

C. Malhotra, M.A. Farooqui, A. Chan, E. Finkelstein, *Duke-NUS Graduate Medical School, Singapore, Singapore*

Understanding end-of-life (EOL) care preferences is important for policymakers and EOL service providers. The objective of this paper was to quantify the EOL care preferences among community-dwelling Singaporeans aged 50+ using a stated preference conjoint survey. The survey was administered to a national sample of 1500 older adults who completed a short survey and then were asked to choose between two hypothetical EOL care scenarios as a result of advanced cancer. The scenarios were described through 7 attributes with between 2 and 4 levels for each: severity of pain, amount of care required from family-members or friends, expected length of survival, quality of health care experience, expected cost of treatment from diagnosis to death, source of payment, and place of death. Ten hypothetical scenarios were presented to each respondent. A Hierarchical bayes procedure was used to estimate partworths for each attribute level and overall attribute importances. Results showed that treatment cost was the dominant attribute, followed by source of payment. Respondents showed a strong preference toward spending money from their own health savings account and were most averse to using a family member's savings. Respondents also reported a high willingness to pay to avoid severe pain or poor quality

care, but were less sensitive to other levels of these attributes. Home deaths were preferred to institutional deaths. Choices were little influenced by amount of care required from family-members or friends. These findings have implications for health insurance design, quality standards for EOL care, pain management, and other EOL care policies in Singapore.

### **SESSION 1590 (PAPER)**

#### **NURSING HOMES**

##### **HANDWASHING IN NURSING HOMES**

N. Castle<sup>1</sup>, L. Wagner<sup>2</sup>, *1. University of Pittsburgh, Pittsburgh, Pennsylvania, 2. New York University, New York, New York*

Use of hand hygiene practices are regarded as an important approach for effective infection control. Despite the importance of hand hygiene practices, challenges such as adherence rates for using appropriate practices exist across many healthcare providers. In this research, information from nurse aides describing their opinions of hand hygiene practices in nursing homes including perceived barriers to hand hygiene are presented. The information comes from a questionnaire consisting of 57 items. Items included in the questionnaire were developed from a review of the literature (including WHO and CDC guidelines), interviews with Directors of Nursing, and interviews with nurse aides. The items were grouped into similar areas representing compliance, facility guidelines and protocols, training, hand washing facilities and materials, and hand washing barriers. The study presented has information from 4,211 nurse aides (response rate of 56%) working in a nationally representative sample of 767 nursing homes (participation rate = 51%). Overall, it was found that 57.4% of nurse aides sometimes comply with hand washing when caring for residents, while 21.7% always comply. With facilities, 43.3% sometimes check that hand washing is performed. New nurse aides undergo adequate hand washing training 29.9% of the time. In summary, self-reported compliance was poor; and, facilities and materials were often lacking. These findings are useful in identifying issues and interventions to address hand hygiene practices.

##### **AMBIENT INTERVENTION FOR MEALTIME SOUND ABATEMENT FEASIBILITY STUDY**

L.L. Joosse, K. o'Regan, *University of Wisconsin-Milwaukee, Milwaukee, Wisconsin*

Background: Despite advances in dementia care, people living in nursing homes are often exposed to non-therapeutic levels of sound, resulting in increased challenging behavioral symptoms. Purpose: The primary aim of this feasibility study was to examine if sound levels and duration of exposure to sound during the meal experience could be reduced with the Ambient Intervention for Mealtime (AIM) sound abatement protocol. Methods: The intervention protocol was implemented in two urban nursing homes and included: a) an environmental assessment, b) collection of baseline sound levels and sources of sound data, c) recommendations for sound abatement strategies were presented to site administration, d) staff training, and e) facility tailored sound abatement strategies and techniques were implemented. Sound levels and sources of sound were collected in 10 minute periods, during the three daily meals, twice weekly for one month pre and post intervention. Results: Pre and post intervention sound data were analyzed using Wilcoxon Rank Sums. Sound level means were statistically significantly decreased during the meal periods (Breakfast  $p=.02$ ; Lunch  $p=.007$ ; Supper  $p=.03$ ). Discussion: Antecedents to predictable rapid rises in sound levels were identified. Individually tailored nursing unit sound abatement intervention was effective in reducing sound. This study demonstrates that sound levels and resident exposure to unwarranted sound can be reduced with a tailored interventional approach. Further studies are needed to confirm these results in additional nursing homes. Similarly, additional research is needed to examine the relationship

between reduced sound stimuli and resident challenging behavioral implications.

### ASSOCIATION BETWEEN TRADITIONAL NURSING HOME QUALITY MEASURES AND TWO SOURCES OF NURSING HOME COMPLAINTS

J. Troyer, W. Sause, *Economics, UNC Charlotte, Charlotte, North Carolina*

**Objective.** To test for an association between traditional nursing home quality measures and two sources of consumer nursing home complaints. **Data Sources.** Nursing home complaints to the North Carolina Long-Term Care Ombudsman Program and state certification agency from October 2002 through September 2006 were matched with Online Survey Certification and Reporting data and Minimum Data Set (MDS) Quality Indicators. **Study Design.** We examine the association between the number of complaints filed against a facility and measures of inspection deficiencies, staffing levels, and MDS Quality Indicators. **Data Extraction.** One observation per facility per quarter is constructed by matching quarterly data on complaints to OSCAR data from the same or most recent prior quarter and to MDS Quality Indicators from the same quarter. One observation per inspection is obtained by matching OSCAR data to complaint totals from both the same and immediate prior quarter. **Principal Findings.** There is little relationship between MDS Quality Indicators and complaints. Ombudsman complaints and deficiencies are generally unrelated, but there is positive relationship between state certification agency complaints and deficiencies. **Conclusions.** Ombudsman and state certification agency complaint data are consumer-directed quality measures that are distinctive from traditional quality measures.

### MEALTIME EXPERIENCES ACROSS A CONTINUUM OF CULTURE CHANGE ENVIRONMENTS

S.L. Molony<sup>1</sup>, C. Monturo<sup>2</sup>, R.P. Lopez<sup>3</sup>, *1. Connecticut Community Care Inc., Bristol, Connecticut, 2. West Chester University of Pennsylvania, West Chester, Pennsylvania, 3. School of Nursing, MGH Institute of Health Professions, Boston, Massachusetts*

**Background:** Food is deeply and inherently meaningful (Monturo, 2004) and breaking bread, or sharing a meal, is one of the most pervasive and meaningful rituals of daily life (Lopez & Amella, 2010). Dining environments and practices have been associated with improved quality of life in cognitively impaired and cognitively intact nursing home residents (Carrier, West, & Ouellet, 2007). Despite the recognition of the importance of milieu to nutritional outcomes and the overwhelming emphasis on culture change in the nursing home, there has been no systematic comparison of the dining milieu in nursing homes along the culture change continuum. **Purpose:** This study provides a rich description and comparisons of mealtime experiences across a range of organizational cultures including traditional, culture change and small house model nursing homes. **Design:** This descriptive, observational study was conducted in six nursing homes in three New England states stratified by position on the culture change continuum. Data were obtained by direct observation, semi-structured interviews with key personnel, and analysis of publicly available material. Administrators' perceptions of nursing home culture and direct care staff members' beliefs about the mealtime experience provided an "insider" view to balance field observations of three or more meals in each environment. **Observations** including food preparation, delivery, service, and consumption. **Results:** Our findings demonstrate the diversity of mealtime environments and experiences across the culture change continuum and identify key elements of a positive dining milieu. We also discuss the congruence between administrator, staff, and researcher perceptions related to everyday mealtime practice.

### CASE REVIEW - AN OPPORTUNITY TO SOLVE CARE PROBLEMS OF RESIDENTS WITH DEMENTIA LIVING IN A NURSING HOME

M. Roes, *Institute for Quality and Case Management (IQC), University of Applied Sciences Bremen, Bremen, Germany*

According to Yin (2009) a case study design should have five components: the research question(s), its propositions, its unit(s) of analysis, a determination of how the data are linked to the propositions, and criteria to interpret the findings. This study used standard techniques for posing research questions and defining the unit of analysis. The study design was focused on exploration and description. The unit of analysis was the nursing process and its integration of a multiprofessional guideline about mobility and safety of residents with dementia. **Findings:** Nurses could easily provide 'thick descriptions about their residents'; Nurses could - without checking the documentation system - and with the support of the whole team - draw a flow chart to analyse the process which lead to the care problems (like falling or wrong medication etc.); but struggled to structure these stories using the nursing process. Interesting was, that the addition of the criteria from the guideline did not confuse the discussion, but helped to clarify the different steps. **Conclusion:** All steps together supported the development of their reflection and the implementation of a reflective practice. The presentation will provide some examples of the successfully implemented case review.

## SESSION 1595 (PAPER)

### PHYSICAL ACTIVITY AND ENVIRONMENT

#### GAIT SPEED AMONG OLDER PARTICIPANTS ENROLLED IN AN EVIDENCE-BASED FALL RISK REDUCTION PROGRAM: A SUBGROUP ANALYSIS

J. Cho<sup>1,2</sup>, M.L. Smith<sup>3,2</sup>, S. Ahr<sup>4,2</sup>, C. Quinn<sup>2</sup>, A. Wilson<sup>2</sup>, M.G. Ory<sup>2</sup>, *1. Scott & White Healthcare, Temple, Texas, 2. Texas A&M Health Science Center, College Station, Texas, 3. The University of Georgia, Athens, Georgia, 4. The University of Memphis, Memphis, Tennessee*

**Background.** Functional performance is a primary risk factor for institutionalization and mortality among older adults. While community-based fall risk reduction programs are becoming widely disseminated, less is known about their impact on gait speed, a key indicator of functional performance. This study examined changes in a standardized functional assessment test, Timed Up and Go (TUG), among participants enrolled in A Matter of Balance/Volunteer Lay Leader model (AMOB/VLL), an evidence-based fall risk reduction program. **Methods.** This study included 71 AMOB/VLL participants enrolled in the Brazos Valley and South Plain regions of Texas. Gait speed was examined at baseline and again eight weeks post-intervention. Paired t-tests were employed to assess program effects on gait speed at baseline and at eight-weeks later for all participants and by subgroup (age, sex, living status, delivery sites, and self-rated health). A Bonferroni correction was applied to compensate for potential error associated with performing multiple t-tests; *p*-values less than 0.0042 (i.e., 0.05/12 comparisons) were statistically significant. **Results.** Overall, gait speed of enrolled participants improved from baseline to post-intervention ( $t=3.22, p=0.002$ ). Significant TUG score changes were observed for participants who lived with others ( $t=4.45, p=0.000$ ), rated their health as excellent/very good/good ( $t=3.05, p=0.003$ ), and attended program workshops in senior centers ( $t=3.52, p=0.003$ ). **Conclusion.** Findings suggest community-based fall risk reduction programs can enhance gait speed among old participants. More translational research efforts are needed to understand factors related to the effectiveness of fall-related programs in terms of functional performance within various populations and settings.

## GENDER DIFFERENCES IN NEIGHBORHOOD WALKING IN OLDER ADULTS

N.A. Gallagher<sup>1</sup>, P. Clarke<sup>2</sup>, C. Loveland Cherry<sup>2</sup>, D.L. Ronis<sup>2</sup>, K.A. Gretebeck<sup>2,3</sup>, 1. Michigan State University, East Lansing, Michigan, 2. University of Michigan, Ann Arbor, Michigan, 3. VA Center for Clinical Management Research, Ann Arbor, Michigan

Walking is the most common type of physical activity chosen by older adults. This cross-sectional study examined the influence of mobility limitations, self-efficacy, outcome expectations and neighborhood environment (density, design, and local destinations) on neighborhood walking in older men (N=106, aged 60-99 years, M=76.78, SD=8.12) and women (N=216, aged 60-99 years, M=75.81, SD=8.46). Using hierarchical regression, the variables explained 32.2% of the variance in neighborhood walking in older men ( $p<.001$ ). Mobility limitations ( $R^2=.09$ ), self-efficacy/outcome expectations ( $R^2=.08$ ) and environment ( $R^2=.15$ ) were significant when first entered into the model ( $p=.01$ ). In the final model self-efficacy ( $\beta=.436, p<.01$ ) density ( $\beta=.217, p<.05$ ) and design ( $\beta=.203, p=.05$ ) were significant. Grid-like streets ( $\beta=.217, p<.05$ ), maintained sidewalks ( $\beta=.217, p<.05$ ), neighborhood aesthetics ( $\beta=.217, p<.05$ ) and crime ( $\beta=.217, p<.05$ ) were design features associated with neighborhood walking in men. In older women, the variables explained 27.3% of the variance in neighborhood walking ( $p<.001$ ). Demographic characteristics ( $R^2=.05$ ), mobility limitations ( $R^2=.09$ ), self-efficacy/outcome expectations ( $R^2=.09$ ) and environment ( $R^2=.04$ ) were significant when first entered into the model ( $p<.05$ ). In the final model, self-efficacy exerted the strongest influence ( $\beta=.484, p<.001$ ), followed by destinations ( $\beta=.166, p<.05$ ), particularly walking to friends' houses ( $p<.001$ ). Walking interventions for all older adults should include enhancement of self-efficacy, but gender differences may exist in environmental influences. Neighborhood walking interventions targeting older women should incorporate local destinations, particularly friends' houses. In older men, neighborhood walking interventions should take into consideration design characteristics associated with walking in this group, including street/sidewalk design, neighborhood surroundings, and crime safety. The relationship between population density and neighborhood walking should be further examined.

## EVALUATION OF ARTHRITIS EXERCISE PROGRAM FOR ELDERLY IN RURAL ARKANSAS: WHAT ARE THE BENEFITS OF THE PROGRAM?

J. Vuk, S. Klein, R. Alcon, C. Beverly, University of Arkansas for Medical Sciences, Little Rock, Arkansas

An arthritis exercise program was conducted for individuals 55 years or older by trained instructors of the Arkansas Aging Initiative in seven rural counties of West Central Arkansas. The purpose of the study was to assess the impact of the exercise program on participants' health related to arthritis and evaluate the quality of the program. Exercise classes based on Arthritis Foundation Exercise Program Instructor's Manual (2005) were offered once a week for eight weeks. Seventy-five participants (81% women) signed informed consent, answered a pre-program questionnaire and demographic questions; sixty-one attended the last class and answered the post-program questionnaire. The highest self-reported condition was osteoarthritis (52%) followed by rheumatoid arthritis (21%). Ninety-three percent of participants reported Caucasian ethnicity, 4% Hispanic, and 3% other. The highest age group was 65-74 (44%), followed by the 75-84 group (40%), and 85 years and older (11%). Participants rated on a scale 1-5 their overall health, and on a scale 1-10 their pain, fatigue, quality of life, and confidence that they can improve quality of life by regular exercise. A paired-sample t-test showed a statistically significant increase in participants' confidence that they can improve quality of life by regular exercises,  $p<.05$ . Ninety-one percent intended to exercise at home and reported an improved condition after completing the program (less stiffness, less pain, more energy, and better mobility). The exercise program in their community was very

important with 61% of these who completed the program. Their comments included requests for frequent exercise classes and a longer program.

## WHY EXERCISE WHEN SPORT IS FUN? EMPHASIZING PLAY MAY BE KEY TO IMPROVING ACTIVITY IN OLDER ADULTS

K.L. Berlin, D.B. Klenosky, Health & Kinesiology, Purdue University, Zionsville, Indiana

Research on why active older individuals continue to be active is limited. This research examines older women (60-92 years) participating in either sports-based or exercise-based activities to understand underlying factors associated with activity choice and how that choice contributes to successful aging. The 256 respondents participate a minimum of 1.6 times per week in either bowling, golfing, swimming or walking. A mixed methodology approach was used to collect objective measures of leisure choice and successful aging and subjective factors underlying specific activity choices. Findings indicate women choose either sports- or exercise-based activities for different reasons but the result, in terms of perceived successful aging, are similar across activities. Participants across all activity groups rate themselves high (Scale 1-10, 1=unsuccessful, 10=highly successful; M=8.03, SD = 1.34) on perceived ratings of successful aging. Golfers, swimmers, and walkers' rating of success increase as the devotion to the activity increases. All respondents cite socialization and being active as key attributes for continued participation. However, goals related to activity choice differ between exercise-based respondents compared to sports-based respondents. Because of the purposive sampling technique used for this study, the findings should be viewed as preliminary and a basis for further hypothesis generation.

## LOWER BODY FUNCTION, NEIGHBORHOOD ENVIRONMENT, AND PHYSICAL ACTIVITY AS MEASURED BY ACCELEROMETERS IN OLDER ADULTS

W. Satariano, M. Kealey, S.L. Ivey, E. Kurtovich, A. Hubbard, University of California, Berkeley, Berkeley, California

Background: Poor lower-body function is associated with reduced mobility in older populations. Purpose: This study sought to determine whether neighborhood environments (e.g., land-use patterns and safety) moderate that association. Methods: The study titled "Environmental Correlates of Physical Activity among Older Adults: A Healthy Aging Research Network (HAN) Collaboration" ("HAN Walking Study") is a cross-sectional sample of 884 people aged 65 years and older identified through senior-serving organizations in Alameda County CA, Cook County IL, Allegheny County PA, and Wake and Durham counties NC. In-person interviews focused on neighborhood characteristics, physical and cognitive function, and physical activity and walking. Functional capacity was tested using measures of lower-body strength, balance, and walking speed. Participants also wore an accelerometer for seven days. Participants with at least ten hours of accelerometer wear time per day on at least four days were included in this accelerometer analysis. Accelerometer outcomes included mean intensity count per minute in wear periods from all valid days and minutes of moderate and vigorous activity bouts (8 out of 10 minute bouts) per day from all valid days. Estimates of main and interaction effects were derived from GEE models. Results: Neighborhood characteristics are associated with average intensity of activity as well as minutes of moderate and vigorous activity in older adults as measured with accelerometers. Neighborhood characteristics were found to moderate the association between lower body function and physical activity.

## TO DRIVE OR NOT TO DRIVE?

## GIVING UP THE KEYS: HOW DRIVING CESSATION AFFECTS LIFESTYLE IN LATER LIFE

A.L. Curl<sup>2</sup>, J.D. Stowe<sup>1</sup>, T.M. Cooney<sup>1</sup>, C.M. Proulx<sup>1</sup>, 1. *Human Dev. & Family Studies, Univ Missouri, Columbia, Missouri*, 2. *School of Social Work, University of Missouri, Columbia, Missouri*

We employed longitudinal data from 7 waves (1998-2010) of the Health and Retirement Study (HRS) to examine whether driving cessation impacts the lifestyles of adults, ages 65 and older. Lifestyle outcomes included involvement in productive roles (paid work, formal volunteering, and informal help to relatives, friends and neighbors), and social engagement. Additionally, we tested the mediating role of physical health, depressive symptomatology and cognitive status in the association between driving cessation and lifestyle outcomes. Understanding why driving cessation affects lifestyle is critical for design and implementation of appropriate interventions. HRS primary respondents, ages 65 and older at baseline, comprised the analytic sample (excluding those who had never driven). Proxy data were not used. The sample (N=1834) was 57% female and 86% White, with a mean age of 70.9 and 12.4 years of education. Multilevel model results provide strong evidence of the negative impact of driving cessation on productive engagement. The likelihood of employment drops ~90% when individuals report no longer being able to drive ( $p < .001$ ). Similarly, driving cessation significantly lowers the odds of informal and formal volunteering. Social engagement (days per week respondent has contact with others), however, increases after driving cessation, though this effect weakens over time. Increased depressive symptomatology and declining health contribute to the likelihood of reduced involvement in all four outcome areas, and cognitive decline reduces informal and formal volunteering. Yet, the mediating role of these health and wellbeing factors is negligible in explaining the effects of driving cessation on the lifestyle outcomes.

## TOOLS TO ASSESS FITNESS-TO-DRIVE: ARE WE MEASURING SOMETHING BEYOND AGE-RELATED CHANGES?

J. Riendeau<sup>1,2,3</sup>, M. Bedard<sup>1,2,3</sup>, 1. *Centre for Research on Safe Driving, Thunder Bay, Ontario, Canada*, 2. *Lakehead University, Thunder Bay, Ontario, Canada*, 3. *St. Joseph's Care Group, Thunder Bay, Ontario, Canada*

Impairment on a number of cognitive measures has been proposed as an indicator of greater risk of poor driving performance and/or crash risk. It is also well established that various measures used to assess driving performance are influenced by age. However, it has been suggested that it is not age per se that affects performance but rather that age is a marker for other changes (e.g., health-related declines in cognition). Nonetheless, it is possible that biological aging may account for changes in performance, but this cannot be determined unless we examine performance over a large age spectrum. To examine this issue we recruited 114 active drivers ranging in age from 18 to 89 years ( $M = 42.30$  years;  $SD = 26.50$  years). Participants were administered a series of cognitive measures routinely utilized to predict driving outcomes (Trails A and B, a short version of the Attention Network Test, and the Useful Field of View Test). In addition, driving performance was measured during a 30-min simulated drive. Age was strongly associated with the cognitive measures ( $r = .56$  to  $.84$ ,  $p < .01$ ) and with unsafe driver behaviour on the simulator ( $r = -.27$ ,  $p < .01$ ). Our results suggest that UFOV test performance, in particular ( $r = .84$ ), may largely reflect age-associated biological changes. These results have implications in predicting driving outcomes among older drivers and in developing age-adjusted normative data.

## CHANGES IN DRIVING STATUS AND TRANSITION FROM COMMUNITY TO RETIREMENT LIVING

A.M. Myers<sup>1</sup>, C. Janssen-Grieve<sup>1</sup>, A.M. Crizzle<sup>1,2</sup>, S.G. Brown<sup>1</sup>, 1. *Health Studies and Gerontology, University of Waterloo, Waterloo, Ontario, Canada*, 2. *Institute of Mobility, Activity and Participation, University of Florida, Gainesville, Florida*

Driving is the preferred mode of transportation and many seniors continue driving well into their 80's and even 90's. Ultimately, most people stop driving which often requires substantial adjustment. Retirement living may offset some of the challenges associated with driving cessation and mobility problems more generally, although no studies have examined the driving status of seniors in retirement homes or changes in driving as seniors transition from community living. We surveyed 206 residents (141 women and 64 men) from four retirement villages in southern Ontario (mean age  $85.1 \pm 6.4$ ). A third still drove, 63% had stopped and 9% had never driven. Never drivers were predominately women (94%), widowed (83%) and received more support services. Current drivers (26% of the women and 35% of the men) were more likely to be married and live with their spouse in apartments ( $p < .001$ ). About 20% of the former drivers still had a valid license and 6% still had a car. For 39% of the former drivers, driving cessation and moving to the retirement village occurred within the same year. Driving cessation preceded the move to the retirement village by at least a year for 45%, while 16% stopped driving after they moved to the village (most in just over a year). These preliminary findings suggest that driving cessation may influence the decision to move to retirement homes and that, for those who still drive at entry, retirement living in turn may influence the transition to non-driving.

## EDUCATIONAL BACKGROUND MAY AFFECT PERFORMANCE ON TOOLS USED TO ASSESS FITNESS-TO-DRIVE

M. Bedard<sup>1,2,3</sup>, M. Man-Son-Hing<sup>4</sup>, S. Marshall<sup>4</sup>, B. Weaver<sup>1,2,5</sup>, 1. *Centre for Research on Safe Driving, Thunder Bay, Ontario, Canada*, 2. *Health Sciences, Lakehead University, Thunder Bay, Ontario, Canada*, 3. *St. Joseph's Care Group, Thunder Bay, Ontario, Canada*, 4. *University of Ottawa, Ottawa, Ontario, Canada*, 5. *Northern Ontario School of Medicine, Thunder Bay, Ontario, Canada*

Background: Researchers and clinicians seek tools to identify unsafe drivers; particularly tools administered rapidly at low cost. However, one concern is that performance on these tools may be affected simply by age and education. We used data from the Candrive cohort of drivers to identify if this is the case with commonly used tools. Methods: Drivers (age  $\geq 70$ ) from seven Canadian sites are evaluated annually with the MMSE, MoCA, Trails A&B, and MVPT. During year 2 we added the SIMARD-MD (a paper and pencil tool used in British Columbia) to the protocol, and during year 3 we added the Centre for Research on Safe Driving version of the Attention Network Test (CRSD-ANT; a 10-minute computer-based tool). When we wrote this abstract we had complete data for 256 participants. We examined the simultaneous contribution of age (one-year increment) and education level (high school/trade school or less versus higher education) on participants' performance. Results: Age was related to performance for all tools (p-values ranging from .001 to .038); the CRSD-ANT was the least affected tool followed by the MVPT. Education affected only the SIMARD-MD ( $p = .009$ ) where a difference of 6.20 points (95% CI = 1.54, 10.86) separated the two education groups (better scores with more education). Conclusions: The results confirmed that age must be considered when assessing fitness-to-drive using the tools examined here. Furthermore, the SIMARD-MD is influenced by educational background; decisions about fitness-to-drive based on the SIMARD-MD may be biased against drivers with less education.

## SELF-RATED DRIVING IS NOT RELATED TO DRIVING SAFETY IN OLDER ADULTS

L.A. Ross<sup>1</sup>, J. Dodson<sup>1</sup>, J.D. Edwards<sup>2</sup>, M.L. Ackerman<sup>1</sup>, K. Ball<sup>1</sup>, *1. Psychology, University of Alabama at Birmingham, Birmingham, Alabama, 2. University of South Florida, Tampa, Florida*

Many states rely on older adults to self-regulate their driving and determine when driving is no longer safe. However, the relationship of older adults' self-rated driving (SRD) in terms of actual driving competency outcomes is unclear. This study investigates SDR in older drivers in terms of (1) systematic differences between high (good/excellent) versus low (poor/fair/average) SRD, and (2) the predictive nature of SRD to adverse driving outcomes (n=350; mean age 73.9, SD=5.25, range 65-91). Adverse driving outcomes included self-reported incidences of (1) being pulled over, (2) receiving a citation, (3) receiving a recommendation to limit/cease driving, (4) self-reported crashes, and (5) state-reported crashes. Results found that older drivers with low SRD reported more medical conditions, less driving frequency, and had received more suggestions to stop/limit their driving; there were no other significant differences. Logistic regression revealed older drivers were more likely to have a state-reported crash and receive a suggestion to limit/stop driving. Men were more likely to report all adverse driving outcomes except receiving a suggestion to stop/limit driving. Regarding SRD, older adults with high SRD were 66% less likely (OR=0.34, 95% CI=0.14-0.85) to have received suggestions to limit/stop driving after accounting for demographics, health and driving frequency. SRD was not predictive of other driving outcomes. 85.14% of older adults rated themselves as either good or excellent drivers regardless of actual previous adverse driving outcomes. SRD is likely not related to actual driving proficiency (e.g., previous crashes) in older adults. Suggestions from others to limit/cease driving may be more influential on SRD.

## SESSION 1605 (SYMPOSIUM)

### BODY FAT AND MUSCLE FAT INFILTRATION – KEY TO FUNCTION IN OLDER ADULTS

Chair: A.B. Newman, *Epidemiology and Division of Geriatric Medicine, University of Pittsburgh, Graduate School of Public Health and School of Medicine, Pittsburgh, Pennsylvania*

Discussant: T. Harris, *National Institute of Health / National Institute on Aging, Bethesda, Maryland*

Both total body fat and fat infiltration into muscle increase with age with adverse impact on functioning. Patterns of total fat and muscle fat infiltration differ in men vs. women and in blacks vs. whites. In this symposium we will present new findings from three ongoing cohort studies of older adults: the Health Aging and Body Composition (Health ABC) Study, the Study of Osteoporotic Fractures in Men (MrOS), and the Tobago Health Study. Total body and muscle fat were assessed with dual energy x-ray absorptiometry (DXA) and computerized tomography (CT) in Health ABC and with peripheral CT in MrOs and the Tobago study. Muscle fat infiltration and total fat together in Health ABC explained much of the sex difference in lower extremity function. In the MrOs study, a new risk factor for muscle fat infiltration was identified, linking peripheral nerve function with muscle fat. In Health ABC, the rate of increase in muscle fat infiltration was found to be concurrent with decline in gait speed. Over time, patterns of disability and limitation could be characterized by fat and fat distribution. Tobagonian men of African ancestry, who are known to have greater muscle fat infiltration than Caucasian ancestry men, were shown to have an acceleration of the increase in this fat depot with age late in life. Together these studies illustrate the importance of muscle fat infiltration to functional decline in old age. In her discussion, Dr. Tamara Harris will review progress in understanding additional key characteristics of age related adiposity.

## BODY FAT AND MUSCLE ATTENUATION EXPLAIN SEX DIFFERENTIAL IN LOWER EXTREMITY FUNCTION IN HEALTH ABC

L.A. Tseng<sup>1</sup>, M. Delmonico<sup>2</sup>, M. Visser<sup>3,4</sup>, R. Boudreau<sup>1</sup>, B. Goodpaster<sup>1</sup>, A.V. Schwartz<sup>5</sup>, E.M. Simonsick<sup>6</sup>, A.B. Newman<sup>1</sup>, *1. University of Pittsburgh, Pittsburgh, California, 2. University of Rhode Island Department of Kinesiology, Kingston, Rhode Island, 3. Department of Health Sciences, VU University Amsterdam, Amsterdam, Netherlands, 4. Department of Epidemiology and Biostatistics, VU Medical Center, Amsterdam, Netherlands, 5. University of California San Francisco, San Francisco, California, 6. Intramural Research Program National Institute on Aging, Baltimore, Maryland*

Higher body fat and lower muscle mass in women might explain their poorer physical performance than men. We compared physical function in 2904 men and women aged 70-79 from the Health, Aging, and Body Composition (Health ABC) study. The Health ABC Physical Performance Battery (HABCPB) is a 0-4 point score consisting of repeated chair stands, standing balance, and 6-meter usual and narrow walk tests. Total body fat and mid-thigh composition (muscle area, intermuscular fat, muscle attenuation, subcutaneous fat) were measured by DEXA and CT. Men performed better than women (LS means 2.33 vs. 2.03, p<0.001), adjusted for race, study site, age and height. Individual body composition measures attenuated (range 3-43%) the sex difference. Together, these components accounted for differences between men and women (LS means 2.16 vs 2.19, p=0.43). Poorer functioning in women compared to men was explained by lower muscle mass, lower muscle attenuation and higher total body fat.

## INCREASING THIGH INTERMUSCULAR FAT IS AN INDEPENDENT PREDICTOR OF DECLINES IN GAIT SPEED: RESULTS FROM THE HEALTH ABC STUDY

K.M. Beavers<sup>1</sup>, D.P. Beavers<sup>1</sup>, D.K. Houston<sup>1</sup>, T.B. Harris<sup>2</sup>, E.M. Simonsick<sup>3</sup>, A.B. Newman<sup>4</sup>, B. Nicklas<sup>1</sup>, S.B. Kritchevsky<sup>1</sup>, *1. Internal Medicine, Wake Forest School of Medicine, Winston-Salem, North Carolina, 2. National Institute on Aging - Laboratory of Epidemiology, Demography, and Biometry, Bethesda, Maryland, 3. National Institute on Aging - Clinical Research Branch, Baltimore, Maryland, 4. University of Pittsburgh, Pittsburgh, Pennsylvania*

Gait speed is a significant predictor of functional status in older adults; however, little data exist identifying modifiable risk factors for gait speed decline. We assessed the longitudinal relationship between change in adiposity measures and gait speed decline over 4 years. Data are from 2315 well-functioning, older (70-79 years) adults (50% women, 38% black) participating in the Health ABC study. Usual walking speed (m/s) over 20-meters was measured in years 2 through 6 and adiposity measures by DXA in years 2 and 6 and CT in years 1 and 6. Gait speed declined by 0.08±0.00 m/s over the 4-year period. Of the adiposity measures, only increases in thigh intermuscular fat independently predicted gait speed decline (-0.01±0.00 m/s per 5.67 cm<sup>2</sup>; p<0.01, for sexes combined). Increasing thigh intermuscular fat is an important predictor of gait speed decline, implying that fat infiltration into muscle strongly contributes to loss of mobility with age.

## BODY COMPOSITION-RELATED PROFILES OF OLDER PEOPLE WITH AND WITHOUT FUNCTIONAL LIMITATION AND DISABILITY

R.A. Murphy<sup>1</sup>, S.B. Kritchevsky<sup>2</sup>, D.K. Houston<sup>2</sup>, E.M. Simonsick<sup>3</sup>, A.B. Newman<sup>4</sup>, F.A. Tylavsky<sup>5</sup>, P.M. Cawthon<sup>6</sup>, T.B. Harris<sup>1</sup>, *1. Epidemiology, Demography and Biometry, National Institute on Aging, Bethesda, Maryland, 2. Wake Forest University, Salem, North Carolina, 3. National Institute on Aging, Baltimore, Maryland, 4. University of Pittsburgh, Pittsburgh, Pennsylvania, 5. University of Tennessee Health Science Center, Memphis, Tennessee, 6. California Pacific Medical Center, San Francisco, California*

Body composition may vary by limitation and disability status. Using data from Health ABC, we created profiles of participants who had no

limitation (n=867), limitation without disability (n=1,536), disability (n=262) and transitioned out of disability (n=157). Weight, grip strength, gait speed, lean mass, % fat and muscle fat infiltration were assessed at baseline, and limitation and disability over 6.5 years. Participants with no limitation were predominately white males and in fully adjusted models, had the greatest gait speed, grip strength, muscle fat and the lowest BMI and % fat (p<0.05). Participants with limitation with no disability had intermediary characteristics such that the proportion of men and whites, gait speed, grip strength and muscle fat decreased in graded manner across groups. Conversely, BMI and % fat increased across groups while lean mass did not vary. Gait speed, grip strength, fat and muscle fat reflect limitation and disability status in older adults.

#### **SKELETAL MUSCLE FAT INFILTRATION ACCELERATES WITH AGING IN AFRICAN ANCESTRY MEN**

I. Miljkovic<sup>1</sup>, Y. Sheu<sup>1</sup>, A.L. Kuipers<sup>1</sup>, B. Goodpaster<sup>2</sup>, C.H. Bunker<sup>1</sup>, A.L. Patrick<sup>3</sup>, J. Zmuda<sup>1</sup>, 1. *Epidemiology, University of Pittsburgh, Pittsburgh, Pennsylvania*, 2. *Division of Endocrinology and Metabolism, University of Pittsburgh, Pittsburgh, Pennsylvania*, 3. *Tobago Health Studies Office, Scarborough, Tobago, Trinidad and Tobago*

Skeletal muscle fat infiltration is a metabolically and functionally important fat depot that increases with aging, and is greater in African compared with European ancestry men. Longitudinal studies examining the natural history and magnitude of changes in skeletal muscle fat with aging are lacking, particularly in African ancestry populations. We examined longitudinal changes in quantitative computed tomography measured calf skeletal muscle attenuation in 450 Afro-Caribbean men aged 40 to 81 years. During the 6 years of follow-up, we observed a significant (P<0.0001) overall percentage decrease (-0.28%/year) in skeletal muscle attenuation, which was greater with increasing age: -0.22%/year, -0.26%/year and -0.37%/year among men aged 40-54 years, 55-64 years, and 65+ years, respectively (P for trend=0.039). These changes were independent of baseline muscle area and total AT. Further studies are needed to better understand the causes and consequences of aging-related increases in skeletal muscle fat infiltration in African ancestry men.

#### **POOR SENSORY AND MOTOR PERIPHERAL NERVE FUNCTION IS ASSOCIATED WITH HIGHER SKELETAL MUSCLE ADIPOSITY: THE OSTEOPOROTIC FRACTURES IN MEN (MROS) STUDY**

E.S. Strotmeyer<sup>1</sup>, J.A. Cauley<sup>1</sup>, K.A. Faulkner<sup>2</sup>, T. Prasad<sup>1</sup>, R.E. Ward<sup>1</sup>, S. Zivkovic<sup>3</sup>, P.M. Cawthon<sup>4</sup>, I. Miljkovic<sup>1</sup>, 1. *University of Pittsburgh, Graduate School of Public Health, Pittsburgh, Pennsylvania*, 2. *National Institute for Occupational Safety and Health (NIOSH), National Personal Protective Technology Laboratory, Pittsburgh, Pennsylvania*, 3. *University of Pittsburgh, School of Medicine, Pittsburgh, Pennsylvania*, 4. *University of California, California Pacific Medical Center Research Institute, San Francisco, California*

Poor peripheral nerve function has been related to lower strength, but not muscle mass, suggesting muscle composition is affected. Sensorimotor nerve function [sural sensory nerve (SNAP=amplitude in uV) and peroneal motor nerve (CMAP=amplitude in mV) conduction from a neurodiagnostic instrument; 1.4-g/10-g monofilament detection] was related to calf intermuscular fat (IMAT) and muscle density using pQCT in 613 men (77.5±5.2 years; 99% white; 21% diabetes) in MrOS from Pittsburgh, PA. In regression analyses, the worst tertile of CMAP vs. middle/best tertiles and lack of monofilament detection (1.4-g for IMAT; 10-g for density) were associated with higher IMAT (p<0.01) and lower density (p<0.05), adjusting for age, race, diabetes, total muscle fat and area, height, lifestyle factors, physical function, medications and diabetes-related conditions. Worst SNAP tertile vs. middle/best tertiles related to higher IMAT (p<0.05). Results indicated poor sensorimotor

nerve function is associated with muscle fat infiltration independent of muscle area in older men.

### **SESSION 1610 (SYMPOSIUM)**

#### **BUILDING WISCONSIN'S COMMUNITY-ACADEMIC INFRASTRUCTURE TO PROMOTE AGING RESEARCH**

Chair: *J.E. Mahoney, University of Wisconsin School of Medicine and Public Health, Madison, Wisconsin*

Co-Chair: *M. Bernard, National Institute of Aging, National Institutes of Health, Bethesda, Maryland*

Discussant: *D. McDowell, Bureau of Aging and Disability Resources, Wisconsin Department of Health Services, Madison, Wisconsin*

The National Institutes of Health recognizes that in order to best meet the health needs of the aging US population, communities should be engaging in all phases of research, from formulating questions, to designing research, to synthesizing findings, to translating findings to community practice. In 2010, the NIH funded 23 awards through the award mechanism "Building Sustainable Community-Linked Infrastructure to Enable Health Science Research". This symposium describes the University of Wisconsin's Community-Academic Aging Research Network (CAARN), funded through this mechanism. Now in Year 2, CAARN has facilitated multiple successful, multidisciplinary research partnerships between researchers from the University of Wisconsin and Wisconsin's Aging Network. Community-academic partnerships are engaged in research to develop, test, and subsequently disseminate small group and internet-based programs to reduce burden of disease and functional impairment among older adults in the community setting. To take research from pilot stage through dissemination, CAARN partners with the Wisconsin Institute for Healthy Aging (WIHA), a novel nonprofit organization whose mission is to disseminate and sustain evidence-based programs for older adults. This symposium will: 1) highlight two successful CAARN-facilitated pilot studies of innovative community-based interventions; 2) discuss how CAARN involves the Aging Network in the research process; 3) discuss the role of WIHA in supporting dissemination of EBPP and improving Aging Network readiness to engage in research. The symposium Co-Chair will highlight the importance of this type of infrastructure for NIA's research goals, and the Discussant will comment on the relevance of models such as CAARN to the Aging Network.

#### **LIGHTEN UP!: PROMOTING WELL-BEING IN OLDER ADULTS**

E. Friedman<sup>1</sup>, C. Ryff<sup>1</sup>, C. Ruini<sup>3</sup>, L. Jaros<sup>2</sup>, J. Ballard<sup>4</sup>, J.E. Mahoney<sup>1</sup>, 1. *University of Wisconsin-Madison, Madison, Wisconsin*, 2. *Aging and Disability Resource Center, Kenosha, Wisconsin*, 3. *University of Bologna, Bologna, Emilia-Romagna, Italy*, 4. *Wisconsin Institute for Health Aging, Madison, Wisconsin*

Older adults often suffer from depression and social isolation, and they are less likely to seek mental health treatment than younger adults. Lighten UP! is a pilot project to develop and document a community-based program to promote well-being in older adults. Based on Well-Being Therapy, which focuses on enhancing well-being rather than minimizing ill-being, the Lighten UP! program consists of 8 weekly group sessions and daily journal entries. Participants progress from identifying positive events, either current or past, to considering obstacles to experiencing or enjoying experiences of well-being. Ultimately, through the educational component of the program, they are introduced to concepts of eudaimonic well-being and the links between thoughts and behaviors, and they work together and individually to generate ideas about how to increase well-being in their lives. The first classes met in January, 2012, and we will present preliminary results in this symposium.

## **MED WISE: IMPROVING OLDER ADULTS' MEDICATION USE**

B.A. Martin<sup>1</sup>, B. Chewning<sup>1</sup>, J. Ballard<sup>5</sup>, J.L. Zander<sup>3</sup>, A. Margolis<sup>1</sup>, R. Smedley<sup>2</sup>, J.E. Mahoney<sup>4</sup>, B. Abramson<sup>5</sup>, *1. School of Pharmacy, University of Wisconsin-Madison, Madison, Wisconsin, 2. Community-Academic Research Network, University of Wisconsin, Madison, Wisconsin, 3. Aging and Disability Resource Center of Portage County, Stevens Point, Wisconsin, 4. University of Wisconsin School of Medicine and Public Health, Madison, Wisconsin, 5. Wisconsin Institute for Healthy Aging, Madison, Wisconsin*

The health and economic toll of medication errors by older adults is well documented, with adverse drug events (ADEs) a major cause of falls, hospitalization and death. Poor communication and medication coordination problems increase the likelihood of ADEs. The Med Wise project builds on the Chronic Care Model which posits that older adults themselves can be the key to successfully addressing this serious public health concern. Med Wise is a result of collaboration between a county Aging & Disability Resource Center (ADRC) and the UW-Madison School of Pharmacy and was facilitated by the Community-Academic Aging Research Network at UW and the Wisconsin Institute for Healthy Aging. The Med Wise program consists of two interactive sessions to improve patient encounters with pharmacists, enabling more appropriate use of medicines by older adults. Preliminary data from pre-post session evaluations documented increased participant knowledge, skills and confidence to interact with pharmacists more actively.

## **KEYS TO SUCCESS IN CREATING SUSTAINABLE COMMUNITY-ACADEMIC PARTNERSHIPS FOR AGING RESEARCH**

J. Ballard<sup>1</sup>, R. Smedley<sup>2</sup>, K. Kedrowski<sup>2</sup>, *1. Wisconsin Institute for Healthy Aging, Madison, Wisconsin, 2. University of Wisconsin, Madison, Wisconsin*

The Community-Academic Aging Research Network (CAARN) builds sustainable community-academic partnerships and ultimately facilitates the development of new, evidence-based healthy aging interventions, through provision of education, technical assistance, facilitation, matchmaking, funding assistance, and access to resources. CAARN provides facilitation and technical assistance at each stage of project development. This presentation will highlight the CAARN process and how it relates to current projects within the Aging Network. We will discuss how potential partners in the Aging Network are identified, how community partners clarify research needs, and how academic partners are "matched". Lastly we will discuss challenges encountered, strategies used to overcome them, and summarize elements that are key to CAARN's success.

## **THE WISCONSIN INSTITUTE FOR HEALTHY AGING: MEETING THE NEED TO DISSEMINATE EVIDENCE-BASED PROGRAMS**

B. Abramson, *Wisconsin Institute for Healthy Aging, Madison, Wisconsin*

This presentation will describe the development and role of the Wisconsin Institute for Healthy Aging (WIHA) as the statewide coordinator of evidence-based prevention programs. WIHA functions as a structure for maintaining ongoing quality control of evidence-based programs that have been disseminated throughout the state. WIHA screens participating organizations for implementation readiness, conducts fidelity checks of ongoing programming, and provides technical assistance to Aging Network Partners across Wisconsin to help them implement and sustain Evidence-Based Programs. We will describe WIHA's goal and vision and its role in implementing, expanding and sustaining high quality evidence-based programs across Wisconsin's Aging Network, in collaboration with health care partners. Lastly, we will explain how CAARN

functions as the research arm of WIHA, with research and dissemination activities being synergistic to each other.

## **SESSION 1615 (SYMPOSIUM)**

### **EXPLORING DYNAMIC BALANCE DISABILITY AND COGNITIVE LOAD USING NOVEL TECHNOLOGIES IN HEALTHY ELDER**

Chair: *C.J. Winstein, Biokinesiology and Physical Therapy, University of Southern California, Los Angeles, California*  
Discussant: *E. Crimmins, University of Southern California, Los Angeles, California*

Recent developments of sensors, data recorders and communication networks allow the unprecedented measurement of physiological, cognitive and behavioral data for research and rehabilitation in those aging into disability. An example is the recent explosion of movement-controlled video games using the new Primesense™ camera and Microsoft Kinect™ system. There is considerable evidence that these games are motivating, engaging, and fun; providing an alternative to traditional and somewhat boring rehabilitation exercises. We assembled a multi-disciplinary team of scientists from the nexus fields of biomedical engineering, rehabilitation-movement science, and gerontology; all part of our Rehabilitation Engineering Research Center on Aging with Disability, to design and conduct a development-of-concept pilot study. This was a single-session counterbalanced exposure to two different dynamic balance tasks in which the participant reached for a virtual target (virtually projected Jewel) or a real target (tennis ball), matched for the number and position of targets and movements under an ordered set of initial conditions (static standing; dynamic stepping). The order of the two task scenarios (Virtual, Real) was counterbalanced across the participants. Dynamic balance and functional screening tools including a novel lower-extremity strength-dexterity test and post-exposure qualitative questionnaires book-ended the two exposures. We report preliminary results focused on understanding the nature of the cognitive, physiological and behavioral effects of VR games beyond the known benefits of engagement in physical activity, potentially better adherence, and social reward that has been previously reported. Future directions and important questions at the nexus of technology, aging and disability research will be discussed.

### **MOVEMENT STRATEGIES IN VIRTUAL AND REAL-WORLD TASK PERFORMANCE**

P. Requejo<sup>1</sup>, E. Wade<sup>2</sup>, R. Proffitt<sup>3</sup>, E. McConnell<sup>3</sup>, B. Lange<sup>3</sup>, D. Liu<sup>1</sup>, S. Mulroy<sup>1</sup>, *1. Rancho Los Amigos National Rehabilitation Center, Downey, California, 2. University of Southern California - Biokinesiology and Physical Therapy, Los Angeles, California, 3. University of Southern California - Institute for Creative Technologies, Los Angeles, California*

Goal-directed actions produced under real or virtual conditions usually evolve with similar movement strategies. This project explores how manipulating the target (virtual and real targets) affects reaching strategies. Fifteen older adults performed a standing balance reach task, requiring stepping and no stepping to reach 8 targets placed around a circle with half on the right and half on the left. Participants were free to choose the step and reach limb. Most used the right hand to reach the virtual target and the ipsilateral hand to reach the real target. In the real-world condition, reach extent was greater than in the virtual condition and generally greater in the stepping than in the standing condition. Likewise, reaching trajectories were straighter in the virtual compared to the real condition. Discussion will focus on within- and between-participant analyses of kinematic variables and implications for development of virtual target tasks that effectively challenge dynamic balance.

## FROM THE MARGINS TO THE MAINSTREAM: INTEGRATION AT THE NEXUS OF TECHNOLOGY, AGING WITH AND AGING INTO A DISABILITY

E. Zelinski, *University of Southern California - Andrus School of Gerontology, Los Angeles, California*

The need for interdisciplinary cross-talk and understanding has never been greater with population aging, disability, and the number of disabled individuals who survive into old age. Much research relevant to technology development to support disabled persons or older adults moving into disability ignores the need to integrate in-depth multidisciplinary perspectives. The 2011 issues of major international journals that address disability, rehabilitation, assistive technology, and aging were examined for the presence of articles crosscutting aging, technology, and disability. Only 1% of articles addressed two of the three areas, and none all of them. For example, most articles on disability conditions increasing in prevalence with age did not address age related changes within the disability or how age changes might affect technology usability. I will address strategies to overcome these issues.

## USER-CENTERED DESIGN AND FEASIBILITY OF A GAME FOR BALANCE TRAINING IN OLDER ADULTS

B. Lange<sup>2</sup>, R. Proffitt<sup>2</sup>, D.J. Rose<sup>1</sup>, *1. California State University Fullerton, Fullerton, California, 2. University of Southern California - Institute for Creative Technologies, Los Angeles, California*

As older adults age, the risk of a fall increases and thirty percent of older adults over 65 fall every year. Many fall prevention programs targeted towards older adults focus on improving balance skills, however few programs for older adults utilize the advances in technology and gaming. In order to develop a feasible game targeting balance training for older adults, the needs and requirements of the target population must be identified. Older adults currently involved in a wellness program for seniors at California State University- Fullerton participated in three phases of development: 1) a needs assessment, 2) iterative user testing of a prototype game for balance and 3) a feasibility study comparing the game to a non-game task. Discussion will focus around the user-centered design of the game and results from the feasibility study including qualitative data screening tools and post assessment interviews.

## REDUCED ABILITY TO STABILIZE GROUND CONTACT WITH THE LEG MAY EXPLAIN GAIT CHANGES IN AGING

V. Stern<sup>2</sup>, E. Lawrence<sup>1</sup>, W. Hu<sup>1</sup>, M. Lyle<sup>2</sup>, C.J. Winstein<sup>2</sup>, P. Requejo<sup>3</sup>, F. Valero-Cuevas<sup>1,2</sup>, *1. University of Southern California - Department of Biomedical Engineering - Viterbi School of Engineering, Los Angeles, California, 2. University of Southern California - Biokinesiology and Physical Therapy, Los Angeles, California, 3. Rancho Los Amigos National Rehabilitation Center, Downey, California*

Metrics including the Timed-Up-and-Go, Berg-Balance-Scale, Activities-Specific-Balance-Confidence-Scale, and Four-Square-Step-Test are commonly used to assess balance and risk of falling. While they are valuable, a metric focusing on the dynamical ability of the lower extremity may provide additional insight at the organ level. Using the Lower Extremity Strength-Dexterity (LE-SD) Test, we measured the lower extremity's ability to stabilize ground contact (and the metrics above) in 15 physically fit participants (59-92 yrs). The LE-SD Test simply requires the user to compress a compliant spring prone to buckling as far as possible (all forces <15% BW). Only the LE-SD Test ( $r^2=0.356$ ,  $p=0.019$ ) and Timed-Up-and-Go velocity ( $r^2=0.277$ ,  $p=0.044$ ) correlated with age (and each other:  $r^2=0.411$ ,  $p=0.010$ ). To our knowledge, the LE-SD Test is the first metric at the organ level of the leg that may explain behavioral deficits of gait without cognitive, strength, or whole-body confounds. This may make it a valuable clinical tool.

## MESURING COGNITIVE LOAD IN HEALTHY ELDERLS DURING A VIRTUAL REALITY (VR) DYNAMIC BALANCE REACHING TASK

Y. Chen, Y. Chung, C.J. Winstein, *University of Southern California - Biokinesiology and Physical Therapy, Los Angeles, California*

The evidence supporting higher levels of engagement in exercise programs using VR games compared with non-VR task practice relies exclusively on questionnaire methodology. One aim of this Nexus project is to determine the cognitive load in two dynamic balance exposures: a virtual Jewel target game and a therapist-directed target task, matched for the number of targets and movements. Fifteen healthy elders (59-92 yrs) performed the two exposures under dual task conditions. On 27% of the trials, participants responded verbally to an unanticipated auditory tone while reaching for the target. A static standing condition established baseline response time (RT). Preliminary data analysis reveals that baseline RT is significantly shorter than for either of the two exposures. Discussion will focus on a comparison of cognitive load and engagement for the two exposures and the implications for proactive intervention programs to maintain and prevent declining dynamic balance with age.

