

## ABSTRACTS

The Gerontological Society of America  
65th Annual Scientific Meeting  
November 14–18, 2012  
San Diego, CA

Abstracts are arranged numerically by session and in the order of presentation within each session.

### SESSION 5 (SYMPOSIUM)

#### AGING AND MIXED EMOTIONS: NUANCES, COMPLEXITY, AND METHODS

Chair: *T.L. Queen, Institute for Social Research, University of Michigan, Ann Arbor, Michigan*

Co-Chair: *L.H. Ryan, Institute for Social Research, University of Michigan, Ann Arbor, Michigan*

Discussant: *D. Isaacowitz, Northeastern University, Boston, Massachusetts*

Emotional complexity is an important topic in research on aging, however, studies to date reveal inconsistent findings. This may be because researchers examine emotional complexity with a variety of methodological approaches, such as day reconstruction, momentary assessments, diaries, and self-administered questionnaires. The purpose of the symposium is to highlight existing and newly developed methods for measuring mixed emotions, as well as to promote discussion about the construct and meaning of emotional complexity. Daniel Grün will compare different conceptualizations of emotional complexity from experience-sampling data. His findings demonstrate that measures of complexity are not consistently indicative of positive personality and adaptation profiles in older adulthood. Tara Queen and Lindsay Ryan will examine mixed emotions within the context of a day reconstruction. They will compare age and cognitive differences in emotional complexity in reported affective states across and within a day. Jacqui Smith contrasts several indices of emotional experiences linked to activities. She asks if these measures are differentially sensitive to individual differences in health and life circumstances among participants in the Health and Retirement Study. Richard Gonzalez will present a novel index for measuring mixed emotions. His model stems from an economic approach, but offers a means to integrate valence and intensity of emotional experiences. He will explore how this measure differentiates individuals and subgroups within the population. As the discussant, Derek Isaacowitz will explore how process may explain the findings presented and suggest possibilities for future research to advance our understanding of aging and emotion.

#### HOW COMPLEX IS EMOTIONAL COMPLEXITY?

D. Grün<sup>1</sup>, M.K. Diehl<sup>2</sup>, *1. Psychology, NC State University, Raleigh, North Carolina, 2. Colorado State University, Fort Collins, Colorado*

Emotional complexity has been regarded as one correlate of adaptive emotion regulation in adulthood and old age. One approach of operationalizing emotional complexity is based on the assumption that variation in affect over time is informative about the complexity of the underlying emotional representations. This approach assesses affective reports over time in an experience-sampling or daily-diary design and computes different scores, that we call time-based indices of emotional complexity. It is not known, however, how such time-based indicators of emotional complexity are related to each other or to other indicators of adaptive functioning. We report findings from two studies, an

experience-sampling study with adults ranging from 23 to 90 years and a 30-day diary study with adults age 18 to 89. Findings show a complex pattern of interrelations suggestive of distinct components of emotional complexity. Findings are discussed in relation to a differentiated approach to emotional complexity.

#### EMOTIONAL COMPLEXITY WITHIN A DAY: PROVIDING A CONTEXT FOR AFFECTIVE REPORTS

*T.L. Queen, L.H. Ryan, Institute for Social Research, University of Michigan, Ann Arbor, Michigan*

Affective reports may differ depending on the frame of reference, with general evaluations perhaps resulting in less granular reports of emotions. In the present study, we explore differences in emotional complexity in affective states across and within a day. Participants aged 50–96 reported on overall emotions yesterday and subsequently rated the emotions they experienced within specific activities. The experience of mixed emotions is evaluated within yesterday and activity-linked reports of emotions. Age differences in mixed versus positive emotions were observed overall yesterday, with older adults tending to report more positive emotional experiences. In contrast, there were no age differences in mixed emotions within activities. There was, however, an interaction between cognitive ability and age, suggesting that higher functioning older adults were more likely to report mixed emotions within activities. The implications of frame of reference and sample characteristics for evaluations of affective experiences will be discussed.