## SESSION 1620 (SYMPOSIUM)

### OUTCOMES FROM PERSON-CENTERED CARE IN LONG- TERM CARE SETTINGS

Chair: *D. Edvardsson, Nursing, La Trobe University, Melbourne, Victoria, Australia, Umeå University, Umeå, Sweden*  
Discussant: *R. Weech-Maldonado, University of Alabama at Birmingham, Birmingham, Alabama*

This symposium will present outcomes of person-centered care (PCC) in long-term care settings. Person-centered approaches to care are increasingly being advocated and implemented in long-term care globally, but outcomes are still sparsely described. The first presentation will highlight resident thriving as an existential outcome of PCC based on pre-post test data from a PCC intervention study in a 120-bed long-term care facility in Stockholm. The second presentation will outline and identify outcomes from the Planetree model of PCC on residents' alarm use, falls with major injury, and dying in place. The third presentation will draw upon MDS records from 77 units to illustrate how PCC-unit residents had better outcomes for cognitive patterns, mood and behavior patterns, physical functioning, medication use, and special treatment/procedure. The fourth presentation draws upon data on 1266 residents with dementia from 157 facilities across Sweden and shows that 82% of residents 'never' or 'almost never' participated in person-centered everyday activities, even though residents participating in outside walks, excursions, parlour games, church visits, and general housing duties had significantly higher quality of life. The fifth presentation used ethnographic observations and interviews with staff and residents to develop the RAISE (Resident-centered Assessment of Interactions with Staff and Engagement) tool that captures the quality and frequency of staff-resident interactions and resident engagement as aspects of PCC. As a whole, this symposium will enable participants to define and measure PCC, and discuss the outcomes of PCC on resident health in long-term care.

### DEVELOPMENT OF THE RESIDENT-CENTERED ASSESSMENT OF INTERACTIONS WITH STAFF AND ENGAGEMENT (RAISE): A NURSING HOME QUALITY OF CARE OBSERVATIONAL TOOL

A. Snow<sup>1,2</sup>, J.A. Palmer<sup>3</sup>, L. Jacobs<sup>2</sup>, P.A. Parmelee<sup>2</sup>, R.S. Allen<sup>2</sup>, D. Berlowitz<sup>3</sup>, C.W. Hartmann<sup>3</sup>, *1. Tuscaloosa VA Medical Center, Tuscaloosa, Alabama, 2. University of Alabama Center for Mental Health & Aging and Dept. of Psychology, Tuscaloosa, Alabama, 3. VA HSR&D Center for Health Quality, Outcomes, and Economic Research, Bedford, Massachusetts*

Person-centered care (PCC) has become a widespread nursing home (NH) care model, yet measuring PCC outcomes remains a challenge. We conducted 60 hours of ethnographic observations and 20 hours of

staff and resident interviews to identify key PCC outcome constructs. Thematic analysis revealed quality and frequency of staff-resident interactions and resident engagement as aspects of person-centered care not captured by current quality assurance systems (e.g., MDS3.0, annual inspections). We then developed a structured observational tool (the RAISE; Resident-centered Assessment of Interactions with Staff and Engagement) to capture these identified constructs. We conducted 100 hours of RAISE observations in 2 VA facilities (8 NH units). Using an iterative approach informed by ethnographic notes and coding meetings, we identified a set of coding rules and administration processes that were as simultaneously efficient, non-reactive, and representative of CLC life. Inter-rater reliabilities have been adequate (Cohen's kappa = .75; n = 47 observations).

### **EVERYDAY ACTIVITIES ARE ASSOCIATED WITH HIGHER RESIDENT QUALITY OF LIFE**

K. Sjögren<sup>1</sup>, L. Petersson<sup>1</sup>, P. Sandman<sup>2</sup>, D. Edvardsson<sup>3,1</sup>, 1. Department of Nursing, Umeå University, Umeå, Sweden, 2. Department of Neurobiology, Care Sciences and Society (NVS), Division of Nursing, Karolinska institutet, Stockholm, Sweden, 3. School of Nursing and Midwifery, La Trobe University, Melbourne, Victoria, Australia

Person-centred care involves providing everyday activities for aged care residents, but there is limited statistical evidence in relation to resident quality of life. This cross-sectional study explored the provision and impact of everyday activities on quality of life among 1266 residents with dementia from 157 residential aged care facilities across Sweden. The Quality of Life in Dementia scale was used to assess quality of life, and the Multi-Dimensional Dementia Assessment Scale to explore participation in everyday activities. The findings show that 82% of residents 'never' or 'almost never' participated in everyday activities. Residents participating in the following everyday activities had significantly higher quality of life: outside walks, excursions, parlour games, church visits, and general housing duties. The findings reinforce the need to provide person-centred and meaningful everyday activities as such promote resident quality of life in long-term care. A higher prevalence of activity based nursing interventions is urgently needed.

### **MULTI-METHOD ASSESSMENT OF PERSON-CENTERED CARE OUTCOMES ACROSS LONG-TERM CARE SETTINGS**

M. Lepore, 1. Planetree, Derby, Connecticut, 2. Brown University, Providence, Rhode Island

Person-centered approaches to care are increasingly being implemented in long-term care (LTC) settings around the world. To identify outcomes of person-centered care (PCC), a multi-method assessment procedure is being implemented in 30 LTC sites that have adopted the Planetree model of PCC, including skilled nursing and assisted living settings in the U.S. and internationally. Monthly evaluation of facility-level performance on numerous measures, including residents' alarm use, falls with major injury, and dying in place, provide quantitative data on PCC outcomes. Results show similarities and differences in PCC outcomes, and changes over time, across skilled nursing and assisted living settings. Satisfaction surveys and focus groups with residents, staff, and family, and organizational self-assessment documentation, provide additional data on PCC implementation and outcomes. Quantitative and qualitative data triangulation informs the efficacy of PCC implementation strategies. Generated outcome and implementation data show multi-method approaches to assessing PCC have value for research and practice.

### **OUTCOMES OF PERSON-CENTERED CARE IN NURSING HOME RESIDENTS: A LONGITUDINAL FOLLOW-UP**

D. Porock, Y. Chang, J. Li, School of Nursing, University at Buffalo SUNY, Buffalo, New York

Aims: This study aimed to evaluate the effect of PCC on nursing home residents' outcomes using the Minimum Data Set (MDS) com-

prehensive assessment data. Methods: This retrospective, longitudinal study was conducted with residents living in two units (PPC-unit and traditional-unit) within one nursing home. The de-identified MDS records of these residents from January 2005 to April 2007 were retrieved from the New York Association of Homes and Services for the Aging (NYAHS). Results: MDS data from 26 PCC-unit residents and 51 traditional-unit residents were analyzed. After adjusting for baseline differences, PCC-unit residents had better outcomes for cognitive pattern, mood and behavior patterns, physical functioning, medication use, and special treatment/procedure. Conclusions: Our findings indicate that PCC generated some better outcomes for residents and provide preliminary evidence to support the uses of PPC in nursing homes. Furthermore the MDS may be sensitive enough to detect differences in PCC research.

### **EXISTENTIAL OUTCOMES OF PERSON-CENTRED CARE – HOW CAN SUCH BE MEASURED, ACHIEVED, IMPLEMENTED AND DISSEMINATED?**

P. Sandman, D. Edvardsson, Nursing, Dept of Neurobiology, Care science and Society, Huddinge, Sweden

Person-centred care is a contemporary buzz word for aged care policy and practice. This presentation will highlight resident thriving as an existential outcome of person-centred care based on pre-post test data from an intervention study promoting person-centred care in a 120-bed?? Long-term care facility in Stockholm, Sweden. The thriving in older residents measurement scale will be presented in relation to contemporary measures of person-centred care, characteristics of long-term care units with high person-centredness will be highlighted, and successful strategies to develop and implement a more person-centred day-to-day care practice in long-term care will be discussed. The presentation will draw upon pre-post test intervention data together with narrative evidence to present existential outcomes such as thriving, of person-centred care for residents, and how such are measured, achieved, implemented and disseminated across long-term care facilities.

## **SESSION 1625 (PAPER)**

### **EDUCATIONAL EVALUATION**

#### **THE DEDICATED EDUCATION UNIT IN LONG-TERM CARE: IMPROVING NURSING STUDENT SKILLS AND PERCEPTIONS**

S.M. Gilbert, C. Dietrich, Radford University, Radford, Virginia

Building on a research project launched in 2009 by Mullenbach and Burggraf (2012), this mixed methods longitudinal study examined skill proficiency and attainment as well as perceptions of older adults and long term care (LTC) as a professional practice specialty. Senior nursing student completed a one day per five week rotation in long term care centers identified as Dedicated Education Units (DEU) where students worked with RN preceptor role models and clinical instructors. Using a pre-test/post-test design, students completed a skills checklist at the beginning and end of each semester. To examine the effectiveness of the intervention, dependent samples (paired) t-tests were used to ascertain whether average confidence ratings changed significantly after DEU experiences. Results show statistically significant improvement in student confidence ratings in performing skills such as, nebulizer treatments, intravenous medications, tracheostomy and wound care, and tube feedings. Reflective journals were recorded after Day 2 and Day 5. Students were first asked to describe perceptions of older adults and LTC as a practice environment. The second journal asked for any new perceptions obtained during the rotation. Descriptive qualitative analysis was used to discover recurrent themes and concepts. This rich data yielded a picture of students' changing perceptions of older adults, an

acute awareness of staffing needs in LTC, and an appreciation for the diversity of the skill set needed to care for this population.

### **THE INTERPROFESSIONAL CLINICAL EXPERIENCE: INTRODUCING INTERPROFESSIONAL TEAM MEETINGS TO TRAINEES**

K.D. Sheppard<sup>1</sup>, C.R. Ford<sup>1</sup>, K.T. Foley<sup>1</sup>, P. Sawyer<sup>1</sup>, C. Ritchie<sup>2</sup>, C.J. Brown<sup>1</sup>, 1. *University of Alabama at Birmingham, Birmingham, Alabama*, 2. *University of California San Francisco, San Francisco, California*

Interprofessional training experiences are gaining importance since the establishment of interdisciplinary teamwork as a core competence in geriatric health care. To meet this need, the University of Alabama at Birmingham Geriatric Education Center (UAB GEC) recently developed a program to provide an interprofessional clinical experience (ICE) for trainees from dentistry, medicine, nursing, nutrition, occupational therapy, optometry, pharmacy, physical therapy and social work. ICE is offered at a university affiliated local nursing home with a previously established clinical rotation for students from dentistry, medicine, nutrition, and occupational therapy. Each week students individually interview with a selected NH resident; they subsequently meet to discuss the resident in an hour-long interprofessional care plan meeting facilitated by a geriatrician. In this meeting, each of the trainees contributes perspectives from their discipline relevant to the care of the resident. This session will describe the development, implementation, and student evaluation of ICE. We will discuss the recruitment of a planning committee of preceptors representing each discipline as well as the development of relationships with nursing home administrators and staff. We will review the learning objectives, team meeting guidelines, and evaluation materials developed by the planning committee. Realized outcomes include an increased awareness of the contributions of each profession to the care of the older adult as well as providing opportunities for collaboration among professions. We will present discipline specific evaluations of the program along with barriers we encountered in implementing the program.

### **DIFFERENCES BETWEEN EXPECTED VS. ACTUAL USE OF INFORMATION FROM VIDEO TELECONFERENCE EVENTS**

R. Chernoff<sup>2</sup><sup>1</sup>, S.H. Jasin<sup>1</sup>, S.M. Porbeck<sup>1</sup>, 1. *University of Arkansas for Medical Sciences, Little Rock, Arkansas*, 2. *GRECC, Central Arkansas Veterans Healthcare System, Little Rock, Arkansas*

The Arkansas Geriatric Education Center has been conducting 90-day post event surveys (PES) on video teleconferences (VTC) since 2007. The objective of the PES was to evaluate the impact of program attendance on clinical practice, transfer of knowledge to co-workers, and use of handouts. Impact was defined as using knowledge in patient care, modifying patient assessment, changing counseling practice, and noticing improved patient outcomes. Since Fall 2010, the following question is included on our event evaluation: "Do you expect to use information from this program in the near future." The possible responses were: "Yes," "No," and "Not applicable." This was done in an attempt to quantify the expected use of information gained by program attendees compared to the self-reported use of information by these attendees to the 90-day PES. Results from the past five VTCs are shown here. Expected Information Use Reported (%) by Attendees to VTCs vs. Actual Use Reported (%) by Respondents to 90-Day PES (Code: VTC = Video teleconference; EU = Expected Information Use Reported by VTC Attendees; AU = Actual Use of VTC Information Reported by 90-Day Post Event Survey Respondents) VTC1: EU=70.7%, AU=75.7%; VTC2: EU=46.3%, AU=59.6%; VTC3: EU=40.2%, AU=62.9%; VTC4: EU=67.9%, AU=69.3%; VTC5: EU=76.7%, AU=73.2%. Data gathered from both event and PES instruments show that AU% is larger than EU% in four of the five VTCs AU% indicat-

ing a greater use of information when in actual practice. Only in VTC5 the opposite is true.

### **MENTORING PHD STUDENTS IN GERONTOLOGY: THE INTERDISCIPLINARY RESEARCH IMPERATIVE**

L. Benefield, B.J. Holtzclaw, J.S. Wilson, K. Buckwalter, *University of Oklahoma Health Sciences Center, Oklahoma City, Oklahoma*

NIH and IOM imperatives to promote interdisciplinary research are based on assumptions that healthcare issues transcend disciplinary or professional boundaries, multi-causal problems require integrative approaches, and advances in intervention require theoretical, technical, and clinical expertise. The Reynolds Center of Geriatric Nursing Excellence and the University of Oklahoma College of Nursing created a unique mentoring and development plan for PhD in Nursing students aimed at engaging students in solving real-world problems via interdisciplinary inquiry. Didactic coursework includes a course in Translational Science, in which students study the concept of interdisciplinarity, the culture and language of disciplines, and role of interdisciplinary understanding in scientific translation. An annual Interdisciplinary Translational Geriatric Research Institute provides a "research incubator" for students and established investigators from a variety of disciplines to develop ideas around presented topics. Sequenced key activities during the program of study include 1) early-in-program experiences to establish an interdisciplinary perspective with national scholars, 2) engagement in provider and consumer input to frame an area of research inquiry and 3) early involvement in interdisciplinary research teams as doctoral students. Outcome examples document the benefits and accelerated student development in interdisciplinary team formation and faculty collaboration across professions as a result of the student engagement. Faculty and student partnered products include grant preparation, presentations, and publications.

### **SUSTAINING COMMUNITY PARTNERSHIPS FOR INTERDISCIPLINARY TRAINING IN HEALTHCARE FOR OLDER ADULTS**

J. Ilardo, J.D. Yonker, *College of Human Medicine, Michigan State University, East Lansing, Michigan*

This presentation will describe the necessary and sufficient conditions for sustaining community-based interdisciplinary geriatric training. The Geriatric Education Center of Michigan (GECM) invited 8 communities to become partners in its interdisciplinary geriatric health professions trainings as community teams during the 2007-2010 grant cycle. The goals of the teams were to conduct needs assessments identifying specific interdisciplinary geriatric continuing education opportunities and to provide trainings using a curriculum developed by GECM core faculty. By 2010 when the grant cycle ended and the next proposal was developed, 4 of the teams had coalesced to the extent that the GECM was able to build upon their accomplishments and expand their efforts in the 2010-2015 project cycle. The teams were assessed to determine their sustainability based on a set of necessary and sufficient conditions. The necessary conditions include 1) respect, trust, inclusiveness and openness among the members; 2) motivation for working together; and 3) the ability to collaborate for the good of the community rather than to compete over turf issues. The sufficient conditions include 1) successful collaborative leadership; 2) effective management structures; and 3) attainment of a pivotal place in their communities for their efforts. To determine what sustains each of these 4 distinctive GECM community teams, we employed a toolkit to assess 1) strategies used to recruit and retain members; 2) how each team determined its specific mission by examining its goals and activities; and 3) strategies used to monitor team's progress and outcomes.

## NEUROSCIENCE &amp; NEURODEGENERATIVE CONDITIONS

## MULTI-MODAL MRI MARKERS OF CNS INTEGRITY ARE ASSOCIATED WITH DEPRESSIVE SYMPTOMS IN THE ELDERLY

H.J. Aizenstein<sup>1</sup>, D.L. Tudorascu<sup>1</sup>, T. Harris<sup>2</sup>, S.B. Kritchevsky<sup>3</sup>, A.B. Newman<sup>1</sup>, K. Yaffe<sup>4</sup>, C. Rosano<sup>1</sup>, 1. *University of Pittsburgh, Pittsburgh, Pennsylvania*, 2. *National Institutes of Health, Bethesda, Maryland*, 3. *Wake Forest, Winston-Salem, North Carolina*, 4. *University of California, San Francisco, San Francisco, California*

**INTRODUCTION:** Late-Life Depression (LLD) is one of the leading causes of decreased quality of life in the elderly. Characterizing the brain imaging correlates of depressive symptoms is essential for understanding the biological mechanisms of LLD, as well as for optimizing prevention and treatment. This study uses multiple MRI sequences to quantify CNS integrity. **METHODS:** Data were from 276 participants (mean age=83.0 SD=2.7) at the Pittsburgh site of the Health, Aging, and Body Composition Study, an epidemiologic study of well-functioning adults. Depression was assessed with the CES-D scale. Neuroimaging markers were grey matter volume (GMV), white matter hyperintensity volume (WMH), and mean WM fractional anisotropy (wmFA), derived from T1-weighted, T2-weighted FLAIR, and DTI sequences, respectively. Since CES-D scores were not normally distributed, a proportional odds model was used, with four groups. Age, gender, and minimal state exam score (MMSE) were examined as co-variables. **RESULTS:** In models co-varying for age, gender, and MMSE, increased CES-D was associated with lower normalized GMV (odds ratio .87,  $p<.004$ ), higher normalized WMH (OR 1.85,  $p<.0001$ ), and lower wmFA (OR 0.79,  $p<.0038$ ). In a full model including all 3 neuroimaging markers, only the WMH remained significant (OR 1.67  $p<.003$ ); there was a trend for GMV (OR .92 ( $p<.084$ ), and no significant independent association with wmFA ( $p=.58$ ). **CONCLUSION:** GMV, WMH, and wmFA are each associated with severity of depressive symptoms. WMH is most associated with depression, and is the only marker independently associated with CES-D. These findings highlight the importance of WMH in elderly mood disorders. *Acknowledgements: NIA/NINDS (R01 AG029232, PI: Rosano, C.) and Pittsburgh Older Americans Independence Center-Claude D. Pepper Center (P30AG024827)*

## BLOOD-BRAIN BARRIER (BBB) BREAKDOWN AND BRAIN-REACTIVE AUTOANTIBODIES AS A TRIGGER FOR CNS DISEASES

R.G. Nagele, N.K. Acharya, M. Han, C. DeMarshall, M.C. Kosciuk, E.P. Nagele, *Univ. of Medicine & Dentistry of NJ - School of Osteopathic Medicine, Stratford, New Jersey*

The integrity of the BBB helps to maintain brain homeostasis by preventing the influx of plasma components into brain tissue. Recent studies have demonstrated the widespread presence of brain-reactive autoantibodies in the blood, some of which bind to neurons during the pathogenesis of CNS diseases such as Alzheimer's disease (AD). Here, we tested the possibility that binding of blood-borne autoantibodies can target specific neuronal subtypes and drive neuronal pathology. Western analysis and human protein microarrays were used to detect brain-reactive autoantibodies in human sera. Immunohistochemistry revealed selective binding of autoantibodies to neurons in regions of AD pathology and BBB breakdown. We tested the effects of autoantibodies on intraneuronal deposition of exogenous amyloid beta1-42 peptide (Abeta42) in adult mouse neurons in brain slice cultures. Binding of human serum autoantibodies and commercial antibodies targeting neuronal surface proteins dramatically increased intracellular Abeta42 deposition in neurons populating the mouse cerebral cortex and hippocampus, regions vulnerable to AD. Protein microarrays revealed the

presence of disease-specific autoantibodies in human sera that may exacerbate disease pathology and contribute to long-term disease progression. Results suggest that BBB breakdown and brain-reactive autoantibodies may act together to trigger aging-associated neurodegenerative diseases like AD and Parkinson's diseases. Additionally, the specific type of CNS disease and its severity may be dictated in part by the location and extent of the BBB breach and the identity of brain-reactive autoantibodies in the blood. This work was supported in part by the Alzheimer's Association and the State of New Jersey Governor's Council on Autism.

## GENE EXPRESSION ASSOCIATIONS WITH MMSE SCORES: PHAGOCYTOSIS OF CNS BETA AMYLOID?

D. Melzer<sup>1</sup>, L. Harries<sup>1</sup>, D.J. Llewellyn<sup>1</sup>, S. Bandinelli<sup>2</sup>, J.M. Guralnik<sup>4</sup>, L. Ferrucci<sup>3</sup>, 1. *Epidemiology and Public Health, University of Exeter, Exeter, United Kingdom*, 2. *Geriatric Unit, Azienda Sanitaria, Firenze, Italy*, 3. *National Institute on Aging, Baltimore, Maryland*, 4. *University of Maryland, Baltimore, Maryland*

**Introduction** Circulating inflammatory markers may play an important role in cognitive impairment at older ages. Mice deficient for the chemokine (C-C motif) receptor 2 (CCR2) develop an accelerated Alzheimer's-like pathology. To identify human gene transcripts most closely associated with Mini Mental State Examination (MMSE) scores we undertook a genome-wide and inflammation specific transcriptome screen in circulating leukocytes from a population-based sample. **Methods** We measured in-vivo transcript levels by microarray analysis in 691 subjects (mean age 72.6 yrs) in the InCHIANTI study. We assessed expression associations with MMSE score at RNA collection and prior 9 year change in MMSE score in linear regression models. **Results** In genome-wide analysis, raised CCR2 expression was cross-sectionally the most strongly associated transcript with lower MMSE score (beta=-0.16,  $p=5.1 \times 10^{-6}$ , False discovery rate 'FDR'  $q=0.077$ ). Amongst inflammatory transcripts, only CCR2 expression was associated with both MMSE score and accelerated decline in score over the preceding 9 years (beta=-0.16,  $p=5.1 \times 10^{-6}$ ,  $q=0.003$ ; and beta=-0.13,  $p=5.5 \times 10^{-5}$ ,  $q=0.03$ ; respectively). CCR2 expression was also positively associated with ApoE e4 Alzheimer's disease risk haplotype. **Conclusions** We show for the first time that CCR2 expression is associated with lower MMSE scores in an older human population. Laboratory models of Ccr2-mediated beta-amyloid removal and regulation of neurogenesis affecting cognitive function may be applicable in humans. CCR2-mediated pathways may provide a possible focus for intervention to potentiate protective reactions to Alzheimer's pathology in older people, including for people with adverse ApoE haplotype.

## MARKERS OF CHOLESTEROL TRANSPORT ARE ASSOCIATED WITH AMYLOID DEPOSITION IN THE BRAIN (CNS)

T.M. Hughes<sup>1</sup>, O.L. Lopez<sup>1</sup>, M. Kamboh<sup>1</sup>, W.E. Klunk<sup>1</sup>, J. Williamson<sup>2</sup>, L.H. Kuller<sup>1</sup>, 1. *Epidemiology, University of Pittsburgh, Pittsburgh, Pennsylvania*, 2. *Wake Forest University, Winston-Salem, North Carolina*

**Background:** Cholesterol levels and factors related to its homeostasis are implicated in the development of late onset Alzheimer's disease (AD) in observational and genetic studies. Recent advances in positron emission tomography (PET) allow for the visualization of amyloid deposition in vivo using the Pittsburgh Compound B (PiB). We hypothesized that plasma and genetic markers of cholesterol homeostasis would also be associated with the presence of amyloid deposition measured by PiB-PET. **Methods:** Plasma and genetic biomarkers were available on 182 participants from the Gingko biloba Evaluation of Memory Study (GEMS) who were cognitively normal or had mild cognitive impairment (MCI) and received neuroimaging at the end of the trial. **Results:** High amyloid deposition was: significantly associated with having a lower mini-mental state exams score ( $<27$ ,  $p=0.04$ ), having MCI

( $p < 0.01$ ), high systolic blood pressure ( $p = 0.04$ ), APOE- $\epsilon 4$  genotype ( $p < 0.01$ ), lower plasma apoE levels ( $p = 0.02$ ) and variation in the ABCA7 gene ( $p = 0.02$ ); marginally associated with low plasma apo J ( $p = 0.10$ ), HDLc ( $p = 0.17$ ) and variation in the ABCA1 gene ( $p = 0.24$ ); but not associated with total cholesterol ( $p = 0.91$ ), LDLc ( $p = 0.73$ ), triglycerides ( $p = 0.48$ ), 24S-hydroxycholesterol ( $p = 0.65$ ), 27-hydroxycholesterol ( $p = 0.47$ ) and variation in the CLU gene ( $p = 0.95$ ). Conclusions: Plasma and genetic factors relating to cholesterol transport were associated with amyloid deposition in the brain of non-demented elderly adults. Concurrent lipid measures and oxidized cholesterol metabolites do not appear to be related to amyloid deposition in cohort. Cholesterol transport may be a potential target for the prevention of amyloid deposition in the brain.

### **IDENTIFYING NEW DRUG TARGETS TO DELAY COGNITIVE AND CNS AGING**

P.A. Dacks, D.W. Shineman, H. Fillit, *Alzheimer's Drug Discovery Foundation, New York, New York*

Age is a major risk factor for several forms of cognitive decline ranging from cognitive aging and age-related memory impairment to severe neurodegenerative disorders including Alzheimer's and other causes of dementia. For virtually all age-related cognitive decline, effective therapeutic interventions do not exist. One attractive approach, termed the "longevity dividend," is to delay the onset of age-related cognitive decline by decelerating the rate of aging. In animal models, treatments that can slow the rates of aging and cognitive decline include dietary restriction and rapamycin, a calorie restriction mimetic that inhibits the nutrient sensor mTOR. Although dietary restriction and rapamycin, in their current form, are inappropriate for use by most humans, they provide proof-of-concept that aging rate can be modified particularly by systems-level treatments that coordinate numerous pathways. In this presentation, we will discuss the potential promise and risks of proposed drug targets to delay age-related cognitive decline. Potential targets include calorie restriction mimetics, omega-3 polyunsaturated fatty acids (eg. DHA), improved glucose and insulin homeostasis, anti-oxidant therapies, and mild hormetic stresses that could upregulate protective response pathways. We will also discuss some of the regulatory and logistical difficulties in developing treatments for humans including the need for reliable and cost-effective biomarkers for aging in the human brain and other tissues.

## **SESSION 1635 (SYMPOSIUM)**

### **APPLYING NARRATIVE GERONTOLOGY TO RESEARCH AND PRACTICE**

Chair: *K. de Medeiros, Miami University, Oxford, Ohio*

Co-Chair: *P. Saunders, Georgetown University, Washington, D.C., District of Columbia*

Discussant: *P. Carder, Portland State, Portland, Oregon*

"Narrative gerontology" broadly describes the use of personal stories to better understand experiences of aging. While much of the work to date has focused on narratives and aging from a theoretical and somewhat abstract perspective, there are many examples of narrative gerontology in research and practice. The purpose of the symposium is to first ask the question, when does story telling become research and then to explore applications of narrative gerontology in settings such as community-based participatory research; in practice, such as narrative medicine; and in new approaches to narrative analysis. The first paper suggests boundaries through which narrative research can be more firmly structured and considered. The second paper introduces how community-based participatory research and focus group discussions uncovered historical experiences of African Americans; and how these experiences were perceived as affecting intent to write advance directives. Findings can help practitioners be better listeners. The third paper presents narrative medicine in action, where doctors/practitioners consider how narrative shapes personal experience and how the writing process

supports this process of self-reflection. The final paper present a new way to examine narrative interview data by tracking the patterns through which informants tell their stories. Overall, this symposium introduces many key concepts and strategies related to narrative research in gerontology.

### **REFINING THE NARRATIVE TURN: WHEN DOES STORY-TELLING BECOME RESEARCH?**

A.S. Barusch, *1. University of Utah, Salt Lake City, Utah, 2. University of Otago, Dunedin, New Zealand*

The narrative turn in gerontology has generated considerable interest and a range of methodological approaches that claim to represent narrative research. Some of these can only be generously termed "research," while others give little more than a nod to "narrative." As narrative research matures, its boundaries must be more clearly defined. This paper examines definitional issues and proposes three criteria for good narrative research, arguing first that in-person data collection should use appropriate initiating prompts while giving the story-teller sufficient time and freedom to present a coherent narrative; second, that data analysis should address not only the content, but also the form of the narrative; and third, that interpretation of data should acknowledge the context of the story-telling, as well as its narrative intent. The process of boundary definition will be further clarified by exploring the possibility of co-authorship between researcher and story-teller and the treatment of the researcher's own narrative.

### **AFRICAN AMERICAN SENIORS' AND ADVANCE CARE PLANNING: IDENTIFYING YOUR WORLDVIEW IN COMMUNITY RESEARCH**

S.K. Crump, *Bioethical Solutions, Minneapolis, Minnesota*

Health practitioners often see research as disconnected and therefore not clearly transferable to clinical practice. If research is to be relevant to practitioners, it is important to be clear about the worldview and paradigm in which the research is conducted, and how this transfers to practice. In this research conducted with African American seniors, the researcher identified the critical theory – constructivism paradigm, which lead to conducting Community-Based Participatory Research (CBPR) with a virtue ethics framework. This approach lead to equitable collaboration on a topic of importance to the community, aimed at improving health and eliminating disparity, guided by a community advisory board. The Tuskegee Nurse's role is explored. Unexpected findings from focus groups were that examining personal relationships can be painful, and the perception that racism and the history of slavery influence the decision to write advance directives. Recommendations are made about having future discussions about advance care planning.

### **HOW NARRATIVE MEDICINE MAKES BETTER HEALERS**

P. Saunders, *Neurology, GUMC, Washington, DC, District of Columbia*

Narrative Medicine (NM) is a burgeoning field that teaches narrative and writing to clinical professionals. The first program was started at Columbia University in 1995 by Dr. Rita Charon, an internist with a doctorate in literature. This program, through narrative training, teaches healthcare professionals to improve the effectiveness of their clinical interactions by developing the capacity for attention, reflection, representation, and affiliation with patients and colleagues. Currently Georgetown University offers an elective in NM. The course teaches concepts of narrative (e.g., life stories, personal narratives, illness narratives). Using a workshop format, instructors facilitate close examination of the writing and reflection process, thus giving students a better understanding of themselves and their practice of medicine. The field of NM is an application of how narrative can be used to help clinicians to become better healers. The long-term goals include improvement in clinical practice as well as patient health outcomes.

## **NARRATIVE RESPONSE TYPE AND INTERVIEW DATA: SOME NEW CONSIDERATIONS FOR ANALYZING NARRATIVE DATA**

K. de Medeiros, *Miami University, Oxford, Ohio*

Although there are many ways in which to make sense of narrative interview data, I propose a new analytical approach based on data from a large qualitative study on the meaning of suffering in old age. In this study, participants used three basic response strategies: reflective, refractive, and chaotic. Reflective describes reportable events which seem to reflect back upon narrator although the narrator remains the subject of the story. The “refractive” narrative is characterized by a gradual movement away (refraction) from the narrator to some other character in the story. Chaotic describes a narrative in which clauses are thematically linked but which lack a linear progression or clear tie to the narrator. Overall, systematically diagramming narrative response strategies led to a deeper interpretation of emerging themes and while avoiding the pitfalls of being either too structural or too interpretive without adequate grounding.

## **SESSION 1640 (SYMPOSIUM)**

### **CIVIC ENGAGEMENT AT DIFFERENT STAGES OF LIFE: HOW, WHY AND WHERE?**

Chair: *A. Domaradzka-Widla, Institute for Social Studies, University of Warsaw, Warszawa, Poland*

Co-Chair: *T. Antonucci, Institute for Social Research, University of Michigan, Ann Arbor, Michigan*

Discussant: *J. James, Boston College, Boston, Massachusetts*

This symposium addresses the roles, mechanisms and reasons for volunteering at different stages of life from an interdisciplinary and international perspective. Invited researchers present psychological and sociological analyses, based on both quantitative and qualitative data. This broad, interdisciplinary approach will permit the identification of a comprehensive perspective outlining different factors explaining civic engagement across life cycle. Antonucci, Ajrouch and Webster, using data from the Social Relations, Age and Health Study, consider social and human capital as factors influencing the likelihood and frequency of volunteering in later stages of life. Domaradzka analyses the Polish women’s motivation to engage in social activity during the pre and post-retirement periods. She studies the benefits of engagement at the individual level, using both quantitative and qualitative data. Lenart discusses the multifaceted role Polish Universities of the Third Age play in integrating elderly back into society and analyses UTAs’ approach towards older adults’ education and civic engagement. Finally, using qualitative data on elderly community involvement in the US, Martinson discusses the ethical implications of promoting normative ideas of lifelong productivity as a necessary condition of being “a good old citizen”. The underlying focus of the symposium is twofold. One is to discuss the possible positive impact of volunteering on the well-being of people in later stages of life. The other is to bring attention to the growing importance of involving older people in activities that can be beneficial for them and for the society, thus creating or tapping into an additional public resource.

### **VOLUNTEERISM: THE ROLE OF HUMAN AND SOCIAL CAPITAL**

T. Antonucci<sup>1</sup>, K.J. Ajrouch<sup>2</sup>, N.J. Webster<sup>1</sup>, *1. Institute for Social Research, University of Michigan, Ann Arbor, Michigan, 2. Eastern Michigan University, Ypsilanti, Michigan*

Participation in volunteering activities by older persons increased dramatically in the last few decades. We examine effects of education and social convoys on the likelihood and frequency of volunteering. Data come from two waves of the Social Relations and Mental Health over the Life Course Study. Regression analyses indicated those with higher education levels (human capital) were more likely to volunteer,

though education did not predict the number of hours respondents reported volunteering per year. Convoys (social capital) do not amplify or substitute for the effect of human capital on the likelihood of volunteering, yet interact with education level to predict volunteer frequency. For example, when geographic proximity of network members decreased over time, those with more education volunteer more hours per year than those with low education. The ways in which convoys and education influence volunteerism are discussed to understand more clearly the contexts in which older adults volunteer.

### **BRIDGING THE GAP? VOLUNTARY ENGAGEMENT AMONG WOMEN IN PRE AND POST-RETIREMENT PERIOD**

*A. Domaradzka-Widla, Institute for Social Studies, University of Warsaw, Warszawa, Poland*

This paper examines the role of social engagement in the pre and post-retirement periods. Quantitative analyses based on World Values Survey data provide background description of the nature of social engagement among Poles and show the difference between positive and negative motivation for activism depending on age, gender and socio-economic status. Qualitative data explains these differences further, using data obtained from 50 individual in-depth interviews with leaders of women’s organizations in Poland. Most of the respondents were 50+ and described their civic engagement as a coping mechanism, enabling them to deal with the transition to retirement. Both analyses allowed for the creation of a typology of volunteers explaining the role of social activism at the individual level in later stages of life. Results indicate that reasons for volunteering are personal and driven by the need for self-fulfillment and interactions with other people that often increase in later stages of life.

### **UNIVERSITIES OF THE THIRD AGE IN POLAND. THE SPACE OF EDUCATION, ACTIVITY AND ENTERTAINMENT OF THE ELDERLY**

*M. Lenart, University of Warsaw, Warszawa, Poland*

Rapidly growing popularity and widening range of activities place Universities of the Third Age as the most important institutions dedicated to the education and engagement of the elderly in Poland. Here we analyze the multifaceted role Polish UTAs play in integrating elderly back into society and their approach towards the education and social activity of the older adults. The results we present specifically focus on understanding how UTAs address the needs of the elderly in three areas: 1) giving opportunities of self-realization and creative development; 2) activating their members and creating the infrastructure necessary to engage and use their potential and 3) strengthening the social capital of their members, also in the perspective of compensation for the lost relations from family and work life. Findings allowed to evaluate the importance of Polish UTAs and form conclusions, referring both to UTAs and general situation of the elderly in Poland.

### **CONSIDERING ELDERS’ COMMUNITY ENGAGEMENT THROUGH A LENS OF EQUAL REGARD**

*M. Martinson, Health Education, San Francisco, California*

Martinson explores the ethically troubling implications of promoting normative ideals of healthy aging that suggest lifelong productivity is a necessary condition to be “a good old person” and “a good old citizen.” An alternative framework of equal regard is presented that emphasizes creating the environmental conditions that support health equity, dignity, and fulfillment for elders. This framework is used to contextualize the results of a qualitative study that explored the lived experiences of community involvement among a diverse sample of 22 elders, and in particular elders’ subjective meanings of community work and healthy aging. Key findings revealed that community involvement and healthy aging are not individual acts or static states, but rather reflect reciprocal interactions between individual, interpersonal and broader

social, political and economic contexts. An equal regard framework is considered in making recommendations for how to best support “healthy aging” in light of these findings.

## SESSION 1645 (SYMPOSIUM)

### CULTURE CHANGE: REVISITING A NEW TOPIC

Chair: *N. Fishman, Robert Wood Johnson Foundation, Princeton, New Jersey*

Discussant: *P. Reed, Pioneer Network, Chicago, Illinois*

Changing the culture of care in long-term care settings to a more person-centered system is an increasingly important goal of providers and policymakers alike, and data are starting to amass regarding culture change adoption and its outcomes. This symposium will present new descriptive research on the current state of culture change in U.S. nursing homes, provide new information regarding the evidence of culture change efficacy, and present preliminary results on the Green House model of culture change as well as upcoming research plans. Points to be discussed include correlates of culture change adoption, noting that state policies themselves relate to and so can promote culture change. Further, environmental redesign is a common component of culture change, and is associated with other systemic changes. While literature on culture change is growing, results from a comprehensive literature review will indicate that overall, more evidence is needed regarding the efficacy of culture change. Finally, one presentation will focus on a specific model of culture change, discussing the process and outcomes of the Green House model and next steps for research. Our discussant, Dr. Peter Reed, CEO of the Pioneer Network, will reflect on the symposium presentations in the context of his organization’s work and the future of culture change. After attending this session, participants will have a better understanding of which settings are more likely to embrace culture change, the manner in which they are likely to adopt it, and the research that is needed and ongoing to establish the related evidence base.

### ADOPTION OF NURSING HOME CULTURE CHANGE

S. Zimmerman<sup>1</sup>, D. Grabowski<sup>3</sup>, A. Elliot<sup>2</sup>, B. Leitzell<sup>4</sup>, *1. Univ North Carolina Chapel Hill, Chapel Hill, North Carolina, 2. Pioneer Network, Chicago, Illinois, 3. Harvard, Boston, Massachusetts, 4. Pennsylvania State University, University Park, Pennsylvania*

One directive of the Affordable Care Act is to transform long-term services and supports into a more person-centered system. In nursing homes, culture change is central to this philosophy, and policymakers must understand factors associated with its adoption. We examined the adoption of culture change including the Green House model among all U.S. nursing homes from 2004-2011, using data from the Pioneer Network, the Online Survey Certification and Reporting system, Medicare cost reports, and the Minimum Data Set. Findings indicated that culture change adopters were more likely to be nonprofit, faith-based, independently-owned, in urban areas, and larger; have fewer minority residents, lower Medicaid census, and lower acuity; and fewer survey deficiencies, more RN staffing, and less relative debt. States experienced greater adoption when they rewarded it in the state pay-for-performance system, had a culture change coalition, and paid a higher Medicaid per diem. Implications for policy will be discussed.

### GREEN HOUSE MODEL: EVIDENCE AND REMAINING QUESTIONS

B. Bowers<sup>1</sup>, S. Sharkey<sup>2</sup>, S.D. Horn<sup>3</sup>, *1. University of Wisconsin-Madison, Madison, Wisconsin, 2. Health Management Strategies, Inc., Austin, Texas, 3. International Severity Information Systems, Inc., Salt Lake City, Utah*

Green House homes were designed to improve both quality of life and quality of care for elders needing skilled nursing care. The model has become increasingly popular, now numbering 120 homes with an

additional 100 in development. While there are promising data on quality of life improvements for elders and their families, more evidence is needed to determine the nature and extent of care practice improvements, clinical outcomes, and costs. This paper will summarize published and unpublished findings from Green House research, including variations in implementation, more direct care time for residents, less decline in resident activities of daily living over time, and improved resident quality of life ( $p < .05$ ). It also will provide an overview of the THRIVE research collaborative, funded by the Robert Wood Johnson Foundation, which is currently addressing some important remaining questions about the Green House model.

### ENVIRONMENTS OF CULTURE CHANGE: FINDINGS FROM THE THRIVE SURVEY OF CULTURE CHANGE ADOPTERS

A. Elliot<sup>2</sup>, L.W. Cohen<sup>1</sup>, S. Sharkey<sup>3</sup>, K. Nolet<sup>4</sup>, S. Zimmerman<sup>1</sup>, *1. Univ North Carolina Chapel Hill, Chapel Hill, North Carolina, 2. Pioneer Network, Chicago, Illinois, 3. Health Management Strategies, Inc., Austin, Texas, 4. University of Wisconsin-Madison, Madison, Wisconsin*

Culture change in nursing homes aims to promote a person-centered culture through transformations related to care practice, workplace, and a homelike atmosphere. While the importance of environmental redesign in overall culture change transformations has yet to be determined, adopters maintain that a smaller physical environment designed for fewer residents is critical to person-centered practice. Since the majority of U.S. nursing homes were designed as larger, more institutional settings, analyzing culture change implementation in the context of the physical environment contributes to the current discourse regarding long-term care policy and practice. To explore this issue, we surveyed over 300 nursing homes identified by national experts as those engaged in sustained culture change adoption. Findings indicate that most adopters engage in environmental redesign and that the extent of adaptation is positively associated with systemic implementation of individualized care and workplace practices. Implications for practice and policy will be discussed.

### WHAT DOES THE EVIDENCE REALLY SAY ABOUT CULTURE CHANGE?

V. Shier<sup>2</sup>, D. Khodyakov<sup>2</sup>, L.W. Cohen<sup>1</sup>, S. Zimmerman<sup>1</sup>, D. Saliba<sup>2</sup>, *1. Univ North Carolina Chapel Hill, Chapel Hill, North Carolina, 2. RAND, Santa Monica, California*

Although nursing home (NH) culture change efforts are becoming more widespread, the empirical evidence supporting culture change efficacy is not well described. We searched peer-reviewed and grey literature databases to identify intervention evaluations that addressed at least one previously defined culture change domain. Of 3,993 titles identified, 529 underwent full text review. Of these, 27 peer-reviewed and 12 grey literature publications met inclusion criteria for data abstraction. Studies varied widely in their scope and examined outcomes. Most studies addressed more than one culture change domain; resident direction, home environment, and close relationships were most common. Studies suggested a range of facilitators and barriers. Few studies adequately described how and to what degree culture change was actually implemented, adding to the challenge of drawing conclusions about culture change efficacy. Although only a few studies reported adverse outcomes, there was no consistent evidence on the efficacy of culture change in NHs.

## SESSION 1650 (SYMPOSIUM)

### GLOBAL ISSUES IN SOCIAL EXCLUSION

Chair: *K. Walsh, Irish Centre for Social Gerontology, National University of Ireland Galway, Galway, Ireland*

As a term, social exclusion has become a key feature of international policy, practice and research discourse. There has also been an increas-

ing prevalence of theoretical and policy perspectives on inclusion, and social, economic and civic deprivation. This growing focus on social exclusion, and its constituent elements, is set against significant upward trends in global aging demographics. There are, therefore, questions around how exclusion and aging patterns intersect in different global contexts and what this means for older people living in these settings. Meanings associated with aging and exclusion are often ambiguous, particularly when viewed from a global perspective, and are compounded by competing interpretations of different disciplines and a lack of cross-comparative conceptualization. The heterogeneity of older populations, global and macro-economic trends, and dimensions of place and the life-course are elements that add to this complexity. Consequently, it is difficult to appreciate the key global issues in social exclusion, the areas of life where people can experience exclusion, and the underlying forces that combine to construct exclusion. This symposium addresses these knowledge deficits by bringing together speakers from the U.S., Canada, the UK and Ireland. The presentations of Dr Adele Hayutin (Stanford University), Professor Norah Keating (University of Alberta), Professor Vanessa Burholt (Swansea University) and Dr. Kieran Walsh (National University of Ireland Galway) will provide insight into: (1) the connections between global aging patterns and exclusion; (2) current knowledge on the conceptualization of age-related exclusion; and (3) the impact of exclusion in different place and jurisdictional settings.

**SOCIAL COHESION IN RURAL COMMUNITIES OF SOUTH WEST ENGLAND AND WALES: THE INVISIBLE IMPACT OF SOCIAL EXCLUSION ON OLDER PEOPLE**

V. Burholt<sup>1</sup>, T. Scharf<sup>2</sup>, B. Winter<sup>1</sup>, *1. Centre for Innovative Ageing, Swansea University, Swansea, United Kingdom, 2. National University of Ireland, Galway, Galway, Ireland*

Social deprivation and poverty can create a class of secondary citizenry confined to subordination as well as social and political exclusion. Szalai (2008) has noted that ‘such a fault line in civil society might deeply endanger social cohesion.’ However, the debate on the link between multiple disadvantage and social cohesion is usually confined to discourse on inner-cities, youth (disengaged, alienated, consumerist) culture, immigration or ethnic diversity. The 2011 riots in the UK (London, Birmingham, Liverpool, Manchester and Bristol) were used by the media to illustrate these fault-lines in society. However, this paper demonstrates that the link between multiple disadvantage and social cohesion extends beyond urban populations and is observed in relatively ethnically homogenous rural areas of England and Wales and experienced by older people. Furthermore, in rural areas this relationship can be mediated by elements of social capital: local concerns, institutional trust, civic participation and social belonging.

**SOCIAL EXCLUSION OF OLDER RURAL PERSONS: CONFRONTING THE RURAL IDYLL**

K. Walsh, E. O’Shea, T. Scharf, *Irish Centre for Social Gerontology, National University of Ireland Galway, Galway, Ireland*

Rural ageing can sometimes be viewed as a dichotomy of experiences, with rural older people either considered as a needs-based group, living in a problematic environmental context, or a set of individuals living an idyllic life-style in supportive communities. It is therefore unsurprising that the complex and contested construct of social exclusion has rarely been explored or understood in rural settings. Yet, such a construct may offer potential for capturing the complex realities of rural older people’s lived experiences. This paper explores potential inequities, challenges and opportunities of rural ageing, in a study of social exclusion in village, near-urban, dispersed, remote and island communities in Ireland and Northern Ireland. 106 semi-structured interviews with older people and 10 focus group discussions with community stakeholders were completed. The cross-jurisdictional findings, which indicate exclusion is both multidimensional and multilayered,

are discussed in reference to notions of the ‘rural idyll’ and ‘problematised rural’.

**CONCEPTUALIZING SOCIAL EXCLUSION OF OLDER PERSONS**

N. Keating<sup>1</sup>, T. Scharf<sup>2</sup>, *1. University of Alberta, Edmonton, Alberta, Canada, 2. National University of Ireland, Galway, Ireland*

Exploration of global issues relating to aging and social exclusion has resulted in convergences of theoretical perspectives and substantive understandings but also regional differences in the relative importance of the domains of exclusion. In this presentation, we present an overview of the domains and drivers of social exclusion, based on a forthcoming book, “From Exclusion to Inclusion in Old Age: A Global Challenge”. This global perspective fosters a positioning of domains of exclusion that are broader than the European roots in which much of the theoretical work concerning social exclusion is grounded. Three domains predominate—exclusion from social relations, material resources and civic engagement. We highlight regional differences in the salience and important components of these domains, calling for increased critical exploration of inequalities among older adults and in the methodological rigour that is a precursor to filling knowledge gaps around domains of exclusion and the risks for experiencing them.

**GLOBAL TRENDS IN POPULATION AGING: EXACERBATING SOCIAL EXCLUSION?**

A. Hayutin, *Center on Longevity, Stanford University, Stanford, California*

The global shift toward older age brackets makes social inclusion of older adults an increasingly important consideration for well-being. While aging is a global phenomenon, population aging differs dramatically across countries and regions largely due to differences in the timing and pace of fertility declines and longevity gains. Most countries face dramatic long-term changes in their age structures and many will be unable to adapt their social, economic, and political infrastructures to the enormous demographic changes that are already surfacing. Moreover, the speed of these changes will make effective adjustment even more challenging. This presentation will provide a broad comparative perspective on patterns of aging across countries, highlighting trends that might exacerbate social exclusion or foster inclusion, including demographic and economic factors such as dependency ratios, labor force participation, gender, migration patterns, living arrangements, and family size.

**SESSION 1655 (SYMPOSIUM)**

**INDIGENOUS PERSONS AND DEMENTIA: COLLABORATIVE RESEARCH TO UNDERSTAND DEMENTIA AND IMPROVE ELDERS CARE**

Chair: *W. Hulko, Social Work, Thompson Rivers University, Kamloops, British Columbia, Canada, University of British Columbia, Vancouver, British Columbia, Canada*

Discussant: *S. Levkoff, University of South Carolina, Charleston, South Carolina*

Increasing attention is being paid to dementia amongst Indigenous persons, particularly First Nation communities in Canada, Native Americans in the United States, and Australian Aboriginal people. This is largely due to the increase in life expectancy for Indigenous persons and the prevalence of dementia risk factors linked to colonization such as diabetes, low socio-economic status, obesity, cardiovascular disease, and low levels of formal education. However, few research studies adopt a decolonizing approach and represent meaningful collaborations with the communities and people under investigation. Through describing and analyzing the process and results of several research projects with Indigenous persons in the area of dementia, this symposium will advance understandings of both the substantive topic of dementia and the design

and execution of a collaborative research project with a historically disadvantaged community and/or a population considered to be vulnerable. Hulko and colleagues will describe the methodology of their collaborative research with Secwepemc Nation Elders and decision-makers in British Columbia and analyze the extent to which decolonization and cultural safety are incorporated. The paper by H. Henderson and C. Henderson will delineate interpretive cultural narratives on impending death among certain American Indian tribes experiencing death with dementia. Jacklin and colleagues will present results from their participatory research on dementia with Aboriginal communities in Ontario suggesting that culturally safe dementia care for Aboriginal people needs to be regionally and/or community specific. The discussant will address the implications of these collaborative research projects for critical gerontological approaches to dementia and aging research with marginalized communities.

#### **USING PARTICIPATORY APPROACHES TO EXPLORE ABORIGINAL UNDERSTANDINGS OF DEMENTIA AND DEMENTIA CARE**

K. Jacklin<sup>1</sup>, W. Warry<sup>2</sup>, J. Pace<sup>2</sup>, 1. *Human Sciences, Northern Ontario School of Medicine, Sudbury, Ontario, Canada*, 2. *McMaster University, Hamilton, Ontario, Canada*

Alzheimer's disease and dementia were identified as an emerging health issue by Aboriginal communities in Ontario Canada in 2007. The authors engaged with communities to develop a comprehensive research strategy to investigate dementia in diverse Aboriginal communities. This paper explores findings from the resulting research program concerning Aboriginal peoples' understanding of and experiences with dementia. We used a participatory research framework working with Aboriginal community organizations and leadership. Semi-structured in-depth interviews (n= 113) were carried out with people with dementia, caregivers, health care providers, elders, and traditional healers at six geographically and culturally diverse research sites in Ontario, Canada. Drawing on this data, we report study findings concerning how dementia and dementia care are experienced by Aboriginal people in diverse settings, and where opportunities exist to improve cultural safety in dementia care. We conclude that culturally safe dementia care models for Aboriginal people need to be regionally and/or community specific.

#### **WORKING TOGETHER TO UNDERSTAND DEMENTIA AND IMPROVE NURSING CARE FOR FIRST NATION ELDERS**

W. Hulko<sup>1,2</sup>, C. Varcoe<sup>2</sup>, S. Mahara<sup>3</sup>, 1. *Social Work, Thompson Rivers University, Kamloops, British Columbia, Canada*, 2. *University of British Columbia, Vancouver, British Columbia, Canada*, 3. *Thompson Rivers University, Kamloops, British Columbia, Canada*

This paper addresses the process of doing research in collaboration with multiple stakeholders, including First Nation Elders, health authority decision-makers, and nursing practitioners. It is based on a completed grounded theory study of First Nation perspectives on dementia and an ongoing community-based research project on culturally safe dementia care that aims to improve nursing care for First Nation Elders with memory loss through the use of traditional storytelling and Indigenous Cultural Competency training. This paper describes measures taken to ensure meaningful collaboration, including the appointment of elder advisors to the research, signing of research agreements with participating communities, and co-authoring of publications and presentations, and some of the challenges encountered along the way. Through analyzing the extent to which this collaborative research program reflects a commitment to decolonization and serves the interests of the various stakeholders, we engage critically with theoretical and methodological developments in Dementia Studies and Indigenous Studies.

## **SESSION 1660 (SYMPOSIUM)**

### **POLICY SERIES: NATIONAL ADULT VACCINATION PROGRAM: CHARTING NEW FRONTIERS ACROSS THE AGING CONTINUUM**

Chair: *G. Douglas, Weill Cornell Medical College, New York City, New York*

Co-Chair: *S. Gravenstein, Alpert Medical School of Brown University, Providence, Rhode Island*

Discussant: *B. Resnick, University of Maryland School of Nursing, Baltimore, Maryland*

This session will feature a call to action policy framework based on findings from a NAVP 2012 April Scientific Summit in Washington DC. These findings will be the foundation for a 2013 invitational conference on vaccinations for adults that will showcase promising and best practices in improving adult vaccination rates. Workgroup members include: R. Gordon Douglas, MD Weill Cornell Medical College Stefan Gravenstein, MD, MPH Alpert Medical School of Brown University Paul Etkind, DrPH, MPH National Association of County and City Health Officials Walter A. Orenstein, MD Emory University School of Medicine Emory Vaccine Center William Schaffner, MD Vanderbilt University School of Medicine The Edward Jenner Society Barbara Resnick, PhD, RN, CRNP, FAAN, FAANP University of Maryland School of Nursing

## **SESSION 1665 (SYMPOSIUM)**

### **THE 2010 NATIONAL SURVEY OF RESIDENTIAL CARE FACILITIES (NSRCF): SELECTED RESULTS AND FUTURE DATA COLLECTION ACTIVITIES**

Chair: *L. Harris-Kojetin, National Center for Health Statistics, Hyattsville, Maryland*

Co-Chair: *P. Carder, Portland State University, Portland, Oregon*

Discussant: *S. Zimmerman, University of North Carolina at Chapel Hill, Chapel Hill, North Carolina*

The 2010 National Survey of Residential Care Facilities, conducted by the Department of Health and Human Services, is the first nationally representative survey of assisted living and other residential care communities (RCCs) as small as 4 beds. Using a probability-based sampling design to select RCCs and current residents, interviews were completed with 2,302 communities. There were 31,100 RCCs with 971,900 licensed beds nationwide. This symposium presents findings on topics important to long-term care (LTC) providers, policy makers, researchers and consumers. The first, on medication management practices, found that most RCCs store and administer medications, 45% administer medications via injections, and only 8% administer IV medications. The second paper describes dementia care. About 17% of RCCs had dementia specific units (DSUs), and compared to non-DSU RCCs, those with DSUs had more beds and were more likely to be purpose-built. Among residents with dementia, those in DSUs were more likely to be white and more physically impaired, but less likely to be Medicaid beneficiaries. The third paper reports baseline data on RCC use of electronic health information; 57% of RCCs reported computerized capabilities to record resident health information, and 16% had computerized capabilities to exchange health information with providers. Each of these three papers reports results comparing community and resident characteristics. The fourth paper introduces a new national study of nursing home, home health, hospice, RCC and adult day services centers providers that will regularly produce information to help monitor the evolving LTC landscape and inform future LTC policy and practice.

## DEMENTIA CARE IN RESIDENTIAL CARE COMMUNITIES

E. Park-Lee, M. Sengupta, L. Harris-Kojetin, *CDC/NCHS, Hyattsville, Maryland*

Dementia care is increasingly becoming an important service provided in assisted living and other residential care communities (RCCs). RCC residents with dementia can be in dementia-specific units (DSUs), either in stand-alone dementia-specific communities or in dementia special care units within larger assisted living buildings, or mixed in with residents without dementia. Using data from 2010 NSRCF, this study presents a descriptive overview of dementia care in RCCs. Comparisons of RCCs with and without DSUs were made relative to facility and resident characteristics. About 17% of RCCs had DSUs. Compared to non-DSU RCCs, RCCs with DSUs had a greater number of beds and were more likely to be purposely built as a RCC. Among residents with dementia, those in DSUs were more likely than those in non-DSUs to be white and more physically impaired, but less likely to be Medicaid beneficiaries.

## MEDICATION MANAGEMENT IN RESIDENTIAL CARE COMMUNITIES

L.L. Dwyer<sup>1</sup>, P. Carder<sup>2</sup>, L. Harris-Kojetin<sup>1</sup>, *1. Division of Health Care Statistics, National Center for Health Statistics, Hyattsville, Maryland, 2. Portland State University, Portland, Oregon*

Medication management is a critical service offered to residents by residential care communities. It includes assisting residents with self-medication and directly administering medications to them. This study examines patterns in medication management in a nationally representative sample of U.S. residential care communities. In the 2010 NSRCF, more than two-thirds of residential care communities assisted residents by delivering pre-packaged unit doses to them (69%) and handing them water to take medications (68%). More than 80% of communities provided a central location for medication storage (94%), cued residents to ensure medication ingestion (91%), administered drops or topical ointments (88%), handed correct doses (82%), and gave medication reminders (80%). Approximately 8% of residential care communities administered intravenous medications, while 45% administered injections to residents. Communities differed by size, ownership, age, chain status, and Medicaid certification status, and provision of skilled nursing services in the medication management tasks they offered to residents.

## ADOPTION BY RESIDENTIAL CARE COMMUNITIES OF COMPUTERIZED CAPABILITIES FOR RECORDING, MAINTAINING, AND EXCHANGING HEALTH INFORMATION

C. Caffrey, E. Park-Lee, *National Center for Health Statistics, Hyattsville, Maryland*

There is little information on the adoption and use of computerized capabilities in residential care communities (RCCs). Using 2010 NSRCF data, this study provides results on RCC adoption of computerized capabilities to record and exchange health information on residents. Among the 31,100 RCCs in 2010, 57% had computerized capabilities to record health information on residents, and one-third of them had five or more of these capabilities. Records of resident demographics, medical provider information, individual service plans, and medication lists were the most common computerized capabilities. In 2010, 16% of RCCs had computerized capabilities to exchange health information on residents with different providers, and almost 10% of them had two or more of these capabilities. Exchange with pharmacies, physicians, and corporate offices were the most common capabilities. This study provides baseline information that may be useful to policymakers, providers, and consumer advocates as they plan for future long-term care needs.

## INTRODUCTION TO THE NATIONAL STUDY OF LONG-TERM CARE PROVIDERS (NSLTCP)—A NEW RESOURCE ON ASSISTED LIVING, RESIDENTIAL CARE COMMUNITIES AND OTHER PAID, REGULATED LONG-TERM CARE PROVIDERS

L. Harris-Kojetin, *National Center for Health Statistics, Hyattsville, Maryland*

The National Center for Health Statistics recently launched the National Study of Long-Term Care Providers. NSLTCP will replace NCHS' periodic National Nursing Home Survey and National Home and Hospice Care Survey, and the one-time National Survey of Residential Care Facilities. Intended to help monitor the evolving LTC landscape, NSLTCP data will be used to produce an overview report on the supply and use of the major types of paid, regulated LTC. The report is currently planned to be updated every two years. NSLTCP will: (1) use only administrative data for providers for which they are available (nursing homes, home health agencies, and hospices); (2) conduct surveys of providers for which national administrative data do not exist (residential care communities, adult day services centers); and (3) provide national, and when possible state-level, information on a small set of provider and user characteristics. We highlight the NSLTCP goals, features, challenges, and opportunities.

## SESSION 1670 (PAPER)

### DEMENTIA CARE INTERVENTIONS IN THE COMMUNITY AND RESIDENTIAL SETTINGS

#### THE WORK OF THE CARE-BASED HAIR SALON: SUPPORTING PEOPLE WITH DEMENTIA TO MAINTAIN THEIR APPEARANCE IN CARE

R. Ward, S. Campbell, *University of Manchester, Manchester, United Kingdom*

While dementia care has been subject to intense scrutiny in recent years many of its more mundane and routine aspects remain overlooked. In particular, it would seem that body work has been relegated to the 'back-stage' of dementia care. Yet, at the heart of much paid care provided to older people lies a tension between provision of tightly defined and regulated 'body-focused' care tasks, and the need to promote opportunities for social engagement, self-expression and the support of personhood. This paper explores that dilemma, grounded in the concrete example of a widespread and yet largely un-researched feature of many dementia care settings - hairdressing. The Hair and Care project is a two-year ethnographic study of the working practices and relationships involved in supporting people with dementia to maintain their appearance and presentation in care settings. Through a focus on appearance-related practices in care we have explored and documented the social, interactional and embodied aspects of these encounters using a mix of qualitatively-driven methods. This paper will focus upon the labour that is involved in the provision of such help and support, drawing particularly upon debates on body work and emotional labour to explore the differing dimensions of this work. Our aim is to make visible the skills involved in this complex, effort-intensive labour alongside the outcomes for service users. Our findings indicate the potential value of integrating hairdressing into the therapeutic work of dementia care and highlight the distinctive contribution that hairdressers can make to care settings.

#### DEMENTIA AND FRIENDSHIP: THE QUALITY AND NATURE OF THE RELATIONSHIPS THAT REMAIN

P.B. Harris, *Sociology, John Carroll University, Cleveland, Ohio*

Friendships are an integral part of the human experience. Yet, dementia often takes a toll on social relationships, and many friends withdraw. This research however, focuses on friendships that remain, despite a

diagnosis of dementia. It examines the quality of the friendships of people with dementia and long-term friendships. Data were collected through two focus groups interviews with people with early stage dementia and their care partners; and through interviews with designated friends (N=23). The findings show that people with dementia do have friends that remain and they have a wide variety of friendships, from those based on one shared activity to those of multifaceted deep relationships. The long-term friendships, which last across the various stages of dementia, appear to fall into two types: one, where the person with dementia has become more like a family member than a friend; and the other where the diagnosis of dementia was the impetus for the relationship to become closer. Practice recommendations to nurture such friendships will be discussed.

#### **TRAINING NEEDS OF DEMENTIA CARE AMONG COMMUNITY MENTAL HEALTH PRACTITIONERS IN BEIJING, CHINA**

H. Hsiao, I. Chi, *Social Work, University of Southern California, Los Angeles, California*

**Background and Purpose:** In China, one of the four hospitals is located in rural areas with more than half of the national population. There are major discrepancies existing between rural and urban areas in terms of financial and medical resources. Due to the lack of trained medical professionals, the problem of caring dementia older adults in rural China is greater than in urban areas. The purposes of this study are: (1) to describe the mental health service delivery in China; and (2) to understand the differences in knowledge of dementia and training needs for dementia caregivers among community mental health practitioners in urban areas versus rural areas. **Method:** Using purposeful sampling method, the present study collected data through conducting focus group discussions around 90 minutes among 40 mental health workers whose major responsibilities are delivering mental health services in clinic centers in Daxing (rural) and Xicheng (urban) districts in Beijing, China in June 2011. Participants mainly included community “doctors” (32%), hospital doctors (20%), and nurses (22%). Fifty percent of them were women and the mean age was 35.72yrs. Ninety two percent had college degrees with mean tenure of 14 years. **Results:** Findings show that compared to mental health practitioners in urban areas, mental health practitioners in rural areas had very limited knowledge about causes, symptoms, and treatment of dementia as well as communication skills with family caregivers. Furthermore, 78% of mental health practitioners in both areas indicated unfamiliarity with caregiving for people with dementia. Lack of specific training in dementia among mental health practitioners in both areas and support from the government led to mental health intervention of the people with dementia less effective. **Conclusion:** This study indicates training needs of dementia care among mental health practitioners in community-based clinical centers in Beijing and provides implications for research and practices. Official institutions should take more active roles in long-term planning and providing training programs for dementia care, especially among rural mental health practitioners and their family caregivers, to enhance the quality of life for people with dementia.

#### **NARRATIVE PRACTICE INSIGHTS FROM A DYADIC DEMENTIA INTERVENTION**

K. Scherrer<sup>1</sup>, B. Ingersoll-Dayton<sup>2</sup>, B. Spencer<sup>2</sup>, *1. Rutgers University, New Brunswick, New Jersey, 2. University of Michigan, Ann Arbor, Michigan*

Memory loss and dementia can be devastating for both caregivers and care recipients. Narrative therapeutic approaches offer promise, as well as challenges, for social interventions with couples where one partner has dementia. The Couples Life Story Approach is a recently-developed method by which practitioners work with such couples to help them narrate the story of their life together. This narrative approach is augmented by mementos (e.g., photos, cards) that are collected by the

couple during the intervention. Significant memories are elicited from both partners and developed into a Life Story Book. Drawing on data from this clinical research intervention with 20 older couples, we ask: What are some of the challenges of conducting narrative based therapeutic interventions with older couples with memory loss? Clinical themes were identified in weekly clinical team meetings, and six of the most prominent themes are presented here. Specifically, 1) How to construct a narrative from disparate stories, 2) How to tell a mutual story, 3) How to tell a story of a couple that hasn't been together as long, 4) How to incorporate others in the story, 5) How to incorporate difficult life moments, and, 6) How to end the story. Within each theme, we utilize case examples to illuminate relevant issues and describe strategies that were developed to resolve these dilemmas. Implications for practitioners and clinical researchers who are engaged in dyadic interventions will be discussed.

#### **EXPERIENCING RELATIONALITY IN AN ARTS-BASED CONTEXT FOR PERSONS WITH DEMENTIA**

L. Meschino<sup>1</sup>, S. Dupuis<sup>1</sup>, C. Dowhaniuk<sup>2</sup>, *1. Murray Alzheimer Research and Education Program, University of Waterloo, Waterloo, Ontario, Canada, 2. Alzheimer Society Kitchener-Waterloo, Kitchener, Ontario, Canada*

Gather at the Gallery is a collaborative art program and research project between the Alzheimer Society Kitchener-Waterloo, the Murray Alzheimer Research and Education Program (University of Waterloo), local artists and art educators in Canada. Inspired by the Meet Me at MoMA model, Gather at the Gallery is a weekly, community-based art-looking and art-making program for people with dementia and their care partners. As a research project, its purposes are: 1) to use a phenomenological approach to describe experiences of meaningful engagement with visual art for persons with dementia and their care partners; 2) to raise awareness of how creative arts can serve an experience of continued companionship and social integration and 3) to expand our understanding of relationship-centred care outside the clinical/medical context. Spanning five 10-week modules, each program module brings together a diverse group of 10-16 participants (5-8 persons with dementia; 5-8 care partners), varying in age (50 - 80 years old), relationship dynamic (husbands and wives; mothers and daughters), stage of dementia (early-stage; mid-stage), prior experience with art, and expectations for the program. The purpose of this paper is to provide detailed descriptions of participants' subjective experiences of relationship-building in the context of the art program. Furthermore, interpretations of lived human relation (relationality) are explored, focussing on participants' connection to self, others, a creative process, as well as, engagement with new learning and with community spaces. Finally, key aspects of the program are identified that can sustain experiences of meaningful relationships and continued engagement in the community.

#### **SESSION 1675 (SYMPOSIUM)**

##### **TRANSLATING BASIC BIOLOGY INTO FUNCTIONAL THERAPEUTICS FOR HUMAN HEALTHSPAN: PROGRESS AND PROSPECTS WITH THE FOXO3 GENE**

Chair: *B. Willcox, Kuakini Medical Center, Honolulu, Hawaii, University of Hawaii, Honolulu, Hawaii*

Co-Chair: *A. Kahn, University of California, San Francisco, California*

Discussant: *E. Hadley, National Institute on Aging, Bethesda, Maryland*

FOXO3 is generally recognized as a pivotal gene in aging since its association with longevity has been replicated in model organisms and multiple human populations. While the functional variant is unidentified, coding variants have been ruled out as playing a major role in longevity. This suggests that the regulation of FOXO3 may be more important in longevity than variations in the primary structure of the

protein. In general, FOXO transcription factors affect numerous aging-related biological functions including apoptosis, cell proliferation and differentiation, energy metabolism, and insulin signaling. They have also been identified as tumor suppressors and activators of stress resistance and detoxification genes. Targeting of FOXO transcription factors has been proposed for the treatment of aging-related dysfunctions, including diabetes, immunological disorders and neurodegeneration, even aging itself (through maintenance of hematopoietic stem cells). To better understand the potential of FOXO3 as a therapeutic target in aging and aging-related diseases we need to better understand the molecular mechanism(s) by which FOXO3 is regulated. In this symposium we will: provide an overview of FOXO function and aging in *C. elegans* and other model organisms, present human sequencing results from targeted areas of functional interest, consider the role of FOXO3 in aging tissues, and consider how genomic variation might help in predicting drug response. The program will end with a discussion of future goals and challenges, including options for identifying potential interventions and therapeutic targets. Supported by NIA grants 2R01AG027060-05A2, 1R01AG038707-01A1, and 2U19AG023122-06A1.

#### FUNCTIONAL GENOMICS OF C.ELEGANS FOXO3/DAF-16

H. Tissenbaum, *University of Massachusetts Medical School, Worcester, Massachusetts*

In *C. elegans*, a single FOXO transcription factor, DAF-16, functions as a central mediator of longevity. Similar to other systems, DAF-16/FOXO function as the downstream target of a conserved, well-characterized insulin/IGF-1 signalling pathway. We have shown that multiple well-conserved signalling pathways intersect with the IIS pathway as well as impinge on DAF-16 for their regulation of lifespan. In turn, this regulation modulates the ability of DAF-16 to regulate its many direct target genes. We will give an overview of regulation of lifespan by DAF-16 including its multiple isoforms and how DAF-16 directly binds to many genes to modulate longevity.

#### HUMAN FOXO3 SEQUENCING: UPDATED ON AREAS OF FUNCTIONAL INTEREST

T. Donlon, Q. He, J.S. Grove, K. Masaki, A. Elliott, B. Willcox, *Timothy Donlon, Timothy Donlon, Honolulu, Hawaii*

FOXO3 is a promising molecular target for enhancing human healthspan through pharmacologic intervention since it is intimately involved in longevity and healthy aging. Common variants are associated with significant difference in lifespan. The actual functional variant (SNP) responsible for longevity has yet to be identified. Therefore, targeted sequencing efforts are being carried out on long-lived subjects of American-Japanese ancestry who are enriched for a longevity phenotype. Thus far, no protein coding sequence variants are implicated in human longevity. Our current efforts are targeting non-coding areas, most notably in intron 2. We will present results on the identification, annotation, and prioritization of DNA sequence variants in regulatory elements in this region, in order to identify candidate variants for functional genotype-phenotype studies of the FOXO3 gene and healthy human aging.

#### THE ROLE OF FOXO IN TISSUE AGING

A. Kahn, *California Pacific Medical Center, San Francisco, California*

Evidence from model systems and humans indicates that FOXO transcription factors are major participants in fundamental biological processes that influence aging and lifespan. Precisely how FOXO affects the latter is uncertain but in *Drosophila*, FOXO/4E-BP works through the autophagy/lysosome system to control proteostasis and delays muscle atrophy, extending lifespan. Mouse upstream regulators of FoxO activity are essential for muscle growth and regeneration, and response to mechanical load. FOXO also appears to mediate the osteoblast response to oxidative stress, osteoblast proliferation and skeletal homeostasis. In the adult CNS, stem cell maintenance, proliferation and neu-

ronal differentiation appear regulated by microRNAs controlled, at least in part, by FoxO3. Importantly, FOXO3 is expressed in major human adult organs and tissues including brain, heart, lung, liver, skeletal muscle, kidney, pancreas, testis, ovary, small intestine and colon. Overall, these findings provide a rational basis for understanding how genetic change in FOXO3 might affect aging and longevity.

#### GENOMIC VARIATION AND PREDICTING DRUG RESPONSE

N.J. Schork, 1. *The Scripps Research Institute, La Jolla, California*, 2. *Molecular and Experimental Medicine, La Jolla, California*, 3. *Scripps Translational Science Institute, La Jolla, California*

Genomic variation is known to influence response to pharmacotherapies. For example, naturally occurring DNA sequence variants in relevant genes or genetic networks can influence both the pharmacodynamic activity of a drug as well as the pharmacokinetic (i.e., metabolism) properties of the drug. As another example, differential gene expression patterns and pathway perturbations that distinguish diseased individuals from non-diseased individuals can indicate potential drug targets for treating those diseased individuals. We describe how genetic variation can be exploited to both identify and validate drug targets as well as predict drug responsiveness. We further consider how genomic variation can be studied specifically in the context of treating age-related diseases as well as in possibly crafting anti-aging therapeutics. After attending this presentation, attendees will be able to identify the major sources of genomic variation that influence drug responsiveness and that should be considered when assessing drug responses, both in vitro and in vivo.

#### SESSION 1680 (SYMPOSIUM)

##### CHARTING NEW FRONTIERS: EXPLORING POST-GRADUATION OPPORTUNITIES ACROSS DISCIPLINES. INSIGHTS FROM THE EXPERTS

Chair: *K.S. Hall, Geriatric Research, Education, and Clinical Center, Veterans Affairs Medical Center, Durham, North Carolina, Duke University, Durham, North Carolina*

Co-Chair: *C. Brown, Virginia Commonwealth University, Richmond, Virginia*

Now, more than ever, junior scholars in the area of aging will pursue a vast array of professional opportunities following graduation. Such opportunities vary as a function of discipline, training, and personal preference. Recognizing the heterogeneity of the post-graduation experience, the ESPO, AGHE, and Task Force on Mentoring have collaborated to create a two-part professional development symposium that will explore 'new frontiers' as it relates to post-graduation career paths. Specifically, a panel of experts has been assembled to speak to 1) the different expectations and opportunities in research-intensive institutions vs. undergraduate teaching institutions; 2) identifying and pursuing industry positions; 3) post-doctoral training opportunities and strategies for getting the most out of the experience; 4) professional opportunities for aging experts in civilian and Veterans Affairs medical settings; and 5) professional considerations for international scholars. This session is designed to aid GSA junior scholars in identifying potential next steps following graduation and strategies for how best to prepare for such endeavors. As such, this session is designed to be interactive, with an emphasis on Q&A so as to allow members to benefit from the insights of this expert panel.

## **OPPORTUNITIES FOR EXPERTS IN AGING WITHIN THE CLINICAL SETTING**

T.M. Johnson, *Geriatrics, Atlanta VA/Emory, Decatur, Georgia*

Both civilian and Veterans Affairs (VA) medical centers offer a wide variety of training and professional opportunities for individuals interested in careers in aging. While many opportunities within teaching hospitals are open only to clinicians with licensure, several initiatives are more broadly open. The goal of this paper is to educate junior scholars on the many opportunities the clinical setting has to offer, including for those who are behavioral scientists, physical/occupational therapists, and social workers, and psychologists. An overview of the opportunities that exist, along with licensing requirements and expectations, will be presented. Discussion will focus on clinical research opportunities including fellowship programs such as the VA Special Fellowship in Advanced Geriatrics, and the VA career development award mechanism. Time will also be devoted to discussing non-research positions (e.g., social work, PT/OT) and strategies for identifying such positions in civilian and VA medical centers.

## **TITLE: OPPORTUNITIES FOR BIOLOGY OF AGING EXPERTS IN PRIVATE INDUSTRY**

E. Blasi, J. Heyen, *Pfizer, San Diego, California*

Title: Opportunities for Biology of Aging Experts in Private Industry Speaker: Eileen Blasi, MS Co-Author/Co-Speaker: Jon Heyen, MS Professional organizations such as the GSA are a valuable resource for emerging scholars to gain insight into potential career paths. While many of these efforts focus on opportunities within academia, opportunities in private industry receive less attention. The decision to pursue a position in private industry varies by both discipline and personal preference. Individuals specializing in the biology of aging and/or pathophysiology of aging patients in the therapeutic settings of oncology, cardiovascular, diabetes, inflammation, bone degeneration, etc. are particularly well-equipped to pursue a position in industry. This session will present the potential benefits and pitfalls of conducting research in an industry setting. Training and education experiences/requirements for such positions and strategies for identifying available aging positions in industry will be presented.

## **DETERMINING THE BEST FIT: A CLOSER LOOK AT UNDERGRADUATE TEACHING INSTITUTIONS**

R.L. Beard, *Department of Sociology & Anthropology, College of the Holy Cross, Worcester, Massachusetts*

Institutional fit remains an age-old question that all emerging scholars must confront. For those interested in a future in academia, the choice of whether to pursue a position at a research-intensive academic institution or an undergraduate teaching institution can be challenging. This session seeks to shed light on the expectations in terms of training background, teaching, mentoring, independent funding, service, and scholarship at an undergraduate teaching institution. This is followed by a frank discussion of the pros/cons of this type of institution/faculty appointment in terms of job security, research productivity, professional fulfillment, opportunities for advancement and work-life balance. Finally, important details relative to the application process and related materials (e.g., content of job talk, teaching demo), along with tips to ensuring a competitive curriculum vitae when applying to undergraduate teaching institutions, will be discussed.

## **EXPECTATIONS, DEMANDS, AND POTENTIAL AT RESEARCH-INTENSIVE ACADEMIC INSTITUTIONS**

E. McAuley, *University of Illinois, Urbana, Illinois*

Institutional fit is a perplexing issue that countless emerging scholars face. For those interested in a future in academia, the choice of whether to pursue a position at a research-intensive academic institution or an undergraduate teaching institution can be challenging. This session focuses on the expectations relative to training background,

teaching, mentoring, independent funding, public engagement, and scholarship at a research-intensive institution. This is followed by a discussion of the pros/cons of this type of institution/faculty appointment in terms of job security, research productivity, professional fulfillment, and opportunities for advancement; particularly, in the current environment of uncertainty regarding grant funding. Finally, important details relative to the application process and related materials (e.g., content of research talk), along with tips to ensuring a competitive curriculum vitae when applying to a research-intensive academic institution, will be discussed.

## **POSTDOCTORAL FELLOWSHIPS: HOW DO I DECIDE?**

D.T. Gold, *Sociology, Duke, Durham, North Carolina*

Increasing competition for academic jobs that are diminishing in number because of fiscal problems has contributed to an increase in doctoral candidates and new PhDs seeking postdoctoral training. While such important is essential in many disciplines, it may not be the best choice for everyone. I will begin this presentation by reviewing criteria that should be used in deciding whether postdoctoral training is appropriate for individuals and will review potential benefits and liabilities of formal postdoctoral training. For those who decide that postdoctoral training is appropriate, I will also consider how those seeking postdoc slots should identify relevant opportunities and select research mentors. I will review how institutional postdoctoral programs evaluate applicants and monitor their success during the training. Finally, I will discuss different postdoctoral opportunities: federally funded programs (institutional or individual), industry funded programs, and non-government grant programs.

## **SESSION 1685 (SYMPOSIUM)**

### **DRIVING ASSESSMENTS FOR OLDER ROAD USERS: THE OLD, THE NEW AND THE INNOVATIVE**

Chair: *S. Classen, Univ of Florida, Gainesville, Florida*

Discussant: *F. Carroll, Univ of Florida, Gainesville, Florida*

The determination of older driver safety is dependent on accurate and reliable screening and assessment tools. This symposium will address, through five presentations, innovative screening and assessment tools to identify older drivers who are medically-at-risk or who are unfit to drive. Screening or assessment tools will include those drawn from self/proxy assessment, clinical batteries of tests, simulated driving performance, on-road performance and naturalistic methods. Specifically, we will focus on (1) an innovative valid and reliable web-based screening tool that has been developed for completion by a proxy reporter to detect at-risk older drivers. The screening has a web-based clinical output form that serves the purpose of facilitating conversations about driving between the older adult and his/her caregiver; of providing an entry point for occupational therapy intervention; and portraying the risk profile of the older driver to health care professional for risk management. We will (2) show findings of older drivers' self-awareness on driving situations that demand a quick response to critical incidents, by using simulated driving assessments. In addressing (3) neurological disorders we will (a) draw from qualitative interviews with occupational therapists/ geriatricians/ stroke consultants to identify the characteristics influencing the decisions of clinicians on fitness to drive following stroke; and (b) determine, from a sample of 100 drivers with Parkinson's disease (PD) the clinical tests that are predictive of pass/fail outcomes via an on-road test for drivers with PD. Finally we will reveal (4) strategies for retention used in assessment of driving performance in the CanDrive naturalistic study.

## THE SAFE DRIVING BEHAVIOR MEASURE FOR AT-RISK OLDER DRIVERS: STEPS IN TRANSLATION

S. Classen, *Univ of Florida, Gainesville, Florida*

This research overviews the main phases to develop the Safe Driving Behavior Measure (SDBM), a web-based tool to detect at risk older drivers. We used a prospective mixed methods research design. From North-Central Florida and Ontario, Canada, driving evaluators completed the SDBM, clinical tests and on-road testing on older drivers (N=200) who also rated their own driving performance and whose family members/ caregivers (N=200) rated their driving performance via the SDBM. We conducted reliability and validity studies on the tool. The findings suggest that the SDBM may be useful for: (1) family members/ caregivers to identify at-risk older drivers and to follow logical next steps based on the clinical output recommendations; (2) occupational therapists to identify an entry point for further interventions; and (3) evaluators to develop realistic and targeted intervention goals to promote safe driving, or suggests options for community mobility, if driving no longer is an option.

## FORMATIVE FACTORS INFLUENCING THE CLINICAL DECISION TO REFER FOR DRIVING ASSESSMENT FOLLOWING STROKE

T. Stapleton, *Occupational Therapy, Trinity College Dublin, Dublin, Ireland*

Off-road driving assessment practices typically focus on quantitative assessment at the operational levels of driving with generally less emphasis on assessment at the strategic level of driving. The focus of this presentation is on the formative factors predetermining a referral for formal driving assessment. Qualitative interviews with 17 senior occupational therapists and 7 geriatricians/ stroke consultant highlighted observable behaviours that influenced the clinical decision making process and stratification of the patient's suitability to drive following stroke. Observable strategic level behaviors such as; awareness/insight, risk taking behaviors, overall response to rehabilitation, family impressions, as well as the overall 'gut feeling' of the therapist or medical doctor, were more influential than scores on standardized tests in the determination of suitability to return to drive. A period of prolonged contact to allow for observation of possible deficits in these strategic level behaviors during functional based activity was considered essential in the stratification process.

## USING THE SIMULATOR AS A TOOL FOR SELF AWARENESS?

A. Dickerson, *Occupational Therapy, East Carolina University, Greenville, North Carolina*

Older drivers believe they are competent drivers. Even medically-at-risk drivers are reluctant to give up driving and fail to recognize why they may be unsafe. Although the on-road driving evaluation is the gold standard for determining fitness-to-drive, those who perform the evaluations cannot ethically put their clients in critical situations to demonstrate fitness. With a driving simulator, a "driver" can be in a critical situation that may result in a crash. This self-awareness experience can be used to discuss the person's "fitness-to-drive". Discussion will be on the results of a study that used simulation scenarios with critical incidents as a tool for self-awareness for medically-at-risk drivers. Subjects were referred by a geriatrician, participated in cognitive testing, and used simulation with feedback. Results suggest that individuals with cognitive impairment found that even with repeated crashes on simulation, the older adults continued to believe they were safe drivers. Caregiver feedback and comparisons to cognitive testing will be discussed.

## CANDRIVE: RECRUITMENT AND RETENTION STRATEGIES FOR A LONGITUDINAL STUDY OF OLDER CANADIAN DRIVERS

S. Marshall<sup>1</sup>, M. Man-Son-Hing<sup>1</sup>, M. Bedard<sup>2</sup>, *1. Ottawa Hospital Research Institute, Ottawa, Ontario, Canada, 2. Lakehead University, Thunder Bay, Ontario, Canada*

Background: The CIHR Team in Driving in Older Persons (Candrive II) Research Program is a prospective study of older Canadian drivers. An objective is to develop a clinical decision rule to assist in identifying at-risk drivers. With this study at the midway point, the focus is on retention. Methods: Potential participants were recruited through stakeholders and the media. We reviewed the literature to identify retention best practices. The team developed a retention plan which involved incorporating educating study personnel, providing non-financial benefits, focusing on minimizing participant study burden, and creating study identity for participants. Results: 933 older drivers were recruited across 7 Canadian sites. To date, 849 participants remain in the study with 11 deaths and 23 voluntarily stopping driving; only 51 discontinued participation for non-medical reasons. Discussion: The prospective study is progressing well and retention is excellent. This will maximize the validity of the clinical decision rule.

## PREDICTORS OF ON-ROAD PASS/FAIL OUTCOMES IN PARKINSON'S DISEASE

A.M. Crizzle, S. Classen, D.N. Lanford, *Occupational Therapy, University of Florida, Gainesville, Florida*

Prior study findings in drivers with Parkinson's disease (PD) are difficult to interpret due to the small and heterogeneous samples. This has limited development of policies and procedural practices for physicians and licensing authorities to determine fitness to drive in PD. Ultimately, the development of evidence based guidelines require Class I studies yielding sample sizes of 100 participants or larger. From our current database of 100 drivers with PD, this study will determine the predictors of on-road driving performance in PD. We will determine what clinical (e.g., visual, cognitive and motor) and neuropsychological tests are predictive of on-road pass/fail outcomes, as assessed by a certified driving rehabilitation specialist, by conducting multiple regression and receiver operating characteristics curves. As this study will prospectively analyze the on-road driving performance of 100 drivers with PD, our findings may inform the development of fitness to drive guidelines.

## SESSION 1690 (SYMPOSIUM)

### EVIDENCE-BASED SCREENING FOR MENTAL HEALTH PROBLEMS IN PRIMARY CARE

Chair: *C.E. Gould, GRECC, VA Palo Alto, Palo Alto, California*

Discussant: *D. Gallagher-Thompson, Stanford University School of Medicine, Department of Psychiatry and Behavioral Sciences, Palo Alto, California*

A majority of older adults present to primary care clinics with mental health problems first, yet depression, anxiety, suicide ideation, and cognitive impairment often are undetected by primary care providers. There is a dire need for improved detection of these problems as cognitive disorders, anxiety disorders, and depressive disorders are the three most prevalent late-life mental health problems. Furthermore, about 75% of individuals who complete suicide had contact with their primary care providers in the past year (Luoma, Martin, & Pearson, 2002). In our symposium, we will address these pressing mental health issues. Specifically, we focus on the assessment of cognitive impairment, anxiety, depression, and suicide. Aligned with the theme of "Charting New Frontiers in Aging," we will integrate new research findings that highlight improved approaches to the detection of mental health problems and evaluate existing assessment approaches used with older patients.

Additionally, we will identify improvements that can be made to primary care clinics and will highlight successful programs, such as the BRIGHTEN program. In the final presentation, data on older adults' follow through with mental health referrals and their accessing of mental health treatment will be discussed. Evidence-based recommendations for the detection of mental health problems and for facilitating follow-up care will be presented and directed at a broad multidisciplinary audience. Our discussant, Dr. Dolores Gallagher-Thompson will consider the implications of these findings for diverse older adults.

#### **ANXIETY SCREENING IN OLDER ADULTS WITH VARYING COGNITIVE ABILITIES**

S.A. Beaudreau<sup>1,3</sup>, C.E. Gould<sup>2</sup>, 1. *Sierra Pacific Mental Illness, Research Education and Clinical Centers (MIRECC), Palo Alto VAHCS, Palo Alto, California*, 2. *Geriatric Research Education and Clinical Center (GRECC), Palo Alto VAHCS, Palo Alto, California*, 3. *Department of Psychiatry and Behavioral Sciences, Stanford University School of Medicine, Stanford, California*

This presentation addresses issues associated with anxiety screening in older adults with varying cognitive abilities—normal, mild impairment and dementia—a salient clinical consideration given the ubiquity of cognitive impairment in late-life. Preliminary analyses from community-dwelling older adults (projected final sample  $n = 80$ ), who completed a psychiatric and neuropsychological battery, indicate that memory was not associated with anxiety severity on the Geriatric Anxiety Scale (GAS;  $n = 69$ ) or Geriatric Anxiety Inventory (GAI;  $n = 60$ ) ( $p > .05$ ). However, poorer language was associated with elevated anxiety on the GAS ( $r = -.28, p = .027$ ), but not the GAI ( $r = .07, p = .62$ ). Internal consistency and construct validity of the GAI and GAS in low vs. high language performance will be compared. Concrete suggestions for use of these and other anxiety screens will be provided for clinicians working with older adults in primary care and other settings.

#### **SCREENING FOR DEPRESSION IN PRIMARY CARE**

E.E. Emery, *Rush University Medical Center, Chicago, Illinois*

Approximately 10% of older adults in primary care meet criteria for major depression, with an additional 16% reporting symptoms that cause functional impairment. Primary care providers routinely fail to recognize depression, particularly among older adults. This is even in the context of primary care physicians being the most common health care provider that older adults bring mental health concerns to. Thus, screening in primary care is critical for the identification of depression among older adults. Screening measures will be reviewed, with recommendations based on setting and population. In the BRIGHTEN program, cut-points for the Geriatric Depression Scale -15 item ( $\geq 5$ ); the Patient Health Questionnaire-2 ( $\geq 3$ ) with multiple response formats; and Patient Health Questionnaire-9 ( $\geq 8$ ) were used to detect depression in a primary care sample for optimal sensitivity and specificity. Comparisons with the depression screening literature, along with acceptability, feasibility, and response formats for older adults will be discussed.

#### **SCREENING FOR SUICIDE RISK AMONG OLDER ADULT PRIMARY CARE PATIENTS**

A. Fiske, *Psychology, Morgantown, West Virginia*

Older adults are at an elevated risk of death by suicide. Primary care settings may provide a particularly valuable opportunity for detection of suicide in this age group, given the fact that the majority of older adults who die by suicide are in contact with a primary care provider within the month prior to the death (Luoma, Martin & Pearson, 2002). Nonetheless, there are numerous challenges associated with screening for suicide risk in these settings and suicidal behavior remains under-recognized in older primary care patients. This presentation will provide an review of suicide risk screening instruments and procedures

that have been evaluated in primary care settings. Implications for referral and treatment will also be discussed.

#### **COMPREHENSIVE SCREENING FOR BEHAVIORAL HEALTH PROBLEMS AMONG OLDER ADULTS WITHIN THREE INTEGRATED MODELS OF CARE**

B. Kaskie, *University of Iowa, Iowa City, Iowa*

Purpose: We examined symptoms identified by a comprehensive screen administered within three integrated models of behavioral health care. Data/Methods: Screenings were completed by 711 older adults who presented in three primary health care clinics over a six month period. Item analysis was used to describe symptomatology among those who scored positive. Results: Positive screens occurred among slightly more than 30% of all older patients. Analysis of 225 positive screens revealed 97 individuals (43%) individuals experienced symptomatology related to a single diagnostic condition: 48 featured two or more symptoms of cognitive impairment, 31 depression, 17 anxiety and 1 substance misuse. The remaining 127 individuals (57%) presented mixed symptomatology, as indicated by a combination of at least one or more cognitive, depression, anxiety, or substance misuse symptoms. Conclusion: Behavioral health problems presented by older adults in primary care are varied and complex. Integrated models that focus exclusively on one set of symptoms are insufficient and should be expanded.

#### **EVALUATING COGNITIVE FUNCTION IN ELDERS BY USING COMPUTERIZED NEUROPSYCHOLOGICAL BATTERY**

P.C. Heyn<sup>1</sup>, R.A. Tang<sup>2</sup>, 1. *University of Colorado Denver Anschutz Medical Campus, Denver, Colorado*, 2. *University of Houston, Houston, Texas*

Because neuropsychological assessment is often a time-consuming procedure, methods to simplify and accurately detect Cognitive Function (CF) in the elderly are needed. This study evaluated older adults' CF using a Computerized Neuropsychological Battery (CNB). The Central Nervous System Vital Signs™ was used to evaluate CF on a diverse sample of older adults ( $N=286$ ). 55 percent of the participants showed at least one abnormal score on selected CF (Stroop, RTT, SAT, CPT). We also found moderate association between race and tests of CF; CPT ( $r=.23; p=.007$ ), SAT ( $r=.23, p=.007$ ), CAT ( $r=.28, p=.003$ ), and cognitive flexibility ( $r=.26, p=.005$ ) indicating that race can explain some of the cognitive variability in the sample. However, when we controlled for education, age, and gender the association was present only on the test of cognitive flexibility ( $r=.22, p=.03$ ). These findings suggest that CNB can be an effective screening tool to identify CF in the elderly.

#### **SESSION 1695 (SYMPOSIUM)**

##### **EXPANDING FRONTIERS OF EVIDENCE IN COMMUNITY-BASED DEMENTIA CARE: ADULT DAY SERVICES**

Chair: *R.G. Logsdon, Psychosocial & Community Health, University of Washington, Seattle, Washington*

Discussant: *S.H. Zarit, Penn State University, University Park, Pennsylvania*

More than 70% of Americans currently diagnosed with dementia live at home in the community. They are able to do so largely due to the support they receive from family members and friends. To facilitate continued care at home, these individuals and their families need access to a range of supportive services. Adult Day Services (ADS) can be a cost-effective approach to providing emotional and health support for individuals with dementia, as well as providing respite to their family caregivers. Despite their potential for improving community-based dementia care, variations in programming and lack of objective evidence for their efficacy have contributed to limitations in funding and availability of these programs. This symposium presents quantitative and qualitative research examining the benefits of adult day services for both individ-

uals with dementia and family caregivers. Dr. Anderson will lead off the discussion with findings from the MetLife National Study, conclusions from a recent think tank, and an updated review of ADS research. Dr. Logsdon will present outcome data from a quasi-experimental investigation of Memory Care and Wellness ADS in Washington State. Dr. Gaugler will describe a mixed methods study to identify respite-enhancing elements and therapeutic activities of ADS and their association with key outcomes. Dr. Sabat will present qualitative data illustrating how ADS participation facilitates social identities and supportive social relationships among people with dementia. Dr. Zarit will conclude with a discussion of the state of the science regarding ADS and recommendations for research to further develop this valuable community-based resource.

### **THE STATE OF ADULT DAY SERVICES: PAST RESEARCH, CURRENT PRACTICES, AND FUTURE DIRECTIONS**

H. Dabelko-Schoeny, K.A. Anderson, *College of Social Work, The Ohio State University, Columbus, Ohio*

Adult day services (ADS) is one of the fastest growing sectors within long-term care, yet research on ADS has lagged behind this growth. In this presentation, the researchers review findings from the MetLife National Study, summarize recent research on ADS, and discuss findings from the national ADS Next Steps Think Tank. In addition to growth, ADS has evolved over the past decade. ADS participants currently have higher acuity levels and present with more complex needs. ADS providers now offer more targeted and specialized services delivered by professional staff. Recent research has also become more advanced and has moved from focusing on ADS attendance, to examining specific interventions. This is a critical step in the development of evidence-informed practices and the notion of ADS as a platform for delivering interventions for costly health care conditions. Building this body of knowledge is essential to the continued expansion of this unique service provider.

### **MEMORY CARE AND WELLNESS: EFFICACY OF SPECIALIZED DEMENTIA CARE IN ADULT DAY SERVICES**

R.G. Logsdon<sup>1</sup>, K.C. Pike<sup>1</sup>, L. Korte<sup>2</sup>, C. Goehring<sup>2</sup>, *1. Psychosocial & Community Health, University of Washington, Seattle, Washington, 2. Washington State Department of Social and Health Services, Olympia, Washington*

This investigation evaluated participant and caregiver outcomes of an innovative new program of dementia-specific adult day services (Memory Care and Wellness Services: MCWS). The objectives of this quasi-experimental investigation were to evaluate whether MCWS improved quality of life, mood, or behavior for participants with dementia and whether caregivers experienced decreased stress, burden, or depression, compared with a no-treatment comparison group. At baseline, mean age of participants was 80 years (range 53-97) and mean MMSE score was 13.74 (sd=6.7). After 6 months, MCWS participants exhibited significantly fewer depressive symptoms ( $p < .05$ ) and a trend toward fewer total behavior problems ( $p < .10$ ), and MCWS caregivers exhibited significantly less distress over behavior problems ( $p < .05$ ) than comparison dyads. Caregivers were highly satisfied with the services. MCWS provides a model of a community-based dementia adult day services, and results provide support for continuing to formalize and expand the MCWS program.

### **ADULT DAY SERVICE UTILIZATION AND OUTCOMES: USING A QUALITATIVE RESEARCH STRAND TO INFORM A MULTI-LEVEL ANALYSIS**

J.E. Gaugler, *University of Minnesota, Minneapolis, Minnesota*

Relying on a sequential exploratory design, the current statewide study of Minnesota adult day service (ADS) programs is in the process of identifying respite-enhancing elements and therapeutic activities of

ADS programs that reduce family caregiver stress, enhance clients' psychosocial well-being, and delay institutionalization over a 12-month period. This presentation will examine how various sources of qualitative information (e.g., participant observation, semi-structured family and ADS staff interviews in a rural and urban ADS setting) will serve to inform subsequent measurement and interpretation of a subsequent, multi-level, longitudinal analysis that will determine whether the respite-enhancing elements and therapeutic activities are linked to caregiver stress, client well-being, and institutionalization in a statewide sample of ADS programs. By providing qualitative and quantitative refinement to a conceptual model of ADS utilization, this presentation will offer important guidance in ascertaining how ADS programs can exert the greatest benefits for clients and their family caregivers.

### **THE ROLE OF THE ADULT DAY CENTER IN FACILITATING EXPRESSIONS OF SELFHOOD AND FRIENDSHIP AMONG PEOPLE DIAGNOSED WITH DEMENTIA**

S.R. Sabat, *Psychology, Georgetown University, Washington, District of Columbia*

Biomedical approaches to understanding people with dementia include the notion, captured in the DSM-IV, that social relationships among people with dementia are negatively affected by the disease process. In addition, in the literature describing the pathology of dementia, it is alleged that due to memory dysfunction, those diagnosed lose aspects of their selfhood. In recent years, both notions have been challenged and it has become clear that the environment in which a person is engaged can be of significant importance. Adult Day Centers can constitute a facilitative social environment for the expression of aspects of selfhood in and for the development of friendships among people diagnosed with dementia. The case study described herein will present qualitative evidence of this important feature of an Adult Day Center environment and propose that such Centers offer invaluable non-pharmacological support for people with dementia and their carers.

## **SESSION 1700 (SYMPOSIUM)**

### **INCREASING THE GERIATRIC HEALTH WORKFORCE ACROSS DISCIPLINES AND LEVELS OF TRAINING**

Chair: *E. Woodhead, GRECC, VA Palo Alto Health Care System, Palo Alto, California*

Discussant: *E.E. Emery, Rush University Medical Center, Chicago, Illinois*

The population of older adults is projected to increase 36 percent in the next decade (Administration on Aging [AoA], 2009). Despite this projected increase, there is a shortage of health care professionals trained to work with older adults (Qualls et al., 2002). Additionally, there are limited opportunities for students to pursue training specific to older adults, as training programs are lacking in both geriatric education and geropsychology training opportunities. Previous research suggests that student training experiences with older adults increase interest in working with this population (Hinrichsen, 2000). Therefore, there is a need to understand how aging content is integrated into the curriculums of psychology students and allied health professionals, as well as how exposure to aging-related topics impacts subsequent attitudes and behavior with regard to working with older adults. The goals of the symposium are to present data on current practices with regards to integrating aging content into the training of psychology undergraduate and graduate students, as well as the training of allied health professionals. This symposium will also highlight ways to enhance aging-related coursework through the use of web-based class activities. We will discuss the importance of introducing aging content early in training and focusing on a lifespan perspective, as well as implications for increasing the geriatric health workforce across disciplines.

## RAISING AWARENESS AT THE UNDERGRADUATE LEVEL: FACILITATING ENGAGEMENT AND REFLECTION ON NURSING HOMES

N.A. Pachana, A. Cody, A. Bakharia, T. Scott, *Psychology, University of Queensland, Brisbane, Queensland, Australia*

Ageing is under-represented within undergraduate psychology curricula, even within developmental courses (Whitbourne & Cavanaugh, 2002). Yet arguably it is difficult to interest students in pursuing work with older adults if prior exposure is lacking. A fourth year undergraduate seminar was designed to encourage facilitation and reflection on a focused ageing topic ("Residential Aged Care: Positive Possibilities", PSYC4341, University of Queensland, Australia). The model of simple custom-designed interactive webpages with blogging tools, integrated into Blackboard and facilitating assignments incorporating students' reflections about the course materials, is presented. This is a Web2.0 solution, allowing tagging of content of diary reflections, as well as allowing for qualitative analyses of diary entry text using the Leximancer (version 3.5) data mining tool (Smith, 2000). Concept maps produced from three cohorts (N=58) revealed a shift over the semester from negative stereotyped themes ("sickness", "lonely", "sad") to more positive complex themes ("staff training", "quality of life", "opportunity").

## EXPOSURE AND EXPERIENCE WITH GEROPSYCHOLOGY CONTENT IN GRADUATE TRAINING: AN EXAMINATION OF STUDENT COMPETENCIES AND CAREER DECISION MAKING

E. Woodhead<sup>1</sup>, E.E. Emery<sup>2</sup>, N.A. Pachana<sup>3</sup>, C. Konnert<sup>4</sup>, B. Edelstein<sup>5</sup>, 1. GRECC, VA Palo Alto Health Care System, Palo Alto, California, 2. Rush University Medical Center, Chicago, Illinois, 3. The University of Queensland, Brisbane, Queensland, Australia, 4. University of Calgary, Calgary, Alberta, Canada, 5. West Virginia University, Morgantown, West Virginia

Geropsychology training experiences may increase interest in working with older adults and help to address the shortage of geropsychologists. Clinical and counseling graduate students in the U.S. (N=376), Canada (N=224), Australia (N=139), and New Zealand (N=25) completed the Pikes Peak Geropsychology Knowledge and Skill Assessment Tool and a geropsychology training questionnaire. Most participants (79.7%) reported that they plan to work with older adults in the future; these individuals had more geropsychology practicum hours ( $p = 0.02$ ), though did not differ on amount of aging-related coursework. Geropsychology knowledge and skills were positively associated with aging-related coursework ( $r = 0.50 - 0.55$ ), practicum hours with older adult clients ( $r = 0.29 - 0.41$ ), and more faculty with aging-related interests ( $r = 0.47 - 0.51$ ). We conclude that practicum experiences are more likely than coursework to interest students in geropsychology, and that geropsychology knowledge and skills are more strongly related to coursework than practicum experiences.