#### MIXED EMOTIONS YESTERDAY: LIFESTYLE AND HEALTH CORRELATES OF DIFFERENT EMOTION CONSTRUCTS

*J. Smith, S. Becker, Institute for Social Research, University of Michigan, Ann Arbor, Michigan*

Indicators of the positive and negative experiences associated with activities in a day complement global measures of life satisfaction. The Health and Retirement Study surveyed a representative subsample of the longitudinal panel (N = 5200; Age 50–97) about participation yesterday in eight activities and feeling intensity during these activities (e.g., happy, interested, calm, frustrated, bored, sad). We examined the differential associations of health (e.g., functional limitations, pain) and lifestyle (e.g., employment and socioeconomic status) with four constructs of the valence of emotional experience: affect balance, two ordinal rankings of feeling intensity, and frequency of peak intensity. Mixed emotional experience was minimal for socializing (i.e. majority only positive). However, the rank ordering of other activities and aggregate experience for the day differed by emotion construct and the constructs were differentially associated with health and lifestyle indicators. Our findings highlight measurement issues in understanding the complexity of emotional experience in older adults.

## ACTIVITY-BASED WELL-BEING: DEVELOPING A PSYCHOLOGICAL MODEL AND DERIVING INDICES

R. Gonzalez, L.H. Ryan, *Institute for Social Research, University of Michigan, Ann Arbor, Michigan*

Researchers assess evaluative-based and experience-based well-being. Evaluative measures require the participant to combine cues, features, and attributes of past events into a judgment. Such an evaluation process is complicated; it relies on memory-based processing, evokes standards of comparison, requires combining activities/experiences into a single number, etc. Some well-being elicitation procedures purport to bypass these problems by providing memory cues and having participants report their emotional experiences during specific activities. While these experienced-based well-being measures may improve the fidelity of data, they also lead to a more complex data structure involving multiple reports on multiple activities. This leads naturally into judgment models for these complex set of judgments. We present several new indices and compare them to existing indices. The indices are illustrated with a data set of over 900 older adults reporting on two days. Implications for the psychological modeling of well-being as a judgment process are discussed.

## SESSION 10 (SYMPOSIUM)

### AGING IN THE WORK CONTEXT: INTERDISCIPLINARY AND INTERNATIONAL PERSPECTIVES

Chair: *S. Scheibe, University of Groningen, Groningen, Netherlands*

Co-Chair: *H. Zacher, The University of Queensland, St Lucia, Queensland, Australia*

Discussant: *L. Carstensen, Stanford University, Palo Alto, California*

The symposium presents state-of-the-art, interdisciplinary and international research on aging in work and organizational contexts. In times of rapid demographic changes and workforce aging, researchers and practitioners from various disciplines have become increasingly interested in ways to motivate and retain both younger and older employees. The four presentations included in this symposium investigate interactive effects between employee or supervisor age and work-related characteristics on important work outcomes. Specifically, Stamov Rossnagel and Scheibe present the results of a weekly diary study showing that the work motivation of younger and older employees depends on the fit between their current work tasks and their task preferences. In the second presentation, the experimental research discussed by Scheibe indicates that emotion regulation skills are particularly important for work role functioning of older employees in jobs that require high levels of emotional labor. Bowen and Staudinger provide an age-sensitive account of the relationship between job satisfaction and work performance. Using a large, multilevel dataset, these researchers show that job satisfaction is a more important predictor of older employees' performance than younger employees' performance. Finally, Zacher examines how age and age-related attitudes of organizational leaders interact in predicting shared positive organizational age cultures for younger and older employees. After attending this symposium, participants will have gained new insight into different approaches to motivate and retain younger and older employees. In addition, the symposium aims to provide participants with current knowledge on theories and methodologies to investigate aging in the work context.

### LINKING EMOTION REGULATION TO WORK ROLE FUNCTIONING IN YOUNGER AND OLDER NURSES

*S. Scheibe, University of Groningen, Groningen, Netherlands*

The call for extending work life is ubiquitous in Western countries, yet little is known about the factors that allow employees to maintain productivity until the end of their career. Longer work lives pose particular challenges in emotionally demanding jobs, such as the nursing profession. A study with 65 nurses (22-62 years; 85% females) was conducted to investigate the role of emotion regulation for effective work

functioning. Participants completed a laboratory task of emotion regulation, in which they saw highly arousing negative pictures under different emotion regulation instructions (reappraisal, distraction, view). Age interacted with emotion regulation to predict work functioning. For nurses with higher emotion regulation skills, age was positively associated with work role functioning, but no relationship was found between age and work role functioning in nurses with lower emotion regulation skills. Thus, emotion regulation skills may help aging workers in emotional labor-type jobs remain productive over time.