## DEMENTIA SAVVY BUT AGEING NAIVE?

E. Beattie, *Queensland University of Technology, Brisbane, Queensland, Australia*

In response to increases in dementia diagnosis more attention is being given to stand alone dementia-specific postgraduate education. Although timely and necessary, models of dementia education typically assume fundamental gerontology knowledge in students and/or take the view that dementia is a discrete knowledge domain not requiring underpinning by broad ageing-centric knowledge, skills and attitudes. Both positions are arguably flawed given that the inclusion of ageing-focused content in undergraduate health discipline education has been eroded in recent years, aging content is frequently taught by non-gerontology educated and experienced faculty, and dementia is primarily a complex aged-related issue. In this presentation models of how dementia-specific education can be solidly grounded in gerontology and considera-

tion be given to the evaluation of, or pre-requisite, gerontology knowledge are offered. Educators leading development of postgraduate dementia training need to be mindful of these issues to ensure the production of a skilled and responsive dementia specialist cadre.

## SESSION 1705 (SYMPOSIUM)

### LIFE EXPERIENCES, WISDOM, AND WELL-BEING

Chair: M. Ardel, *University of Florida, Gainesville, Florida*  
Discussant: G.E. Vaillant, *Harvard Medical School, Boston, Massachusetts*

This symposium explores the relation between life experiences, wisdom, and well-being through four studies that use both qualitative and quantitative methods. The first two presentations employ samples of younger and older Canadian and US adults to test whether wisdom is positively related to life satisfaction. Qualitative analyses reveal that in contrast to low wisdom scorers, high wisdom scorers tended to be more effective in using autobiographical reasoning to articulate their understanding of wisdom and its contribution to their life satisfaction. They also tended to value perspective-taking and learning from experiences and from others more than low wisdom scorers who tended to mention self-centered attributes as wisdom characteristics. The next presentation provides a test of the MORE wisdom model, which proposes that individuals' with greater Mastery, Openness, Reflection skills, and Emotion regulation are more likely to learn from experiences and grow in wisdom. Indeed, analyses showed that wisdom nominees exhibited higher levels of the four MORE resources than matched control participants with lower wisdom scores when talking about difficult events in their life. The last presentation attempts to explain the pathway between wisdom and well-being. Using a random sample of 1006 older adults and structural equation models with well-being as a latent variable, analyses show that the relationship between wisdom and subjective well-being is completely mediated by resilience, a sense of mastery, and less perceived stress. Overall, the studies suggest that the development of wisdom benefits older adults' subjective well-being through an increase in eudaimonic well-being.

### AUTOBIOGRAPHICAL REASONING AS CONTRIBUTING TO WISDOM AND WELL-BEING

M. Ferrari, N.M. Weststrate, *University of Toronto, Toronto, Ontario, Canada*

The relationship between wisdom and well-being depends in part on how these constructs are measured. In this study, Pavot and Diener's Life Satisfaction Scale was used as a general measure of well-being, and Ardel's 3D-Wisdom Scale (3D-WS) as a measure of wisdom. A Canadian sample of 50 younger (21-30) and 32 older (65-85) adults, equally divided by gender, participated in the study. Participants completed the two scales and were also asked to speak about wise moments in their lives and about wise people they knew. Wisdom score, but not age, was significantly related to life satisfaction. A follow-up qualitative analysis with the 2 highest and 2 lowest scoring participants on the 3D-WS in each age group found no difference in the wisdom stories of these participants, but a striking differences in how effectively they used autobiographical reasoning to articulate their understanding of wisdom and its contribution to their life satisfaction.

### WISDOM IN LIFE: AN EXTREME CASE ANALYSIS FOR UNDERSTANDING THE POSITIVE HUMAN DEVELOPMENT

H. Oh, *University of Florida, Gainesville, Florida*

This study sought to illustrate and clarify how and to what extent wisdom characteristics were understood differently between the top-10 and bottom-10 wisdom scorers on the Three-Dimensional Wisdom Scale in a sample of 50 young (age 21-30) and 50 older (age 65+) adults. The two groups were compared regarding the characteristics of their

wisdom nominees and subjective perception of wisdom. A mixed-method design adopted a nonparametric method, content analysis, and social network analysis for quantitative configuration and qualitative confirmation. The result showed that the top scorers were primarily older people with higher life satisfaction and better health status than the lower scorers. Moreover, the bottom group identified more self-centered attributes as wisdom characteristics, whereas people in the top appreciated the virtue of perspective-taking and learning from experiences and others. Content analysis and network analysis confirmed these distinctions, indicating the importance of altruistic, reciprocal attributes as prerequisites for wisdom development.

#### **LIFE EXPERIENCES AND WISDOM: TESTING A DEVELOPMENTAL MODEL**

J. Glueck, S. Koenig, K. Naschenweng, L. Dorner, I. Strasser, *Alpen-Adria University Klagenfurt, Klagenfurt, Austria*

It is probably undisputed among wisdom researchers that life experience is a necessary ingredient of wisdom. But how exactly do life experiences foster wisdom, and why do the same experiences lead some people to become wiser but not others? The MORE wisdom model (Glück & Bluck, in press) proposes that four personal resources influence how individuals appraise, deal with, and reflect upon life experiences. People high in these resources grow even from difficult challenges. In a first test of the model, wisdom nominees were compared to an age- and gender-parallel control group. They were interviewed about difficult events in their life; transcripts were rated according to the four MORE resources. Wisdom nominees who also scored high on wisdom measures showed higher levels of all four MORE resources than control participants with low wisdom scores. Thus, wisdom seems to develop in individuals oriented toward eudaimonic rather than hedonic well-being.

#### **EXPLAINING THE PATHWAY BETWEEN WISDOM AND WELL-BEING: MEDIATING EFFECTS OF RESILIENCE AND MASTERY**

M. Ardel<sup>1</sup>, D. Jeste<sup>2</sup>, 1. *Sociology and Criminology & Law, University of Florida, Gainesville, Florida*, 2. *University of California, San Diego - Stein Institute for Research on Aging, Department of Psychiatry, Department of Neurosciences, San Diego, California*

Past studies have shown that wisdom, measured as a combination of cognitive, reflective, and compassionate personality qualities, tends to be positively related to subjective well-being in old age. It is not clear, however, what the psychological mechanisms are that might account for this association. We examined the possible mediating effects of resilience, sense of mastery, and perceived stress on the wisdom and well-being relationship, using a randomly selected sample of 1006 older adults ( $M = 77$  years) from the Successful Aging Evaluation Study and structural equation models with well-being as a latent variable. LISREL results confirmed that resilience, mastery, and perceived stress mediated the relationship between wisdom and subjective well-being. Wisdom appears to strengthen older adults' resiliency, sense of control, and ability to cope with aging-related losses, which tend to reduce feelings of stress and increase subjective well-being. Hence, wisdom seems to be a valuable psychological resource in old age.

### **SESSION 1710 (SYMPOSIUM)**

#### **MIXED FEELINGS, MIXED RESEARCH? A DECADE REVIEW OF RESEARCH ON INTERGENERATIONAL AMBIVALENCE**

Chair: *M.J. Hogerbrugge, Faculty of Social and Behavioral Sciences, Utrecht University, Utrecht, Netherlands*

Co-Chair: *J.P. Lendon, University of Southern California, Los Angeles, California*

Discussant: *K. Lüscher, University of Konstanz, Konstanz, Germany*

A decade ago, the Journal of Marriage and Family published a collection of essays on ambivalence in intergenerational relations (i.e. the

psychological and sociological contradictions of family ties). Extending the works of Merton and Barber, Coser, Smelser, and prompted by a pivotal article by Luescher and Pillemer (1998), the special issue discussed the utility and importance of understanding ambivalence in family relations. This 2002 debate on ambivalence stimulated an abundance of excellent research by scholars from all over the U.S. and Europe. The decennial of the JMF publications has inspired the organizers of this symposium to synthesize the past 10 years of research, discuss the empirical and theoretical contributions of ambivalence, and explore future research directions. Bringing together both established – including some of the original contributors of the special issue of JMF – and emerging experts on intergenerational relationships, the symposium will particularly focus on the following questions: What do we know about ambivalence in family relations that we did not know ten years ago? What are the determinants for and consequences of experiencing ambivalence for both parents and children? What progress has been made regarding its conceptualization and measurement? How does the current stream of research and understanding compare to the original theoretical considerations by Luescher and Pillemer, and the 2002 debate initiated by Ingrid Connidis and Julie McMullin? Finally, what gaps in our knowledge remain to be investigated?

#### **DISAGGREGATING THE EFFECTS OF POSITIVE AND NEGATIVE DIMENSIONS OF AMBIVALENCE ON PSYCHOLOGICAL WELL-BEING**

M. Gilligan<sup>1</sup>, J. Sutor<sup>1</sup>, K. Pillemer<sup>2</sup>, 1. *Purdue University, West Lafayette, Indiana*, 2. *Cornell University, Ithaca, New York*

Direct and indirect measures of intergenerational ambivalence have been used to capture the simultaneous positive and negative feelings of parent-adult child relations. The implicit assumption has been that these measures can be used almost interchangeably; however, recent research calls into question whether they are, in fact, measuring the same phenomenon. In this paper we examine whether the effect of indirect intergenerational ambivalence on psychological well-being captures the effect of contradictory feelings, or may instead measure only the negative component of the relationship. Using data from the Within-Family Differences Study, we investigate this question by disaggregating the positive and negative dimensions commonly used to create indirect ambivalence measures to examine what effect adding positive feelings to negative feelings has on mothers' and adult children's psychological well-being. Analyses support the hypothesis that the negative component of the indirect ambivalence measure is, in fact, driving these associations.

#### **INTERGENERATIONAL AMBIVALENCE: IS IT DISTINCT FROM NEGATIVE RELATIONSHIP QUALITY?**

C.S. Hartnett<sup>1</sup>, K. Birditt<sup>1</sup>, K. Fingerman<sup>2</sup>, S.H. Zarit<sup>3</sup>, 1. *University of Michigan, Ann Arbor, Michigan*, 2. *University of Texas, Austin, Texas*, 3. *Pennsylvania State University, State College, Pennsylvania*

Indirect ambivalence is defined as the experience of simultaneously high positive and negative relationship quality with or without awareness of those feelings. Researchers often combine positive and negative relationship ratings to form an indirect ambivalence score. Because there is typically little variation in positive quality and more variation in negativity, indirect ambivalence scores may reflect negative relationship quality. This study examines associations among relationship quality (positive, negative, ambivalence), parent and child characteristics (e.g., demographic characteristics, health, life problems), and well-being to establish whether indirect ambivalence represents a distinct construct. Participants ages 40 to 60 ( $N = 633$ ; 53% women) reported their relationship quality with up to three of their adult children and their parents. Findings revealed that indirect ambivalence scales may reflect variability in negative quality. We propose using a categorical assessment of ambivalence which has distinct associations (compared to negative quality) with individual characteristics and well-being.

### DOES AMBIVALENCE MATTER? INTERGENERATIONAL AMBIVALENCE AND DEPRESSION OVER THE ADULT LIFE COURSE OF OLDER PARENTS

J.P. Lendon, M. Silverstein, *Gerontology, USC, Los Angeles, California*

Research examining intergenerational ambivalence, mixed feelings between adult children and older parents, have found interesting associations between ambivalence and psychological well-being. However, few studies have been able to test the long-term causal relationships. Thus, we investigate the mutual interplay between parents' ambivalence and depression over ten years of their life course. Ambivalence may lead to increases in depression, but being more depressed may increase ambivalence between parents and children. Bivariate dual change score models were used to analyze 900 parent-child dyads from five waves (1988-2005) of the Longitudinal Study of Generations. The best model, both statistically and theoretically, ( $\chi^2=370$ ,  $df=177$ ,  $RMSEA=.035$ ) indicates parents with greater levels of depression experienced a subsequent decline in ambivalence, when controlling for gender, self-rated health, and parent-child similarity and contact. This research provides unexpected evidence for a dynamic link between depression and its influence on the quality of relationships between aging parents and adult children.

### SHIFTS IN INTERGENERATIONAL RELATIONS OVER TIME: A BEHAVIORAL, TYPOLOGICAL, AND LONGITUDINAL APPROACH TO AMBIVALENCE

P.A. Dykstra, N. Schenk, *Sociology, Erasmus University Rotterdam, Rotterdam, Netherlands*

This paper focuses on shifts in adult child-parent relationship type using the first two waves of the Netherlands Kinship Panel Study (NKPS). We employed Latent Transition Analysis to determine the prevalence and predictors of shifts. Ties with a high probability of exchanges of emotional and practical support together with a relatively high probability of conflict over material and personal issues were identified as ambivalent. Less than 5% of all dyads shifted to a different type. Over a period of three years, there is considerably more continuity in adult child-parent relationships than change. Insofar shifts took place, they were most likely from the ambivalent type, as hypothesized. Relationships with mothers and with daughters were more likely to shift from the ambivalent than were relationships with fathers and with sons, which is contrary to Connidis and McMullin's (2002) argument that women face greater constraints managing ambivalence. Moving away prompted a shift from the ambivalent type, which is consistent with the notion that moving away serves as an escape option.

### AMBIVALENCE IN FAMILY TIES OVER THE LIFE COURSE: PROGRESS AND PROSPECTS

I.A. Connidis, *Sociology, University of Western Ontario, London, Ontario, Canada*

Since the publication of the exchange on ambivalence in *Journal of Marriage and Family*, under the Editorship of Alexis Walker, the concept of ambivalence has enjoyed a remarkable degree of attention. In this paper, I review the ways in which the concept of ambivalence has been applied. This review considers both empirical and conceptual applications of the concept, the family relationships and issues to which ambivalence has been applied, and the extent to which the focus has been on psychological versus sociological ambivalence. I conclude my remarks with some thoughts on future prospects for the concept of ambivalence in the study of family ties across the life course. Objectives: Participants will learn about the multi-dimensional uses of the concept of ambivalence. Participants will learn how the concept of ambivalence can be applied to particular family relationships, to families as social domains, and to structured social relations.

### PSYCHOLOGICAL WELL-BEING IN THE OLDEST OLD

Chair: Y. Gondo, *Osaka University, Osaka, Japan*

Co-Chair: D.S. Jopp, *Fordham University, Bronx, New York*

The oldest-old is a largest growing segment of population in developed countries. The research interests however, had been focused mainly on the biological (longevity) and medical (health and illness) dimensions. The purpose of the symposium is shade light on the psychological aspect, especially emotional well-being of oldest-old. Interestingly, some previous studies reported well maintained psychological well-being in oldest old and centenarians, regardless of their decline of physical function and health condition. Still two questions are remains; (a) whether this paradoxical phenomenon is a globally observed; and (b) what are the mechanism and background characteristics responsible for it. At this symposium several papers from different countries will be presented and discuss the mechanisms.

### PSYCHOLOGICAL WELL-BEING IN THE OLDEST OLD AND IT CORRELATION WITH DEVELOPMENT OF GEROTRASCENDENCE

Y. Gondo<sup>1,2</sup>, Y. Masui<sup>2</sup>, H. Inagaki<sup>2</sup>, H. Iwasa<sup>2</sup>, *1. Osaka University, Osaka, Japan, 2. Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan*

The purpose of this study is to test cross-sectional differences and longitudinal change in physical function and psychological well-being for young-old (N=775), old-old (N=419) an oldest-old (N=150). Cross-sectional results showed larger age-related decrease in grip strength, IADL and health status relative to longitudinal results. Smaller or null differences were observed in morale and subjective health. Longitudinal data also showed that decline in psychological well-being variables was smaller in oldest old. Physical function variables predicted psychological well-being variables in young-old and old-old, but not in oldest old. New sample for oldest-old (N=155) showed individual with high scores on the gerotranscendence scale showed higher psychological well-being, regardless of their lower functional status. These findings indicate that the oldest old maintain their psychological well-being and development of gerotranscendence is important contributor for higher psychological well-being.

### DISTAL AND PROXIMAL PREDICTORS OF COGNITIVE STATUS AMONG CENTENARIANS

G.D. da Rosa<sup>1</sup>, P. Martin<sup>1</sup>, I.C. Siegler<sup>2</sup>, L. Poon<sup>3</sup>, *1. Human Development and Family Studies, Iowa State University, Ames, Iowa, 2. Duke University, Durham, North Carolina, 3. University of Georgia, Athens, Georgia*

The purpose of this study was to investigate distal and proximal influences on centenarians' mental status. Using data from the Georgia Centenarian Study, 239 centenarians were interviewed about childhood information, and their mental status was assessed. Proxies provided information about centenarians' education and their personality traits. Results from the structural equation model indicates that the model had an acceptable fit,  $\chi^2$  ( $df = 7$ ) = 17.649,  $p = .0001$ ,  $RMSEA = .07$  and  $SRMR = .06$ . Mother's education ( $\beta = .19$ ,  $p < .05$ ), centenarians' education ( $\beta = 1.06$ ,  $p < .001$ ), and Conscientiousness ( $\beta = .08$ ,  $p < .01$ ) were significantly associated with mental status. Education mediated the relationship between parents' education and mental status, Conscientiousness significantly mediated the relationship between father's education and mental status and education status of centenarians and mental status. In sum, two distal predictors and two proximal predictors positively predicted cognitive functioning in centenarians.

**PREDICTORS OF WELL-BEING IN CENTENARIANS:  
PRELIMINARY RESULTS FROM THE FORDHAM  
CENTENARIAN STUDY**

D.S. Jopp<sup>1</sup>, M. Park<sup>1</sup>, A. Cavanagh<sup>1</sup>, Y. Meschian<sup>1</sup>, M.M. De Feo<sup>1</sup>,  
M.E. Paggi<sup>1</sup>, M. Tropea Fane<sup>2</sup>, S. Raghavan<sup>1</sup>, 1. *Psychology, Fordham  
University, Bronx, New York, 2. Teachers College, New York, New  
York*

Research on very old individuals often focuses on which factors are linked to longevity, but rarely investigates what contributes to well-being at this age. This study examined personal resources (i.e., sociodemographic, financial, social, health) and their link to aging satisfaction (Lawton, 1975). Data included 58 participants of the Fordham Centenarian Study (Mage = 98; range 95-102 years). Reflecting gender differences in survival, 70% of participants were women. Correlational analysis indicated that education was unrelated to aging satisfaction. Income was unrelated, but the ability to afford bills and medications was linked to aging satisfaction. Number of living children was the only social predictor. Health played a central role for well-being, as indicated by strong correlations for number of diseases, pain, fatigue and health restrictions. In sum, when testing the importance of personal resources for well-being, findings suggest that satisfaction with aging in centenarians is most strongly associated with positive health conditions.

**"I AM NOT TIRED OF LIFE" - CENTENARIANS BETWEEN  
THE WILL TO LIVE AND THE END OF LIFE**

K. Boch<sup>1</sup>, C. Rott<sup>1</sup>, V. d'Heureuse<sup>1</sup>, K. Boerner<sup>3</sup>, D.S. Jopp<sup>2,1</sup>, 1. *Institute of  
Gerontology, Heidelberg University, Heidelberg, Germany, 2.  
Fordham University, Bronx, New York, 3. Jewish Home Lifecare,  
Research Institute on Aging, New York, New York*

Being 100 years old is a challenging situation, not only because of physical restrictions, cognitive deficits and (often times) reduced social participation, but also because of being so close to the end of life. In the present study, we investigated what centenarians think about death and dying and how they deal with their own finitude. Data from 35 centenarians of the ongoing Second Heidelberg Centenarian Study was used. Participants were asked a series of open questions and we used content analysis to evaluate their answers. The majority of centenarians were prepared for their end (78%), and 67% believed in a life after death. At the same time, 88% indicated that they would have no desire to die. In sum, the preliminary data suggests that the centenarians actively deal with their impending end, but none of the respondents indicated that the end of life was threatening.

**THE ROLE OF THE APOE4 GENE AND FATIGUE  
INFLUENCING LONELINESS: FINDINGS FROM THE  
GEORGIA CENTENARIAN STUDY**

R.B. Hensley<sup>1</sup>, P. Martin<sup>2</sup>, S. Jazwinski<sup>3</sup>, L. Poon<sup>4</sup>, 1. *Psychology, The  
College of Saint Scholastica, Duluth, Minnesota, 2. Iowa State  
University, Ames, Iowa, 3. Tulane University, New Orleans, 4.  
University of Georgia, Athens, Georgia*

The purpose of this study was to analyze the role that the APOE4 gene as well as fatigue played in participants in the Georgia Centenarian Study. These variables were analyzed to determine whether they predicted loneliness. Blocked regression analyses were utilized in this study. In the first block, we included gender, ethnicity, current marital status, and past schooling. In our second block, we added the APOE4 allele, followed by a fatigue summary score in the third block. Results indicated that APOE4 was significantly predicted loneliness,  $\beta = .277$ ,  $p < .05$ . In addition, fatigue was a significant predictor of loneliness,  $\beta = .40$ ,  $p < .01$ . The more fatigued centenarians were, the higher the level of loneliness. These results not only add to our understanding of the link between a genetic-based variable (APOE4) and loneliness, but also provide new insight into how fatigue influences loneliness as well.

**SESSION 1720 (SYMPOSIUM)**

**QUALITY OF CARE FOR PEOPLE WITH DEMENTIA  
ACROSS CARE SETTINGS: INTERNATIONAL  
PERSPECTIVES**

Chair: A. Pot, *Netherlands Institute of Mental Health and Addiction, Utrecht, Netherlands, VU University, Amsterdam, Netherlands*  
Co-Chair: M. Downs, *Bradford Dementia Group, Bradford University, Bradford, United Kingdom*  
Discussant: B. Bowers, *University of Wisconsin-Madison, Madison, Wisconsin*

Quality of care for people with dementia is now an international priority. It is widely recognized that quality of care for people with dementia requires attention to interactions between care staff and residents and engagement in meaningful activities. This in turn requires a supportive environment and an adequately prepared workforce. It is now timely to adopt a critical perspective on the methods we use both to assess and to develop the quality of care provided across a range of settings. This symposium draws on research on quality of care for people with dementia conducted in two countries: the Netherlands and England. The first presentation challenges the way we study the effects of small-scale, home-like nursing home settings and proposes that it is more meaningful to talk in terms of small scale care characteristics rather than small scale care home settings. The second presentation examines the relationship between small scale care characteristics and residents' involvement in activities. The third presentation challenges us to take a more sophisticated approach to examining interactions in care settings such that we move beyond counting the number of interactions and assess the extent to which these interactions address psychological needs. The fourth presentation examines an emerging area of interest in dementia care, workforce development in dementia care for hospital staff, exploring staff perspectives on the appropriateness of training.

**FOCUS ON SMALL-SCALE CARE FOR PEOPLE WITH  
DEMENTIA**

A. Pot<sup>1,2</sup>, B.M. Willems<sup>1,2</sup>, D. Smit<sup>1,2</sup>, J.D. Lange<sup>1</sup>, 1. *Program on Aging, Netherlands Institute of mental health and Addiction, Utrecht, Netherlands, 2. VU University, Amsterdam, Netherlands*

Small-scale care refers to care in a home-like environment, focusing on residents' psychological well-being rather than on physical needs. The question that will be discussed in this presentation is: To what extent is small scale care provided in different types of long-term care facilities for people with dementia? Data from the Netherlands Living Arrangement for people with Dementia (LAD) study are used. The LAD-study is an ongoing monitor in a variety of living arrangements on staff ratio, characteristics of the organization of care, quality of care, residents' quality of life, and well-being of care staff. Measurement cycles are repeated once every two years, those in 2009 and 2011 are completed. Results show that there is much variation in the amount of small scale care provided within the same type of long-term care facilities. There is also much overlap between the amount of small scale care provided by different long-term care facilities for people with dementia. Some regular nursing homes provide even more small scale care as some group living homes do. We will discuss the importance and consequences of this finding, not only for scientific research but also for daily practice.

**SMALL SCALE DEMENTIA CARE AND ACTIVITY  
INVOLVEMENT PEOPLE WITH DEMENTIA**

D. Smit<sup>1,2</sup>, B.M. Willems<sup>1,2</sup>, J.D. Lange<sup>1</sup>, A. Pot<sup>1,2</sup>, 1. *program on aging, Netherlands institute of mental health and addiction, Utrecht, Utrecht, Netherlands, 2. VU University, Amsterdam, Netherlands*

Long term dementia care is increasingly organized in small-scale care settings. In these settings a homelike environment is created, and activities are organized around daily household routines. While some

family caregivers are enthusiastic about this activity approach, others wonder whether residents receive less options for activity involvement. The purpose of this study was to look into the relationship between indicators of small scale care and activity involvement, using data of 1327 residents of 136 living arrangements for people with dementia received from the LAD-study. Both general activity involvement, involvement in preferred activities, and involvement in different types of activities were studied. A positive relationship between small scale care and activity involvement was found, as well as a serious lack of activity involvement of older, male and dependent residents in small and larger scale care.

#### **THE EXTENT TO WHICH STAFF INTERACTIONS ADDRESS PEOPLE WITH DEMENTIAS' NEEDS AND EFFECT THEIR WELLBEING**

B.M. Willems<sup>1,2</sup>, D. Smit<sup>1,2</sup>, L. Arnold<sup>1</sup>, J.D. Lange<sup>1</sup>, A. Pot<sup>1,2</sup>, *1. Program on aging, Netherlands institute of mental health and addiction, Utrecht, Netherlands, 2. VU University, Amsterdam, Netherlands*

There is a growing awareness that long term care for people with dementia should be centered around fulfilling their needs for attachment, comfort, inclusion, identity, and occupation to provide high quality of care. The day-to-day interactions with care staff are crucial to these needs being met. The aim of this study therefore was to explore the extent to which interactions of healthcare staff with people with dementia address these needs and how this effects residents' well-being. Data were used from the LAD-study, including 53 people with dementia in 9 arrangements in the Netherlands. This study showed that some needs of people with dementia are more often addressed by care staff than others. While the needs that are less often met, such as the need for identity, attachment, and inclusion, seem to have a more positive impact on residents' wellbeing. Consequences for care staff training and daily practice will be discussed.

#### **IMPROVING QUALITY OF ACUTE HOSPITAL CARE FOR PEOPLE WITH DEMENTIA: A MODEL FOR WORKFORCE DEVELOPMENT**

C. Surr, J. Crossland, E. Malet, J. Robins, M. Downs, *Bradford Dementia Group, University of Bradford, Bradford, United Kingdom*

People with dementia occupy a significant proportion of acute care beds. Acute care staff often lack knowledge and skills to care for them. As a result people with dementia experience prolonged hospital stays and may be prescribed antipsychotic drugs. Staff education and training is therefore vital. This pilot study implemented an acute workforce development model in two National Health Service general hospitals. Seventy-five ward staff across the two hospitals received Foundation level training, 50 received additional Intermediate level training and were developed as learning facilitators. Focus groups were conducted with those trained. The sample was primarily female and comprised of nurses. They discussed perceived impact of the training on their knowledge and skills to deliver person-centered dementia care and its implementation in their everyday practice. After attending this session participants will be able to discuss a model for acute workforce development and its perceived impact on staff knowledge and skills.

### **SESSION 1725 (SYMPOSIUM)**

#### **THE AGE-RELATED POSITIVITY EFFECT: PAST, PRESENT, AND FUTURE PERSPECTIVES**

Chair: *A.E. Reed, Department of Psychology, Stanford University, Stanford, California*

Discussant: *M. Mather, University of Southern California, Los Angeles, California*

Mounting evidence supports the notion of an age-related positivity effect in attention and memory, whereby processing biases shift across adulthood from negative toward positive information. However, key

questions regarding the contours and moderators of the effect remain unanswered. This symposium will address these issues through cutting-edge empirical investigations and a meta-analytic perspective. We will present novel research on the roles of health and culture, the neural correlates, and the generalizability and robustness of the positivity effect. First, English and Carstensen will discuss the influence of health status on the positivity effect in decision making. In their study, healthy but not unhealthy older adults showed age-related positivity effects while reviewing information for health-related decisions. However, health did not moderate positivity for non-health decisions. Then, Luong and Charles will present research on the positivity effect for memories of emotion-inducing social interactions in European-Americans versus Chinese-Americans, revealing that the recall of positive versus negative emotions depends critically on the interaction between age and culture. Next, Ford and colleagues will present an event-related functional neuroimaging study that demonstrates age differences in recruitment of prefrontal and posterior brain regions during the retrieval of positive versus negative autobiographical memories. Reed and colleagues will then present a meta-analysis of the positivity effect literature, illustrating that while the positivity effect is robust and generalizable, the size of the effect is moderated by attentional constraint, experimental paradigm, and older-versus-younger age disparity. To conclude, Mather will discuss these findings with respect to the existing literature, and suggest future research directions.

#### **DOES POSITIVITY OPERATE WHEN STAKES ARE HIGH?: THE ROLE OF HEALTH IN OLDER ADULTS' DECISION-MAKING**

T. English, L. Carstensen, *Psychology Department, Stanford University, Stanford, California*

Past research suggests that older adults prioritize emotional goals when making health-related decisions, and therefore they tend to show positivity in their information processing. However, it is not clear whether these results generalize to less healthy samples. Unhealthy older adults may be more motivated to make effective health related decisions because their choices may have more immediate and serious consequences. As a result, they may review health information in a more balanced manner. We examined the role of health status in older adults' review of information in hypothetical decision scenarios. As expected, unhealthier adults showed less age-related positivity than healthier adults when reviewing information during health related decisions. However, health status was not related to positivity for non-health related decisions. These results are consistent with a motivational account of the positivity effect and suggest that older adults can temporally override their chronic emotion focus in response to situational demands.

#### **AGE AND CULTURAL DIFFERENCES IN POSITIVELY-BIASED EMOTIONAL MEMORIES FOR A NEGATIVE SOCIAL EXCHANGE**

G. Luong, S.T. Charles, *Psychology and Social Behavior, University of California, Irvine, Irvine, California*

The current study examined age and cultural differences in emotional memories for a negative social interaction with a confederate in a sample of 159 adults [80 younger (18-28 years old), 79 older (60-88 years old)]. We also examined how appraisals of the task and confederate changed after one week. Results showed that European Americans displayed a positivity bias not present among Chinese Americans. Moreover, the positivity bias varied by age among European Americans: older European Americans remembered experiencing less negative emotions than were actually reported and younger European Americans recalled experiencing more positive emotions than were actually reported during the interaction. There were no age differences in changes in the appraisals of the task, but European Americans appraised the task more favorably and Chinese Americans appraised the task less favorably after

one week. Both older adults and Chinese Americans appraised the confederate less favorably across the week.

### **AGE-RELATED CHANGES IN THE NEURAL CORRELATES OF POSITIVE AND NEGATIVE AUTOBIOGRAPHICAL MEMORY RETRIEVAL**

J.H. Ford<sup>1</sup>, K.S. Giovanello<sup>2</sup>, E. Kensinger<sup>1</sup>, *1. Dept. of Psychology, Boston College, Chestnut Hill, Massachusetts, 2. University of North Carolina, Chapel Hill, Massachusetts*

Research suggests that significant age-related changes are apparent in autobiographical memory retrieval when the qualitative content of the memories is examined. One such change is a tendency for older adults to rate personal events as more positive than young adults (the positivity effect). However, this effect has not been shown consistently in the autobiographical memory literature. The current studies were conducted to identify circumstances where the positivity effect does and does not emerge. Additionally, event-related functional neuroimaging studies were used to examine the neural networks recruited by emotional autobiographical memory retrieval in healthy young and older adults. Compared to young adults, older adults recruit the medial prefrontal cortex to a greater extent during emotional relative to neutral memory retrieval. Understanding how healthy aging influences older adults' autobiographical memory retrieval provides valuable insight into how memory representations and emotion regulation change with time and experience.

### **META-ANALYSIS OF THE AGE-RELATED POSITIVITY EFFECT**

A.E. Reed<sup>1</sup>, L. Chan<sup>1</sup>, J. Mikels<sup>2</sup>, *1. Department of Psychology, Stanford University, Stanford, California, 2. DePaul University, Chicago, Illinois*

Increasing evidence points to an age-related positivity effect, which refers to a shift across adulthood in the ratio of positive-to-negative information processed in attention and memory. Many empirical studies have examined the positivity effect, but their inconsistent findings have raised questions about the effect's robustness, reliability, and moderators. To address these issues, we conducted a meta-analysis of 59 separate empirical studies (total N = 4390) selected from peer-reviewed journal articles incorporating age comparisons of memory and/or attention for positive and negative stimuli. Results indicate that the positivity effect is reliable and robust, with a small-to-medium overall effect size, though moderated by various methodological factors: The positivity effect size is relatively larger for studies with unconstrained (versus constrained) attention, wider (versus narrower) age comparisons, and measures of memory (versus attention). These results have direct implications for theoretical and empirical perspectives on lifespan developmental changes in the processing of emotional information.

## **SESSION 1730 (SYMPOSIUM)**

### **THE EXPERIENCES OF DIRECT CARE WORKERS: QUALITY OF CARE AND WORKFORCE ISSUES**

Chair: *K. Boerner, Jewish Home Lifecare/Mount Sinai School of Medicine, New York, New York, Mount Sinai School of Medicine, New York, New York*

Discussant: *C. Beck, University of Arkansas, Little Rock, Arkansas*

This symposium focuses on the experience of direct care workers (i.e., certified nursing assistants in the nursing home and home health aides in the community). The three presentations each provide a unique perspective on how front-line staff respond to work-related challenges, and contribute to identifying aspects that can become barriers to a positive work experience. This knowledge has important implications for delivery and quality of elder care, as well as for employment satisfaction and stability among direct care workers in nursing home and home care settings. Lack of attention to

and support for dealing with work-related challenges may contribute to the extremely high turnover rate in this population. The first presentation by Patricia Parmelee and colleagues focuses on nursing assistants in nursing home settings, and delineates race/ethnicity-related differences and similarities in communications between nursing staff and residents during daily care routines. In the second presentation, Sandy Butler and Mark Brennan-Ing concentrate on stresses and challenges experienced by home care aides and identify characteristics of both aide and the home care agency as predictors of job retention in this group. The third presentation by Kathrin Boerner includes both nursing home and homecare staff, and centers on direct care workers' responses to patient death. Findings depict grief symptoms experienced by staff, and show associations between grief- and employment-related outcomes. Quality of care and workforce implications as well as recommendations for how to better meet staff support needs will be discussed.

### **RACIAL/ETHNIC DIFFERENCES IN CNAS' COMMUNICATION WITH RESIDENTS DURING CARE ROUTINES**

P.A. Parmelee<sup>1</sup>, R.S. Allen<sup>1</sup>, T. Stem<sup>1</sup>, L. Burgio<sup>2</sup>, *1. Center for Mental Health & Aging, The University of Alabama, Tuscaloosa, Alabama, 2. University of Michigan, Ann Arbor, Michigan*

Resident-staff relationships are a key aspect of overall quality of long-term care. There is some evidence, largely qualitative, that race/ethnicity can influence nursing assistants' (NAs') interactions with residents in complex ways. This presentation is an exploratory look at that question in quantitative fashion. Using data from an intervention targeting NAs' verbal communication skills, we analyzed observer ratings of staff-resident interactions during daily care routines. Although overall rates of communications did not differ, Non-Hispanic White NAs used significantly more specific (care-related) communications; African Americans (AAs) tended toward more general, non-care-related statements. Overall differences in rated quality of communication were minimal but some effects emerged for number and rate of positive vs. unhelpful statements. We found few differences as a function of resident race, but were limited by the relatively small number of AA residents. Discussion will address implications for quality of care, NAs' work experience, and staff training approaches.

### **A MIXED-METHOD ANALYSIS OF JOB RETENTION AMONG HOME CARE AIDES**

S. Butler<sup>1</sup>, M. Brennan-Ing<sup>2</sup>, *1. University of Maine, Orono, Maine, 2. AIDS Community Research in America, New York City, New York*

People prefer to age in place. With increasing numbers of elders needing personal care, the demand for home care aides is expanding at the same time that home care agencies face high turnover rates. Based on data from a longitudinal, mixed-method study, this paper explores the experiences of 261 home care aides in a rural state. Six factors predicted longer job tenure (R<sup>2</sup>=.363): older age, living rurally, higher wages, higher autonomy and personal accomplishment scores, and lower physical function. Discriminant function analysis revealed significant differences between workers at for-profit compared to not-for-profit companies; workers at the former tended to be younger, have shorter job tenures, and higher personal accomplishment scores. Thematic analysis of telephone interviews revealed significant differences (p<.05) in reported experiences for short-term versus long-term workers, with low compensation and agency communication being more problematic for the former. Implications for improving job conditions and increasing retention will be highlighted.

## **WHEN A PATIENT DIES: RESPONSES OF FRONT-LINE STAFF IN NURSING HOMES AND HOMECARE**

K. Boerner<sup>1</sup>, O.R. Burack<sup>1</sup>, S.E. Mock<sup>2</sup>, 1. *Jewish Home Lifecare/Mount Sinai School of Medicine, New York, New York*, 2. *University of Waterloo, Waterloo, Ontario, Canada*

This study examined how direct care workers respond to patient death and the types of support they may need. Participants were 100 certified nursing assistants (CNAs) and 70 home health aides (HHAs) who lost a patient in their care about two months before. Data collection involved comprehensive semi-structured in-person interviews. Findings demonstrate that experiences of CNAs and HHAs reflect many of the core grief symptoms and expressions typically reported by family caregivers. They further show that experiencing more intense grief is related to: a closer relationship with the patient, a more meaningful work experience, depersonalization, and taking sick days around the time of death. Findings suggest that close relationships and grieving the loss of a patient are important features of a meaningful work experience, and that burnout symptoms and absenteeism can be negative side effects when staff bereavement following patient death is not addressed and supported in the work place.

## **SESSION 1735 (SYMPOSIUM)**

### **GSA 2012 SYMPOSIUM SUBMISSION TRANSLATION SCIENCE: IMPLEMENTING SOCIAL-BEHAVIORAL INTERVENTIONS FOR ELDERLY AND THEIR CAREGIVERS IN THE "REAL WORLD"**

Chair: *L.D. Burgio, University of Michigan, Ann Arbor, Michigan*  
Discussant: *E. Wethington, Cornell University, Ithaca, New York*

Translational research in the social sciences is at a crossroad in several respects. One is the burgeoning number of evidence-based interventions available for a host of physical and emotional problems. Second is the increasing demand by federal agencies, community-based health systems, and clinicians for evidence-based interventions that can be used in the real world. However, the cross in the road, and the main barrier, is the absence of commonly accepted strategies for translating interventions for use in the community. Presenters in this session will discuss the translational strategies used in their attempts to implement social-behavioral interventions for Elders and their caregivers in real world settings. The first two presenters will discuss translation and implementation of comprehensive AD caregiver support programs (REACH OUT and NYUCI) to Area Agencies on Aging. The third presenter will discuss the efficacy and potential for large-scale translation of programs to improve the care of elders in assisted living facilities (STAR-ALR). This presenter will focus on adherence to the RE-AIM model of translation. The fourth presenter will discuss a home-based tailored activity program (TAP) designed to reduce agitation and improve the quality of life of dementia patients. In this study, normalization process theory was used to adapt the program for use in a chronic care hospital. The fifth presenter will discuss the translation of an evidence-based collaborative care model to address the needs of both AD patients and their caregivers (PREVENT) for feasible use in a primary care clinic. All of the presenters will include discussion of treatment fidelity and barriers to implementation.

### **LESSONS LEARNED FROM TRANSLATING THE NYU CAREGIVER INTERVENTION INTO THE COMMUNITY**

M.S. Mittelman, *Psychiatry, NYU Langone School of Medicine, New York, New York*

The NYU Caregiver Intervention (NYUCI) was evaluated with a randomized controlled trial that demonstrated that improving social support conveyed multiple benefits for both the spouse-caregiver and the person with Alzheimer's disease. The structure of the NYUCI permits flexibility of content, making it ideal for diverse cultures. The NYUCI is now being replicated in community settings with training and ongoing

consulting by the original research team. Translating an intervention from the research environment to the community posed unforeseen challenges. It was not possible to adhere to the original eligibility criteria or the time frame – 6 counseling sessions within 4 months, and agencies were unrealistic about the number of caregivers they could enroll and the clinical skills necessary. The lack of control groups in the demonstration projects makes it difficult to draw quantitative conclusions, although caregivers reported satisfaction, improvement in coping and reduced strain due to positive involvement of family members.

### **PROVIDING CARE TO THE CAREGIVER: IMPLEMENTING THE PREVENT MODEL IN A MEMORY CARE CLINIC**

M. Austrom<sup>1,2,3</sup>, C.A. Alder<sup>2</sup>, C. Callahan<sup>1,3</sup>, M. Boustani<sup>1,3</sup>, A. Perkins<sup>3</sup>, H.C. Hendrie<sup>1,3</sup>, G. Sachs<sup>1,3</sup>, 1. *Indiana University School of Medicine, Indianapolis, Indiana*, 2. *Indiana Alzheimer Disease Center, Indianapolis, Indiana*, 3. *Indiana University Center for Aging Research, Indianapolis, Indiana*

Effective management of AD requires comprehensive care for both patients and caregivers. The PREVENT study, a randomized control trial in primary care at Wishard Health Services (WHS), demonstrated the effectiveness of collaborative care to address the needs of AD patients and caregivers. In 2007, an interdisciplinary team using complex adaptive theory and the reflective adaptive process translated the PREVENT model into a locally sensitive and self-sustaining clinical program at WHS. The team distilled the PREVENT intervention to its essential components in order to adapt the model to clinical care at WHS while maintaining fidelity to the proven intervention. The Healthy Aging Brain Center (HABC) was developed and began delivering care in 2008. With ongoing support of WHS leadership, implementation of the PREVENT model in HABC has resulted in effective patient management and care and reduced caregiver burden. Support provided by IP-RISP R24MH080827. Dr. Austrom was also supported by NIH-P30AG10133.

### **TRAINING STAFF IN ASSISTED LIVING RESIDENCES TO IMPROVE DEMENTIA CARE: IT DOESN'T GET ANY MORE "REAL WORLD" THAN THIS**

L. Teri<sup>1</sup>, G. McKenzie<sup>2</sup>, D.M. La Fazia<sup>1</sup>, K.C. Pike<sup>1</sup>, J. vanLeynseele<sup>1</sup>, 1. *U. Washington — School of Nursing, Seattle, Washington*, 2. *Oregon Health Sciences University, Ashland, Oregon*

The Seattle Protocols, a series of evidence-based programs to improve the care of older adults with dementia, have been implemented throughout the US and abroad. This presentation provides new data on STAR, Staff Training in Assisted-living Residences, recently investigated in 20 Assisted living residences (130 resident-staff dyads) in a two-pronged trial to examine STAR efficacy and potential for large-scale translation. Results include: (1) How each STAR-ALR met treatment fidelity criteria (program design, training, delivery, receipt and enactment) and (2) How STAR met criteria for implementation and dissemination (RE-AIM): Reach: enrolled sites were representative of U.S. ALRs; Effectiveness: statistically significant improvement on resident depression, behaviors and anxiety; staff satisfaction and skill; Adoption/Implementation: STAR skills were consistently used by staff; 89% reported that dementia care improved with use of STAR; and Maintenance: 100% recommended STAR training and intended continue use. Our findings support further dissemination and large-scale translation of STAR.

### **TRANSLATING THE TAILORED ACTIVITY PROGRAM IN A CHRONIC CARE HOSPITAL FOR DEMENTIA PATIENTS: CAN WE IMPROVE STANDARD CARE WITH AN EVIDENCE-BASED PROGRAM**

L. Gitlin, *Hopkins University, Baltimore, Maryland*

The Tailored Activity Program (TAP), a home-based intervention for dementia patients can reduce agitation and improve life quality. TAP

involves identifying preserved capabilities, interests and deficits from which activities are matched to patients' profiles. We apply Normalization Process Theory (NPT) to describe TAP's translation for delivery in a chronic care hospital specializing in geropsychiatric conditions for which behavioral disturbances are common and difficult to manage. NPT identifies 4 factors for successful integration of interventions into practice: coherence (making sense of TAP), team composition/engagement; collective action enabling implementation, and reflexive monitoring (benefit/cost appraisals). Clinical team members did not initially differentiate TAP from current practice (low coherence) yet commitment and engagement was high. Understanding how TAP affected daily work and staffing patterns involved collective action to evaluate compatibility, training needs, and costs. Additional challenges included translating TAP from an 8 session/4-month intervention for delivery in 21 days and initiating TAP upon admission.

### **THE REACH OUT CAREGIVER SUPPORT PROGRAM: DISSEMINATION AND CULTURAL ADAPTATION**

L.D. Burgio, *University of Michigan, Ann Arbor, Michigan*

REACH OUT is a comprehensive AD caregiver support program tailored for use in Area Agencies on Aging (AAAs). The program is a translation of the REACH II clinical trial protocol that emerged through a partnership between The Alabama Department Of Senior Services and The University Of Alabama in 2005. Since the publication of the original REACH OUT translation trial in 2009 the program has been implemented in North Carolina, Vermont and Puerto Rico. The presentation will focus on adaptations of the program made at each of the three sites, with emphasis placed on modifications made to the program due to significant cultural differences at the Puerto Rico site.

## **SESSION 1740 (PAPER)**

### **COGNITIVE PROCESSES**

#### **DO WE NEED TO WAIT FOR 9 YEARS? — REPEATED ASSESSMENTS OF COGNITIVE FUNCTIONS WITHIN ONE DAY VS. OVER 9 YEARS**

H.H. Dodge<sup>1,2</sup>, C. Wang<sup>2</sup>, A.I. Ford<sup>3</sup>, J. Heidebrink<sup>2</sup>, R. Albin<sup>2</sup>, B. Giordani<sup>2</sup>,  
1. *Oregon Health & Science University, Portland, Oregon*, 2. *University of Michigan, Ann Arbor, Michigan*, 3. *Louisiana Tech University, Ruston, Louisiana*

Background: Detecting subtle cognitive changes during the pre-symptomatic phase of dementia is often difficult by using traditional neuropsychological tests and could require a long duration of follow-up before any changes are observed. Computerized neuropsychological tests administered multiple times one day have been proposed to be more sensitive to subtle cognitive changes and thereby aid in detecting pre-symptomatic dementia. Objective: We assessed whether trajectories of cognitive functions obtained over 9 years using traditional neuropsychological tests are associated with trajectories of repeated assessments conducted during one day using Cogstate computerized tests. Methods: 83 community volunteers free from dementia at baseline were followed on average 7.39± 0.40 years with annual assessments. At the end of the follow-up, subjects completed subtests of Cogstate computerized battery 4 times during one day. Joint latent trajectory models were used to examine associations between trajectories of cognitive test scores collected over 9 years and those collected within one day. Results: We identified three latent trajectories of CERAD delayed recall scores as the best model using 9 years of data and three latent trajectories of Cogstate paired associate learning error scores (CPAL, visual memory) for the data collected within one day. Subjects who showed the greatest learning effects and the highest baseline delayed recall scores predominantly (99.9%) belonged to the trajectory of the lowest error scores in CPAL. Conclusions: Administration of computerized tests at multiple times within a day could be a cost effective means of identi-

fying past longitudinal trajectory of cognitive performance and aid in detecting pre-symptomatic dementia.

### **LEARNING FROM ONE'S MISTAKES: EFFECTS OF AGE AND ERROR PROCESSING**

N.D. Anderson<sup>1,2</sup>, A. Cyr<sup>1,2</sup>, 1. *Rotman Research Institute, Baycrest, Toronto, Ontario, Canada*, 2. *University of Toronto, Toronto, Ontario, Canada*

Most of us believe that we learn from our mistakes, but neuropsychological research, including our own, shows that errors hinder older adults' memory for target information and recommends that errors be avoided during learning. However, we also have evidence that committing errors during episodic learning can be beneficial to older adults' memory performance. Here, we introduce our theoretical framework of error processing in episodic learning that accounts for the conflicting behavioural findings noted above. Inspired by the work of Craik and of Braver on age-related differences in cognitive control, we argue that the learning context can invoke either self-initiated control processes to gate errors from further processing, or reactive control processes to use errors to aid memory for correct information; moreover, younger and older adults differ in how they process errors during learning, with older adults relying more on reactive control, in contrast to younger adults who can flexibly deploy both modes of control. We describe two studies in which we manipulate the learning context and correspondingly the degree to which learning errors benefit later memory for correct information in younger and older adults. We argue that learning errors that serve as 'stepping stones' to correct information, thereby invoking reactive control processes, support memory, while other errors only cause interference needing to be inhibited via self-initiated error control. These results turn memory rehabilitation practice on its head by identifying the contexts in which learning errors should be harnessed in the service of memory.

### **CARDIOVASCULAR AND PSYCHOSOCIAL INFLUENCES ON COGNITIVE FUNCTION IN THE S.O.C.A. STUDY**

R.C. Sims<sup>1</sup>, D.T. Mwendwa<sup>2</sup>, 1. *University of Delaware, Newark, Delaware*, 2. *Howard University, Washington, District of Columbia*

Research that has explored differences in cognitive function between African American (AA) older adults and their White counterparts has largely ignored variability in cognitive function within the AA population. Evidence suggests that AAs may experience accelerated cognitive aging as a function of biological, psychological, and social factors. This biopsychosocial perspective supports the notion that cognitive function among AAs may be influenced by factors such as cardiovascular risk and poor psychosocial outcomes. An understanding of the role of each of these influences is key to characterizing the trajectory of cognitive function for AAs across the lifespan. The HealthPARC Study of Cognitive Aging (S.O.C.A.) aims to explore variability in cognitive function among middle age and older AAs across a number of biological, psychological, and social factors. S.O.C.A. is a cross-sectional, community-based study of 200 middle age and older African Americans (mean age=59.31, SD=11.49) in the Washington, DC metropolitan area. Specifically, it was hypothesized that cognitive function among middle age AAs (40-59) and older AAs (60+) would not vary significantly due to existing cardiovascular and psychosocial risk factors in the middle age group. Participants completed cognitive and psychosocial measures, provided self-reported demographic and health information, as well as, measures of blood pressure and obesity. Preliminary results demonstrated no significant differences in cognitive function between age groups in the domains of verbal memory, working memory, and letter fluency. The influence of cardiovascular and psychosocial factors on cognitive performance for middle age participants will be discussed.

## COGNITIVE AND CEREBRAL RESERVE MODIFY THE RELATIONSHIP BETWEEN CEREBELLUM VOLUME AND COGNITION

E. Vuoksima<sup>1,2</sup>, M.S. Panizzon<sup>1</sup>, C.E. Franz<sup>1</sup>, L. Eyler<sup>1,3</sup>, C. Fennema-Notestine<sup>1</sup>, M.J. Lyons<sup>5</sup>, A. Dale<sup>1</sup>, W.S. Kremen<sup>1,4</sup>, 1. *University of California San Diego, La Jolla, California*, 2. *University of Helsinki, Helsinki, Finland*, 3. *VA San Diego Healthcare System, San Diego, California*, 4. *VA San Diego Healthcare System, La Jolla, California*, 5. *Boston University, Boston, Massachusetts*

Not many studies have investigated whether the effect of cognitive/cerebral reserve is evident before people become elderly and/or develop dementias. Also, the cerebellum has been studied primarily with respect to motor function, but it is understudied with respect to cognition. We studied the association between cerebellar gray matter volume and general cognitive ability and whether their association is modified by measures of cognitive and cerebral reserve among 516 middle-aged (51–60 y.) male twins. General cognitive ability at age 20 and at midlife was measured with Armed Forces Qualification Test (AFQT). We used age 20 AFQT as a measure of cognitive reserve and cortical gray matter volume as a measure of cerebral reserve. The outcome variable was midlife AFQT. All analyses were adjusted for family relatedness (twins within families), age, scanner effects, and intracranial volume. Rather than main effects, interactions are required for confirmation of the reserve hypotheses. A cortical gray matter volume X cerebellar gray matter volume interaction was a significant predictor of middle-age general cognitive ability. Also, the age 20 AFQT X cerebellar gray matter volume interaction term was a significant predictor of middle-age AFQT when we compared the upper and lower quartiles based on age 20 AFQT scores. These interactions showed that the size of cerebellum was related to midlife cognitive ability, but only among individuals with lower levels of cognitive or cerebral reserve. Thus, the effect of reserve can already be observed in non-elderly, middle-aged adults.

## AN ERP STUDY OF SUCCESSFUL EPISODIC RETRIEVAL: DIFFERENT BRAIN RESPONSES WITH MATCHED PERFORMANCES BETWEEN MILD COGNITIVE IMPAIRMENT AND NORMAL OLDER ADULTS

J. Li, *Institute of Psychology, Chinese Academy of Sciences, Beijing, China*

Introduction Mild Cognitive Impairment (MCI) is a transitional stage from normal aging to dementia. The objective of this study was to determine whether a source retrieval ERP is an effective neural marker for differentiating MCI from normal older adults while their behavioral performances were matched which may have implications for identifying seniors at risk for cognitive decline. Methods A source memory task was conducted on 16 aMCI and 15 healthy older adults. Event-Related Potentials (ERPs) were recorded during retrieval phase. Memory performances were matched between the two groups by manipulating the number of items presented for each study session. Results The behavioral results showed that both source memory and item memory performances were perfectly matched between aMCI group under easy condition and healthy elderly group under hard condition. While under such case, the ERP results showed remarkable differences between the two groups. First, the right-lateralized positive-going old new effect significantly decreased for aMCI group compared to control group, especially on the parietal sites. Second, the negative left-lateralized old new effect extended to the posterior sites of right hemisphere only in aMCI group but not in control group. Conclusions The results showed that source retrieval ERP is an effective neural marker for differentiating MCI from normal older adults even when they have matched task performances. The results also suggested that MCI brain may involve more regions to compensate their reduced efficiency of dedicated circuits so that they could behave like normal older adults.

## SESSION 1745 (PAPER)

### DEMOGRAPHY OF AGING

#### CHARTING NEW FRONTIERS FOR HEALTH AND PENSION REFORM UNDER THE PRESSURE OF AGING BABY BOOMERS: DISENTANGLING THE PARADOX OF APOCALYPTIC DEMOGRAPHY

A.V. Wister, *Gerontology, Simon Fraser University, Vancouver, British Columbia, Canada*

The aging of the large baby boomer cohorts has fuelled apocalyptic prophecies of the negative influence of population aging for health care, pensions, and social programs. We have observed the manufacturing of crises based on exaggerations of demographic patterns, such as arguing that health care systems will crumble under the weight of population aging, rates of dementia will spiral, or that the pension systems will run dry. Gerontologists have responded by debunking this ‘myth’ drawing heavily from studies that show that population aging has only contributed a modest amount to the rise in health care spending over the past few decades; and that pension systems can be retrofitted to accommodate aging baby boomers. However, there are several reasons why one should be careful to conclude that population aging in the future will not be a significant factor in health care and pension system resource formulae. First, analyses conducted at times when population aging was gradual may significantly underestimate the aging effect. Second, there may be shifts in the primary drivers of health care costs (e.g., hospital, pharmaceuticals, physician costs), which could affect the relative weight of population aging. Third, changes to pension eligibility without understanding its unanticipated consequences may create new problems for low income older persons. Fourth, regardless of the relative effect of population aging, there will be a significant increase in the absolute number of older persons requiring more intense health care and drawing on public pensions in the future. Finally, debates have tended to focus on the numbers of older people with little attention devoted to the unique characteristics of older boomers.

#### LOCAL POPULATION AGING AND INDIVIDUAL HEALTH TRAJECTORIES AT OLDER AGES

J. Raymo<sup>1</sup>, E.M. Vogelsang<sup>1</sup>, J. Liang<sup>2</sup>, E. Kobayashi<sup>3</sup>, T. Fukaya<sup>3</sup>, Y. Sugihara<sup>3</sup>, 1. *Sociology, Univ of Wisconsin, Madison, Wisconsin*, 2. *Univ. of Michigan, Ann Arbor, Michigan*, 3. *Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan*

Are health trajectories at older ages associated with population aging at the local level? Japan is an ideal setting in which to address this question given the rapidity of population aging, tremendous regional variation in the pace of population aging, and relatively limited geographical mobility at older ages. Results of growth curve models based on six waves of data from a nationally representative sample indicate that population aging in respondents’ municipality of residence is associated with both the level and slope of health trajectories beyond age 60. We find that the predicted probability of fair or poor health at first observation is negatively associated with the proportion of the local population age 65 and over up to a point (about 14%), beyond which local-area aging is associated with worse health. This relationship becomes even more pronounced after controlling for population stability and economic well-being at the municipality level, both of which are associated with less favorable health outcomes at older ages. We also find that residence in more rapidly aging municipalities is positively associated with the pace of health decline across older ages, a relationship that is not explained by local-area demographic and economic characteristics. This presentation will provide participants with a theoretical and empirical basis for thinking about the ways in which

rapid change in local area age structure is associated with individual health at older ages. Participants will also be able to discuss features of rapidly aging municipalities that may underlie the relationships we summarize.

### **WHY HAS THE EDUCATIONAL GRADIENT OF MORTALITY RISK INCREASED AMONG U.S. WOMEN?**

J.K. Montez<sup>1</sup>, A. Zajacova<sup>2</sup>, 1. *Center for Population & Development Studies, Harvard University, Cambridge, Massachusetts*, 2. *University of Wyoming, Laramie, Wyoming*

The inverse association between educational attainment and mortality risk ("the educational gradient") in the United States is firmly established. Since the mid-1980s the gradient increased most noticeably among white women compared with white men, black women, and black men. However, little is known about underlying mechanisms. Here, we use the National Health Interview Survey Linked Mortality File to examine the increasing gradient across 1986-2006 among white women 45-84 years of age (N=230,692). This study moves beyond prior research in two ways: 1) examining the trends by cause of death and 2) assessing the potential contribution of a range of mechanisms including early-life conditions, marriage and spousal education, economic well-being, psychosocial well-being, and health behaviors. Results reveal that the gradient increased for deaths from heart disease, lung cancer, chronic lower respiratory disease, breast cancer, and diabetes; diverging trends in economic well-being and health behaviors between education levels contributed to the overall increase. Our findings suggest that maximizing the high-school graduation rate for all women and (re)designing work-family policies that allow women who want to work outside the home to secure (desirable) employment may reduce the widening mortality gap among U.S. women.

### **PATHS TO LONGEVITY: HEALTH AND FUNCTIONING PROFILES OF U.S. ADULTS WHO SURVIVE TO AGE 90 AND BEYOND**

J.A. Ailshire, H. Beltrán-Sánchez, E. Crimmins, *Andrus Gerontology Center, Univ Southern California, Los Angeles, California*

Reaching advanced old age is becoming an increasingly common experience in the U.S, yet there are very few studies of health and functioning of exceptionally long-lived individuals and little is known about the health trajectories of those who survive to extreme old age. The current study uses data from the ongoing, nationally representative Health and Retirement Study to examine variation in health and functioning trajectories over 17 years of follow-up for two groups of individuals, those who did and did not survive to ages 90 and older, as well as among survivors. Although the mean number of diseases and ADL limitations increased over time for both survivors and non-survivors, the survivors had fewer diseases and ADL limitations at every wave compared to non-survivors. Cognitive function also declined over time and did not initially differ by survivorship. However a gap emerged midway through the study period when mean cognitive function among non-survivors began to decline more rapidly than it did among survivors. Prior research on centenarians suggests that older adults can be classified as surviving to exceptional old age having escaped, delayed the onset of, or survived with disease and disability. However, we found distinct latent classes describing variability in health and functioning trajectories among those who reach very old age that suggest there are more varied pathways than those that have been previously identified. This study contributes to the growing body of research on extreme longevity in the U.S. and globally by highlighting the considerable variability in paths to longevity.

## **SESSION 1750 (PAPER)**

### **DISTRESS IN LATER LIFE**

#### **GENDER DIFFERENCES IN THE TRAJECTORIES OF DEPRESSION AND DEPRESSIVE SYMPTOMOLOGY IN THE YEARS LEADING TO DEATH**

R.A. Burns<sup>1</sup>, M.A. Luszcz<sup>2</sup>, P. Butterworth<sup>1</sup>, K. Kiely<sup>1</sup>, K.J. Anstey<sup>1</sup>, 1. *Centre for Research on Ageing, Health and Wellbeing, The Australian National University, Canberra, Australian Capital Territory, Australia*, 2. *Flinders Centre for Ageing Studies and Department of Psychology, Flinders University, Adelaide, South Australia, Australia*

Significant gender differences in rates of depression are reported. Females frequently report higher levels of depression. However, in older adults, this relationship changes approaching mortality, with males at increased risk of reporting depression. However, it is unclear to what extent these changes reflect increased clinical depression or increases in sub-syndromal depressive symptomatology as a consequence of other health related effects. We utilise Random Effects Models to compare the changes in depression between males and females on a measure of depressive symptomatology and a measure of probable clinical depression over a 16 year period. Participants (n = 3,300) were from the Dynamic Analyses to Optimise Ageing (DYNOPTA) project and aged between 45-103 years at baseline (M = 59.90; SD = 12.10) for whom mortality data was available. Results identified increased depressive symptomatology and likelihood of depression in the years preceding mortality. Whilst males reported the greatest change in depressive symptomatology, no gender differences were found in the increase in probable depression when approaching mortality. Increased depressive symptomatology is a particularly vulnerability for males and may reflect underlying illness or health related behaviours that places males at increased risk of depression.

#### **SUICIDAL IDEATION AND RESPONSE TO TREATMENT IN OLDER ADULTS WITH SOCIAL ANXIETY DISORDER**

A. Petkus<sup>1</sup>, J. Wetherell<sup>2,3</sup>, M.B. Stein<sup>3</sup>, M. Craske<sup>4</sup>, D. Chavira<sup>3</sup>, C. Sherbourne<sup>7</sup>, G. Sullivan<sup>5</sup>, P. Roy-Byrne<sup>6</sup>, 1. *San Diego State University / University of California, San Diego Joint Doctoral Program in Clinical Psychology, San Diego, California*, 2. *VA San Diego Healthcare System, San Diego, California*, 3. *University of California, San Diego, San Diego, California*, 4. *University of California, Los Angeles, Los Angeles, California*, 5. *University of Arkansas, Little Rock, Arkansas*, 6. *University of Washington, Seattle, Washington*, 7. *RAND Corporation, Los Angeles, California*

Anxiety disorders are common in older adulthood. Social Anxiety Disorder (SAD) in younger adults is associated with a number of negative outcomes, including suicide, yet little is known about SAD in later life. In this investigation, we examined age differences in characteristics and treatment outcomes of older (age 60 and older, n=35) and younger/middle-aged (age 18-59, n=368) participants with SAD from the Controlling Anxiety with Learning and Management (CALM) study. CALM was an 18-month effectiveness trial in primary care comparing treatment as usual to a collaborative care intervention which included medication management and/or cognitive behavioral therapy. The primary outcome for this current study was the social phobia inventory (SPIN). Secondary outcomes for this study included depression as measured by the Patient Health Questionnaire-8 (PHQ-8), the Anxiety Sensitivity Index (ASI), and BSI Anxiety scale. At baseline a higher proportion of older participants expressed suicidal ideation (40% vs. 25%; p=0.003) and intent (11.4% vs. 1.1%; OR=11.74, p=0.001) compared to younger adults. Linear mixed models examining treatment outcome over time found a significant age by intervention by time interaction on the SPIN (p=0.03), and ASI (p<0.01), but not on the PHQ-8 (p=0.19) or BSI Anxiety (p=0.33). Effect size estimates for the intervention on

SPIN symptoms at post treatment were substantially greater for younger ( $d=0.37$ ) than for older adults ( $d=0.05$ ). In sum, these findings suggest that older adults with SAD may be at higher risk for suicide and have a poorer response to a collaborative care intervention than younger adults.

#### CHRONICITY OF PTSD AND RISK OF DISABILITY IN OLDER AMERICANS

A.L. Byers<sup>1,2</sup>, T.C. Neylan<sup>1,2</sup>, K. Covinsky<sup>1,2</sup>, K. Yaffe<sup>1,2</sup>, 1. *University of California, San Francisco, San Francisco, California*, 2. *San Francisco VA Medical Center, San Francisco, California*

**Introduction:** Most studies have examined the impact of depression and generalized anxiety disorder (GAD) on disability in late life. The purpose of our study was to determine nationally representative estimates of the association of posttraumatic stress disorder (PTSD) to disability. **Methods:** We studied 3,314 participants aged  $\geq 55$  years (mean age (SD)=66.2 (8.7)) from the Collaborative Psychiatric Epidemiology Surveys (60.1% female; 34.1% White, 35.4% Black, 17.7% Hispanic, 12.8% Asian). PTSD was assessed over the lifespan using DSM-IV criteria; classified as no PTSD, early-life only (age  $< 55$ ), early-life with late-life (age  $\geq 55$ ) recurrence, and late-life only. Disability was defined by 5 domains (out of role, self-care, mobility, cognition, and social) using the WHO-DAS. Analyses included logistic regression, using weights and complex design-corrected statistical tests. **Results:** 1.9% of older adults had early-life PTSD only, 1.8% had recurrent PTSD in late-life, and 0.6% had late-life only, with rates higher for women (2.6%, 2.4%, and 0.7%) than men (1.0%, 0.9%, and 0.4%;  $p < 0.001$ ). Prevalence of disability increased going from no PTSD to late-life for all WHO-DAS domains ( $p < 0.001$  for trend). For example, prevalence of impairment in mobility was 22.3%, 49.0%, 58.9%, and 61.3%, respectively. After adjusting for demographics, medical conditions, depression, GAD, and substance abuse, early- and late-life PTSD significantly ( $p < 0.05$ ) increased odds of disability in all domains, except self-care, compared with no PTSD (early-life, odds ratios [ORs]=1.0-2.0; recurrent late-life, ORs=3.0-8.0; late-life, ORs=4.0-11.0). **Conclusions:** Disability in older Americans is highly influenced by PTSD over the lifespan, particularly PTSD that occurs or recurs in late life.

#### PHYSICIANS' DETECTION OF LATE-LIFE DEPRESSION: THE ROLE OF DEPRESSED MOOD AND COGNITIVE IMPAIRMENT

J.J. Gregg<sup>1</sup>, A. Fiske<sup>1</sup>, M. Gatz<sup>2</sup>, 1. *Psychology, West Virginia University, Morgantown, West Virginia*, 2. *University of Southern California, Los Angeles, California*

Depression in later life is associated with decreased cognitive functioning, increased social and functional impairment, and increased all-cause mortality. Thus, accurate assessment of late-life depression is a critical public health issue. The present study examined factors that may impede or facilitate physicians' detection of depression in later life. Participants included 344 adults from the Swedish Adoption/Twin Study of Aging (SATSA) aged 50 years and older at the time of the first project questionnaire. Physician detection of depression was determined by (1) outpatient medical records, (2) antidepressant prescription, or (3) inpatient hospitalization between 1986 and 1994. Depressive symptoms were measured by highest score on the Center for Epidemiologic Studies-Depression Scale (CES-D) completed as part of SATSA data collection; endorsement of depressed mood was examined using two items from the CES-D. The Mini-Mental State Examination (MMSE), also completed as part of SATSA, indicated cognitive impairment. Physician detection of depression was significantly related to CES-D score (OR=1.12, 95% CI=1.06-1.18). The CES-D item regarding feeling depressed significantly moderated this association, such that a one unit increase on the CES-D increased the likelihood of detection by 15% in the context of higher endorsement of the item stating that the person felt depressed. Neither the CES-D item related to feeling sad nor cognitive

impairment acted as a moderator. Findings suggest that physicians should routinely assess for other symptoms associated with late-life depression besides depressed mood (e.g., sleep problems, pain, psychomotor retardation), especially since non-dysphoric depression in later life also is related to significant negative health outcomes.

#### EFFECTS OF ACCULTURATION AND SOCIAL NETWORK SUPPORT ON DEPRESSION AMONG OLDER KOREAN IMMIGRANTS

B. Kim<sup>1</sup>, C. Sangalang<sup>2</sup>, L.B. Maradik Harris<sup>2</sup>, 1. *School of Social Work, University of Hawaii at Manoa, Honolulu, Hawaii*, 2. *UCLA, LA, California*

**BACKGROUND:** Acculturation and social network support have been identified as predictors of mental health for immigrant and older populations. The present study examined both independent and interactive effects of acculturation and social network support on depressive symptomatology among older Korean immigrants. **METHODS:** Self-reported measures included socio-demographic characteristics, acculturation, social network support, and depressive symptoms. This study used cross-sectional analysis of a community-based cohort. **RESULTS:** After controlling for the effects of demographic variables, a robust hierarchical regression model indicated that social network support was negatively associated with depressive symptoms. Also, the interaction between acculturation and social network was significantly associated with lower levels of depressive symptoms ( $\beta = -.29$ ,  $p < .05$ ). In other words, older Korean immigrants who had high levels of social network support and were highly acculturated exhibited lower levels of depression compared to those who had low support and were highly acculturated. **IMPLICATIONS:** Our findings call attention to the role of social network support in the mental health of elderly Korean immigrants. Service providers can develop strategies for decreasing depression in this population by increasing social network support, especially with family members.

#### SESSION 1755 (SYMPOSIUM)

##### YEARS RESEARCH AND STUDY PROGRAM ON GERIATRICS –FORSCHUNGSKOLLEG GERIATRIE

Chair: C. Becker, *Geriatric Rehabilitation, Robert-Bosch Krankenhaus, Stuttgart, Germany*

Discussant: A. Lukas, *Agaplesion Bethesda Krankenhaus, Ulm, Germany*

This symposium is performed in honor of the GSA President Prof. Laurence Z. Rubenstein and the work he has been doing for the Robert Bosch geriatric fellowship program (<http://www.bosch-stiftung.de/content/language2/html/13539.asp>) as chairman of the international selection board. Facing the demographic transition geriatric medicine plays an increasingly important role in health care. Academic geriatric medicine is still inadequately represented in many countries and in Germany in particular. To modify this situation, the "Forschungskolleg Geriatrie" was established. The aim of the research program "Forschungskolleg Geriatrie" is to train and provide further education for physicians aiming to achieve an academic leadership position in geriatric medicine in Germany, Switzerland or Austria. The program is conducted in cooperation with seven clinical academic centres in Germany and Switzerland. Fellows are employed by one of these geriatric centers for the entire funding period of four years. The midcareer program is funded by the Robert Bosch Foundation, one of large private charity organization in Germany dedicated to support aging research. Since ten years more than 30 candidates have successfully passed the program. In the meantime many of them have received leading positions in the geriatric field. The first aim of the symposium is to show the wide range of geriatric and gerontological research issues of alumni and current grant holders supported by this research and study program. The second aim is to

show new assessments and added values of existing assessments in different geriatric fields, investigated by grant holders.

### **CHRONIC PAIN AND DEPRESSION IN OLDER ADULTS: ONLY MEDIATION? RESULTS FROM THE ACTIFE ULM STUDY**

M.D. Denkinger<sup>1</sup>, A. Lukas<sup>1</sup>, T. Nikolaus<sup>1</sup>, S. Franke<sup>2</sup>, 1. *Agaplesion Bethesda Hospital, Ulm, Germany*, 2. *Siegen University, Siegen, Germany*

**Objectives** To analyze what dimensions of pain predict depressive symptoms in late. **Methods** Cross-sectional study in community dwelling older adults (mean age 76, n=1127) from southwest Germany. CGA including pain and depression (Hospital Anxiety and Depression Scale). Associations of pain (level, frequency, chronicity, painful body sites) and depression was assessed using multivariate methods and mediation models including bootstrapping. Results Association was strongest for the number of painful body sites (OR 1.20, CI 95% = 1.11 to 1.31, p<0.001), less for pain level and frequency (OR 1.12, CI 95% = 1.01 to 1.23, p=0.027 and OR 1.18, CI 95% = 1.01 to 1.37, p=0.033). Chronicity was not associated. However, these associations were mediated by comorbidity and loneliness with strong indirect effects and therefore disappeared in the full model. **Conclusions** The number of painful body areas was the best predictor of depression in older adults. Associations were mediated by comorbidity and loneliness.

### **EPIDEMIOLOGY OF PELVIC FRACTURES**

K. Rapp, *Gerontologic Rehabilitation Clinic, Robert-Bosch-Hospital, Stuttgart, Germany*

The literature about the epidemiology of pelvic fractures in old age is limited. An overview over the literature and new data with age- and sex-specific incidence rates in people with and without disability will be presented.

### **OBSERVER-RATED PAIN ASSESSMENT INSTRUMENTS IMPROVE BOTH THE DETECTION OF PAIN AND THE EVALUATION OF PAIN INTENSITY IN PEOPLE WITH DEMENTIA**

A. Lukas<sup>1</sup>, J.B. Barber<sup>2</sup>, S.J. Gibson<sup>2,3</sup>, 1. *AGAPLESION Bethesda Klinik Ulm, Ulm, Germany*, 2. *National Ageing Research Institute, Parkville, Melbourne, Victoria, Australia*, 3. *Caulfield Pain Management and Research Centre, Caulfield, Melbourne, Victoria, Australia*

**OBJECTIVE:** Proxy-rated pain assessment instruments are effective in identifying the presence of pain in dementia cases. The objective of this presentation, based on a study of nursing home residents, is to show that they also have utility in evaluating intensity of pain. **RESULTS:** Discriminant function analysis revealed: 1) that the use of proxy-rated instruments improved recognition of the presence or absence of pain by 28.5% (in dementia) and 33.3% (in cognitively intact adults) above chance; 2) the same instruments improved the classification of residents into the correct self-report rating group of pain intensity by 50.7% (in dementia) and 39.2% (in cognitively intact adults) above chance. **CONCLUSIONS:** The use of observer-rated behavioural pain assessment instruments to assess pain in elderly people with impaired ability to self-report enables carers to detect both the presence of pain and the severity of pain. Information thus acquired should lead to more effective pain management.

### **SUSTAINABILITY OF MOTOR TRAINING EFFECTS IN OLDER PEOPLE WITH DEMENTIA**

T. Zieschang, M. Schwenk, P. Oster, K. Hauer, *Geriatric Medicine, AGAPLESION Bethanien Hospital, Heidelberg, Germany*

Sustainability of motor training effects was evaluated in a RCT in persons with confirmed mild to moderate dementia. Participants underwent a 3-month progressive resistance and functional group training

specifically developed for patients with dementia (Intervention, n=62) compared to a motor placebo activity (Control, n=60). After nine months the gains in functional performance were sustained with significant group differences in the primary endpoint (5-chair-rise, relative change: IG:-8.54 (22.57) vs. CG:+10.70 (45.89) sec, p=0.014). Strength as measured by the primary endpoint 1-Repetition Maximum was still elevated (time effect for T1 vs. T4: 148.68 ± 57.86 vs. 172.79 ± 68.19 kg, p<0.001) but between group differences disappeared (relative change: maximal strength, IG: 22.75 (40.66) vs. CG: 15.60 (39.26), p=0.369). After attending this session, participants will have an overview of the literature on motor training in persons with dementia and will be able to appraise important characteristics of an efficient and sustainable training program.

## **SESSION 1760 (SYMPOSIUM)**

### **CARE FOR THE OLDER PERSONS: FOCUS ON PRESERVATION OF INDEPENDENCY AND AUTONOMY**

Chair: *J.G. Hoogerduijn, University of Applied Sciences Utrecht, Utrecht, Netherlands*

Co-Chair: *M. Schuurmans, University of Applied Sciences Utrecht, Utrecht, Netherlands*

Preservation of independency and autonomy in older persons is an important goal for all health care workers. Functional decline in older people is one of the greatest threats to independent living because it can lead to reduced mobility and autonomy and increased dependency. Functional decline is associated with an increased risk for mortality, readmission and increased health care costs. Therefore, early identification of persons at risk for functional decline may contribute to improve care for older patients. Additionally, several steps can be taken to prevent onset and adverse outcomes if identification is followed by a comprehensive geriatric assessment and targeted interventions. This symposium aims to highlight research evidence of various strategies to preserve independency. The first presentation focuses on identification of frailty, complex care needs and wellbeing in community-dwelling older people with polypharmacy. Problems related with polypharmacy create risk of hospitalization. The second presentation shows an instrument for early identification of drug related problems in older adults living in the community. Third presentation shows the development and validation of a four item instrument to identify older hospitalized patients at risk for functional decline. Fourth presentation shows interventions that effectively reduce postoperative problems that can result in functional decline, such as depression, infection and postoperative pulmonary complications in older elective cardiac surgery patients. All studies are conducted within the scope of nursing' contribution in preservation of functioning.

### **THE PREDICTION OF FUNCTIONAL DECLINE IN OLDER HOSPITALIZED PATIENTS**

J.G. Hoogerduijn<sup>1</sup>, B.M. Buurman<sup>3</sup>, J.C. Korevaar<sup>3</sup>, D.E. Grobbee<sup>2</sup>, S.E. de Rooij<sup>2</sup>, M. Schuurmans<sup>1,2</sup>, 1. *University of Applied Sciences Utrecht, Utrecht, Netherlands*, 2. *Utrecht University, Utrecht, Netherlands*, 3. *Academic Medical Center Amsterdam, Amsterdam, Netherlands*

30%-60% of older patients experience functional decline after hospitalization, associated with an increase in dependence, readmission, nursing home placement and mortality. In two cohorts studies (n=492) and (n=484) an instrument was developed and validated to predict functional decline in older (65+) hospitalized patients. Functional decline was defined as a decline of at least one point on the Katz ADL index at follow-up compared to pre-admission status. 35% of all patients in the development cohort and 32% in the validation cohort suffered functional decline. The model could accurately predict functional decline (AUC 0.71). Sensitivity, specificity, positive and negative predictive values were 87%, 39%, 43% and 85%, respectively. Pre-admission need

for assistance in instrumental activities of daily living, use of a walking device, need for assistance in traveling, and no education after age 14 are the predictors of a model to identify older patients at risk for functional decline following hospital admission.

### EARLY RECOGNITION OF DRUG RELATED PROBLEMS IN HOMECARE

C.G. Sino<sup>1</sup>, M.L. Bouvy<sup>2</sup>, I.M. Schop<sup>4</sup>, P.A. Jansen<sup>3</sup>, M. Schuurmans<sup>1,5</sup>, 1. *University of applied sciences, Utrecht, Netherlands*, 2. *Utrecht University, Division of Pharmacoepidemiology and Clinical Pharmacology, Utrecht, Netherlands*, 3. *University Medical Centre Utrecht. Department of Geriatrics and Expertise Centre Pharmacotherapy for Old Persons Utrecht. The Netherlands, Utrecht, Netherlands*, 4. *Utrecht University. The Netherlands, Utrecht, Netherlands*, 5. *University Medical Centre Utrecht, Department of Rehabilitation, Nursing Science and Sports. The Netherlands, Utrecht, Netherlands*

Home healthcare employees are particularly well positioned to act in a preventive way to recognize symptoms of potential Drug Related Problems (DRPs). The instrument of the Home Observation of Medication-related problems by homecare Employees (HOME) is an early recognition tool. In an observational study (N=115) the observations made by home healthcare employees were compared with the findings from an in-dept medication interview by a specialized nurse to assess concurrent validity of the instrument. The HOME instrument identified 470 potential DRPs (median 4.0; IQR 4.0) observations per patient. The medication interview identified 610 potential DRPs (median 5.0; IQR 4.0). The specificity of the HOME instrument was high (78%-99%) for thirteen of the fifteen subcategories. The sensitivity was moderate (63%, 63% and 67%) to high (81% and 86%) for five of the fifteen subcategories. This study shows that observations by home healthcare employees add to the early recognition of DRPs.

### THE PREDICTION OF FUNCTIONAL DECLINE IN OLDER HOSPITALIZED PATIENTS

J.G. Hoogerduijn<sup>1</sup>, B.M. Buurman<sup>3</sup>, J.C. Korevaar<sup>3</sup>, D.E. Grobbee<sup>2</sup>, S.E. de Rooij<sup>3</sup>, M. Schuurmans<sup>1,2</sup>, 1. *University of Applied Sciences Utrecht, Utrecht, Netherlands*, 2. *Utrecht University, Utrecht, Netherlands*, 3. *Academic Medical Centre Amsterdam, Utrecht, Netherlands*

30%-60% of older patients experience functional decline after hospitalization, associated with an increase in dependence, readmission, nursing home placement and mortality. In two cohorts studies (n=492) and (n=484) an instrument was developed and validated to predict functional decline in older (65+) hospitalized patients. Functional decline was defined as a decline of at least one point on the Katz ADL index at follow-up compared to pre-admission status. 35% of all patients in the development cohort and 32% in the validation cohort suffered functional decline. The model could accurately predict functional decline (AUC 0.71). Sensitivity, specificity, positive and negative predictive values were 87%, 39%, 43% and 85%, respectively. Pre-admission need for assistance in instrumental activities of daily living, use of a walking device, need for assistance in traveling, and no education after age 14 are the predictors of a model to identify older patients at risk for functional decline following hospital admission.

### FRAILITY, COMPLEX CARE NEEDS AND WELLBEING IN COMMUNITY-DWELLING OLDER PEOPLE WITH POLYPHARMACY

N. Bleijenberg<sup>1</sup>, V.H. ten Dam<sup>1</sup>, I. Drubbel<sup>1</sup>, M.E. Numans<sup>1</sup>, N. de Wit<sup>1</sup>, M. Schuurmans<sup>2</sup>, 1. *Julius Center for Health Sciences and Primary Care, Utrecht, Netherlands*, 2. *University Medical Centre Utrecht, Utrecht, Netherlands*

One of today's most challenges in health care is to provide care to older people with complex care needs. Although the level of frailty and their prevalence in older people is frequently reported, less attention has

been given to identify complex care needs in this population. Understanding their needs can contribute to provide optimal care on a patient needs approach. The aim of this study is to assess frailty (Groningen Frailty Indicator), complex care needs (Intermed-for elderly) and Well-being (Groningen Wellbeing Indicator) in community-dwelling older people with polypharmacy. In total, 1289 patients participated in this cross-sectional study. Mean age was 75 years (SD: 8.1). Most patients were female (58.1%), 851 patients (64.7%) were frail, 107 patients (8.3%) had complex care needs, and a moderate wellbeing was measured. Frail patients reported more complex care needs and a lower wellbeing than non-frail patients. Results on specific domains will be presented.

### PREADMISSION INTERVENTIONS PREVENTING POSTOPERATIVE COMPLICATIONS IN OLDER CARDIAC SURGERY PATIENTS: A SYSTEMATIC REVIEW OF THE LITERATURE

R. Ettema<sup>1,2</sup>, H. Koeven<sup>2</sup>, M. Schuurmans<sup>1,2</sup>, 1. *Faculty of Healthcare, University of Applied Sciences Utrecht, Utrecht, Utrecht, Netherlands*, 2. *University of Utrecht, Utrecht, Utrecht, Netherlands*

Objective(s): Literature on postoperative complications in cardiac surgery patients shows high incidences of delirium, depression, pressure ulcers, hospital infections, postoperative pulmonary complications and atrial fibrillation. These complications are associated with functional and cognitive decline and a decrease in the quality of life and well-being after discharge. It is unclear how older cardiac surgery patients can best be prepared for their hospital admission with cardiac surgery. Methods: We systematically reviewed the literature following the PRISMA statement guidelines. Results: Of 1,335 initial citations, 31 were subjected to critical appraisal. Finally, 23 studies were included, of which we derived a list of preventive interventions. These interventions have been shown to effectively reduce postoperative depression, infection and postoperative pulmonary complications in older elective cardiac surgery patients. Conclusions: Mainly comprehensive approaches prevent the occurrence of postoperative depression and postoperative pulmonary complications. Infection can be best prevented by combined disinfection with CHX and immune-enhancing nutritional supplement.

### SESSION 1765 (SYMPOSIUM)

#### DISSEMINATION RESEARCH IN FALLS PREVENTION: "STEPPING ON" IN A WISCONSIN COMMUNITY

Chair: *J.E. Mahoney, University of Wisconsin School of Medicine and Public Health, Madison, Wisconsin*

Co-Chair: *J. Stevens, National Center for Injury Prevention & Control, Centers for Disease Control & Prevention, Atlanta, Georgia*

Discussant: *M.G. Ory, Program on Healthy Aging, Texas A&M Health Science Center School of Rural Public Health, College Station, Texas*

While a number of effective community-based fall prevention interventions exist, only a few have been translated into programs and widely implemented. Implementing effective programs requires skills and resources that many community organizations lack. Dissemination research is designed to bridge this program implementation gap. Stepping On is a group-based multifactorial falls prevention program that, in a randomized trial, reduced falls by 31%. This symposium describes the process and results of two evaluations of Stepping On: First, from a four-year dissemination research study funded by the CDC that was conducted in three Wisconsin communities; and second, from a statewide dissemination effort that enrolled over 2000 older adults in Stepping On over the same four-year time period. Presenters will discuss: 1) How key elements of Stepping On were determined through Delphi Consensus; 2) The lapses in fidelity that occurred

in a pilot implementation, and the use of root cause analysis to determine causes and solutions to these lapses; 3) Results from research that tested program implementation in three different settings (a parks and recreation center, a senior retirement community and a church) and using leaders from two different backgrounds (health professional vs. non-health professionals); and 4) pre-and post workshop fall outcomes from implementing Stepping On statewide. The symposium Co-Chair will highlight how this research informs CDC's agenda for fall prevention activities, and the Discussant will comment on the role of research in driving successful dissemination and additional questions related to translation of Stepping On for widespread community use.

#### **USE OF THE DELPHI CONSENSUS TECHNIQUE TO DETERMINE KEY ELEMENTS OF STEPPING ON**

V.L. Gobel<sup>1</sup>, A.E. Schlotthauer<sup>3</sup>, J.E. Mahoney<sup>1</sup>, L.M. Clemson<sup>2</sup>, K.A. Mack<sup>4</sup>, T. Shea<sup>5</sup>, S.F. Cech<sup>6</sup>, 1. *University of Wisconsin School of Medicine and Public Health, Madison, Wisconsin*, 2. *University of Sydney, Sydney, Queensland, Australia*, 3. *Medical College of Wisconsin, Injury Research Center, Madison, Wisconsin*, 4. *CDC/National Center for Injury Prevention and Control, Atlanta, Georgia*, 5. *University of Wisconsin Hospitals and Clinics, Madison, Wisconsin*, 6. *Greater Wisconsin Agency on Aging Resources, Inc., Madison, Wisconsin*

Translating interventions from experimental research studies to community programs is important for effective interventions to be broadly adopted into public health practice. This presentation describes how the Delphi consensus technique was used to elucidate the key elements of Stepping On, an evidence-based fall prevention intervention from Australia. Knowing the key elements is essential for maintaining fidelity and for developing training programs to successfully adapt the intervention for widespread use in the United States. Nineteen international content experts were identified, recruited, and surveyed using a three-round Delphi Consensus technique; 105 key elements were identified and guided decisions when adapting the program. Adaptations included improving the leader training program, developing criteria for who can be a successful leader, and techniques for monitoring fidelity. The key elements also helped guide decisions related to updating and adapting program content.

#### **USE OF ROOT CAUSE ANALYSIS TO IMPROVE FIDELITY WHEN IMPLEMENTING STEPPING ON**

T. Shea<sup>1</sup>, J.E. Mahoney<sup>2</sup>, V.L. Gobel<sup>2</sup>, J. Janczewski<sup>1,2</sup>, S.F. Cech<sup>3</sup>, 1. *University of Wisconsin Hospital and Clinics, Madison, Wisconsin*, 2. *School of Medicine and Public Health, Madison, Wisconsin*, 3. *Greater Wisconsin Agency on Aging, Madison, Wisconsin*

This presentation will demonstrate using root cause analysis (RCA) to recommend solutions to problems with maintaining fidelity when implementing the Stepping On program. After modifying the Stepping On manual for use in the United States, we conducted a pilot Stepping On program and monitored it for fidelity to the key elements. Fidelity was assessed at each session by both an expert physical therapist and an experienced peer leader using a checklist of key elements. Loss of fidelity was noted in areas of adult learning, exercise, leader's role, and delivery of program content. Root causes identified for these areas included: leaders without the appropriate background, insufficient training (related to exercise and group facilitation), high levels of frailty among participants, and communication gaps between class leaders and site administrators. Our findings led to changes in how the program was structured, leader recruitment and training, and participant recruitment.

#### **RESEARCH ON THE TRANSLATION AND IMPLEMENTATION OF STEPPING ON IN THREE COMMUNITY SETTINGS**

A.E. Schlotthauer<sup>1</sup>, P.M. Layde<sup>1</sup>, J.E. Mahoney<sup>2</sup>, K.A. Mack<sup>3</sup>, T. Shea<sup>4</sup>, A.L. Christiansen<sup>1</sup>, V.L. Gobel<sup>2</sup>, L.M. Clemson<sup>2</sup>, 1. *Medical College of Wisconsin Injury Research Center, Milwaukee, Wisconsin*, 2. *University of Wisconsin School of Medicine and Public Health, Madison, Wisconsin*, 3. *Centers for Disease Control and Prevention National Center for Injury Prevention and Control, Atlanta, Georgia*, 4. *University of Wisconsin Hospital and Clinics, Madison, Wisconsin*, 5. *University of Sydney Health Sciences, Sydney, New South Wales, Australia*

The goal of this study was to determine the importance of program feasibility, acceptability, reach, uptake, and fidelity to key program elements to inform widespread adoption of Stepping On. Implementation considerations included the type of host organization, rural versus urban location, the leader's professional background (health versus non-health professional), and whether a phone call could replace the home visit prescribed in the original program. These factors were studied using a mixed methodology of surveys, focus groups and content expert fidelity observations. The study identified organizational challenges to implementation that varied by setting. There were no implementation differences between rural and urban locations, and no differences in program fidelity between health and non-health professional leaders. Home visits identified more home hazards than did phone calls. However, in follow-up there was no significant difference in remediation of those home hazards. Lessons from this research will inform widespread dissemination of Stepping On.

#### **EVALUATION OF STEPPING ON IMPLEMENTATION ACROSS WISCONSIN**

J.E. Mahoney<sup>1</sup>, R. Gangnon<sup>2</sup>, L.M. Clemson<sup>3</sup>, V.L. Gobel<sup>1</sup>, V. Lecey<sup>4</sup>, 1. *Medicine, University of Wisconsin School of Medicine and Public Health, Madison, WI, Wisconsin*, 2. *University of Wisconsin Dept. of Biostatistics & Medical Informatics/Population Health, Madison, Wisconsin*, 3. *University of Sydney, Sydney, New South Wales, Australia*, 4. *Greater Wisconsin Agency on Aging Resources, Inc., Madison, Wisconsin*

Between January 2008 and June 2011, Stepping On classes conducted across Wisconsin were attended by 2310 adults (mean age 78, 73% women). Participants reported a mean of 1.2 falls in the 6 months prior to enrollment. The rate ratio for falls in the 6 months after the program compared to the 6 months before was 0.50 (95% CI 0.45 to 0.56), and the rate ratio for the second 6 month period after the program ended compared to baseline was 0.52 (95% CI 0.46 to 0.59). The pre-post reduction in falls did not differ significantly by type of workshop leader (health professional versus non-health professional), nor by location (rural versus urban). These results suggest that with sufficient training and by selecting for prior experience, professionals from a variety of backgrounds may effectively lead Stepping On. Further, rural older adults are as likely as urban to benefit from the program.

#### **SESSION 1770 (SYMPOSIUM)**

##### **HEALTH OUTCOMES AND HEALTH DISPARITIES IN OLDER ADULTS: SOCIETAL AND CULTURAL FACTORS**

Chair: *S.A. Greenberg, University of Pennsylvania, Philadelphia, Pennsylvania*

Discussant: *C. Brown, Virginia Commonwealth University, Richmond, Virginia*

Improving our understanding of health outcomes and health disparities remain public health priorities; particularly as they relate to aging. Emerging research will be presented on important health-related outcomes and associated health disparities that are rooted in medical, societal, and cultural factors found both in the United States and around the

world. New findings will be presented including the influence of hypertension on cognition and mortality in Japan, the association between preventive health care utilization and hypertension in older Chinese adults, qualitative factors influencing obesity and health disparities in Appalachian women, the consequences of initial hip fracture while receiving skilled nursing care, and the impact of home health skilled nursing visits on hospitalization. Pursuant to this year's theme, this symposium will explore emerging frontiers in aging. The objective of this symposium is to present multiple cross cultural perspectives from health outcomes and health disparity research. Current findings and implications for future research in aging emphasizing connections within and across individuals, systems, environments, cultures, and nations are incorporated.

#### **WHAT HAPPENS TO THE PATIENT WHEN THEY FRACTURE THEIR HIP DURING SNF CARE?**

N. Leland<sup>1,2</sup>, J.M. Teno<sup>2</sup>, P.L. Gozalo<sup>2</sup>, J. Bynum<sup>3</sup>, V. Mor<sup>2</sup>, 1. *University of Southern California, Los Angeles, California*, 2. *Brown University, Providence, Rhode Island*, 3. *Dartmouth Medical School & Dartmouth Institute for Health Policy and Clinical Practice, Hanover, New Hampshire*

Approximately 1.6 million patients receive rehabilitation in a skilled nursing facility (SNF) each year after an acute hospital stay with the goal of regaining health and function. This study examined patient outcomes among a Medicare population who experienced their first hip fracture while receiving SNF care. Between 1999 and 2007, 29,201 individuals experienced their first hip fracture while receiving SNF care. Within the first 60 days following the fracture, 26.5% died. Among the 6,128 (20.1%) patients discharged back to the community two-thirds (n=3,938) were able to remain in the community a consecutive 30 days. Experiencing a hip fracture while receiving SNF care is a sentinel event which limits the patient's ability to return home and stay home. Therefore, fall prevention should be an integral piece of the SNF plan of care.

#### **THE IMPACT OF NUMBER OF HOME HEALTH SKILLED NURSING VISITS ON HOSPITALIZATION AND DEATH**

M. O'Connor<sup>1,2</sup>, A.L. Hanlon<sup>1,2</sup>, M.D. Naylor<sup>1,2</sup>, K.H. Bowles<sup>1,2</sup>, 1. *University of Pennsylvania, Philadelphia, Pennsylvania*, 2. *NewCourtland Center for Transitions and Health, Philadelphia, Pennsylvania*

**Aims:** Examine the relationship between number of skilled nursing (SN) visits on the occurrence of and time to first hospitalization and death within 90 days after home health (HH) discharge. **Methods:** Retrospective analysis of five CMS-owned data sets from 2009 (Outcomes Assessment Information Set, Home Health Agency Standard Analytic File, Medicare Provider and Analysis Review File, Beneficiary Summary and Provider of Services file). Propensity score analysis was applied prior to logistic and Cox Proportional Hazards Regression Analyses (n=4,500). **Results:** 16.3% of HH recipients were hospitalized within 90 days of discharge from HH. Number of SN visits was not associated with the occurrence of (p = 0.5014) or time to first hospitalization (p = 0.3300), or the time to death (p=0.3337). **Conclusions:** This study begins to fill the gaps in knowledge regarding the outcomes of Medicare-reimbursed HH beneficiaries. Additional research is critical to generate evidence to improve beneficiary outcomes.

#### **OBESITY FACTORS AND FAMILY INFLUENCE AMONG OLDER APPALACHIAN WOMEN**

T. O'Brien<sup>2,1</sup>, L.S. Nemeth<sup>2</sup>, L. Talbot<sup>1</sup>, 1. *Nursing, UNCC, Charlotte, North Carolina*, 2. *Medical University of South Carolina, Charleston, South Carolina*

Appalachian women are often older and live with limited employment, income, education, and access to health care compare to other women living in the United States. The specific aims of this study are:

1) to examine social and contextual factors influencing obesity, or the adoption and maintenance of health behaviors to prevent obesity, and 2) ascertain social themes of insecurity, stress and a sense of powerlessness in an uncertain economy among Appalachian women. A qualitative design was used to explore obesity among Appalachian women using semi-structured interviews. Perspectives were gained (n=13) about family values relating to nutrition and weight management. Five themes emerged from both groups: struggles with weight control and family tradition, solutions, negative role models and lack of time messages in the media, and stressors of obesity. This study provides identification of possible strategies to decrease obesity and health disparities for women living in the Appalachian region.

#### **THE JAPANESE PARADOX: HYPERTENSION AND HEALTH IN THE ELDERLY POPULATION OF JAPAN**

S. Davarian<sup>1</sup>, E. Crimmins<sup>1</sup>, Y. Saito<sup>2</sup>, A. Takahashi<sup>2</sup>, 1. *Gerontology, University of Southern California, Los Angeles, California*, 2. *Nihon University, Tokyo, Japan*

The Japanese population is relatively healthy, with low rates of heart disease, obesity, diabetes, and the longest life expectancy in the world but high rates of hypertension. Japan provides a unique opportunity to examine how various aspects of health influence each other in a relatively healthy population. This study examined the influence of hypertension on mortality and cognitive performance in the elderly population of Japan utilizing the Nihon University Japanese Longitudinal Study of Aging (NUJLSOA) (n=2195). Contrary to literature on the US, in Japan hypertension was neither associated with mortality (OR: 0.91, 95% CI: 0.55-1.51) nor with cognitive performance using logistic and OLS-regression, respectively. These findings persisted even when education, gender, and common hypertension comorbidities were added. The findings suggest that aging may be conceptualized differently in various countries; it appears that in the US aging might be a constellation of diseases, whereas in Japan this is not the case.

#### **A CROSS-SECTIONAL STUDY ABOUT PREVENTIVE HEALTH CARE UTILIZATION AND HYPERTENSION IN CHINA**

X. Pan, *Miami University, Oxford, Ohio*

**Objective** The aim of the present study is to examine the association between the utilization of preventive health service and the diagnosis of hypertension among older Chinese (65+). **Design** A cross-sectional study by using 2006 survey data of China Health and Nutrition Survey (CHNS). **Sample** 1,643 participants in the sample, 89 (5.39%) used preventive health service. **Analysis** The association was analyzed with multiple logistic regression by adjusting for sociodemographic and lifestyle factors (including age, gender, SES, residence area, smoking and alcohol consumption) as well as the comorbidity of Type 2 diabetes (DM). **Results** The utilization of preventive health care is significantly related with the diagnosis of hypertension ( $\chi^2=9.33$ ,  $p<.01$ ). People with hypertension are 1.06 times more likely to use preventive health care than their counterparts without hypertension. **Conclusion** Hypertension is a significant predictor for the utilization of preventive health care among 65 and older Chinese in Mainland, China.

#### **SESSION 1775 (SYMPOSIUM)**

##### **METHODOLOGICAL CHALLENGES TO UNDERSTANDING AGING THROUGH DYSREGULATION OF COMPLEX HOMEOSTATIC NETWORKS**

Chair: *A.A. Cohen, University of Sherbrooke, Sherbrooke, Quebec, Canada, Groupe de Recherche PRIMUS, Centre Hospitalier Universitaire de Sherbrooke, Sherbrooke, Quebec, Canada*  
Co-Chair: *K. Bandeen-Roche, Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland*

Many aging researchers are moving away from the idea that there is a single, simple biological cause of aging, and evidence is accumu-

lating for multiple processes and systems. Because many of these systems interact with and regulate each other in maintaining physiological homeostasis, there is a substantial likelihood of complex feedback loops contributing substantially to aging. Furthermore, these interactions may occur across different hierarchical levels, with lifestyle choices such as physical activity affecting biological processes, which in turn may affect cognitive processes, etc. While such a multi-systemic model of aging holds promise for explaining most of the observed data on aging, the posited complexity presents substantial methodological challenges. Controlled experiments are ill-suited to exploring the system-level properties of such complex networks, where the results on an experiment could change depending on the interactions of hundreds of other factors. At the same time, there are also no silver bullet statistical or epidemiological methodologies for exploring these questions, nor are there fully developed datasets containing all the key parameters involved over the full life course. Accordingly, we have invited four experts from different domains of aging research to share and discuss their thoughts on how we move forward in addressing these complexities. The format will be a panel discussion.

#### **DATA ANALYTIC CHALLENGES TO DEVELOPING MEASURES OF MULTI-SYSTEM DYSREGULATION IN AGING**

K. Bandeen-Roche, *Biostatistics, Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland*

Challenges to developing measures of multi-system dysregulation in older adults and, perhaps, biological aging, include: (1) Assembling databases in which development can proceed. Existing cohort studies on aging are subject to different measurement methods, selection biases, etc. Additional experimental data may be necessary. (2) Selecting available biomarkers most relevant to the goal. Both biology and measurement (e.g. reliability, validity) are relevant. (3) Establishing viable conceptual frameworks for research. For example, two competing hypotheses are that (i) there exists a “biological clock” that can be inferred from multiple sentinel physiological changes, and (ii) “aging” results from loss of plasticity of a physiological systems network whose properties can be inferred from appropriate models and experimental designs. (4) Applying data analytic methods that can link physiological system measures to conceptual frameworks to yield valid measures of dysregulation. Candidate methods include intensively predictive procedures, structural equations, and latent variable models.

#### **ASSESSING AGING WITHIN THE CONTEXT OF COMPLEX, INTERACTING SYSTEMS: CHALLENGES FOR BIOGERONTOLOGY**

D. Ingram, *Pennington Biomedical Res Center, Baton Rouge, Louisiana*

By virtue of their training, biologists are prone to focus on singularity when searching for mechanisms of biological phenomena—single molecule, single receptor, single gene. Even when considering a single pathway as the next level of complexity, the desire remains to keep it simple. Biogerontologists are no exception to this approach; however, the complexities of aging have forced them increasingly to consider more complex systems and analysis. Nathan Shock, a founder of gerontology, emphasized systems in consideration that aging is manifested as a decline in homeostatic processes. The genomic revolution has forced biogerontologists to deal with this complexity and sparked greater use of bioinformatics. Such efforts have generated application of transcriptional profiling of aging and aging interventions using gene array. These efforts have been evolving for further application of proteomics and metabolomics, but these technologies remain ahead of the ability to use them efficiently and effectively.

#### **THE LIMITS OF LIMITLESS DATA**

T. Harris, *NIA IRP, Bethesda, Maryland*

I am both a geriatrician and an epidemiologist. As a geriatrician, I know that outcomes in old age are multi-system and as an epidemiologist, I know that means that I should include all the domains that contribute to these outcomes. But this means that the participants in my studies will need to move into the clinic for at least several days as I used expensive, state-of-the-art technologies to assess multi-level sub-clinical and clinical disease and computers and interviewers to ask hours of questions and cognitive tests. How can researchers in gerontology stay ahead of the information tsunami in designing reasonable studies that still allow exploration of cutting edge methods?

#### **SESSION 1780 (SYMPOSIUM)**

##### **NCCA GENE D. COHEN RESEARCH AWARD IN CREATIVITY AND AGING SYMPOSIUM**

Chair: *L.S. Noelker, Benjamin Rose Institute, Cleveland, Ohio*

Co-Chair: *G. Hanna, National Center for Creative Aging, Washington, DC, District of Columbia*

Discussant: *M.C. Patterson, MindRAMP, Silver Spring, Maryland*

The Gerontological Society of American in partnership with the National Center for Creative Aging, an affiliate of George Washington University, will present the 4th Annual Gene D. Cohen Research Award in Creativity and Aging to Bruce Miller MD, Professor, Director, The Memory and Aging Center at University California, San Francisco. Dr. Miller will report on his research that charts a new course for establishing links between brain function and creative expression through studies on frontal lobe dementia. The research shows that creative expression is related to promoting and maintaining brain function and general wellbeing as well as providing indicators for progression of brain disease. Creative expression was also shown to mitigate cognitive decline by providing auxiliary methods of communication and socialization. This presentation will be supported by two others, one that examines the state of the field of research related to the arts and human development with a focus on later life. Promising directions and priorities for future research studies are discussed. The third presentation reports on findings from recent studies investigating the quality of later life for older artists and the resulting innovative intergenerational program that was developed to preserve their artistic legacies. The symposium will showcase these pioneering studies that help to establish a new role for humanities and the arts across the spectrum of aging research, education and practice.

##### **ARTISTIC CREATIVITY IN THE SETTING OF DEMENTIA**

B. Miller, *University of California San Francisco, San Francisco, California*

Some individuals with the semantic variant of primary progressive aphasia (svPPA) develop new artistic skills in the setting of neurodegenerative disease. Visual activities such as drawing, painting or sculpting may arise as the patient loses verbal language aptitude. Creativity in visual art, music and mechanical design with svPPA has been reported. The artwork of people with svPPA tends to be literal versus abstract and the use of color is striking. As the illness encroaches upon the right anterior temporal lobe, faces often become distorted, reflecting specific deficits in recognizing faces, emotions and meaning. As patients lose the meaning of words, images become more vague and eccentric. The elements often show no contextual meaning or relationships to other elements. The composition may not represent a coherent expression of an idea, but the arrangement can be highly original. Generally, paintings are realistic or surrealistic without a significant abstract component.

## THE STATE OF THE RESEARCH FIELD ON CREATIVITY AND HUMAN DEVELOPMENT IN LATER LIFE

G. Hanna, *National Center for Creative Aging, Washington, District of Columbia*

The state of the current research field on creativity and aging as it relates to human development in later life is a focus of the recently released "The Arts in Human Development Framing a National Research Agenda for the Arts, Lifelong Learning, and Individual Well-Being." This section of the white paper was authored by the National Center for Creative Aging and produced by the National Endowment for the Arts. Its purpose is to feature the pioneering work of researchers such as Drs. Cohen and Miller in forming a new frontier for aging studies. Originating from a summit held by the US DHHS and the National Endowment for the Arts, this paper has led to an interagency governmental task force that is working across disciplines and professions to review and revise funding priorities for future research in the area of the humanities and the arts as related to aging initiatives.

## IMPACT OF CAREERS IN THE ARTS ON AGING AND THE QUALITY OF LATER LIFE

J. Jeffri, *National Center for Creative Aging, Washington, District of Columbia*

Complementing the research findings of Miller and Cohen, the ABOVE GROUND project studied 146 professional visual artists in the New York metro area. These artists, who have spent a lifetime making art, report higher self-esteem than the general population, good to excellent health, and positive emotions in relation to their work. With these characteristics and resilience, tenacity, and a life of meaningful work, older artists can serve as models for aging well. This prototypical research led to ART CART: SAVING THE LEGACY, a program matching interdisciplinary teams of graduate students in health, aging and arts disciplines with older artists. Together, they document the artists' work and this provides a model of positive aging and deep experiential learning for students. ART CART is being replicated in two cities in 2012 and 2013 with a parallel research component using some of Cohen's instruments to measure general health, loneliness, depression, and mastery.

## SESSION 1785 (PAPER)

### COGNITIVE FUNCTION: EFFECTS AND OUTCOMES

#### GAIT SPEED AND COGNITION IN A HIGH FUNCTIONING COHORT OF OLDER PERSONS

R. Marottoli<sup>1,2</sup>, K. Araujo<sup>1</sup>, P. Peduzzi<sup>1</sup>, *1. Internal Medicine, Yale University School of Medicine, New Haven, Connecticut, 2. VA Connecticut, West Haven, Connecticut*

**Background:** While an association between gait and cognition has been identified among impaired individuals, the relationship between these abilities in higher functioning individuals is less well known. **Methods:** Participants were community-living active drivers age 70 years and older recruited from medical clinics and community sources. A variety of cognitive and physical abilities were assessed at baseline, including timed walk over 10 feet up and back at usual pace (UP) and as quickly as possible (rapid pace, RP) **Results:** The 615 drivers had a mean age of 78.8 ( $\pm 4.9$ ) years, 12% were women, and mean MMSE score was 27.4 ( $\pm 2.1$ ) points. Cognitive measures strongly correlated with gait speed at the  $p < .001$  level included: MMSE (#correct, correlation coefficient  $-0.18$  UP,  $-0.22$  RP), Babcock Immediate ( $-0.12$  UP,  $-0.14$  RP) and Delayed ( $-0.19$  UP,  $-0.21$  RP) Recall, Trails A ( $0.21$  UP and RP), Trails B ( $0.26$  UP,  $0.30$  RP), Visual Scanning ( $-0.29$  UP,  $-0.31$  RP), and Symbol Digit Modalities ( $-0.28$  UP,  $-0.31$  RP) **Conclusion:** A variety of cognitive measures assessing global cognition and higher level abilities were strongly associated with gait speed in a cohort of high functioning individuals. Awareness of this

association could lead to early identification of individuals at risk for subsequent functional decline and the development of intervention strategies.

## THE EFFECTS OF COGNITIVE-BEHAVIORAL THERAPY ON INSOMNIA AMONG COMMUNITY-DWELLING OLDER PEOPLE: A RANDOMISED CONTROLLED TRIAL

Y.S. Doris, *The Chinese University of Hong Kong, Hong Kong, Hong Kong, Hong Kong*

Insomnia is a prevalent problem affecting older people worldwide. There is ample evidence to indicate that the devastating effects of late-life insomnia on health and functional status. This longitudinal randomized controlled trial with waiting list attention-controlled group aimed at examine the effects of cognitive-behavioral therapy (CBT) on sleep pattern, sleep quality and daytime impairment among older people with insomnia. A total of 197 subjects were recruited from 6 elderly community centers in Hong Kong. Cluster randomization allocated them to either intervention ( $n=108$ ) or waiting-list attention-placebo control groups ( $n=89$ ). The intervention group received an 8-week group training on a multi-modal CBT including cognitive therapy, sleep hygiene, stimulus control and relaxation therapy whereas the attention-controlled group received health talks. Outcome evaluation using actigraphy, Pittsburg Sleep Questionnaire Index (PSQI) and Sleep Impairment Index (ISI) were conducted for both groups at baseline, immediately after training, and 1month, 3months and 6 months thereafter. Then, the control group also received CBT training. Analysis with general lineal model indicated that the CBT has significantly improved the total sleep time ( $p < 0.001$ ), nocturnal awakening ( $p < 0.001$ ), sleep latency ( $p < 0.001$ ), sleep efficacy ( $p < 0.001$ ), PSQI ( $p < 0.001$ ), and SII ( $p < 0.001$ ). The improvement in sleep quality and sleep pattern remained at the 6-month evaluative endpoints. This study indicated that CBT is an effective and feasible non-pharmacological intervention to improve late-life insomnia. A knowledge transfer fund was obtained to empower social and health care professionals through train-the-trainer workshops and user-friendly toolkits to conduct CBT for late-life insomnia in various community care settings in Hong Kong.

## EXCESS MEDICAL COSTS ASSOCIATED WITH COGNITIVE DECLINE: WHERE DO COST DIFFERENCES OCCUR? A CNS STUDY

C. Leibson<sup>1</sup>, K.H. Long<sup>2</sup>, J.E. Ransom<sup>1</sup>, R.O. Roberts<sup>1</sup>, S.P. Hass<sup>3</sup>, A.M. Duhig<sup>3</sup>, V.S. Pankratz<sup>1</sup>, R.C. Petersen<sup>1</sup>, *1. Mayo Clinic, Rochester, Minnesota, 2. Economics Consulting, LLC, St. Paul, Minnesota, 3. Abbott Laboratories, Abbott Park, Illinois*

We observed higher medical costs with worsening cognitive status, from normal through mild cognitive impairment (MCI) to dementia. This work attempts to identify the source of excess costs. Subjects were a subset of the Mayo Clinic Study of Aging (MCSA). MCSA used population-based records-linkage Rochester Epidemiology Project (REP) resources to construct a stratified random sample ( $N=6,171$ ) from Olmsted County, MN residents, age 70-89 years. Following neurologist's review of medical records, subjects meeting criteria for dementia were defined as prevalent dementia as of review date (index) ( $N=484$ ). Remaining eligible subjects were invited to be prospectively evaluated using comprehensive clinical/neuropsychological assessments. At initial assessment (index), 2,452, 537, and 119 met criteria for normal, MCI, or newly-discovered dementia. Using REP provider-linked line-item billing data, we obtained all diagnosis codes and all medical services/procedures 1-year before index. We computed total costs and assigned 2010 nationally stan-

standardized wage- and inflation-adjusted dollar estimates. We combined newly-discovered with prevalent dementia. We assessed contributions of age, sex, and pre-index co-morbidity (excluding dementia diagnoses) to cost differences across categories. Compared to normal subjects, age- and sex-adjusted costs remained significantly higher for dementia (mean difference=+\$5,316) and MCI (+\$859). After including pre-index comorbidity, dementia vs. normal differences were attenuated (+\$2,210); MCI vs. normal differences disappeared (-\$35). Of 17 ICD-9-CM chapters, the proportions assigned  $\geq 1$  non-dementia diagnosis were significantly higher for both MCI and dementia vs. normal subjects for Infectious/parasitic Diseases, Respiratory Diseases, Signs/symptoms, Injury/poisoning, and Mental disorders. Comorbid conditions associated with declining cognition account for much of observed excess medical costs.

### **AEROBIC EXERCISE: EFFECTS ON ALZHEIMER'S SYMPTOMS**

F. Yu<sup>1</sup>, N.W. Nelson<sup>2</sup>, K. Savik<sup>1</sup>, M. Dysken<sup>3</sup>, J. Wyman<sup>1</sup>, 1. *University of Minnesota School of Nursing, Minneapolis, Minnesota*, 2. *Saint Thomas University, Minneapolis, Minnesota*, 3. *Minneapolis VAMC, Minneapolis, Minnesota*

**Background:** Increasing evidence suggests that aerobic exercise might be therapeutic for Alzheimer's disease (AD) because it is related to reduced AD incidence, alters brain structure in AD transgenic animals, and improves cognition in non-AD individuals. Nonetheless, exercise studies in AD are just emerging and show conflicting results, largely due to inconsistent outcomes and poor exercise prescription and delivery. Hence, the purpose of this study was to inform power analysis in future studies by generating effect size (ES) of a 6-month moderate intensity cycling intervention on AD symptoms. **Methods:** A pre-test post-test design was used to qualify 29 community-dwelling older adults with AD. A trained research assistant who was blinded to the study purpose assessed cognition using the AD Assessment Scale – cognition, activities of daily living (ADLs) using the Disability in AD scale, and the prevalence of and caregiver distress from behavior and psychological symptoms of dementia (BPSD) use the Neuropsychiatric Inventory at baseline and 6 months. **Results:** Participants maintained cognition, ADLs, and BPSD during the 6-month cycling, while caregiving distress was significantly reduced. The ES is .13 ( $p = .48$ ) for global cognition, .03 ( $p = .87$ ) for verbal memory, .31 ( $p = .87$ ) for executive function, .18 ( $p = .34$ ) for ADLs, and .28 ( $p = .16$ ) for BPSD, and .4 ( $p = .04$ ) for caregiver distress from baseline to 6 months. **Discussions:** Findings from this study indicate that aerobic exercise might be effective at reducing AD symptoms. This study provides ESs to guide the power calculation in future studies.

### **EVIDENCE ON CHANGES IN THE CENTRAL NERVOUS SYSTEM CONTROL OF MOVEMENT ACROSS THE LIFESPAN AND IN AGING**

C. Rosano, *University of Pittsburgh, Pittsburgh, Pennsylvania*

Gait and balance problems are common and severely disabling in older adults. The number of older adults at risk for physical disability is rapidly increasing, and onset of mobility impairment is associated with loss of independence, hospitalization, and premature death. However, mobility impairments in community-dwelling older adults are largely understudied, particularly regarding the role of the central nervous system. This has hampered the development of clearly defined pathophysiology, clinical terminology, and effective treatments. Understanding the mechanisms of mobility impairment has the potential to greatly improve clinical and preventive care for older adults.

## **SESSION 1790 (PAPER)**

### **ENDOCRINOLOGY AND METABOLISM IN THE OLDER ADULT**

#### **THE EFFECTS OF SELECTIVE ESTROGEN RECEPTOR MODULATOR TREATMENT FOLLOWING HORMONE REPLACEMENT THERAPY ON ELDERLY POSTMENOPAUSAL WOMEN WITH OSTEOPOROSIS**

T. Hayashi, K. Ina, H. Nomura, *Geriatrics, Nagoya University Graduate School of Medicine, Nagoya, Japan*

**Objectives:** A comparison between the atheroprotective and osteoprotective effects of the selective estrogen receptor modulator (SERM) raloxifene and those of hormone replacement therapy (HRT) has not been made in elderly. **Methods:** A randomized prospective controlled trial was performed in a cohort of 32 elderly Japanese women with osteoporosis receiving HRT (estriol plus medroxyprogesterone) for more than 1 year. In 16 randomly selected subjects, HRT was changed to raloxifene therapy (60mg/day, 71.4 $\pm$ 3.4 years, SERM group). The other 16 patients were continued on HRT (71.8 $\pm$ 2.9 years, HRT group). As a control group, 14 subjects were enrolled, did not take any medications and were age-matched to experimental patients (72.5 $\pm$ 3.3 years, control group). Plasma lipids, TNF $\alpha$ , adiponectin, NO metabolites (NO $_x$ : NO $_2$ - and NO $_3$ -), cyclic GMP and bone-mineral density (BMD) were evaluated at baseline and at 26 and 52 weeks after enrollment. **Results:** SERM (Raloxifene) increased high-density-lipoprotein-cholesterol levels and tended to decrease low-density-lipoprotein-cholesterol levels ( $P = 0.058$ ) compared with baseline. Adiponectin, NO $_x$  and cGMP levels were significantly increased after 6 months compared with baseline or the HRT group. TNF $\alpha$  was decreased by raloxifene. In control subjects, no significant changes were observed in any of these markers. Bone-mineral density was higher at baseline in the raloxifene and HRT groups than in the control group, and BMD increased 12 months after baseline in the HRT and control group. **Conclusion:** SERM improved BMD and endothelial function in elderly postmenopausal women with osteoporosis who had received HRT, and these effects were comparable to or slightly stronger than those of HRT. Changes in adiponectin and TNF $\alpha$  may underlie the improvements in endothelial function, such as NO signaling.

#### **ASSOCIATION OF ANDROGEN RECEPTOR GENE (CAG)N REPEAT POLYMORPHISM WITH OBESITY IN OLD MALES**

X. Li, X. Chu, *First Department of Geriatric Cardiology, Chinese PLA General Hospital, Beijing, China*

**Background:** The association between androgen status and obesity in males has not been fully understood. The aim of this study is to investigate androgen, androgen receptor level and AR gene CAG length polymorphism associated with waist circumference in older males. **Methods:** A study was performed randomly to select 323 males who aged from 60-92 years old in a community in Beijing. Luteotrophic hormone (LH), follicle-stimulating hormone (FSH), estradiol (E2) and total testosterone (TT) were measured by chemiluminescence technique. Free testosterone (FT), sex hormone binding globulin (SHBG) and dehydroepiandrosterone sulphate (DHEA-s) were measured by ELISA. Mean fluorescent channel (MFC) of androgen receptor in peripheral lymphocyte was analyzed by flow cytometry. DNA sequencing of the CAG repeat from which the N-terminal domain of the first exon of the AR gene, were analyzed by applied Biosystems 3730xl DNA Analyzer. **Results:** With increase of waist circumference, DBP and E2/T were elevated gradually. TT was decreased, and E2 was ascended in obesity,  $p < 0.05$ . MFC was no correlation with BMI, WHR and waist circumference. CAG repeat were positively associated with BMI ( $p = 0.044$ ), but its association was no longer significant after adjusting for age ( $p = 0.067$ ). Multiple linear

regression analysis showed that E2 was positively relation to waist circumference and TT was negatively relation to waist circumference. Conclusion TT was decreased, E2 and E2/T were increased in obesity males; E2 positively and TT negatively related to waist circumference. MFC and CAG length polymorphism were of no correlation with body fat distribution.

#### **PERSISTENCE OF THE EFFECT OF BODY SIZE AT BIRTH ON DYSGLYCAEMIA AND TYPE 2 DIABETES IN OLD AGE: AGES-REYKJAVIK STUDY**

M. von Bonsdorff<sup>2,1</sup>, M. Muller<sup>2,3</sup>, T. Rantanen<sup>1</sup>, M. Garcia<sup>2</sup>, I. Thorsdottir<sup>6</sup>, V. Gudnason<sup>4,5</sup>, L.J. Launer<sup>2</sup>, T.B. Harris<sup>2</sup>, 1. *Gerontology Research Center and Health Sciences, University of Jyväskylä, University of Jyväskylä, Finland*, 2. *Laboratory of Epidemiology, Demography and Biometry, Intramural Research Program, National Institute on Aging, Bethesda, Maryland*, 3. *VU University Medical Center Amsterdam, Department of Internal Medicine, Amsterdam, Netherlands*, 4. *Icelandic Heart Association, Kopavogur, Iceland*, 5. *University of Iceland, Faculty of Medicine, Reykjavik, Iceland*, 6. *Unit for Nutrition Research, University of Iceland and Landspítali, National University Hospital of Iceland, Reykjavik, Iceland*

**Objectives:** We studied the effect of birth size on glucose and insulin metabolism among older non-diabetic individuals. We also explored the combined effect of birth size and midlife body mass index (BMI) on type 2 diabetes in old age. **Methods:** Our study comprised 1682 Icelanders whose birth records included anthropometrical data. The same individuals had participated in the prospective population-based Reykjavik Study, where BMI was assessed at a mean age of 47 years, and in the AGES-Reykjavik Study during 2002 to 2006, where fasting glucose, insulin, and HbA1c were measured and HOMA-IR calculated at a mean age of 75.5 years. Type 2 diabetes was determined as having a history of diabetes, using glucose-modifying medication, or fasting glucose of >7.0 mmol/l. **Findings:** 249 had prevalent type 2 diabetes in old age. Lower birth weight and body length were associated with higher fasting glucose, insulin, HOMA-IR, and HbA1c among old non-diabetic individuals. Higher birth weight and ponderal index at birth decreased the risk for type 2 diabetes in old age, OR 0.61 (95% CI 0.48-0.79) and 0.96 (95% CI 0.92-1.00), respectively. Compared with those with high birth weight and low BMI in midlife, the odds of diabetes was almost five-fold for individuals with low birth weight and high BMI, (OR 4.93, 95% CI 2.14-11.37). **Interpretation:** Excessive weight gain in adulthood might be particularly detrimental to the health of old individuals with low birth weight. Clinicians should consider unfavourable exposures during early life along with the well-known risk factors for dysglycaemia.

#### **INTRAMUSCULAR INTERLEUKIN-6 IN OLDER ADULTS WITH TYPE 2 DIABETES: RELATIONSHIPS TO BODY COMPOSITION**

Y. Wang<sup>1,2</sup>, D. Simar<sup>3</sup>, K.A. Anderberg<sup>1</sup>, Y. Mavros<sup>1</sup>, M. Kay<sup>1</sup>, B. Baune<sup>4</sup>, N.A. Singh<sup>1,5,6</sup>, M.A. Fiatarone Singh<sup>1,7</sup>, 1. *The University of Sydney, Sydney, New South Wales, Australia*, 2. *University of California, San Francisco, San Francisco, California*, 3. *The University of New South Wales, Sydney, New South Wales, Australia*, 4. *The University of Adelaide, Adelaide, South Australia, Australia*, 5. *The Centre for STRONG Medicine, Balmain Hospital, Sydney, New South Wales, Australia*, 6. *Royal Prince Alfred Hospital, Sydney, New South Wales, Australia*, 7. *Tufts University, Boston, Massachusetts*

Skeletal muscle has been identified as an endocrine organ, and muscle-derived IL-6 has been shown to have insulin sensitizing and anti-inflammatory properties. Therefore, we hypothesized that higher

levels of intramuscular IL-6 and IGF-1 after acute resistive exercise would be associated with favorable body composition characteristics and better insulin resistance, and IL-6 and IGF-1 would be related to each other. **Method:** The cohort consisted of 50 adults over 60 years of age with type 2 diabetes. Fasting insulin resistance was determined via the homeostatic model of assessment 2. Whole body composition was derived from bioelectrical impedance analysis and regional body composition was measured by computed tomography. Intramuscular IL-6 and IGF-1 were analyzed via cytometric bead assay in vastus lateralis muscle biopsy samples after a bout of resistive exercise. **Results:** Intramuscular IL-6 was directly related to intramuscular IGF-1 (Rho=0.62, p=0.001), as well as a more favorable body composition profile, including lower body mass index (Rho=-0.40, p<0.03) and whole body fat mass (Rho=-0.35, p=0.05), and higher relative skeletal muscle mass (Rho=0.34, p<0.06), as hypothesized. Unexpectedly, IL-6 was directly related to age (Rho=0.38, p=0.04) and was not related to insulin resistance. By contrast, intramuscular IGF-1 was not related to body composition or insulin resistance. **Conclusions:** Intramuscular IL-6 after acute exercise appears to differ from pro-inflammatory IL-6 derived from visceral adipocytes, as it was related to favorable body composition profile. Additional investigations of intramuscular IL-6 adaptations to acute stimuli or chronic lifestyle interventions designed to improve insulin resistance are required.

#### **AMBULANT 24-HOUR GLUCOSE RHYTHMS IN CHRONOLOGICAL AGE AND FAMILIAL LONGEVITY IN INDIVIDUALS WITHOUT DIABETES**

C. Wijman<sup>1</sup>, D. van Heemst<sup>1</sup>, E. Slagboom<sup>1,2</sup>, H. Pijl<sup>1</sup>, F. Van der Ouderaa<sup>1,2</sup>, R. Westendorp<sup>1,2</sup>, S. Mooijaart<sup>1,2</sup>, 1. *Leiden University Medical Center, Leiden, Netherlands*, 2. *Netherlands Consortium for Healthy Ageing, Leiden, Netherlands*

**Background.** Glucose metabolism is involved in ageing and familial longevity. Ambulant continuous glucose monitoring provides 24-hour glucose rhythms under daily-life conditions, allowing detailed analysis of mean glucose levels and its variability. **Objective.** To determine the association of 24-hour glucose rhythms with chronological age and familial longevity in individuals without diabetes. **Design.** Cross-sectional. **Participants.** Twenty-one young (aged 22 to 37 years) and 37 middle-aged individuals (aged 44 to 72 years) from the general population, and 26 middle-aged individuals with propensity for longevity (aged 52 to 74 years). All individuals were free of diabetes. **Main outcome measures.** Parameters of mean glucose levels and its variability, derived from 24-hour glucose rhythms obtained by continuous glucose monitoring. **Results.** Compared to young individuals, middle-aged individuals from the general population had higher mean glucose levels (5.3 vs 4.7 mmol/L, p<0.001), both diurnally (p<0.001) and nocturnally (p=0.002). Furthermore, glucose variability was higher in the middle-aged compared to the young (standard deviation 0.57 vs 0.70 mmol/L, p=0.025). Compared to middle-aged individuals from the general population, middle-aged individuals with propensity for longevity had lower overall mean glucose levels (5.2 vs 5.4 mmol/L, p=0.047), which were more outspoken nocturnally (4.8 vs 5.2 mmol/L, p=0.003) than diurnally (5.3 vs 5.5 mmol/L, p=0.14). There were no differences in glucose variability between these groups. For all comparisons, results were independent of body mass index. **Conclusions.** We observed a significant difference in most parameters of 24-hour glucose rhythms with different chronological age. Second, we observed lower mean glucose levels driven by nocturnal glucose levels in individuals with propensity for longevity compared to middle-aged individuals from the general population, which may reflect a longevity-specific trait.

## SESSION 1795 (PAPER)

### LONG TERM CARE STAFF ISSUES AND PRACTICES: THE AFFECT ON QUALITY

#### EMOTIONAL INTELLIGENCE AND BURNOUT IN HEALTH PROFESSIONALS

N. Galdona, E. Urdaneta, E. Aldaz, I. Etxeberria, *Ingema, San Sebastian, Guipuzcoa, Spain*

Burnout has been conceptualized as a psychological syndrome that takes place in response to chronic interpersonal stressors on the job, however some people are affected more than others. An individual skill that would help to better understand why certain subjects are more susceptible to the negative consequences of stress than others is Emotional Intelligence. This study assesses the relationship between dimensions of burnout and emotional intelligence in a sample of health professionals. A cross sectional study was conducted with 46 health professionals working in a variety of nursing homes in Spain. Burnout was measured using the Maslach Burnout Inventory-HSS, which is based on the three-dimensional conceptualization of burnout (emotional exhaustion, depersonalization and (reduced) personal accomplishment), perceived emotional intelligence was measured by TMMS-24 (a self-reported emotional intelligence scale), and the ability to manage emotions was evaluated by the MSCEIT (ability to be open to feelings, and to modulate them in oneself and others so as to promote personal understanding and growth). It was studied whether there was an association between the dimensions of burnout and emotional intelligence using Pearson correlation analysis. It was found that Personal Achievement was significantly correlated with Emotional Clarity ( $r=0.51$ ;  $p=0.00$ ) and Managing Emotions ( $r=0.32$ ;  $p=0.03$ ). From these results it may be deduced that the ability to manage one's own emotions and recognize other people's, as well as perceived emotional clarity, are especially useful in the practice of health professionals and it is necessary the training of emotional intelligence in health professionals to prevent occupational stress.

#### TAKING A CLOSE LOOK AT PAY-FOR-PERFORMANCE PROGRAMS FOR NURSING HOMES

C. Mueller<sup>1</sup>, K. Abrahamson<sup>2</sup>, H. Davila<sup>1</sup>, L. Kouns<sup>3</sup>, T. Inui<sup>3</sup>, R.A. Anderson<sup>4</sup>, E. Miech<sup>3</sup>, G. Arling<sup>3</sup>, *1. Nursing, Univ of MN-School of Nursing, Minneapolis, Minnesota, 2. Western Kentucky University, Bowling Green, Kentucky, 3. Indiana University, Indianapolis, Indiana, 4. Duke University, Durham, North Carolina*

Minnesota has implemented a unique, grass roots pay-for-performance program enabling 199 nursing home providers to develop and implement 89 quality improvement (QI) projects for which they receive a rate increase linked to negotiated performance indicators. We employed case study methods, including in-depth telephone interviews and facility site visits, to comprehensively evaluate the experiences of administrators, project leaders, and direct care staff within eight projects, involving 98 facilities, participating in this pay-for-performance program. The eight projects focused on various clinical and quality of life domains. Common challenges to project implementation were obtaining buy-in and overcoming resistance to change among staff, residents, and families; resource limitations including personnel and space; and selecting performance measures that captured the overall positive changes occurring within the facility. Specifically, staff buy-in was a challenge in project areas that involved changes in long-standing work routines and integration of additional work processes such as increased documentation requirements. Challenges were overcome by getting input from and providing education to direct care staff early in the process, engaging supportive leadership and enthusiastic staff to promote change, and developing frequent opportunities for interdisciplinary communication. As the projects progressed and successes were realized, resistance to change was mitigated. Case study results highlighted the importance of involv-

ing staff from a variety of disciplines and roles, building capacity to enact organizational change and improve quality beyond the domain of the project, and the benefits of QI efforts in terms of public perception of the facility, staff satisfaction, and resident quality of life.

#### NURSING HOME CULTURE CHANGE: IMPACT ON CARE PRACTICES AND QUALITY

J.A. Lucas<sup>1,4</sup>, J.R. Bowblis<sup>2,3</sup>, J. Straker<sup>2,3</sup>, *1. Institute For Health, Health Care Policy, and Aging Research, Rutgers Univ, New Brunswick, New Jersey, 2. Miami University, Oxford, Ohio, 3. Scripps Gerontology Center, Oxford, Ohio, 4. Seton Hall University, So. Orange, New Jersey*

Culture change (CC) is an increasingly popular person-centered care approach that may substantively improve the culture and environment of nursing homes (NH). Except for improved satisfaction, this movement has gained momentum through face validity, and is largely unproven with respect to CC's impact on resident quality of care. This study examines the association of extent of CC involvement and NH care practices and outcomes. Using 2005-06 Ohio Culture Change Index data from 829 of Ohio's 950 facilities (87% response rate) merged with OSCAR data, NH quality indicators were regressed on overall CC involvement. Quality indicators included: the use of antipsychotics, catheters, and feeding tubes; pressure sores; total deficiencies; and total nurse staffing. Nearly half (46%) of facilities reported working on CC. Involvement varied by activity type: 54% reported involving residents in 3/more care decisions; 36% involved staff/families in 2/more staffing/activity decisions; while 16% made 2/more physical environment changes. Cronbach's alpha for overall CC was .76. Regressions showed that higher overall CC was associated with significantly less antipsychotic use, less feeding tube use, lower total deficiencies, and more total staffing. While not reaching significance, catheter use showed a negative association. Findings demonstrate that overall CC involvement is associated with higher quality in NHs. This would suggest that CC is a potential means to improve quality, but further research is needed to determine if CC induces higher quality or if high quality facilities are more likely to engage in CC.

#### THE INFLUENCE OF ORGANIZATIONAL CONTEXT ON USE OF RESEARCH AND STAFF OUTCOMES IN HEALTHCARE AIDES

C.A. Estabrooks<sup>1</sup>, J. Squires<sup>2</sup>, G.G. Cummings<sup>1</sup>, D.G. Morgan<sup>3</sup>, N.J. Stewart<sup>3</sup>, P. Norton<sup>4</sup>, L.R. Ginsberg<sup>5</sup>, K.S. McGilton<sup>6</sup>, *1. University of Alberta, Edmonton, Alberta, Canada, 2. Ottawa Hospital Research Institute, Ottawa, Ontario, Canada, 3. University of Saskatchewan, Saskatoon, Saskatchewan, Canada, 4. University of Calgary, Calgary, Alberta, Canada, 5. York University, Toronto, Ontario, Canada, 6. Toronto Rehab, Toronto, Ontario, Canada*

Policy changes in Canada have enabled many older persons to live in the community for longer periods of time than in the past. Consequently older adults now entering nursing homes have high dependencies on formal care providers – they are more frail, with more complex medical conditions and at more advanced stages of dementia than previously. The majority of their direct care is provided by unregulated care aides who are poorly remunerated, have little status in the health system, and who experience significant levels of work related stress. The objective of this study (part of the larger Translating Research in Elder Care or TREC Program) was to examine the influence of modifiable elements of organizational context on staff outcomes and staff's use of best practices. Study participants were 1506 care aides from 36 nursing homes in the Canadian prairie provinces stratified by public/private ownership and size. Structured interviews were completed using the general TREC survey that includes the Alberta Context Tool (ACT), the Maslach Burnout Inventory, the SF-8TM, and several measures of best practice use. Context assessments (from the ACT) of the nursing homes were grouped using cluster analysis into nursing homes with a

more or a less favorable context. Scatter plots and other graphical displays demonstrate consistent patterns; care aides in nursing homes with a more favourable context report better outcomes. Specifically, nursing homes with a more favorable organizational context were associated with higher use of best practices, better staff health, lower burnout, and greater job satisfaction.

### **A PILOT STUDY DESIGNED TO IMPROVE RESIDENT CARE AND FRONTLINE STAFF ENGAGEMENT IN NURSING HOMES**

C.A. Estabrooks<sup>1</sup>, L.A. Cranley<sup>1</sup>, G.G. Cummings<sup>1</sup>, C. Regier<sup>2</sup>, D. McLeod<sup>3</sup>, D. Barnard<sup>4</sup>, M. Van Dijk<sup>5</sup>, P. Norton<sup>6</sup>, 1. *University of Alberta, Edmonton, Alberta, Canada*, 2. *BC Interior Health Authority, Penticton, British Columbia, Canada*, 3. *Bethany Care Society, Calgary, Alberta, Canada*, 4. *Health Sciences North, Sudbury, Ontario, Canada*, 5. *BC Patient Safety & Quality Council, Vancouver, British Columbia, Canada*, 6. *University of Calgary, Calgary, Alberta, Canada*

Safer Care for Older Persons (in Residential) Environments (SCOPE) was a two-year pilot (2010-2012) funded by Health Canada in seven nursing homes in western Canada. Our purpose was to evaluate feasibility of engaging frontline staff (primarily healthcare aides) to use quality improvement (QI) methods to incorporate best practices into resident care. The 12-month QI initiative was modeled on the Institute for Healthcare Improvement Breakthrough Series Collaborative and the Canadian Safer Healthcare Now! campaign. QI teams in each nursing home, led by healthcare aides, focused on pain management, difficult behaviors or pressure ulcer prevention. The intervention included local measurement, virtual and face-to-face learning congresses, QI methods, ongoing support, and networking. Teams reported barriers to and facilitators of change, team communication, relationships, group cohesion, and progress towards resident care goals. Organizational context and staff outcome data were obtained by survey. MDS-RAI 2.0 data were used to assess changes in resident outcomes. We ranked QI team success based on their process work during the intervention. Despite the short intervention, we saw early improvement trends in resident outcomes and staff engagement. Facilitators of QI team success were: strong teamwork, good communication, team motivation, manager support, and team engagement. Barriers included QI team turnover, lack of leadership engagement at some sites, and high learning curves among staff around QI techniques. We concluded that investing at the microsystem level, i.e., in frontline staff knowledge and skills of QI activities and effective teamwork, is central to advancing quality care and improving quality of worklife in nursing homes.

## **SESSION 1800 (PAPER)**

### **PROMOTING OLDER ADULT HEALTH AND QUALITY OF LIFE**

#### **DETECTION AND INTERVENTION OF HEALTH PROBLEMS AFTER STROKE- A NURSE-LED FOLLOW-UP PROGRAM**

A. Jönsson<sup>1,3</sup>, H. Pessah-Rasmussen<sup>3,2</sup>, 1. *Dept of Health Sciences, Lund University, Lund, Sweden*, 2. *Lund University, Lund, Sweden*, 3. *Skane University Hospital, Malmö, Sweden*

Secondary prevention among stroke survivors has been reported to be neglected. This randomized controlled trial examines whether a structured nurse-led follow-up program three months after stroke improves health status one year after stroke. During one year, all survivors one month after stroke from a university hospital in Malmö, Sweden, were approached for participation. Those consenting were randomized to intervention group with structured follow-up at three months or to standard care (control group) (mean age 73.8/73.7 years). Three months after stroke, a nurse specialist (NS) followed up the intervention group

regarding risk factors and health problems after stroke. The NS sent urgent health problems immediately to a stroke clinician; otherwise patients were referred to a GP for non-urgent or rehabilitative interventions. Patients were informed about stroke and life style factors. Depression/anxiety was assessed by patient self-report with the EQ-5D scale. After three months, 80% of the intervention group (n=194) needed 1-4 interventions compared with 63% (p<0.001) in the same group after one year, and 74% in the control group (n=197) (p=0.022) after one year, and only 40% in the intervention group experienced depression/anxiety compared with 52% in the control group (p=0.042). A nurse-led follow-up three months after stroke resulted in reduced need for interventions and lower prevalence of self-reported depression/anxiety one year after stroke compared to standard care. The follow-up program may be further enhanced by collaboration between a NS and a stroke clinician at the outpatient clinic regarding all medical interventions before referring patients to the GP for continued follow-up.

### **NEIGHBOURHOOD ENVIRONMENT, MOBILITY AND SOCIAL PARTICIPATION IN OLDER ADULTS: RESULTS FROM A SCOPING STUDY**

M. Levasseur<sup>1,2</sup>, J. Desroches<sup>1</sup>, M. Gé né reux<sup>2</sup>, A. Vanasse<sup>2</sup>, C. Beaulac<sup>3</sup>, ÉLISE Paquette<sup>4</sup>, ÉRIC Chabot<sup>5</sup>, L. Gosselin<sup>6</sup>, 1. *Research Centre on Aging, Health and Social Services Centre – University Institute of Geriatrics of Sherbrooke (CSSS-IUGS), Sherbrooke, Québec, Canada, Sherbrooke, Quebec, Canada*, 2. *Faculty of Medicine and Health Sciences, Université de Sherbrooke, Sherbrooke, Quebec, Canada*, 3. *Ordre des urbanistes du Québec, Montréal, Quebec, Canada*, 4. *Ministère de la Famille et des Aînés, Québec, Quebec, Canada*, 5. *Société de transport de Sherbrooke, Sherbrooke, Quebec, Canada*, 6. *Sherbrooke Ville en santé inc., Sherbrooke, Quebec, Canada*

As mobility and social participation are both key determinants amenable to change of many favourable health and quality of life outcomes, it is important to identify factors that influence them. Although several investigations have been carried out on mobility, social participation and neighbourhood environment, there is no clear integration of these results available yet. The main objective of this scoping study is to provide a comprehensive understanding on how neighbourhood environment influences mobility and social participation in older adults. A rigorous methodological scoping studies framework was used. Twenty databases from different fields (public health, urban planning, rehabilitation and gerontology) were searched with forty predetermined keywords. Data were exhaustively analyzed, organized and synthesized by the two research assistants following PRISMA-guidelines and knowledge users were consulted. Majority of the 32 selected articles reports results of cross-sectional studies, mainly conducted in US, and a few in Europe. Studies mostly focused on neighborhood environment associations with mobility, and sparsely with social participation. Neighborhood environment is often considered a mediator of the influence of mobility on social participation. The magnitude of the influence of neighborhood environment is modified by age of individuals, disability levels, perception of risks, streets designs, proximity of resources and availability of public transit. Selected articles raised methodological issues concerning lack of consensus on 1) spatial scale and 2) definition of neighborhood environment. This comprehensive synthesis of empirical studies will ultimately support decisions, and the development of innovative interventions and clear guidelines for the creation of age-supportive environments.

### **BUILDING BLOCKS OF PREVENTIVE HEALTH BEHAVIORS: RECOMMENDATIONS AND READINESS TO CHANGE**

H. Aronow<sup>1</sup>, J.E. Hahn<sup>2</sup>, 1. *Nursing Research & Development, Cedars-Sinai Medical Center, Los Angeles, California*, 2. *University of New Hampshire, Durham, New Hampshire*

The growing number of older adults aging with and into disability has highlighted the need to advance self-management of chronic dis-

ease as part of national policy to improve health and lower the costs of health services. Multidimensional health risk appraisal (M-HRA) has been promoted as a method to target recommendations to maintain and improve health. In this study we sought to link recommendations with readiness to change, adherence, and, ultimately, to changes in health status. Method. Ninety-one adults aging with intellectual and/or developmental disabilities (I/DD) were visited at home by a nurse practitioner (NP) for three visits over 1-3 years. The NP completed M-HRA, made recommendations and recorded adherence and changes in health. Results. Preliminary results on 78 individuals at the second visit are reported; 58% female; 63.5% white; median age = 54.5. Forty percent remembered receiving the recommendations from their first visit; although when prompted with the three top priority recommendations, over 80% reported having “started working on it” or “done a lot” to follow the recommendations. Approximately two-thirds were accomplishing their goals with help of people in their support systems. A total of 345 specific recommendations were given: 70% for specific self-care activities; 19% to see a physician or other community provider; and 6% involved specific social/environmental actions. Conclusions. While persons living in the community with life-long disability are particularly challenged with chronic disease, their experience and responses to a preventive intervention provides an important opportunity to explore models of behavior change, generalizing to all older adults.

#### **ASSESSING PSYCHO-EMOTIONAL CHALLENGES IN PERSON-CENTERED THERAPY WITH OLDER ADULTS**

S. von Humboldt, I. Leal, *Research Unit in Psychology and Health, I&D, ISPA – Instituto Universitário, Lisbon, Portugal*

**Aims:** This research aims to evaluate psycho-emotional challenges for older adults and the relevance of person-centered therapy (PCT) for older adults. **Methods:** Forty senior adults, aged above 65 years ( $M = 71.7$ ;  $SD = 4.6$ ) were assessed with the the Self-Esteem Scale (‘SES’) and the Mini-Mental State Examination (MMSE). Socio-demographic data, including gender (57.5% women), marital status (37.5% married) and education (39.2% mandatory school) were also assessed. Bivariate associations were performed. **Results:** Results yielded a set of five descriptive categories that captured the distinct ways older adults perceived psycho-emotional challenges and that reflected the individual’s perceived importance of PCT: ‘time perspective’, ‘the aging body’, ‘autonomy and control’, ‘cognitive endurance’ and ‘loss and reminiscing’. Regarding bivariate associations, results indicated that ‘autonomy and control’ was associated with the ‘aging body’ and with ‘time perspective’. This latter was also associated with ‘loss and reminiscing’. **Conclusions:** This study highlights the importance of PCT for older adults facing psycho-emotional challenges in old age. Interventions with older adults may benefit from clearly understanding older adults’ specific issues as an important component for promoting successful aging and reducing health disparities. **Key words:** Aging, care, congruence, older adults, person-centered therapy, psycho-emotional challenges, successful aging.

#### **NEW FRONTIER IN VOICE TREATMENT FOR PARKINSON’S DISEASE: SINGING IMPROVES VOCAL QUALITY OF LIFE**

M. Tanner<sup>1,2</sup>, L. Liu<sup>1</sup>, L. Rammage<sup>3</sup>, S. Warren<sup>1</sup>, *1. University of Alberta, Edmonton, Alberta, Canada, 2. Glenrose Rehabilitation Hospital, Edmonton, Alberta, Canada, 3. University of British Columbia, Vancouver, British Columbia, Canada*

A study was conducted to examine a group vocalization program designed to improve the voices of people with idiopathic Parkinson’s disease (IPD). A single group pretest-posttest research design was used. A total of 28 people with IPD participated in the study. The intervention program took place twice a week for six weeks. Each session included vocal warm-up, vocal exercises, singing exercises, choral speech, and choral singing with piano accompaniment. Video and audio

files of songs and exercises to facilitate daily vocal practice were provided. Participants were tested for pre- and post-treatment changes in “vocal quality of life”. Two participant-rated measures, the Voice-Related Quality of Life (V-RQOL) and the Speech Intelligibility Inventory: Self Assessment Form (SII), were used to assess “vocal quality of life”. A statistically significant improvement ( $p < .001$  and effect size of .93) was found on the SII. The results from both questionnaires were found to be clinically relevant. Voice group interventions similar to this study are now offered in the Edmonton community and at the Glenrose Rehabilitation Hospital. Participants include people with voice problems due to multiple causes such as Parkinson’s disease, stroke, brain injury, deconditioning and normal aging.

## **SESSION 1805 (SYMPOSIUM)**

#### **COMMUNITY COLLABORATION AS THE NEW-OLD FRONTIER FOR ENGAGING STUDENTS IN AGING**

Chair: *E. Welleford, Gerontology, VCU, Richmond, Virginia*  
Discussant: *D.C. Burdick, The Richard Stockton College of New Jersey, Galloway, New Jersey*

Gerontology programs are well-positioned to respond to the call for increased levels of Community Engagement currently being encouraged by higher education. Gerontology programs have a long history of community engagement on which to draw. In this symposium, presenters will describe replicable lessons learned from their own program successes as they revisit the call to make connections, make friends, and make some noise in this new frontier of Community Engagement. Evidence based strategies for program success will be described across the continuum from classroom to campus to community. Presenters will share findings from specific program successes including 1) increases in enrollment and scholarship dollars as a result of community engagement initiatives in the classroom, 2) Program sustainability through successful stakeholder relationships across campus and community, and 3) a community identified needs approach to generating core competencies. Finally, the discussant will review themes and key strategies for participants seeking success through community engagement efforts.

#### **CHARTING A COURSE FOR CREATING & SUSTAINING SUCCESSFUL COMMUNITY-UNIVERSITY COLLABORATIONS IN AGING**

R.J. Karasik, *Gerontology, St. Cloud State University, St. Cloud, Minnesota*

Considerable attention has been given to the benefits of experiential education (e.g., community-based research; intergenerational service-learning; internships) for students in gerontology and geriatrics (Blair & Minkler, 2009; Blieszner & Artale, 2001; Karasik, 2007; 2009; Silverstein, Moorhead & Murtha, 2001). Community-University collaborations can also help sustain academic programs in difficult times. Benefits to programs include alignment with University mission and goals for civic engagement, increased program visibility, student recruitment, and employment opportunities for graduates. Developing successful Community-University collaborations, however, can pose a variety of challenges (Karasik & Wallingford, 2007). Drawing on survey data and focus group responses from community and university partners, the current study examines some of the challenges of developing and maintaining strong community-university partnerships and lays out a framework used for building successful collaborations. Key elements of this framework include: identifying compatible partners; agreeing upon mutually beneficial tasks and goals; creating a communication plan; and addressing the logistics

## COMMUNITY OUTREACH AS A GROWTH STRATEGY

D.J. Van Dussen, *Sociology, Anthropology, and Gerontology*,  
*Youngstown State University, Youngstown, Ohio*

Youngstown State University's gerontology program has made community outreach and collaboration a key component of its programs. We have a community advisory committee made of 9 key employers and government agencies. Through this program we have been able to identify over 40 internship locations through networking and place over 90% of our students in aging related positions or graduate school. The committee is designed to improve understanding of gerontology as a field of study and to help our programs create curricula that will help local employers with their needs. Additionally we have been able to have a high community profile which has led to donations for the creation of scholarship funds. Our strategy has shown success through enrollment growth over the past 5 years (4 students enrolled in 2006; 85 students in 2012). Our program would not be successful without our partnerships and the high level of community engagement.

## USING COMMUNITY ENGAGEMENT TO STRENGTHEN ACADEMIC PROGRAMS IN GERONTOLOGY

M. Erickson, E.J. Bergman, C.H. Pogorzala, *Gerontology Institute, Ithaca College, Ithaca, New York*

Infusing opportunities for community engagement into the gerontology curriculum has important benefits for students, community partners and academic programs. The current study draws on experiences teaching gerontology to undergraduates and suggests that contact with older adults within an introductory aging class can encourage students to continue with gerontology courses and envision a future working with older adults. These outcomes lead to increased enrollments which are vital to gerontology program sustainability. Results of the Student Attitudes on Aging Studies survey (N=300) suggest that aging-related service learning participation has a positive effect on students' interest in aging courses and aging-related careers. Further, we trace the impact of participation in an optional service learning experience in introductory courses. Quantitative findings related to increased course and degree program enrollment are supported by qualitative evidence drawn from student papers, which cite the importance of community engagement in shaping their educational and professional goals.

## ENGAGING THE COMMUNITY IN THE EDUCATION OF OUR FUTURE PROFESSIONALS THROUGH CIVIC ENGAGEMENT PROJECTS

K. Kopera-Frye, *Gerontology, University of Louisiana at Monroe/Institute of Gerontology, West Monroe, Louisiana*

Involving the community in the education of our future gerontologists is a win-win situation for all: the university, student, and instructor. In terms of the university benefits, many colleges and universities have civic engagement as part of their mission and vision. Students can potentially secure a job upon graduation through their experiential learning connection with community partners. The instructor benefits from employing a pedagogical approach which Shulman (2002) and others note involves deeper, meaningful learning, well beyond the classroom walls. However, the learning experiences need to be carefully planned and well-organized. Some of the challenges, e.g., changing students' preconceptions about the experience, and potential solutions, e.g., involving the community agency in the evaluation of the student experience, will be shared. Evaluation of the civic engagement experiences is critical, and tools used to evaluate the student learning experiences and sample portfolios will be shared. Benefits of this approach will be highlighted.

## CHARTING A COURSE FOR A NEW GERONTOLOGY CERTIFICATE PROGRAM: COLLABORATING WITH CAMPUS AND COMMUNITY STAKEHOLDERS

T. Kruger, *Indiana State University, Terre Haute, Indiana*

While creating a gerontology certificate at a regional comprehensive university without existing aging studies, a collaborative approach

was taken. Working with community and campus stakeholders allowed the identification of needs of those who might direct students to the certificate program and of potential internship hosts/future employers while forging bonds across the community. Based on suggestions from various faculty and aging services providers, objectives for a nascent gerontology certificate were developed. Stakeholders desired that students be able to distinguish normal aging changes from pathological conditions/behaviors, contribute to older adults' well-being, and be aware of policies affecting older adults. This collaborative approach facilitated progression through the academic hierarchy as the program was reviewed and fostered interest and investment in the program from academic and community representatives. This session will describe the development of the objectives for a new gerontology certificate program and compare the community-identified core competencies with AGHE standards and guidelines.

## SESSION 1810 (SYMPOSIUM)

### LGBT AGING CULTURAL COMPETENCY TRAINING: UNDERSTANDING AUDIENCE, MODALITIES AND EFFECTIVENESS

Chair: R. Moone, *Greater Twin Cities United Way, Minneapolis, Minnesota*

Discussant: S. Butler, *University of Maine, Orono, Maine*

Lesbian, gay, bisexual and transgender (LGBT) people represent a significant minority within the older adult population. However, very little cultural competency training addresses the unique needs and challenges of LGBT older adults. Further, research on cultural competency training and LGBT older adults is virtually non-existent. The four studies within this symposium represent a comprehensive examination of cultural competency training from an LGBT aging perspective. Croghan and colleagues investigated the mainstream aging service provider perceptions of service delivery to LGBT clients and implications for LGBT aging cultural competency training. Understanding resource constraints facing providers, and the burgeoning modalities of provider training that have emerged of late, Moone and colleagues surveyed service providers on preferences for and utilization of cultural competency training modalities. Giunta and colleagues present findings on the evaluation of LGBT aging cultural competence curricula created by the National Resource Center on LGBT Aging. Finally, Rowan and colleagues provide a case study of introducing LGBT aging sensitivity training. Together the panelists describe the need, methods, implementation, and effectiveness of LGBT aging cultural competency training. The session's discussant, Sandra Butler, will offer implications of the rapidly growing developments in LGBT aging services and facilitate discussion of future directions for research, practice, and policy.

### AGING SERVICES PROVIDER PERCEPTIONS OF LGBT CULTURAL COMPETENCY TRAINING: UNDERSTANDING PARAMETERS FOR PROGRAM DEVELOPMENT

R. Moone<sup>2,1</sup>, C. Croghan<sup>2</sup>, J. Smith<sup>2</sup>, 1. *Greater Twin Cities United Way, Minneapolis, Minnesota*, 2. *Training to Serve, St. Paul, Minnesota*

A number of studies on lesbian, gay, bisexual and transgender (LGBT) older adults depict significant health disparities in comparison to heterosexual peers. This burgeoning research, coupled with federal initiatives, inspired the creation of cultural competency training curricula on LGBT aging. This is the first study to investigate aging services provider participation and preferences in LGBT cultural competency training. Of the participants (n=202), the vast majority (66.7%) did not include LGBT in staff training and only 5% of organizations believed staff could participate in a training over two hours. The implications from the study are quite profound for current providers of LGBT aging cultural competency training. Most curricula are based on four hour sessions and are delivered in person. This study investigated the perception of aging service providers; however, additional research is

needed on the effectiveness of training delivered in short periods of time in an online format.

### **INTRODUCING A SERIES OF LGBT OLDER ADULT CULTURAL SENSITIVITY TRAININGS IN RURAL AND URBAN KENTUCKY**

N. Rowan<sup>1</sup>, L. Paris<sup>2</sup>, S. Bowland<sup>1</sup>, B. Gordon<sup>3</sup>, S.A. Lawrence<sup>1</sup>, *1. Kent School of Social Work, University of Louisville, Louisville, Kentucky, 2. Park View Psychiatric Services, Jeffersonville, Indiana, 3. Kentuckiana Regional Planning and Development Agency, Louisville, Kentucky*

Multiple challenges face the LGBT aging population including the need for culturally sensitive community resources and health and mental health care provisions. With scarce resources for an increasing aging population, programs specifically for LGBT older adults are virtually non-existent. Instead, LGBT older adults access services through mainstream aging service providers that serve all populations. To better equip providers with tools to serve this diverse community, a number of LGBT aging curricula have developed across the US. Through the seven-county KIPDA region Mental Health and Aging Coalition, funding was secured to introduce a series of LGBT older adult cultural sensitivity trainings in rural and urban Kentucky. This presentation will provide a case study on the implementation and effectiveness of cultural competency training with aging service providers.

### **IMPROVING CULTURAL COMPETENCE IN AGING AND LGBT SERVICES NATIONALLY: TESTING THE EFFICACY OF THE NATIONAL RESOURCE CENTER ON LGBT AGING TRAINING CURRICULA**

N. Giunta<sup>1</sup>, L.G. Van Sluytman<sup>2</sup>, H. Meyer<sup>3</sup>, *1. Hunter College, City University of New York, New York, New York, 2. Morgan State University, Baltimore, Maryland, 3. Services and Advocacy for GLBT Elders (SAGE), New York, New York*

The National Resource Center on LGBT Aging (NRC) is a partnership of organizations nationwide led by Services & Advocacy for GLBT Elders (SAGE), and supported by the U.S. Administration on Aging. The NRC provides, among other resources, cultural competence training using curricula designed for both aging and LGBT service organizations. This paper presents analyses of pre-and post-test measures of knowledge and attitudes around LGBT aging among aging service providers (N = 441) and LGBT service providers (N = 85) who attended trainings. Results include increased knowledge around creating safe environments ( $t = 1.03, p < .001$ ), and increased comfort with using culturally competent language. These findings are promising in that trainings were delivered in various geographic locations nationally, suggesting replication potential of the NRC curricula in diverse settings. Future directions for research to be discussed include experimental and longitudinal designs to further examine both efficacy and effectiveness.

### **AGING SERVICE PROVIDER PERCEPTIONS OF READINESS TO WORK WITH LGBT CLIENTS**

C. Croghan<sup>1</sup>, K. Knochel<sup>3</sup>, R. Moone<sup>2</sup>, J.K. Quam<sup>2</sup>, *1. Croghan Consulting, Roseville, Minnesota, 2. University of Minnesota, Minneapolis, Minnesota, 3. Augsburg College, Minneapolis, Minnesota*

Over the last decade there have been considerable local and federal resources invested in development and delivery of lesbian, gay, bisexual and transgender (LGBT) cultural competency training curricula. However, most of this work has been done with little or no formal assessment of mainstream aging service provider perceptions about working with LGBT clients. This study examines the Aging Network perceptions of readiness to serve; half of existing agencies (n=320) participated in the study. Three out of five did not support development of separate LGBT specific services; one in four did not believe LGBT clients

would be welcomed by local service providers; and four out of five were willing to offer training. These results point to a significant service gap for LGBT clients and support resource investment in delivery of LGBT aging cultural competency training to ensure availability of quality services.

## **SESSION 1815 (SYMPOSIUM)**

### **POLICY SERIES: TRANSFORMING ADVANCED CARE FOR OLDER ADULTS**

Chair: *B.W. Lindberg, Consumer Coalition, Washington, District of Columbia*

Discussant: *B.W. Lindberg, National Academy on an Aging Society, Washington, District of Columbia*  
Discussant: *T. Koutsoumpas, Coalition to Transform Advanced Care, Washington, District of Columbia*

Leaders in the area of advanced care, staff of the Coalition to Transform Advanced Care, and policy experts will discuss the evolving field post-health care reform. Topics will include the work of leading health care providers, consumer advocates, and other stakeholders. The session will address best practices, obstacles to success in the field, and regulatory and legislative updates.

## **SESSION 1820 (PAPER)**

### **DETERMINANTS AND CONTEXTS OF NURSING HOME QUALITY OF CARE AND LIFE**

#### **THE INFLUENCE OF CONSISTENT ASSIGNMENT OF NURSE AIDES IN NURSING HOMES**

N. Castle<sup>1</sup>, J. Engberg<sup>2</sup>, J.C. Ferguson-Rome<sup>1</sup>, *1. University of Pittsburgh, Pittsburgh, Pennsylvania, 2. RAND, Pittsburgh, Pennsylvania*

Consistent assignment has developed as a preferred practice in nursing homes based on little empirical evidence in the peer reviewed literature. In this research, the association of consistent assignment of Nurse Aides (NAs) with quality of care of nursing home residents is examined (using 14 indicators of care quality). Data used came from a survey of nursing home administrators (response rate = 65%), the Online Survey Certification and Reporting data, and the Area Resource File. The quality indicators came from Nursing Home Compare. The information including consistent assignment and staffing variables of Registered Nurses, Licensed Practical Nurses, and NAs were measured in 2007, and came from 3,941 facilities. Multivariate regression models using a spline functional form (also known as a piecewise linear functional form) were used. An average of 68% of nursing homes reported using consistent assignment. However, the actual levels used varied. In the multivariate analyses, consistent assignment was associated with 10 of the 14 quality indicators. The functional forms did vary for the quality indicators; but on average, a level of 78% consistent assignment appeared to be most beneficial. Less than 35% of facilities used consistent assignment at this level (or greater). The findings presented here provide some justification for the use of this staffing practice for NAs.

#### **SATISFACTION OF DISCHARGED NURSING HOME RESIDENTS**

N. Castle<sup>1</sup>, J. Sangl<sup>2</sup>, *1. University of Pittsburgh, Pittsburgh, Pennsylvania, 2. Agency for Healthcare Research and Quality, Rockville, Maryland*

The CAHPS Nursing Home Survey of discharged nursing home residents' experiences (NHCAHPS-D), originally tested in 2005, is being updated (to include transition items) and finalized (with larger sample size). In this research, we present the psychometric properties of the NHCAHPS-D. Short-term residents discharged over a three month period from nursing homes were used as the sample frame. A random sample of 370 nursing homes (response rate = 67%) from across the

U.S. with 4,926 returned surveys (response rate = 70%) were used in the analyses. Analyses consisted of: simple descriptive statistics consisting of the percent or mean for each item; summary score for each satisfaction category (i.e., domain); applied psychometric properties of the instrument, such as the completeness of data, score distributions, item-scale consistency, and reliability of domain scores; and, confirmatory factor analysis findings examining the extent to which the items in each domain appear to represent the same underlying constructs as the long stay resident instrument. The findings show that the domains of meals, comfort and cleanliness, safety and security, medications and pain management, nursing home staff, services, nursing home environment, visitors, medical care, autonomy, transition out of the nursing home, and overall ratings perform very well. NHAHPS-D should have considerable relevance because more than half of all elders cared for in nursing homes are now discharged home. Moreover, when satisfaction information from current (long stay) residents is compared with those of elders discharged home substantial differences exist. This would indicate that these are different populations with different needs.

#### **DEVELOPMENT OF THE NURSING HOME SOCIAL WORKERS' LEADERSHIP COMPETENCE SCALE IN END OF LIFE CARE**

E.J. Cherlin<sup>1</sup>, W. Klein<sup>2</sup>, 1. Yale University School of Public Health, New Haven, Connecticut, 2. University of Connecticut School of Social Work, West Hartford, Connecticut

The standards for delivering palliative and end of life care established by the National Association of Social Work require that social workers have expertise in order to lead efforts around palliative and end of life care issues with individuals, groups and organizations. We know that hospice care in the nursing home has been associated with improved quality of care of seriously ill nursing home residents. Social workers have the potential to improve access and early initiation of hospice and palliative care to seriously-ill residents residing in nursing homes; yet, many factors hinder nursing home social workers' recognition as leaders in meeting the needs of seriously-ill nursing home residents and their families. We conducted a mixed methods study in Connecticut of 231 nursing home social workers in order to develop and validate a scale to assess the areas in which social workers need greater competence to be leaders in the delivery of end of life care in the nursing home setting. Factor analysis resulted in a preferred five-factor solution including competence in 1) communication and practice, 2) clinical knowledge, 3) social work policy issues, 4) hospice and palliative care legal issues, and 5) hospice benefits and financing. Having a brief, easy-to-administer Leadership Competence Scale can be incorporated into state-by-state or national studies in order to better understand the variation in nursing home social workers' level of leadership competencies in end of life care

#### **EVALUATION OF AHRQ'S ON-TIME PRESSURE ULCER PREVENTION PROGRAM**

L.E. Olsho<sup>1</sup>, W.D. Spector<sup>2</sup>, C. Williams<sup>1</sup>, W. Rhodes<sup>1</sup>, R.V. Fink<sup>1</sup>, R. Limcangco<sup>2</sup>, D.T. Hurd<sup>1</sup>, 1. U.S. Health Division, Abt Associates Inc., Cambridge, Massachusetts, 2. Agency for Healthcare Research and Quality, Rockville, Maryland

Pressure ulcers present serious health and economic consequences for frail elders in nursing homes. The Agency for Healthcare Research and Quality, in partnership with the New York State Department of Health, has sponsored and implemented the On-Time Quality Improvement for Long Term Care, a program intended to reduce pressure ulcer rates and improve workflow processes in participating nursing homes. The On-Time Program is designed to improve long-term care by turning daily documentation into useful information that enhances clinical care planning. We employed a quasi-experimental design to assess the program's effectiveness in reducing the rate of in-house acquired pressure ulcers among nursing home residents. We collected monthly resi-

dent-level data on pressure ulcer incidence between 2008 and 2010 for 3,124 residents of 12 nursing homes employing the intervention, and for 2,604 residents of 13 purposively-selected comparison facilities not employing the intervention. Intervention rollout occurred on a varying timeline across participating units, with individual process improvements and associated reports adopted in different combinations and sequences. We account for this heterogeneity in implementation by separately estimating effects for each On-Time report component. Impacts are estimated via a random effects model including resident- and facility-level covariates. We find a statistically significant reduction in pressure ulcer incidence associated with the joint implementation of four core On-Time reports. Impacts vary with implementation of specific report combinations. Analyses of heterogeneity in impacts by individual-level pressure ulcer risk indicate larger effects among high-risk residents.

#### **VALIDATING A MODEL OF FINANCIAL DISTRESS IN NURSING HOMES: IMPLICATIONS FOR QUALITY**

A.Y. Landry<sup>1</sup>, R. Pradhan<sup>1</sup>, R. Weech-Maldonado<sup>1</sup>, J. Epane<sup>1</sup>, N. Castle<sup>2</sup>, 1. Health Services Administration, University of Alabama at Birmingham, Birmingham, Alabama, 2. University of Pittsburgh, Pittsburgh, Pennsylvania

Evidence from other industries suggests that financial distress may have negative effects on nursing home quality and access to care. This study will validate the Altman Z-score model, a predictive financial distress model frequently used in other industries, for use with nursing homes. This model sums 4 weighted financial ratios into a score that is the basis for identifying organizations at risk for financial distress. Four data sources are used: Medicare Cost Reports, the Online Survey Certification and Reporting (OSCAR) file, the Area Resource File, and nursing home closure data for the period of 1999 - 2005. Our independent variables consist of financial ratios representing liquidity, long-term profitability, operational efficiency, and productivity. Our dependent variable consists of closure vs. non-closure. Approximately 1800 closures occurred between the years 1999 and 2005. Using Multiple Discriminant Analysis, we will determine if the four ratios included in Altman's Z-score accurately predict nursing home closure, and we will create optimal weights to maximize our predictive capabilities. Based upon the score generated using the validated Altman Z-score model, we will categorize nursing homes into one of three groups: (1) high risk of closure, (2) moderate risk of closure, and (3) good financial health. Chi-square analysis will be used to examine between group differences with regard to for-profit status, chain affiliation, and metropolitan location. Models such as the Altman's Z-score can be used to identify nursing homes at financial risk, and can aid policymakers and managers in crafting interventions that might stem potential access and quality problems.

### **SESSION 1825 (PAPER)**

#### **ECONOMICS OF AGING AND PUBLIC POLICY**

##### **MITIGATING ILLNESS-RELATED HOUSEHOLD DEVASTATION THROUGH INBUILT ECONOMIC RESILIENCE OPTIONS**

M.A. Simon<sup>1</sup>, B. Gunia<sup>2</sup>, E.J. Martin<sup>1</sup>, C. Foucar<sup>1</sup>, T. Kundu<sup>3</sup>, D. Ragas<sup>1</sup>, L. Emanuel<sup>1</sup>, 1. Obstetrics and Gynecology and Preventive Medicine, Northwestern University, Feinberg School of Medicine, Chicago, Illinois, 2. Johns Hopkins University, Baltimore, Maryland, 3. Peace Research Institute, Oslo, Norway

Illness can frequently cause multigenerational economic devastation. Costs of direct care account for some of this economic impact, but much is attributable to lost patient and family caregiver work income. Inbuilt Economic Resilience (IER) options aim to mitigate economic impact on the household. One IER option is to build on the skills that family caregivers acquire during patient care, facilitating a post-bereave-

ment transition into the health care industry and providing economic relief to low-income families. After identifying support among patients, families, and health care providers for establishing a health care employment option to train and certify informal caregivers in palliative care, we sought to investigate the feasibility of designing such an educational system. We compiled a core set of applicable skills acquired during informal caregiving through interviews with experts in geriatrics and palliative care as well as information provided by the National Family Caregivers Association. We investigated current medical certification programs and provided rankings by cost and expected salary upon completion. Further, we designed a sample questionnaire to enable program coordinators to identify caregivers best suited for economic resilience program participation. Given the rapidly evolving US health care system and the current economic recession, IERs merit closer attention. Our paper offers an overview and practical plan for implementation of our proposed IER. Our goal is to provide concrete steps and actionable guidance to interested practitioners and executives. We detail how interested parties would identify candidates, provide certifiable knowledge, skills, and abilities, and connect candidates to the health care industry.

### **WORK, RETIREMENT AND POLICY IMPLICATIONS FOR OLDER ADULTS WITH INTELLECTUAL DEVELOPMENTAL DISABILITIES**

B.B. Pieper, J. Dacher, *Nursing, The Sage Colleges, Troy, New York*

Discussion of retirement options for individuals with intellectual and developmental disabilities (I/DD) is relatively new. As individuals with I/DD are living longer, this vulnerable population is more likely to enter into a retirement phase of life, much like the general population of older adults. Few if any data are available to inform the planning, policy agenda and resource allocation for this new phenomenon. During the first phase of pilot work, experience was gained in interviewing this unique population group, exploring data collection methods (video) and identifying ways to elicit rich data. Additionally, a focus group was conducted with the supportive employment site management team to make explicit these individuals' assumptions about work and retirement. The purpose of this paper is to describe the lived experience and meaning of work for a group of 20 individuals, as the first step in partnering with them and the agencies that support them, to create meaningful retirement options that are supported by public policy. The meaning of work (as opposed to retirement, a much more abstract concept) was a way of gaining access to the thoughts and feelings about an activity participants engage in daily. In light of recently mandated changes in Medicaid Managed Care there is a risk that unique retirement needs of these individuals will go unmet because of the need for cost efficiencies and loss of funding for community based programs. A discussion of the findings relative to changes in policy and funding for support of individuals with I/DD is included.

### **ECONOMICS OF PREVENTIVE GERONTOLOGY: HEALTH IMPACT ASSESSMENT OF DIABETES SELF-MANAGEMENT PROGRAMS IN SENIOR CENTERS**

M.C. Fahs<sup>1</sup>, G. Bayaz-Ozturk<sup>1</sup>, X. Wang<sup>2</sup>, W. Gallo<sup>1</sup>, *1. Health Policy and Management, CUNY School of Public Health at Hunter College, New York, New York, 2. PhD Program in Economics, CUNY Graduate Center, New York, New York*

The integration of evidence-based public health strategies with principles of gerontology in community-based senior services settings has made important progress in recent years. Yet scant attention has been devoted to understanding their economic value. Consequently, policy support for public health infrastructure, guidelines, and benefits, critical to dissemination and sustainability, remains marginal. In this study, we use health impact assessment and cost effectiveness analysis to predict the potential for senior centers to be cost effective partners in population-based diabetes control strategies. Data are from the 2008 NYC Health Indicators Project, the first representative sample of senior cen-

ter attendee health status. Over 6,400 NYC senior center participants have been diagnosed with Type2 diabetes. Using advanced computer-based disease simulation modeling techniques, we project 10-year cost savings of \$3,000 per person associated with implementing a diabetes self-management program among all NYC senior centers. Applying conservative population projections for the current NYC senior center diabetic population cohort, total 10-year cost savings are estimated to be \$19 million, or \$1.3 million annually. The most significant health impact is a 40% reduction in insulin use; the risk of amputation is reduced by 20%, and the risk of stroke is reduced by 10%. Public health intervention through preventive gerontology, by improving the delivery of existing therapies through implementation in community-based aging services organizations, may be as valuable as the development of new therapies, and remains a fundamental challenge for translation research and policy linking public health and gerontology.

### **GLOBAL AGING AND PUBLIC POLICY**

L. Polivka<sup>1</sup>, B. Luo<sup>2</sup>, *1. Claude Pepper Center, Florida State University, Tallahassee, Florida, 2. Western Washington University, Bellingham, Washington*

The first part of this paper will focus on an analysis of changes in the global political economy and in many domestic economies over the last 40 years and the impact of these changes on the ability of developed and, especially developing nations to respond to the economic and health care needs of their rapidly growing populations of older persons. Neoliberal (conservative) economic policies have been implemented in many countries over the last several decades resulting in reduced expenditures for public programs, including health care, privatization of many previously public programs, reductions in revenues (taxes), deregulation of finance and the growing influence of corporate elites in the political system. These neoliberal policies have been strongly supported by international financial organizations (IMF, World Bank) and the U.S. (Washington consensus). This presentation will assess the effects of these policies on income support and health care for the elderly and emerging resistance to them in many countries since 2000. The second part of the paper will focus on emerging health and long-term care trends and policies in China, where the already very large older population is projected to double over the next 40 years. China has a rapidly developing capitalist economy characterized by neo-keynesian rather than neoliberal policies and featuring a more state centered economic model designed to ensure the centrality of the Communist Party. The paper will discuss the implications of this economic model and political system for the future of aging related policy, especially health and long-term care, in China.

### **HETEROGENEOUS IMPACT OF THE NON-CONTRIBUTORY PENSION PROGRAM 70 Y MÁS ON NUTRITION AND DIET AMONG A MEXICAN SAMPLE OF RURAL ELDERLY**

A. Salinas-Rodríguez, K. Moreno-Tamayo, B. Manrique-Espinoza, M. Tellez-Rojo Solis, *Instituto Nacional de Salud Pública, Cuernavaca, Morelos, Mexico*

A rising body of evidence documents the impact of some non-contributory social pensions targeted toward elderly, on poverty, labour force participation, migration patterns, food household consumption and children's nutrition. But currently, there is a gap in the evaluation literature regarding the impact of economic transfer programs on individual outcomes such as elderly's diet and nutritional status. Using data from the Mexican non-contributory program 70 y más, a differences-in-differences model with fixed effects was used to estimate the impact of the program on elderly's total energy and macronutrient intakes, percentage of adequacy intake (PAI) and nutritional status; also it was explored any possible heterogeneous effects by sex, ethnicity, and household socioeconomic status (SES). A sample of 1138 individuals aged 70-74 years who received (approximately US\$40) every month were

compared with 884 individuals aged 70–74 years in the control group. After 11 months of exposure, the results indicate a positive impact on protein (3.1g/d,  $p < 0.05$ ) and carbohydrates intake (15.1g/d,  $p < 0.1$ ). An increase attributed to the program was also observed in the PAI of proteins (5.9%,  $p < 0.05$ ) and carbohydrates (8.3%,  $p < 0.1$ ). We also found heterogeneous effects. The impact of the pension on energy, macronutrient intake and PAI were significantly higher among women, indigenous groups, and among the elderly belonging to the lowest SES. Overall, there was no program effect on nutritional status. The program 70 y más exhibits evidence that cash transference targeted toward old people is positively associated with dietary outcomes.

## SESSION 1830 (SYMPOSIUM)

### INFLAMMATION, OXIDATIVE STRESS, ADIPOSE TISSUE AND AGING: INFLAMMATION NATION - ARE INFLAMMATORY RESPONSES WITH AGE MEDIATED BY INCREASED FAT?

Chair: *H.M. Brown-Borg, University of North Dakota, Fargo, North Dakota*

Co-Chair: *H.M. Brown-Borg, University of North Dakota, Fargo,*

*North Dakota* Co-Chair: *M.E. Starr, University of Kentucky, Lexington, Kentucky*

Inflammation and oxidative stress are hallmarks of aging and age-related disease. Nevertheless, the specific mechanisms that contribute to increased inflammation and oxidative stress remain unclear. This symposium will focus on the interrelationship between adipose tissue, inflammatory responses and age-related disease.

### THE NLRP3 INFLAMMASOME REGULATES ADIPOSE TISSUE INFLAMMATION AND IMMUNE-SENESCENCE

V.D. Dixit, *Immunobiology, Pennington Biomedical Research Center, Baton Rouge, Louisiana*

Emergence of chronic ‘sterile’ inflammation during obesity in absence of overt infection or autoimmune process is a puzzling phenomenon. The Nod Like Receptor (NLR) family of innate immune cell sensors like the Nlrp3 inflammasome are implicated in recognizing certain non-microbial origin ‘danger–signals’ leading to caspase-1 activation and subsequent IL-1 $\beta$  and IL-18 secretion. We show that reduction in adipose tissue expression of Nlrp3 is coupled with decreased inflammation and improved insulin–sensitivity in obese type-2 diabetic patients. The Nlrp3 inflammasome senses the lipotoxicity–associated ceramide to induce caspase-1 cleavage in macrophages and adipose tissue. Ablation of Nlrp3 prevented the obesity–induced inflammasome activation in fat depots and liver together with enhanced insulin–signalling. Furthermore, elimination of Nlrp3 in obesity reduced IL-18 and adipose tissue IFN $\gamma$  along with an increase in naïve and reduction in effector adipose tissue T cells. Collectively, these data establish that Nlrp3 inflammasome senses obesity–associated ‘danger–signals’ and contributes to obesity–induced inflammation and insulin–resistance.

### AGE-DEPENDENT INDUCTION OF PRO-INFLAMMATORY AND PRO-THROMBOTIC GENES IN ADIPOSE TISSUE BY INFLAMMATORY STRESS

H. Saito, M. Starr, *Surgery, University of Kentucky, Lexington, Kentucky*

Aging is characterized by reduced tolerance to physiological stressors including infection and inflammation. Compared to young mice, aged mice under inflammatory stress exhibit increased mortality accompanied with dysregulated inflammation and enhanced thrombosis; however, the mechanisms for age-associated loss of stress tolerance are poorly understood. Our microarray analysis revealed that visceral white adipose tissue expresses a large number of genes for inflammatory cytokines and pro-thrombotic factors upon inflammatory stress, and that expression of many of these genes is augmented by aging. Our *in vitro*

organ culture experiments revealed that such age-associated increase in inflammatory gene expression is due, not only to increased fat mass, but to changes in the nature of the fat. Further, cell separation showed that age-dependent induction of these factors occurs more strongly in stromal cells compared to adipocytes. Altered gene expression in adipose tissue appears to be partly responsible for loss of stress tolerance in old age.

## AGING, FAT TISSUE, INFLAMMATION, AND CELLULAR SENESCENCE

J. Kirkland<sup>1</sup>, T. Tchkonja<sup>1</sup>, T. Pirtskhalava<sup>1</sup>, Y. Zhu<sup>1</sup>, N. LeBrasseur<sup>1</sup>, R. Miller<sup>2</sup>, J. van Deursen<sup>1</sup>, *1. Robert and Arlene Kogod Center on Aging, Mayo Clinic, Rochester, Minnesota, 2. Department of Pathology, University of Michigan, Ann Arbor, Michigan*

Fat tissue is frequently the largest organ in humans, undergoes pronounced age-related changes in function and distribution, and is a major source of inflammatory cytokines and chemokines, especially in advanced age. Fat tissue lipid storage capacity declines with aging. This contributes to fat redistribution from subcutaneous to visceral fat depots, muscle, liver, bone marrow, and other ectopic tissues, and underlies systemic lipotoxicity due to cytotoxic effects of lipids. Senescent preadipocytes accumulate in fat with aging and obesity. They secrete inflammatory cytokines, chemokines, and matrix proteases, collectively referred to as the senescence-associated secretory phenotype or SASP. Fat tissue senescent cell accumulation, fat redistribution, and dysfunction are delayed in long-lived mutant mice. Although the percent of senescent cells in fat is low in advanced age (around 10%), eliminating senescent cells using genetic strategies (“INK-ATTAC”) or interfering with the SASP pharmacologically delays or partially reverses age-related fat tissue and systemic dysfunction in mice. Support: NIH grants AG41122, AG13925, and AG31736, and the Ellison, Ted Nash, Glenn, and Noaber Foundations.

## SESSION 1835 (SYMPOSIUM)

### THE AGING RENIN-ANGIOTENSIN SYSTEM AND THE POTENTIAL FOR INTERVENTION

Chair: *J.D. Walston, Medicine/Geriatrics, Johns Hopkins University, Baltimore, Maryland*

Co-Chair: *P.M. Abadir, Medicine/Geriatrics, Johns Hopkins University, Baltimore, Maryland*

Discussant: *K. High, Wake Forest, Winston-Salem, North Carolina*

Declines and dysregulation in multiple physiological systems contribute to chronic disease, frailty, and late life decline in function and independence. The understanding of the role of the renin-angiotensin system (RAS) on these age-related processes has increased rapidly in the recent past with the discovery that Angiotensin II (Ang II) promotes inflammation and the generation of reactive oxygen species and the discovery of a functional mitochondrial RAS that includes a functional angiotensin type 2 receptor (AT2R). Importantly, the number of mitochondrial AT2R decrease with age and increase with AT1R blocker losartan. Further, blocking the RAS in older mice with losartan facilitates skeletal muscle healing and slows muscle deterioration in disuse atrophy. Given the potential importance of this pathway in aging, and a readily available pharmaceutical intervention, further studies to identify the crucial biological components and interactions between systems on a variety of biological pathways and tissues are underway and will be presented in this symposium. First, ongoing efforts to unravel the impact of losartan on the mitochondrial RAS and on mitochondrial function in aging will be presented. Data regarding the age-specific effects of losartan on skeletal muscle atrophy in aging mice will be presented. Data presenting the role of aging related changes in RAS on cardiac muscle and the ability of losartan to help restore the cardiac phenotype towards that of younger animals will be presented. Finally, data that

presents the relationship between serum mediators of the RAS and cognitive parameters in older adults will be presented.

#### **AGE-DEPENDENT EFFECTS OF ANGIOTENSIN II TYPE I RECEPTOR BLOCKADE ON DISUSE ATROPHY**

T.N. Burks<sup>1</sup>, O. Lucas<sup>2</sup>, E. Andres-Mateos<sup>1</sup>, R. Marx<sup>1</sup>, J. Simmers<sup>1</sup>, J.D. Walston<sup>1</sup>, R.D. Cohn<sup>1</sup>, *1. Johns Hopkins University School of Medicine, Baltimore, Maryland, 2. Johns Hopkins University, Baltimore, Maryland*

The aging of skeletal muscle is a dynamic process that occurs as a result of multiple biological and environmental factors including changes in the renin-angiotensin system (RAS) and decreased physical activity. Angiotensin II type I receptor blocker (ARB) losartan has produced beneficial results in ameliorating the muscle phenotype of several conditions. Here we show that the benefits of losartan on disuse atrophy are age-dependent. Losartan confers no protection against disuse atrophy in young mice and partial protection in adult mice. However, it completely protects against the loss of muscle mass in aged mice. This is particularly important because aged muscle lacks the ability to recover from disuse atrophy. The discrepancies in results are due to the modulation of pathways downstream of RAS, particularly the TGF- $\beta$  pathway. These data show that the age-related changes in the RAS affect the impact of ARBs on the maintenance of skeletal muscle.

#### **REGULATION OF MITOCHONDRIAL BIOGENESIS WITH LOSARTAN IN THE HEART OF 150 WEEKS OLD AGED MICE**

P.M. Abadir, B.R. Manwani, H. Yang, C. Lin, J.D. Walston, *Johns Hopkins University, Baltimore, Maryland*

A functional mitochondrial angiotensin system was recently identified. Given the known relationship between aging and mitochondrial biogenesis, and the emerging understanding of local mitochondrial RAS system, we hypothesized that blocking AT1R with losartan in vivo would increase mitochondrial biogenesis and survival gene production. To test this hypothesis, quantitative PCR was used to calculate CytB /GAPDH ratio and to measure mitochondrial survival genes Sirt1, Sirt3, Nampt, and PGC-1 $\alpha$ . AT1R blockade increased mitochondrial biogenesis in the heart of treated young (age 20wks, N=5) and old mice (age 150wks, N=5) (3.84 fold and 4.37 fold increase respectively). Mitochondrial survival gene expression in the heart was not increased and PGC-1 $\alpha$ , one of the main regulators that drive biogenesis, was in fact down-regulated by 50% and 55% in young and old treated mice respectively. The role of the RAS system in maintaining mitochondrial levels might therefore be a key mechanism in promoting healthy aging.

#### **LOSARTAN IMPROVES AGING-ASSOCIATED DECLINE IN MYOCARDIAL ENERGY METABOLISM**

A. Akki, P.M. Abadir, A. Gupta, V.P. Chacko, H. Yang, J.D. Walston, R.G. Weiss, *Medicine, Cardiology, Johns Hopkins Medical Institution, Baltimore, Maryland*

Aging is associated with increased mitochondrial angiotensin-II type-1 (AT1R) receptor density that is reversed by chronic treatment with Losartan, an AT1R blocker. To determine whether long-term AT1R blockade effects myocardial function or energy metabolism in older mice, we employed non-invasive 1H magnetic resonance imaging and 31P spectroscopy at baseline and after 4 weeks of Losartan treatment (40-60 mg/kg/day). Compared to young controls (20 week-old, n=5), old mice (150 week-old, n=5) exhibited a significantly higher left ventricular (LV) mass (103 $\pm$ 4.8 vs. 121 $\pm$ 3.9 mg, young vs. old, P<0.05) and a markedly lower Phosphocreatine (PCr)/ATP (1.84 $\pm$ 0.10 vs. 1.51 $\pm$ 0.05, P<0.05) with no difference in ejection fraction. Four weeks of Losartan normalized LV mass (100 $\pm$ 1.7 vs. 107 $\pm$ 6.6, mg, P=0.33) and PCr/ATP (1.75 $\pm$ 0.02 vs. 1.74 $\pm$ 0.12, P=0.95) in old mice. These findings suggest that AT1R blockade not only normalizes LV mass but also improves myocardial energetics in aging.

#### **THE RENIN ANGIOTENSIN SYSTEM (RAS) AND PHYSICAL FUNCTION**

S. Yasar, H. Polinder - Bos, G. Harris, V.R. Varma, N.S. Fedarko, P. Rabins, M. Carlson, *JHU/APL, Baltimore, Maryland*

The RAS plays a role in physical function by regulating blood flow and energy supply of skeletal muscle. However, it is not clear through which component of the RAS differences in physical function and fatigue in older individuals being affected. We hypothesized that higher levels of blood markers of RAS would influence activity and fatigue in older adults. A secondary cross-sectional data analysis of the Brain Health Study, a nested trial within the Baltimore Experience Corps Trial, of 123 community-dwelling adults aged at least 60 years was performed. Associations between blood angiotensin II (AngII) and angiotensin converting enzyme (ACE) levels and physical function related measures, weight loss and fatigue were evaluated using multiple linear regression analysis. Of the 123 participants, 35 had blood levels of AngII and ACE available. Significant positive associations were found between AngII and fatigue ( $\beta$ =0.39; p=0.04) but no other parameters.

#### **SESSION 1840 (SYMPOSIUM)**

##### **CTI IN THE COMMUNITY: PARTNERSHIPS, PATIENTS AND OUTCOMES**

Chair: *A.B. Stevens, Scott & White Healthcare, Temple, Texas, Texas A&M Health Science Center, Temple, Texas*

Discussant: *A. Berman, John A. Hartford Foundation, New York, New York*

Care transition programs have been a major focus to address costs associated with hospital readmissions and improve patient outcomes and quality of care. This is especially true as the Centers for Medicare and Medicaid Services (CMS) will implement a hospital readmission reduction program in FY2013 and started funding Community Based Care Transitions Program projects in 2012 to test care transition models for high risk Medicare beneficiaries to reduce readmissions and improve patient outcomes. The Administration on Aging's Aging and Disability Resource Center (ADRC) Evidence Based Care Transitions program provides grant funds to ADRCs to implement evidence-based care transition models in partnership with healthcare systems to engage older adults and individuals with disabilities. ADRCs play a critical role during care transitions to support and empower individuals to take control of their healthcare. This session will present an overview of the ADRC Evidence Based Care Transitions program, the partnerships between ADRCs and healthcare systems, and highlight two care transition projects implementing the Care Transitions Intervention® model (the Central Texas ADRC program and the California ADRC program). Additionally, Amy Berman from the John A. Hartford Foundation will serve as the discussant for this symposium. Ms. Berman heads the Foundation's Integrating and Improving Services grants which focus on development and dissemination of innovative, cost-effective models of care including care transitions that improve health outcomes of older adults.

##### **USING EVIDENCE-BASED CARE TRANSITIONS PROGRAMS TO SUPPORT A COMPREHENSIVE PERSON-CENTERED SYSTEM**

C. Ryan, *US Administration on Aging, Washington, District of Columbia*

AoA, CMS and the Veteran's Administration (VA) share a vision of a No Wrong Door/Single Point of Entry (NWD/SPE) as serving as an integral component of health and long-term care reform and essential in the development of effectively managed person-centered service systems at national and state levels. These person-centered systems are envisioned to: optimize choice and independence; be served by an adequate workforce; be transparent, encourage personal responsibility; provide coordinated, high quality care; be financially sustainable; and utilize health information technology. NWD/SEP systems have a history

of collaborating with healthcare partners across the country to develop and implement care transition programs. Participants will learn about NWD/SEP functions and their work with care transitions; identify opportunities for collaboration; and describe outcomes of successful care transition partnerships between NWD/SEP and health care providers.

#### **REACH AND IMPLEMENTATION OF CTI® IN AN ADRC-HEALTHCARE PARTNERSHIP IN TEXAS**

J.L. Thorud<sup>1</sup>, A. Hochhalter<sup>1,2</sup>, R. McGhee<sup>3</sup>, A.B. Stevens<sup>1,2</sup>, *1. Scott & White Healthcare, Temple, Texas, 2. Texas A&M Health Science Center, Temple, Texas, 3. Central Texas Aging and Disability Resource Center, Belton, Texas*

In the first six months of the AoA/CMS-funded Texas program, 795 hospitalized older adults were eligible and 272 (34%) chose to enroll to receive Care Transitions Intervention® (CTI) services. Enrollees were diverse in terms of ethnicity, age, gender, rurality of residence, self-rated health, and health literacy. Sixty-eight (N=184) percent of enrollees completed at least the home visit intervention contacts. CTI coaching techniques lead to the majority of participants defining a personal health goal. Likewise, one or more medication discrepancy was identified for 24% of those who completed at least one visit, with a mean of 2.7 discrepancies per person. While preliminary findings suggest multiple benefits of CTI, challenges to reaching older adults with support during transitions home after hospitalization are common. Strategies that facilitate reach into the target patient population and methods to ensure fidelity to the CTI model will be presented.

#### **CALIFORNIA AGING DISABILITY RESOURCE CENTER CTI IMPLEMENTATION: LESSONS LEARNED AND NEXT STEPS**

M.M. Parrish, *LifeCourse Strategies, Orinda, California*

With several federal grants providing support for an evidence-based care transitions program, California developed and administered an initiative (2006-2012) to implement the Care Transitions Intervention (CTI) through an Aging Disability Resource Center (ADRC) – local hospital(s) partnership. This presentation will review the structure of the initiative, which includes establishment of a state project team to provide technical assistance and support, a Learning Community, and a standardized data set, and the initiative's focus under the most recent Administration on Aging ADRC Care Transitions Grant – to identify and engage diverse and underserved communities in the CTI. The presentation will also discuss lessons learned from the initiative, specifically addressing implementation, partnerships, and sustainability, and will share key data findings and next steps for the ADRCs and their respective CTI programs.

#### **SESSION 1845 (SYMPOSIUM)**

##### **GRANDPARENTS RAISING GRANDCHILDREN: RESILIENCE AND OTHER POSITIVE ASPECTS OF RELATIVE CAREGIVING**

Chair: *K. Bundy-Fazioli, Colorado State University, Fort Collins, Colorado*

Discussant: *L. Yancura, University at Hawaii at Manoa, Honolulu, Hawaii*

In spite of adversity, grandparents raising grandchildren have demonstrated resilience and determination in their ability to persevere. Resilience research focuses on protective factors using a psychosocial framework that promote positive outcomes. Research focused on protective factors that help to foster positive wellbeing in grandfamily households is crucial for supporting the direction of strength-based practice and interventions. There is a wealth of information pertaining to risk factors for this population, for instance problems related to health, poverty, and lack of social supports. This symposium seeks to balance what we know regarding health and wellbeing

risks for grandparent caregivers by shedding light on the positive aspects of caregiving. In particular, the first paper by Hayslip and Neuman focuses on resiliency factors in custodial grandparents using longitudinal findings. The next paper by Gladstone focuses on resiliency from the perspective of internal and external discontinuity. The third paper by Ficker, Lichtenber, Lysack and Hannigan addresses African American grandparenting norms within an urban context examining the benefits of family involvement. The fourth paper by Conway uses intervention research to explore the benefit findings for physical and emotional adaptations of African-American and Latino grandparents. And lastly, Whitley, Kelley and Campos provide a descriptive report of the positive coping behaviors for African American grandparents raising grandchildren with special needs. The discussant, Dr. Yancura, will integrate the findings from these papers addressing future research needs and providing a discussion on implications for practice

##### **RESILIENCE AND ADJUSTMENT- WHAT CAUSES WHAT? ONE-YEAR LONGITUDINAL FINDINGS FOR CUSTODIAL GRANDFAMILIES**

B. Hayslip, C. Neumann, *Psychology, University of North Texas, Denton, Texas*

Resilience can be conceived as trait-like, as a dynamic process, or as an outcome derived from one's experience. How custodial grandparents deal with caregiving-related lifestyle changes and with grandchild-specific demands may reflect resilience or may bring about resilience. We explored relationships over time between measures of resilience and parental efficacy and measures of adjustment and parental stress among 87 custodial grandparents who were reassessed over a year. Inspection of the cross lagged relationships over time suggested that while resilience at Time 1 predicted ( $p < .01$ ) adjustment at Time 2, Time 1 adjustment did not predict Time 2 resilience. In contrast, cross lagged correlations between parental efficacy and parental stress suggested relationships over time between the two to be bidirectional in nature. While these findings suggest that resilience may be a trait-like attribute, parental efficacy's relationships with parental stress over time are likely to be dynamic and mutual in nature.

##### **BENEFIT FINDING: A COGNITIVE INTERVENTION FOR THE PSYCHOLOGICAL HEALTH OF AFRICAN AMERICAN AND LATINO GRANDMOTHERS RAISING THEIR GRANDCHILDREN**

F. Conway, *Psychology, Adelphi University, Garden City, New York*

The grandparent caregiving phenomenon stems from a myriad of circumstances adversely affecting the parents of children. This study explored the physical and emotional adaptation of African-American and Latino grandparents to potentially adverse situations which result in their assuming parental responsibilities for their grandchildren. Sixty-seven African-American and Latino grandparents, who are primary caregivers of at least one grandchild, participated in the study and completed protocol measures: demographic questionnaire, benefit finding (the post traumatic growth inventory) and psychological wellbeing (Brief Symptom Inventory). Zero order correlations and multiple regressions confirmed the findings that the benefit-finding process is highly correlated with the grandparent's reduced experience of psychological distress, with significantly less positive symptom distress ( $t = -2.08, p < .05$ ) and a trend towards lower levels of interpersonal sensitivity ( $t = -1.90, p = .06$ ) among grandparents who are high benefit finders. These results have importance for cognitive interventions with grandparent caregivers which are discussed.

## GRANDPARENTS RAISING GRANDCHILDREN: A DISCONTINUOUS LIFE EVENT AND ITS RELATIONSHIP TO RESILIENCY

J. Gladstone, *McMaster University, Hamilton, Ontario, Canada*

This paper examines ways that grandparents who are raising their grandchildren respond to adversity. We conceptualize adverse conditions that caregiving grandparents experience in terms of internal and external discontinuity (Atchley, 1989). Data were gathered from 33 caregiving grandparents who were involved with the child welfare system. Findings show that discontinuity is related to: having to take on a parental role regarding grandchildren; interacting differently with the middle generation; and being involved with child protection services. Grandparents manage this discontinuity by identifying positive aspects of the caregiving experience and by looking for markers that reinforce their status as grandparents and suggest that parenting responsibilities towards their grandchildren will eventually diminish. Our conclusion is that the concept of "resiliency" may be linked to internal and external discontinuity and is consistent with a strength based approach when working with caregiving grandparents.

## GRANDMOTHERS RAISING GRANDCHILDREN WITH DISABILITIES: THE POSITIVE SIDE OF THE STORY

D. Whitley<sup>4,1</sup>, S.J. Kelley<sup>2,1</sup>, P.E. Campos<sup>3,1</sup>, *1. Georgia State University, Atlanta, Georgia, 2. Byrdine F. Lewis School of Nursing and Health Professions, Atlanta, Georgia, 3. Project Healthy Grandparents, Atlanta, Georgia, 4. School of Social Work, Atlanta, Georgia*

Research has demonstrated that children under the custodial care of their grandparents experience various developmental disabilities due to prenatal exposure to substances, coupled with poor parental functioning following birth. However, researchers are also beginning to recognize that many families have positive experiences related to raising their grandchildren with special needs. This presentation is a description of the positive coping behaviors of a small sample of African American custodial grandmothers and their young grandchildren who are participating in a program designed to enhance caregivers' well-being. The grandchildren in these families, ages 1- 5 years, received a full developmental diagnostic evaluation and treatment protocol. The presentation includes quantitative results, highlighting caregivers' coping strategies as measured by the FACES and FCOPEs scales; qualitative statements from custodial grandparents emphasize specific positive perceptions about raising their grandchildren around themes of actual caregiving responsibilities, family relationships, and community supports. Discussion includes implications for programmatic service designs.

## OLDER AFRICAN AMERICANS CARING FOR GRANDCHILDREN: A NORMATIVE STUDY IN AN URBAN CONTEXT

L.J. Ficker<sup>1,2</sup>, P.A. Lichtenberg<sup>1,2</sup>, C. Lysack<sup>1,2</sup>, *1. Wayne State University, Detroit, Michigan, 2. Institute of Gerontology, Detroit, Michigan*

The goal of this study was to document the extent of caregiving of African American grandparents for grandchildren in an urban context, both current and over the lifespan. We interviewed 501 community-dwelling African American elders over age 55. Over half of the sample had a grandchild live in their household during their lifetime. Despite studies that highlight African American grandparents caregiving due to a crisis (e.g., parental death, teen pregnancy, AIDS, substance abuse), supportive reasons for living with a grandchild (e.g., helping an adult child go to college, buy a home, travel for work or military service, or provide support during divorce) were endorsed by almost half the sample (46.1%). Grandparents who had ever lived with their grandchildren (past or present) had significantly more current social interaction with their grandchildren and received significantly more tangible support from them at the present time, regardless of the reason for grandparent involvement.

## SESSION 1850 (SYMPOSIUM)

### HEALTH, HEALTH CARE SERVICE NEEDS, PERCEIVED SERVICE AVAILABILITY, AND PATTERNS OF SOCIAL CONNECTIONS AMONG OLDER ADULTS LIVING IN URBAN AND RURAL ENVIRONMENTS

Chair: *J. Yorgason, Brigham Young University, School of Family Life, Provo, Utah*

Residents in rural communities tend to be older than their urban counterparts (Gallardo 2010), and may face different challenges from those in urban areas such as limited access to healthcare (Iezzoni, Killeen, & O'Day, 2006). Social connections may be especially important for those living in rural areas (Kaufman, Kosberg, Leeper, & Tang, 2010). In this symposium, papers address health care service needs, perceived service availability, and patterns of social connections among older adults living in urban and rural environments. The first paper uses data from 3,513 adults living in Montana to assess health care use across highly rural, rural, and urban settings. Findings indicated fewer primary care physician visits by respondents living in rural and highly rural compared to urban areas. The second paper uses data from 1,662 older adults living in Montana to explore health status and resources as predictors of anticipated mobility. Findings indicated that those living in highly rural and rural areas that enjoy better health are less likely to move than their urban counterparts. The third paper addresses the health care needs of rural versus urban, and male versus female veterans through community focus groups carried out Montana and Utah. Findings highlight a need in rural areas for better access to specialized health care. The last paper used daily diaries from 161 later life couples to explore links between daily received support and daily outcomes. Findings indicated that support was significantly related to daily levels of depression, anxiety, and life satisfaction. Results different by rural status.

### WHO GOES TO THE DOCTOR? ENABLING AND INHIBITING FACTORS AFFECTING HEALTH CARE ACCESS BY OLDER RURAL RESIDENTS

V. Call, C.E. Yost, *BYU, Provo, Utah*

It is well known that rural elderly face access barriers to medical services (Bull et. al., 2001; Goins et. al., 2005). Little research focuses on the determinants of health service use in rural areas. We use the Behavioral Model (Andersen & Davidson, 2007; Andersen, 1995) and the 2011 Montana Health Matters data (n=3,513) to examine the predisposing, enabling, and need characteristics that predict an older person's access to their primary care physician. Rural and highly rural elderly were significantly less likely than urban elderly to visit their primary care physician in the last 60 days. Patterns of predisposing, enabling, and need variables that increased or decreased the odds of going to their physician were also significantly different. For example, PTSD symptoms increased the odds of going to their doctor in urban but not rural areas. Alternatively, having insurance increased physician visits in rural but not urban or highly rural areas.

### HEALTH STATUS, RESOURCES AND RESIDENTIAL MOBILITY AMONG THE ELDERLY IN URBAN, RURAL, AND HIGHLY RURAL MONTANA COMMUNITIES

L. Erickson, *Brigham Young University, Provo, Utah*

The increasing health risks elderly face as they age ultimately create discontinuities in their lifestyle. These life disruptions may be particularly prominent among rural residents because without the overall population base to support substantial elder care services, rural communities may be unable to support their disproportionate numbers of older residents compared, forcing some to move. Using data representative of Montana I examine whether the health status and resources available to elderly residents (age 60+, N = 1662) in urban, rural, and highly rural communities influences whether they anticipate having to move. Preliminary results indicate that although access to quality health

and elder care uniformly reduce mobility expectations across urban, rural, and highly rural communities, healthier rural and highly rural residents are less likely while healthier urban elderly are more likely to expect to move. Subsequent analyses will explore how formal and informal sources of care can account for these differences.

### **EXPERIENCES OF ELDERLY VETERANS WITH ACCESSING HEALTH CARE IN UTAH AND MONTANA: A GENDER COMPARISON**

C. Ward, *Sociology, Brigham Young University, Provo, Utah*

Disparities in the care provided to male and female veterans have been persistent. Compared to their male counterparts, female veterans are more likely to have poor health status, low income, lack adequate insurance, higher instances of stress and trauma, and lower levels of VA use. This paper presents results of a focus group study concerning the health care needs of older men and women veterans in Utah and Montana, including non-natives and Native Americans in rural and urban areas. Findings include the needs for better access to specialized care and the important roles women veterans play in addressing their own needs and the needs of other generations of veterans. Additionally, findings suggest that women veterans often experience isolation both in the military as well as after they return, a situation that affects their access to health care resources.

### **DAILY ASSOCIATIONS BETWEEN FAMILY AND COMMUNITY SUPPORT WITH DAILY LEVELS OF DEPRESSION, ANXIETY, AND LIFE SATISFACTION**

J. Yorgason<sup>1</sup>, H. Choi<sup>2</sup>, K. Gustafson<sup>1</sup>, W. Godfrey<sup>1</sup>, A. Bond<sup>1</sup>, *1. School of Family Life, Brigham Young University, Provo, Utah, 2. Penn State University, Altoona, Pennsylvania*

Formal resources are often limited in rural areas (Iezzoni, Killeen, & O'Day, 2006). As such, social connections may associate with indicators of well-being differently for urban versus rural older adults (Kaufman, Kosberg, Leeper, & Tang, 2010). Using daily diaries from 161 later life couples across 14 days, this study examined links between daily received support and daily anxiety, depression, and life satisfaction. Moderating factors of rural/urban environment, veteran status, and gender were also examined. Findings from multilevel "actor" models indicated that daily family and community support were individually linked with daily levels of life satisfaction for males and females, and to depression for males. Rural and veteran status moderated links between community support and daily depression and anxiety for both males and females. Results from models exploring "partner" effects will also be discussed.

## **SESSION 1855 (SYMPOSIUM)**

### **INEQUALITY AND AGE: THE INTERGENERATIONAL EQUITY DEBATE IN THE UK**

Chair: *J.S. Macnicol, Social Policy, London School of Economics, London, United Kingdom*

Discussant: *S.E. Rix, AARP, Washington, District of Columbia*

In recent welfare state analyses, there has been much discussion of inequalities of socio-economic status, race/ethnicity, gender, disability status, and so on, yet inequalities of age remain relatively neglected. Despite a few notable exceptions, issues of distributional justice across the lifecourse have also not been adequately considered by liberal democratic political theorists. Yet age-based inequalities are of vital importance to all modern welfare states, which effect a pronounced redistribution of resources across the lifecourse. Cross-sectional analysis appears to reveal sharp distinctions between 'winners' and 'losers' in the distribution of public resources; yet when one compares completed lives the distributional effects are much more complex. The whole issue of inequalities of age has attained heightened salience by the recent debate on intergenerational equity in the UK, against a background of

economic recession, inflated property prices and high levels of youth unemployment, leading to accusations that a selfish 'welfare generation' of baby boomers has monopolised resources at the expense of those generations below it. At the same time, older people are having to work later in life, state pension ages are set to rise and further public expenditure cuts may hit services for older people. There will undoubtedly be discussion of generational distribution for many years to come. This symposium will therefore explore a debate that is topical, urgent and relatively neglected.

### **THE REAPPEARANCE OF AN INTERGENERATIONAL EQUITY DEBATE IN BRITAIN**

J.S. Macnicol<sup>1</sup>, J.S. Macnicol<sup>2</sup>, *1. London School of Economics, London, United Kingdom, 2. Social Policy, London School of Economics, London, United Kingdom*

Intergenerational equity has been the subject of controversy in Britain recently, at a populist and academic level. Against a background of public expenditure cuts, the issue of what should be a 'just' allocation of public resources between generations has become very relevant. The debate today in many ways replicates an equivalent one twenty years ago in both the USA and the UK. A key question is therefore why a debate has reappeared in Britain now. The concept of intergenerational equity is highly problematic and contested, raising such issues as the definition of a generation, generational location, intra-versus inter-generational inequalities, collective agency, and so on. One central issue is whether narratives of intergenerational injustice conceal widening class inequalities. This paper will review the interpretative issues, and conclude with a brief analysis of whether the history of policies for older people in Britain reveals intergenerational equity to have been an important issue.

### **STAYING PUT OR MOVING ON? THE POLITICS OF HOUSING IN AN AGEING POPULATION**

L. Livsey, D. Price, *Institute of Gerontology, King's College London, London, United Kingdom*

In the UK, the media and political classes increasingly represent housing occupancy and wealth as sites of intergenerational schism, while the housing of the over 65's is viewed by Government as a legitimate target for funding retirement and care. In this paper, we analyse historic policy texts to demonstrate that political concerns and moral panics about housing and welfare consumption by the old at the expense of the young have been repeatedly deployed over time for political purposes. These representations neglect social inequalities in housing wealth, resurrect discourses of 'deserving' and 'undeserving poor', hide the inadequate housing of many older people and the residualisation of state provision in late life care, disguise the regressive effect of using housing equity to fund late-life care, and mask multiple policy and market failures. By so casting these problems, attention is deflected away from the erosion of social citizenship in contemporary welfare policy.

### **STAYING PUT OR MOVING ON? THE POLITICS OF HOUSING IN AN AGEING POPULATION**

D. Price, L. Livsey, *Institute of Gerontology, King's College London, London, United Kingdom*

In the UK, the media and political classes increasingly represent housing occupancy and wealth as sites of intergenerational schism, while the housing of the over 65's is viewed by Government as a legitimate target for funding retirement and care. In this paper, we analyse historic policy texts to demonstrate that political concerns and moral panics about housing and welfare consumption by the old at the expense of the young have been repeatedly deployed over time for political purposes. These representations neglect social inequalities in housing wealth, resurrect discourses of 'deserving' and 'undeserving poor', hide the inadequate housing of many older people and the residualisation of state provision in late life care, disguise the regressive effect of using

housing equity to fund late-life care, and mask multiple policy and market failures. By so casting these problems, attention is deflected away from the erosion of social citizenship in contemporary welfare policy.

### **GENERATIONAL JUSTICE, GENERATIONAL HABITUS AND THE 'PROBLEM' OF THE BABY BOOMERS**

P. Higgs, C.J. Gilleard, *University College London, London, United Kingdom*

The financial crisis has seen the re-emergence of a debate about the lack of generational justice in the UK. Despite the definitional debates of what constitutes a generation a general agreement has been reached that those cohorts associated with the 'baby booms' of the mid-twentieth century constitute the problem. These post-war cohorts have not only benefited from educational opportunities and relatively stable employment opportunities but have also experienced higher levels of income and material comfort than previous cohorts. For the cohorts following behind the world looks less friendly and that the advantages of present day retirees can only be sustained at the expense of younger cohorts. This paper takes a critical approach to this view and suggests that the issue of intergenerational justice masks other social and political processes. Generation therefore acts as a prism through which multiple social concerns can be refracted rather than being the origin of them

## **SESSION 1860 (SYMPOSIUM)**

### **MULTIPLE PERSPECTIVES ON THE MEANING OF ENGAGEMENT IN LATER LIFE**

Chair: *J. James, Boston College, Chestnut Hill, Massachusetts*  
Discussant: *M.K. Diehl, Colorado State University, Fort Collins, Colorado*

Most theories of pathways to healthy and positive aging suggest the importance of staying engaged with life for enhanced well-being and cognitive functioning (Morrow-Howell, 2010; Reitzes, Mutran, & Verrill, 1995; Rowe & Kahn, 1998). Largely, these injunctions have been interpreted as staying active or one form or another of the "busy ethic" (Ekherdt, 1986). Yet, findings from the Life & Times in an Aging Society Study (James, Besen, Matz-Costa, & Pitt-Catsoupes, 2012), based on a convenience sample of over 800 adults, ages 21-83, suggest that being involved in any one of four roles (work, volunteering, caregiving, or education) but not particularly challenged by it, excited about it, or dedicated to it is worse for well-being than not being involved at all. These findings are especially important for adults age 65+. Panelists for this symposium will examine various meanings of engagement, its assessment, and the challenges therein. Both quantitative and qualitative data will be used to discuss engagement in everyday activities (life tasks), and in civic and volunteer activities. Panelists will discuss engagement as participation in an activity (e.g. activity theory), which will be differentiated from engagement as deep investment of the self (e.g., work engagement theory). Longitudinal data spanning 50 years will examine both barriers to and facilitators of engagement. A second study will provide evidence of the role that engagement plays in inhibiting cognitive decline. Personality development will be emphasized as an important factor in later life engagement strategies.

### **THE MEANING OF SUCCESSFUL AGING IN RELATION TO ENGAGEMENT IN ACTIVITY**

J. James, C. Matz-Costa, E. Besen, M. Brown, *Boston College, Chestnut Hill, Massachusetts*

Successful aging takes on different meanings for adults. Some adults focus on the importance of health while others focus on finding meaning in life. Although there are many different views in the academic literature about the meaning of successful aging, it is not clear that older adults themselves have similar views. Still less is known about how definitions of successful aging relate to actual engagement, or deep psy-

chological investment in activities. The current study examines differences in the meaning of successful aging between a subsample of adults over the age of 65 who are both involved in activities (n=183) and those who are uninvolved (n=60) and how they relate to engagement. The most common theme in the definitions was the importance of social relationships followed by the importance of activity. The relationships among the themes and engagement in four activities (paid employment, volunteering, caregiving, and education) will be discussed.

### **WHAT DO I HAVE TO "USE" TO NOT "LOSE IT"? A NEW PERSPECTIVE ON MEASURING ACTIVITY ENGAGEMENT IN RELATION TO COGNITION**

A.A. Bielak, *Colorado State University, Fort Collins, Colorado*

One facet of cognitive aging research focuses on identifying factors that may prevent or delay cognitive decline. Engagement in social, cognitive, and physical activities has been shown to be positively associated with cognition in older age. The measurement of self-reported activity participation varies from study to study, but one theme is constant: Activity participation is measured according to time spent doing specific activities, from completing crossword puzzles, to skiing on the slopes. However, is this only way we can measure activity engagement? This talk explores the likelihood of a specific activity being the "holy grail" of cognitive protection, and suggests a new perspective on assessing activity engagement in relation to cognitive ability. This approach differs from the current method of measuring specific activity participation in various ways, including focusing on the characteristics of activities, and accounting for individual differences in effort.

### **ENGAGEMENT AND PERSONALITY DEVELOPMENT**

U.M. Staudinger, *Jacobs Center on Lifelong Learning, Jacobs University Bremen, Bremen, Germany*

In a 15-months longitudinal study, it was investigated whether participation in a nation-wide program financed by the German Government and aiming at the promotion of civic engagement in older age shows effects on personality development. The intervention program consisted of a 3 x 3 days seminar where participants were taught important skills to support their success in conducting projects in their community. It was hypothesized that volunteering in combination with an empowering training program represents a contextual resource that facilitates increases in openness to new experience which usually shows decline after midlife. To unfold its facilitative power, however, the contextual resource needs to be combined with personal resources, in particular internal control beliefs. The control group was composed of volunteers of the waiting list for participating in the program. Results confirm this hypothesis and are discussed in the light of societal consequences.

### **ADOLESCENT PERSONALITY AS PREDICTOR OF ENGAGEMENT IN EVERYDAY ACTIVITIES IN OLDER ADULTHOOD**

P.M. Wink, *Psychology, Wellesley College, Wellesley, Massachusetts*

Findings from the Institute of Human Development Longitudinal study were used to investigate adolescent predictors of engagement in everyday life tasks or activities in older adulthood, a span of over 50 years. The findings confirmed the usefulness of distinguishing between maturity based on growth and adjustment. Adolescent personalities characterized by growth, as operationalized by observer ratings of openness to experience, and adjustment, as operationalized by observer ratings of conscientiousness, both predicted self-reported overall engagement in everyday activities at age 70s as measured by Cantor's Scale of Life Tasks. However, only adolescent openness predicted involvement in creative activities (e.g., singing in a choir, painting, sculpting) and those designed to expand one's knowledge and only adolescent conscientiousness predicted engagement in social activities involving family,

neighbors, and friends. These relationships remained significant after controlling for gender and social class of family of origin.

## SESSION 1865 (SYMPOSIUM)

### NEW FRONTIERS IN SOCIAL GERONTOLOGY: EXPLORING GERONTOLOGICAL THEORY WITHIN AND ACROSS DISCIPLINES

Chair: *J. Allen, University of South Florida, Tampa, Florida*

Co-Chair: *B.D. Capistrant, Harvard University, Cambridge, Massachusetts*

Discussant: *K.F. Ferraro, Purdue University, West Lafayette, Indiana*

While the field of gerontology is sometimes characterized as “data-rich but theory-poor,” there is growing recognition of the importance of theory in advancing gerontological knowledge. Because aging is a universal human experience that affects and is affected by all facets of life, gerontological theories draw from multiple disciplines to build a more comprehensive explanation of patterns and processes of aging. Social gerontology, in particular, draws on traditions of the social sciences and humanities to situate the experience of aging in broader interpersonal, familial, and societal perspectives. The aim of this session is to highlight the importance of theory development alongside empirical investigation and to encourage new work on social theory both within and across the gerontological disciplines. The first presentation considers theoretical approaches such as power relations to address the need for research and interventions that first consider inequalities that underlie individual differences among aging populations. The second presentation introduces a typology of the “Third Age” and examines a framework with which to guide a deeper understanding of the implications, opportunities, and expectations associated with this new life phase. The third presentation introduces five scenarios (i.e. aging as a lifelong process, cumulative advantage/disadvantage, interrelationships between aging persons and environment, variability vs. universality, and agency/structural constraints) to examine parameters for future theory development in aging that expand across disciplinary boundaries. Finally, a fourth presentation by the winner of the Theoretical Developments in Social Gerontology Paper Award, which will provide an interdisciplinary perspective on social gerontology theory, will conclude the session.

### A TYPOLOGY OF THE THIRD AGE: INSPIRING THEORETICAL DEVELOPMENT FOR EXAMINING A NEW PHASE OF LIFE

*D.C. Carr, V.W. Marshall, Institute on Aging, University of North Carolina at Chapel Hill, Chapel Hill, North Carolina*

The Third Age is the period in the life course after departure from one’s career but prior to the onset of disability. A variety of initiatives seeking to increase the activity and engagement of older adults target “third-agers”. However, little effort has been made to develop frameworks with which to guide a deeper understanding of the implications, opportunities, and expectations associated with this new life phase. In this presentation, I introduce a typology of the Third Age, which can provide foundation for future research examining this new period of life.

### FIVE SCENARIOS FOR FUTURE THEORIES OF AGING

*V.L. Bengtson, D.A. Lloyd, Roybal Institute on Aging, University of Southern California, Los Angeles, California*

Research in the social and behavioral science of aging has been criticized for not developing theory consistently. Yet in recent years there has been a resurgence of interest in theory, and theoretical advances have helped bring together previously unconnected bodies of empirical findings. In particular the concept of intersectionalities and the cumulative disadvantage/advantage hypothesis has been useful in developing explanations across and within disciplines. In this paper I wish to

call attention to five developments or scenarios that might provide parameters for future theory development in aging that expand across disciplinary boundaries: (1) Aging as a lifelong process rather than a state; (2) Cumulative advantage/disadvantage at both the individual and population levels; (3) Interrelationships between environment and aging individuals; (4) Focusing on variability rather than universality; (5) Individual agency or structural constraints. The paper will use examples from research described in the new “Handbook of Theories of Aging.

### UNDERSTANDING ‘DIFFERENCE’: THE IMPORTANCE OF THEORY

*T. Calasanti, Virginia Tech, Blacksburg, Virginia*

Although gerontologists have become increasingly aware of and attentive to diversity among the older population, research and interventions can remain at the level of describing differences and intervening at an individual level, rather than trying to understand the sources of such variations. Taking a theoretical approach that focuses on power relations, and exploring varying experiences based on gender and age relations, I give examples of what can occur when we construct interventions without first attempting to understand and dismantle the inequalities that underlie differences.

## SESSION 1870 (SYMPOSIUM)

### RISK FACTORS FOR SUICIDAL BEHAVIOR IN OLDER ADULTS: CHARTING GLOBAL CONNECTIONS

Chair: *K.A. Van Orden, Psychiatry, University of Rochester Medical Center, Rochester, New York*

Discussant: *Y. Conwell, Psychiatry, University of Rochester Medical Center, Rochester, New York*

Suicide is a global public health problem that accounts for more than 1 million deaths worldwide. Suicide prevention is highly relevant to work with older adults: in most countries, suicide rates rise with age for both men and women and peak among the oldest old. However, there is global variability in rates and risk factors for suicidal behaviors in later life, which is the focus of this symposium. Considering late-life suicide from a global perspective is highly relevant to the conference theme of “charting connections” because the reasons for both global differences and commonalities are largely unexplored. Dr. Van Orden will begin with an overview of late-life suicide from a global perspective. Next, Dr. Wiktorsson will present results from a case-controlled study of older Swedish men and women who attempted suicide, emphasizing depression, personality traits, and physical health. Dr. Draper will then present results from a controlled psychological autopsy study of middle-aged and older Australian adults who died by suicide, emphasizing the role of personality traits. Next, Dr. Miller will present on the association between household firearm ownership and late-life suicide in the US, including a discussion of means restriction. Finally, considering within-country variability is also important. Dr. Van Orden will present on differences in endorsement rates for death and suicide ideation among older adults in the US as a function of race and social support. The symposium will conclude with a discussion, led by Dr. Conwell, on suicide prevention in older adults from a global perspective.

### RACIAL DIFFERENCES IN SUICIDE IDEATION AMONG OLDER ADULTS IN THE U.S

*K.A. Van Orden, A. O’Riley, T. Richardson, C. Podgorski, Y. Conwell, Psychiatry, University of Rochester Medical Center, Rochester, New York*

Suicide rates in the United States vary as a function of age, gender, and race. Very little research, however, has examined the prevalence of suicide ideation in later life as a function of gender and race; this research is important given that suicide ideation is a contributor to risk for suicide deaths and is a sign of distress. The current project examines racial differences in the prevalence of death and suicide ideation over the

past year (i.e., using the Paykel Scale) and also considers possible social factors that may, in part, account for these differences. The sample consists of 377 older adults (16% African American) who accessed an aging service organization in Monroe County, NY. Results indicate that white subjects were significantly more likely to endorse any form of death or suicide ideation over the past year (30%) compared to African Americans (17%; chi square = 4.14,  $p < .05$ ). The effect of race was partially accounted for by religious strength and perceived social support from family. These results suggest that social factors may function as protective factors for suicide ideation among older African Americans, and therefore may contribute to lower suicide ideation rates in that population.

### **PERSONALITY TRAITS, SUICIDE AND PSYCHIATRIC DISORDER: A CONTROLLED PSYCHOLOGICAL AUTOPSY STUDY**

B. Draper<sup>1</sup>, A. Altendorf<sup>1</sup>, D. De Leo<sup>2</sup>, J. Snowdon<sup>3</sup>, K. Kolves<sup>2</sup>, 1. UNSW, Randwick, New South Wales, Australia, 2. Griffith University, Brisbane, Queensland, Australia, 3. University of Sydney, Sydney, New South Wales, Australia

A controlled psychological autopsy study of suicide in middle-aged and older persons was undertaken in two Australian cities. Our aim is to describe the personality traits of 65 suicide victims (28 aged 60+) who died without an active psychiatric disorder as compared with 194 suicide victims who had an active psychiatric disorder at death and 116 sudden death controls (SDC) who did not have a psychiatric disorder. Next-of kin were interviewed and completed the NEO-FFI to measure personality traits and the SCID for psychiatric disorder. Suicide victims without an active psychiatric disorder had higher Neuroticism and lower Extraversion scores than SDCs without a psychiatric disorder; and higher Agreeableness and Conscientiousness scores than suicide victims with an active psychiatric disorder. Older suicide victims had higher Conscientiousness scores than younger victims. There were no differences on the Openness to Experience domain. Personality factors contribute to suicide and interact with psychiatric disorders.

### **FACTORS ASSOCIATED WITH SUICIDE ATTEMPT IN PERSONS AGED 80 AND ABOVE: A COMPARISON STUDY**

S. Wiktorsson, O. Åkerblom, T. Marlow, I. Skoog, M. Waern, *Psychiatry, Neuroscience and Physiology, Mölndal, Sweden*

Background: Elderly have high suicide rates. This study aimed to identify factors associated with attempted suicide in late life. Methods: Fifty-five suicide attempters participated in the study. Comparison subjects ( $n = 220$ ) were selected from our population studies on health and ageing. Depressive symptoms were rated with the Montgomery-Åsberg Depression Rating Scale (MADRS). Results: Cases scored higher on the MADRS than comparisons (mean = 25.1 vs. 5.8,  $p < 0.001$ ). Previous episode(s) of depression was reported by 56% of the cases compared to 19% among comparisons ( $p < 0.001$ ). Depression was reported in a first-degree relative in 31% among cases compared to 16% among comparison subjects ( $p = 0.010$ ). Proportions with diabetes, asthma and heart attack did not differ between groups. However, stroke was more common among cases compared to comparisons (38% vs. 20%,  $p = 0.005$ ). Conclusions: Early detection of depression is of importance.

## **SESSION 1875 (SYMPOSIUM)**

### **THE DOWNSIDE OF POSITIVE AND SUPPORTIVE SOCIAL TIES (REVISITED)**

Chair: K. Fingerman, *University of Texas, Austin, Texas*

Co-Chair: K.S. Birditt, *University of Michigan, Ann Arbor, Michigan*

Although research clearly documents benefits from warm and intimate relationships across adulthood, studies also have found that some relationships generate detriments. This symposium revisits this topic by looking with greater complexity at potential problems in relationships

that are typically positive. Luong and Rook discuss roles of age and interpersonal motivations in shaping different facets of older adults' social tie. They found older participants did not report stronger relational-harmony motivations or positive social ties, but they did report fewer negative social ties. Birditt found age differences in daily positive interpersonal interactions and their links with well-being over a 14 day period. The study revealed that middle aged individuals reported greater negative affect and oldest old individuals reported more cognitive interference when they had more positive interactions. Fuller-Iglesias explores negativity within positive family relationships and identifies the association with well-being among Mexican adults. Findings demonstrate differences across relationship type and suggest a significant negative impact of controlling and irritating behavior even in positive relationships. Fingerman et al. describe the downside of parental support. Grown children's perceptions that parents' gave conflicted support were associated with: a) features of support (i.e., less frequent support), b) parents' feelings about providing support (e.g., greater stress providing help), and c) poorer quality parent-child relationships. Overall, this symposium demonstrates the diversity of relationship experiences and that relationship characteristics typically thought of as beneficial may actually be harmful.

### **WHEN FAMILY SUPPORT ISN'T SUPPORTIVE: PERCEPTIONS THAT PARENTAL SUPPORT IS CONFLICTED**

K. Fingerman<sup>1</sup>, Y. Cheng<sup>1</sup>, K.E. Cichy<sup>2</sup>, 1. *University of Texas, Austin, Texas*, 2. *Kent State University, Kent, Ohio*

Family support is often beneficial, but family members may provide help in ways that make the recipient feel beholden or intruded upon. Grown children (aged 18 to 41,  $N = 592$  reporting on 1,158 parents) rated their perceptions of whether parents provided conflicted support. Parents rated their perceptions of providing support. Multilevel models revealed that offspring's perceptions of conflicted support were associated with: a) features of the support (i.e., less frequent support, greater likelihood offspring experienced life problems necessitating support), b) parents' feelings about providing support (e.g., greater stress providing help, beliefs that grown children should be autonomous), and c) poorer quality relationships between parents and grown children, (e.g., less positive quality, more negative quality, children rating parents as self-absorbed). Negative experiences of family support appear to involve dynamics reflecting parental negative feelings about providing help as well as poor relationship qualities associated with diminished support.

### **AGE DIFFERENCES, INTERPERSONAL MOTIVATIONS, AND POSITIVE VS. NEGATIVE ASPECTS OF SOCIAL TIES IN LATER LIFE**

G. Luong, K.S. Rook, *University of California, Irvine, California*

Social motivations are believed to change with age, leading older adults to pursue emotionally rewarding social relationships and to avoid unrewarding relationships. Little research, however, has explicitly examined age and relational-harmony motivations in relation to positive and negative aspects of older adults' social ties. The current study examined these associations in a representative sample ( $N = 916$ ) of older adults. Analyses that controlled for sex, health conditions, and functional health revealed that older participants did not report stronger relational-harmony motivations, more positive social ties, or more frequent positive social exchanges, but they did report fewer negative social ties ( $p < .001$ ) and less frequent negative exchanges ( $p < .001$ ). Older participants also felt more satisfied with their positive exchanges ( $p < .001$ ) and less bothered by negative exchanges ( $p < .01$ ). The roles of age and interpersonal motivations in shaping different facets of older adults' social ties will be discussed.

## **NEGATIVE SIDE OF POSITIVE INTERACTIONS: AGE DIFFERENCES IN EXPOSURE AND REACTIVITY TO POSITIVE DAILY INTERACTIONS**

K.S. Birditt, *Institute for Social Research, University of Michigan, Ann Arbor, Michigan*

Older people report fewer tensions in their relationships than younger people but less work has been done examining daily positive interactions. This study examines age differences in daily positive interpersonal interactions and their links with well-being. Participants included 110 adults ages 40 to 95 who completed daily phone interviews every day for 14 days. Each day participants reported whether they experienced interactions that made them feel good or happy and completed assessments of their well-being. Participants described an average of 1.38 positive interactions each day. There were no age differences in the frequency of positive interactions. The influence of positive interactions on well-being varied by age. Middle aged individuals reported greater negative affect when they reported more positive interactions. Oldest old individuals reported more cognitive interference when they had more positive interactions and lower associations between positive interactions and positive affect. The findings suggest that positive interactions are not universally beneficial.

## **NEGATIVITY WITHIN MEXICAN ADULTS' POSITIVE FAMILY RELATIONSHIPS**

H. Fuller-Iglesias, *Human Development and Family Science, North Dakota State University, Fargo, North Dakota*

Recent studies have highlighted the often ambivalent nature of family social support. Though the importance of family relationships within Mexican culture has been increasingly studied in recent years, little is known about the prevalence and implications of ambivalence within these relationships. Using data from the Survey of Social Relations and Well-being in Mexico (Fuller-Iglesias & Antonucci, 2009), this study explores negativity within positive family relationships and identifies the association with well-being. Selected participants (aged 30-90) reported highly positive relationships with their spouses ( $N = 571$ ), siblings ( $N = 471$ ), or children ( $N = 382$ ). Despite this high positivity, some participants reported negativity in the form of irritating, demanding, controlling, and arguing behaviors, with prevalence varying by relationship. Regression analyses indicated that negativity was more prevalent among men and individuals of lower socioeconomic status. For spousal and sibling relationships, irritating behavior was associated with stress, and controlling behavior was associated with depressive symptoms; whereas, negativity in the child relationship did not predict well-being. Implications will be considered in light of the unique cultural context.

## **SESSION 1880 (SYMPOSIUM)**

### **THE MEANING OF MEMORY: CONVERGING OPERATIONS FROM REMINISCENCE, NARRATIVE, AND AUTOBIOGRAPHICAL MEMORY**

Chair: *T.W. Pierce, Department of Psychology, Radford University, Radford, Virginia*

Discussant: *L. Yancura, University of Hawaii at Manoa, Honolulu, Hawaii*

Life stories, or memories of one's personal history, are increasingly recognized as an important source of benefits for both storytellers and listeners. The Life Story is of central importance to a number of disciplines within gerontology, including reminiscence and life review, narrative studies, and autobiographical memory. However, these disciplines have developed as independent traditions of research and practice, with their members pursuing different goals derived from different theoretical perspectives and using different methods. The goal of this session, sponsored by the Reminiscence and Aging Interest Group, is to examine the degree to which the fields of reminiscence, narrative, and auto-

biographical memory overlap with and complement each other in their use of life stories to explore the personal past. Speakers representing each area will (a) explore the interface of these three areas, with examples drawn from empirical research, (b) examine the effects of autobiographical writing and oral reminiscence on self-concept and the formation of new friendships, (c) describe the functions of reminiscence in older Black adults, and (d) present a mathematical model of the reminiscence bump in autobiographical memory and its relationship with subjective well-being. The four presentations illustrate the degree to which theoretical and practice-based links among the conceptually distinct fields of narrative, reminiscence, and autobiographical memory can be forged through a mutual recognition of the life story as a fundamental unit of analysis.

### **THE LIFE ALREADY LIVED: LOOKING BACK THROUGH DIFFERENT CONCEPTUAL LENSES**

S. Bluck, *University of Florida, Gainesville, Florida*

This talk provides an introduction to the symposium through analysis of the interface of adult developmental literatures on the life story, reminiscence, narrative, and autobiographical memory. These areas share a common focus on psychosocial representations of 'the life already lived,' and all suggest that the personal past can be used adaptively as a resource in aging. They also vary substantially, however, through differential emphasis on several components. These include the relative focus on 'big vs. little' stories, significant versus everyday past events, language as integral to recall, past events that are shared with others versus recalled privately, and views of the reconstructive nature of recalling the personal past. Illustrative empirical examples will be used to highlight the strengths of methods from the life story, narrative, and autobiographical memory traditions. The extent to which synthesis across areas might be practical and fruitful will be discussed.

### **USING WRITING AND REMINISCENCE GROUPS TO IMPROVE SELF-CONCEPT IN OLDER ADULTS: FINDINGS FROM A RANDOMIZED CONTROL TRIAL**

K. de Medeiros<sup>1</sup>, A. Mosby<sup>2</sup>, *1. Miami University, Oxford, Ohio, 2. University of Maryland Baltimore County, Baltimore, Maryland*

Although the idea that writing or talking about the past will ultimately have a positive effect on self concept and overall wellbeing is at the center of many writing and reminiscence interventions, there have been few randomized controlled trials to test these constructs. In the current study, we conducted baseline testing on self-concept (TSCS), depression (GDS), and subjective wellbeing (SF36) on 51 older adults living in retirement communities before randomizing them to one of three groups: a structured autobiographical writing group, an oral reminiscence group or a wait list control. We conducted follow-up testing at eight weeks and 3 months and found significant improvement in several domains of self concept (TSCS and SF36) over time with greater improvement in the writing group, but not in depressive symptoms. Overall our findings support the potential effectiveness of such interventions in a variety of settings for older adults.

### **SOCIOCULTURAL INFLUENCES ON REMINISCENCE FUNCTIONS IN OLDER BLACK ADULTS**

J. Shellman, *University of Massachusetts Lowell, Lowell, Massachusetts*

This paper will present the results of a descriptive survey study that examined the influence of sociocultural variables on the patterns and functions of reminiscence in a sample of community-dwelling older Black adults ( $N=238$ ). Data were collected using the 39 item Modified Reminiscence Functions Scale (MRFS) in two urban areas in the northeast. Age and gender were positively associated with the reminiscence functions to teach/inform and pass on family history while church attendance was found to be negatively associated with bitterness revival. Regression analysis revealed age, gender and church attendance as

predictors of reminiscence functions in older Black adults. These results have implications for how reminiscence is facilitated with older Black adults to improve their mental health and well-being. Recommendations for future reminiscence research with older Black adults will be discussed.

### **THE DYNAMICS OF THE REMINISCENCE BUMP IN OLDER ADULTS**

J.J. Schroots<sup>1</sup>, T.W. Pierce<sup>2</sup>, 1. ERGO/University of Groningen, Amsterdam, Netherlands, 2. Redford University, Virginia, Virginia

Older adults recall a disproportionately high number of life events that occurred in late adolescence and/or early adulthood. The pattern is referred to as the “reminiscence bump” and has been empirically demonstrated with widely divergent techniques, including the Life-line Interview Method (LIM). To study the dynamics of the reminiscence bump, the Janus model of two coupled systems (Schroots, 2008) has been developed for the simulation of various event patterns – e.g. life-lines - as they emerge over the life-span. In this presentation we report data from the Amsterdam Longitudinal Study of Autobiographical Memory showing that older adults experiencing higher levels of loneliness are most likely to devote larger portions of life-lines to the bump period. Fits of these results to the Janus model support the hypothesis that higher levels of loneliness reflect a need to draw on memories from a period of life more filled with meaningful personal relationships.

## **SESSION 1885 (SYMPOSIUM)**

---

### **THE ROLE OF PERCEPTIONS OF AGING IN BEHAVIOR AND ADJUSTMENT: EFFECTS OF CONTEXTS AND DOMAINS**

Chair: A.E. Kornadt, Department of Psychology, Friedrich-Schiller-Universität, Jena, Germany

Co-Chair: M. Wiest, German Centre of Gerontology, Berlin, Germany

Discussant: B.R. Levy, Yale School of Public Health, New Haven, Connecticut

A vast amount of research attests to the influence that perceptions of old age, aging, and the old have on developmental regulation and adjustment across the life span. However, only recent studies have acknowledged the differentiated nature of those perceptions and the moderating role of context factors in their influence on individual aging processes. The present symposium picks up on these recent advances and gaps in research, and demonstrates the influence of domain-specific perceptions of aging on subjective and objective indicators of adjustment. Using data from the German Ageing Survey, a large representative longitudinal study, Wurm, Schütz, and Wolff demonstrate that societal and environmental context factors such as the density of medical care influence whether a positive view on aging is related to the occurrence of chronic diseases. Also analyzing data from the German Ageing Survey, Wiest and Wurm provide evidence for differential effects of domain-specific aging self-perceptions on mortality. Kornadt and Rothermund show that general age stereotypes and personal future self-views are differentially related to the subjective importance people assign to specific life domains in the face of expected gains and losses. Finally, by an intervention study, Klusmann, Evers, Schwarzer, and Heuser explain how physical exercise in old age buffers against a negative view on one's aging. Together, these presentations demonstrate the importance of a differentiated and multidimensional view on perceptions of aging for an understanding of their effects on the aging process.

### **ON THE MEANING OF HEALTH AND CONTEXT FACTORS FOR A POSITIVE VIEW ON AGING**

S. Wurm<sup>1</sup>, B. Schütz<sup>2</sup>, J.K. Wolff<sup>1</sup>, 1. German Centre of Gerontology, Berlin, Germany, 2. University of Tasmania, Hobart, Tasmania, Australia

Whether or not people have positive views on aging (PVA) depends considerably on individual health status and on health supply in the environment. We examined whether the structural density of health supply (DHS) plays a role in the extent to which chronic disease (CD) influences PVA. Using data from the German Ageing Survey (age range: 40-85, N=6.151), hierarchical multi level models were estimated to investigate whether DHS at the county level had an impact on the relationship between CD and PVA. The DHS by general practitioners (GPs) was considered as indicator for opportunity structures of medical care on the county level. The findings support the hypothesis of a cross-level interaction between CD and DHS. Findings suggest that the negative relationship between CD and PVA can be buffered: In counties with a higher DHS, CD are of lower importance for PVA than in counties with fewer GPs per inhabitant.

### **SELF-PERCEPTIONS OF AGING AND LONGEVITY: BENEFITS IN OLD AGE**

M. Wiest, S. Wurm, German Centre of Gerontology, Berlin, Germany

Previous studies have shown that longevity is increased by positive self-perceptions of aging (SPA). Based on domain-specific SPA, the present study examines whether the perception of aging as associated with both physical losses and developmental gains has an impact on longevity depending on age. Data comes from the German Ageing Survey (N=3.191, 40-85 years). 14-year survival was predicted by domain-specific SPA, and the effect of age was explored. Perceiving aging as associated with gains predicted higher longevity (HR = .80, 95% CI = .70-.92, p = .001; controlling for socio-demographics and health indicators); however, expecting physical losses was not associated with longevity. Positive SPA were more important among older adults (65+ years) as compared to middle-aged adults (40-64 years). Findings support that positive SPA are beneficial for longevity. Once age-related changes become more salient, the view that aging is still associated with gains becomes more important.

### **WHO CARES FOR WHAT? EFFECTS OF PERCEPTIONS OF AGING ON THE IMPORTANCE OF LIFE DOMAINS**

A.E. Kornadt, K. Rothermund, Department of Psychology, Friedrich-Schiller-Universität Jena, Jena, Germany

What we think about being and getting old has been shown to influence action selection, well-being, and health, especially in old age. In our study, we investigated how perceptions of aging are related to the subjective importance people assign to different life domains and thus regulate adjustment in the face of expected gains and losses. We assessed views of the self as an old person, current self-views, and importance ratings in eight different life domains (N=769, aged 30 to 80). Future self-views were related to domain-specific importance ratings, but only for persons with a more positive current self-view. If current or future self-ratings were negative, domains were rated as less important indicating disengagement. In life domains that are related to social goals (family, friends, leisure), this relationship was especially pronounced for older participants. The results attest to the pivotal role of age-related expectations for developmental regulation throughout the life span.

### **BECOMING PHYSICALLY ACTIVE MEANS TO BUFFER NEGATIVE VIEWS ON AGING**

V. Klusmann<sup>2,1</sup>, A. Evers<sup>2,3</sup>, R. Schwarzer<sup>4</sup>, I. Heuser<sup>2</sup>, 1. Psychology, University of Konstanz, Konstanz, Germany, 2. Charité Universitätsmedizin Berlin Campus Benjamin Franklin, Berlin, Germany, 3. University of Heidelberg, Heidelberg, Germany, 4. Freie Universität Berlin, Berlin, Germany

With increasing age, people appear to develop a more negative view on aging which is accompanied with less health behavior and

a worse health status. We examined whether newly engaging in physical exercise can counteract negative views on aging and studied the underlying motivational mechanism. Healthy women (N=247) aged 70-93 years were randomized either to a 6-month 3-day/wk exercise course, an active, i.e., a computer course with equal duration and frequency, or a passive control group. The exercise group showed less negative views on aging as opposed to both the active and the passive control group,  $F(2,225)=5.39$ ,  $p=.005$ . Moreover, the buffering effect of exercise was mediated through a high direct approach orientation which implies a focus on immediate positive emotions derived from being active,  $B=-0.31$ , 95% CI=-0.68 to -0.05. Exercise participation in old age holds the potential to overcome subjective ageist bias through an enhanced orientation on proximal emotional gains.

## SESSION 1890 (SYMPOSIUM)

### WHAT MAKES A RELATIONSHIP? EXAMINATION OF APPROACHES AND METHODS TO THE STUDY OF SOCIAL INTERACTION IN LONG TERM CARE

Chair: P. Saunders, *Neurology, GUMC, Washington, DC, District of Columbia*

Co-Chair: K. de Medeiros, *Miami University, Oxford, Ohio*

Discussant: F. Oswald, *Goethe University, Frankfurt, Germany*

People residing in long-term care (LTC) facilities are faced with many personal challenges, including forming friendships, feeling “at home,” and finding enjoyable, social activities. The ability to develop and maintain relationships is linked with positive psychological and health outcomes in the aging population. These issues affect individuals who are cognitively normal as well as those who suffer from dementia. While research on institutional settings has offered solutions through therapeutic design and caregiving strategies, there is a need to better understand the personal, environmental, and social factors influencing the experience of individuals in LTC. This symposium brings together researchers from a variety of fields to examine the construct of social interaction. Each participant will present original research and/or a survey of methodological issues in this area. From the field of gerontological linguistics, Saunders and de Medeiros examine the issues inherent in defining the unit of social interaction among residents with dementia. From the field of social psychology, Sheehan examines the media’s portrayal of older people living in institutional settings and the choices people make regarding their social interactions. Roberts brings an international perspective to issues of how housing policy affects social interaction. She approaches the study social interaction from an architectural and aging vantage point. Gerontological researcher, Savundranayagam, observes not only how social interaction occur but what is missing from an interaction between staff and residents. This symposium concludes with remarks from Dr. Frank Oswald who brings an interdisciplinary, aging approach.

### HOW MANY SOCIAL INTERACTIONS MAKE A FRIENDSHIP? EXAMINATION OF THE ANALYTICAL PROCESS IN STUDYING SOCIAL INTERACTION AMONG PEOPLE WITH DEMENTIA LIVING IN LONG-TERM CARE SETTINGS

P. Saunders<sup>1</sup>, K. de Medeiros<sup>2</sup>, *1. Neurology, GUMC, Washington, DC, District of Columbia, 2. Miami University, Oxford, Ohio*

People with dementia residing in long-term care (LTC) facilities are faced with many personal challenges, including forming friendships, feeling “at home,” and finding enjoyable, social activities. The ability to develop and maintain relationships is linked with positive psychological and health outcomes in the aging population. These issues affect individuals who are cognitively normal as well as those who suffer from dementia. While research based on institutional settings has offered solutions through therapeutic design and caregiving strategies, there is

a need to better understand the personal, environment, and social factors influencing the experience of individuals in LTC. This paper examines the issues inherent in defining a unit of social interaction. These include who are the participants, how long is an interaction, what needs to occur during an interaction to be considered a social interaction? The challenges include what constitutes language and/or communication within a social interaction. Data are drawn from a mixed methods study on friendship in LTC.

### LEGISLATING HOME: THE IMPACT OF THE REGULATION OF SMALL HOUSE SETTINGS ON SOCIAL INTERACTION FOR LONG TERM CARE RESIDENTS IN NOVA SCOTIA, CANADA

E. Roberts, *Human Environmental Sciences, University of Missouri-Columbia, Columbia, Missouri*

The province of Nova Scotia, Canada recently funded 11 new LTC facilities under government guidelines requiring that all of these facilities be built in the model of the small house community, with multiple cottages of 12-15 residents each, and person centered care as an operational requirement. This qualitative study was conducted comparing two LTC facilities in Nova Scotia to determine the impact of the new guidelines on resident social interaction. The first facility (n=51) was built prior to the funding, and the second (n=49) was one of the first in the province to be designed and built to the new guidelines. Observations and interviews took place for 8 weeks in both facilities. The study findings revealed that while both settings included multiple opportunities for social interaction, it is the complex relational ties between staff, residents, management, and the environmental features of each facility which impact resident patterns of social interaction.

### STRATEGIES FOR NAVIGATING THE SOCIAL WORLD OF ASSISTED LIVING: SOCIAL PSYCHOLOGICAL PERSPECTIVES

N.W. Sheehan, *Human Development & Family Studies, University of Connecticut, Storrs, Connecticut*

Elders living in assisted living and other LTC settings must navigate social relationships with fellow residents, direct care staff and program administrators. However, the social dynamics and social interactions in these settings are not well understood. Some recent media portrayals raise significant concerns regarding how impaired residents are stigmatized or shunned. Current research in residential LTC settings, such as assisted living (AL), highlights the complex social dynamics among residents, staff, and family members and the diverse strategies that residents use in their social interactions. As residents’ personal and interpersonal circumstances change, they may either proactively alter their behavior to limit their social involvement or find that other residents treat them differently because of their increased dependence. From a social psychological perspective, current research about factors influencing the nature of social interactions in AL settings, transitions in social relationships, and strategies for negotiating social involvement in such settings will be discussed.

### WHAT DO MISSED OPPORTUNITIES FOR PERSON-CENTERED COMMUNICATION TELL US ABOUT STAFF-RESIDENT SOCIAL INTERACTION IN LONG TERM CARE?

M.Y. Savundranayagam, *School of Health Studies, Western University, London, Ontario, Canada*

Social interaction with long-term care residents with dementia has been characterized as task-oriented, patronizing, and/or overly directive. Long-term care settings are typically social contexts that emphasize dependency and threaten the personal identity of older residents. Conversations (N=46) between staff-resident dyads were audio-recorded during routine care tasks over twelve weeks. Conversations were coded for (a) person-centered communication, (b) specific instructions, and

(c) missed opportunities where person-centered communication could have been facilitated. Exemplars of missed opportunities and alternative person-centered responses will be illustrated. The findings revealed that missed opportunities highlight the need for staff training. Moreover, the data revealed a common communication sequence where utterances coded as person-centered were followed by utterances coded as missed opportunities. This sequence suggests that the positive impact of person-centered communication may be undermined when such communication is followed by missed opportunities. The findings underscore the importance of sustaining person-centered communication while completing routine care tasks.

## **SESSION 1895 (PAPER)**

### **FINANCES AND HEALTH**

#### **FINANCIAL STRAIN AND HEALTH IN OLDER COUPLES: A FIXED EFFECTS MODEL**

J.R. Kahn<sup>1</sup>, J. Kling<sup>1</sup>, S.L. Szanton<sup>3</sup>, M. Shardell<sup>2</sup>, D. Alley<sup>2</sup>, *1. Sociology, University of Maryland, College Park, Maryland, 2. University of Maryland School of Medicine, Baltimore, Maryland, 3. The Johns Hopkins University School of Nursing, Baltimore, Maryland*

Perceived financial strain is strongly associated with poor health, even after controlling for objective economic status (typically income). This association is often interpreted as the stressful effect of financial hardship on health. Alternately, perceived financial strain may provide better measurement of socioeconomic resources, suggesting that the observed independent association between financial strain and health may reflect variation in financial resources not captured by income. This analysis uses unique longitudinal data on spousal dyads from the 2006 and 2008 waves of the Health and Retirement Study to estimate the association between perceived financial strain (measured by four items in 2006) and three health outcomes measured in 2008 (self-rated health, depressive symptoms and mobility limitations). To overcome the limitation of unmeasured financial resources, we used fixed effects models to assess the relationship between spousal differences in perceived financial strain (correlation within spouses=0.63) and health within a household, thereby accounting for household financial resources (N=1533 spouse pairs). In sex-stratified longitudinal analysis, financial strain was associated with change in each health outcome, but after adjustment for covariates, the only significant association was between financial strain and increases in depressive symptoms. Similarly, fixed effects models found no evidence of an effect of financial strain on self-rated health or mobility limitations, but found a moderately significant association between financial strain and depressive symptoms ( $p=0.065$ ). These findings suggest that the impact of financial strain on health may be due to unmeasured household resources more than a direct effect of the stress associated with financial hardship.

#### **LINKED LIVES IN THE "GREAT RECESSION": PERSONAL AND FAMILY ECONOMIC STRESS AND OLDER ADULT HEALTH**

J.A. Ailshire, *Andrus Gerontology Center, Univ Southern California, Los Angeles, California*

The economic crisis that began in 2008 is expected to have significant immediate and long-term consequences for the health and well-being of the older adult population. However, there is currently limited research on how the recession was experienced by older adults. Furthermore, the experiences of older adults may have been linked to the recession experiences of their family. Therefore, the health and well-being of older adults may have been shaped not only by their own personal experiences in the recession, but also the experiences of their families. Using the linked lives perspective in life course theory as an orienting theoretical framework and data from the nationally representative Health and Retirement Study 2009 internet survey, this study

examined associations between recession-related experiences of financial strain and housing instability and the health and well-being of older Americans. Results show that disadvantaged groups, including non-whites and less educated older adults, were at greater risk of experiencing housing instability or financial strain themselves and were more likely to have family with similar experiences. In addition, net of personal demographic and socioeconomic characteristics, older adults who were themselves or had family affected by the recession were more likely to report having poor health, experiencing difficulty sleeping, and being depressed. In addition to providing new empirical data on how the recession had affected older adults, this study contributes to our understanding of the interdependency of human lives and the significant role of families in shaping individual experiences of social and economic changes.

#### **THE IMPACT OF HEALTH AND FINANCIAL LITERACY ON DECISION MAKING IN COMMUNITY-BASED OLDER ADULTS**

B.D. James, P.A. Boyle, J.S. Bennett, D.A. Bennett, *Medicine, Rush Alzheimer's Disease Center, Chicago, Illinois*

We examined the association of health and financial literacy with decision making in 525 community-dwelling older persons without dementia from the Rush Memory and Aging Project. Health and financial literacy were assessed via a series of questions designed to measure comprehension of health and financial information and concepts. The two scores were averaged to yield a total literacy score. A modified, 12-item version of the Decision Making Competence Assessment Tool was used to measure financial and healthcare decision making (6 items each), using materials designed to approximate those used in real world settings. All 12 items were summed to yield a total decision making score. On average, participants correctly answered 67% of the literacy questions (health=61.6%, SD=18.8%, financial=72.5%, SD=16.0%). In linear regression models adjusted for age, sex, education, cognitive function, income, depression, and chronic medical conditions, total literacy score was positively associated with decision making total score (estimate=0.64, SE=0.09,  $p<0.001$ ), as well as healthcare (estimate=0.37, SE=0.05,  $p<0.001$ ) and financial decision making (estimate=0.27, SE=0.05,  $p<0.001$ ). There was evidence of effect modification such that the beneficial association between literacy and healthcare decision making was stronger among older persons, poorer persons, and persons at the lower ranges of cognitive ability. This study is among the first to show that in older persons without dementia, higher levels of health and financial literacy were associated with better decision making, suggesting that improvements in literacy could facilitate better decision making and lead to better health and quality of life in later years.

#### **THE RELATIONSHIP BETWEEN FAMILY NETWORK, INTERGENERATIONAL TRANSFERS OF FINANCIAL SUPPORT, AND SELF-RATED HEALTH AMONG AGING PARENTS IN URBAN CHINA: PERCEIVED FILIAL PIETY AS THE MEDIATOR**

W. Mao, I. Chi, *School of social work, Univ Southern California, Los Angeles, California*

Objectives. Family network and intergenerational support were shown to be central to the well-being of older adults in Chinese societies characterized by filial piety. China provides a unique context for studying their effects on self-rated health among aging parents. This study explores direct and indirect effects of family network and intergenerational transfers of financial support on self-rated health and examines the role of perceived filial piety as the mediator in the aforementioned relationship among aging parents in urban China. Methods. Data came from the nationally representative study "Sample Survey on Aged Population in Urban and Rural China in 2006," collected by the China Research Center on Aging. A subsample of parents aged 60 and older in urban China (N=7,898) was included in path analysis using Mplus

5.1. Results. The model fit was good ( $\chi^2/df=11.797/1$ ,  $p=0.0006$ ; CFI=0.997; RMSEA=0.038). After adjusting for socio-demographic variables, co-residence with children, robust family network, and perception of children as pious were positively related with self-rated health while providing financial support to children was negatively related with self-rated health. Perceived filial piety of children was shown to mediate the relationship between family network and self-rated health. Conclusion. Besides encouraging and maintaining family network, interventions need to consider the effects of perceived filial piety of children in order to promote self-rated health among aging parents in urban China.

## SESSION 1900 (PAPER)

### MARRIAGE, HEALTH, AND COPING

#### YOURS, MINE, AND OURS: HOW OLDER NEWLYWEDS COPE WITH MCI

N. Brossoie, K.A. Roberto, R. Blieszner, *Center for Gerontology, Virginia Tech, Blacksburg, Virginia*

A marriage in late life can bring unforeseen challenges to newlyweds, such as when one spouse becomes a caregiver for the other before their relationship has time to mature and grow. Using an ethnographic approach, we examined how three couples, married less than three years, coped with the husbands' diagnosis of mild cognitive impairment (MCI). In-depth qualitative interviews were conducted with wives and husbands independently, soon after they had received the diagnosis and 12- and 24-months thereafter. Each couple married believing that incidents of short-term memory loss were signs of normal aging. Analysis revealed three key findings: (1) Couples did not regret marrying and accepted MCI as another health problem to manage together; (2) The lack of relationship history prevented the development of clearly defined household and relationship responsibilities. Husbands assumed they successfully managed their responsibilities, but their wives disagreed. Wives reluctantly took on responsibilities they did not perceive to be their own, including monitoring and managing their husbands' personal health, finances and investments, and long-term care plans, as well as communicating with his family and friends; and (3) Husbands and wives drew emotional support from their own children and friends they knew before the marriage. They did not turn to nor expect support from their spouses' family and friends. Findings suggest that community professionals need to recognize the distinct challenges of newlywed caregivers and offer services that include giving emotional support, identifying coping strategies that include their spouse's family and friends, and providing information about managing symptoms of MCI.

#### POSITIVE AND NEGATIVE MARITAL RELATIONSHIPS AND DEPRESSIVE SYMPTOMS: A GROWTH CURVE ANALYSIS

H. Ahn, *SOCIAL WORK, UNIVERSITY OF WISCONSIN MADISON, Madison, Wisconsin*

Research demonstrates that involvement in marital relationships benefits psychological and/or physical well-being. Marital quality is also known to have significant impact on health. There still remain many ambiguities, however, about the developmental dynamics in which marital exchanges (i.e., marital quality) are associated with changes in depressive symptoms over time. What are the effects of positive and negative marital exchanges on changes in depressive symptoms over time and across the adult life span? Socioemotional selectivity theory, a life course perspective to social goals, suggests that marital exchanges become more important to well-being as people age. I conduct a series of latent growth curve analyses using Mplus version 6.1. Data are from the Americans' Changing Lives study, for the subgroup of respondents ( $n=1,129$ ) who were continuously married across the first three waves (1986, 1989, & 1994). Findings show that negative marital exchanges are significantly associated with the initial levels and rates of change

of depressive symptoms. Especially, negative marital exchanges have more potent effects on the trajectories of depressive symptoms among older adults than younger adults. Positive marital exchanges are not substantially associated with changes in depressive symptoms over time. Education and female are associated with a slower rate of decline in depressive symptoms over time. Overall findings demonstrate that negative marital exchanges have significant effects on the trajectories of depressive symptoms over time especially among older adults. The present study demonstrates the importance of considering marital quality in the understanding of the life course trajectories of psychological well-being

#### DYADIC ASSOCIATIONS BETWEEN MARITAL QUALITY AND PHYSICAL HEALTH IN OLDER COUPLES: EDUCATION AS A MODERATING FACTOR

H. Choi, *Penn State University Altoona, Altoona, Pennsylvania*

Recent research suggests that high-quality marriage is more accessible to people with higher education, whereas the less educated are more likely to experience low-quality marriage. The present study extended the marital inequality literature by examining whether education might moderate the effects of positive and negative marital quality, reported by a spouse (i.e., actor) and his partner (i.e., partner), on changes in functional impairment. Data came from the last 4 waves of the Health and Retirement Survey (2004 - 2010), a biennial study of a U.S. representative sample of men and women aged 50+ and their spouses. The analytic sample consisted of heterosexual couples married to each other over the 6-year period and selected to report their positive and negative marital quality in 2004. For statistical analyses, I estimated a series of lagged Actor-Partner Interdependence Models using SAS PROC MIXED. Results indicated that education moderated actor and partner effects of marital quality on changes in functional impairment. With regard to the actor effect, higher education exacerbated the effect of negative marital quality on increases in the number of functional limitations. By contrast, the partner effect of negative marital quality on increases in functional impairment emerged only among spouses with lower education. Further, the partner effect of positive marital quality on declines in functional impairment was found only among spouses with higher education. The findings on the partner effects suggest that the more educated reap greater health benefits from good-quality marriage, whereas poor-quality marriage put the less educated at greater health risks.

#### LIFE COURSE INFLUENCES OF PSYCHIATRIC DIAGNOSIS ON MIDLIFE INTIMATE ATTACHMENT: DOES MARRIAGE MATTER?

C.E. Franz<sup>1</sup>, A. Ramundo<sup>1</sup>, W.S. Kremen<sup>1,3</sup>, M.J. Lyons<sup>2</sup>, *1. Psychiatry, University of California San Diego, La Jolla, California, 2. Boston University, Boston, Massachusetts, 3. San Diego VA HealthCare System, San Diego, California*

Psychiatric diagnoses are often associated with lower marriage rates and less marital stability. Adults with personality disorders tend to be higher in insecure attachment (high levels of attachment related anxiety and/or avoidance) which may interfere with successful affect regulation and stress reduction. The majority of adults with psychiatric disorders do marry and it may be that marriage functions as a protective factor. We examined whether marital status modulated longitudinal associations between psychiatric diagnoses and attachment. We predicted that married adults with previous psychiatric diagnoses would be more securely attached at age 55 than unmarried adults with prior diagnoses. Participants were 1235 men from the Vietnam Era Twin Study of Aging (average age 55) who were interviewed with the DSM III-R Diagnostic Interview Schedule in 1992 (average age 42). We analyzed outcomes of a diagnosis if it occurred in more than 5% of the sample [major depression (8.3%), PTSD (7%), conduct disorder (7.9%), drug (9.8%) and alcohol dependence (35%)]. Attachment style was assessed with the