### ORGANIZATIONAL AGE CULTURES: THE INTERPLAY OF CHIEF EXECUTIVE OFFICERS' AGE AND ATTITUDES TOWARD YOUNGER AND OLDER EMPLOYEES

*H. Zacher, The University of Queensland, Brisbane, Queensland, Australia*

In the context of an aging workforce, employees and organizations may benefit from favorable shared assumptions about younger and older employees. In this study, the authors investigated interactive effects of chief executive officer (CEO) age and attitudes toward younger and older employees on positive organizational age cultures for younger and older employees. Data came from 68 CEOs of small businesses and 281 employees. Results were consistent with expectations based on organizational culture and upper echelons theories. The relationship between CEO age and organizational age culture for younger employees was negative for CEOs with a less positive attitude toward younger employees and positive for CEOs with a more positive attitude toward younger employees. In addition, the relationship between CEO age and organizational age culture for older employees was positive for CEOs with a more positive attitude toward older employees and non-significant for CEOs with a less positive attitude toward older employees.

### FIT FOR MOTIVATION? A TASK-LEVEL VIEW ON AGE DIFFERENCES IN WORK MOTIVATION

*C. Stamov Rossnagel<sup>1</sup>, S. Scheibe<sup>2</sup>, 1. Jacobs Centre on Lifelong Learning, Jacobs University, Bremen, Germany, 2. University of Groningen, Groningen, Netherlands*

We tested the notion that age differences in work motivation arise from shifts in work preferences at task level, rather than from changes in overall motivation. Employees of a German city council (N=164, age M=45.86 ± 8.92 years) rated their preferences for six categories of work tasks as classified by the Work Design Questionnaire (Humphrey & Morgeson, 2006). Over five consecutive weeks, participants indicated for each week their actual work tasks, which we used to calculate task fit, i.e. the extent to which actual task demands matched desired task demands. Across task domains, task fit predicted work effort in that week. Tasks affording high information processing demands and task variety were the strongest predictors of effort. Older employees reported higher actual decision making authority and task significance than younger employees. On tasks placing high problem solving demands, task fit decreased with age. We discuss implications for age-differentiated personnel development strategies.

### AGE MODERATES THE RELATIONSHIP BETWEEN JOB SATISFACTION AND PERFORMANCE

*C. Bowen, U.M. Staudinger, Jacobs Center on Lifelong Learning and Institutional Development, Bremen, Germany*

The happy worker hypothesis postulates that employees who are more satisfied with their job perform better. Specifically, satisfied employees are thought to be more motivated to invest effort in doing their job well, resulting in better performance. Developmental research has illustrated that the relationship between motivation and performance tends to be stronger at older ages. We therefore hypothesized that the relationship between job satisfaction and job performance should be stronger among older workers. Results from multi-level regression analysis of cross-sectional data from 1032 employees aged 19-66 years

nested in 119 work teams and five companies confirmed that age moderated the relationship between job satisfaction and supervisor-rated performance in the hypothesized direction. For employees above 50, the relationship between job satisfaction and performance was partially mediated by the desire to retire. Results support the notion that motivational variables are especially important for older workers' job performance.

## SESSION 15 (SYMPOSIUM)

### INTERVENTIONS THAT SPAN THE CAREGIVING CAREER: A HEALTH CONTINUUM APPROACH

Chair: *C.W. Sherman, Institute for Social Research, University of Michigan, Ann Arbor, Michigan*

Discussant: *K. Hepburn, Emory University, Atlanta, Georgia*

Caregiving research experts have noted that interventions need to be tailored to address the evolving needs of chronically ill care recipients and their family caregivers. As chronic diseases, such as dementia or cancer progress, family caregivers must adapt their interactions with the care recipient as well as with larger systems, such as health professionals. Interventions must strive to offer an optimal 'fit' of curriculum content and format to meet caregivers' needs. The papers in this symposium represent innovative intervention approaches that span the arc of caregiving and reflect distinct stages of disease. Blieszner and colleagues will present outcomes findings from a novel intervention for caregivers of persons with Mild Cognitive Impairment. Sherman's paper examines how caregiver characteristics (e.g., gender, age, relationship) and disease duration influence caregiver outcomes in a community-wide implementation of the evidence-based dementia intervention, Savvy Caregiver Program. Samia documents caregiver well-being outcomes from a unique "Savvy II" program that focuses on caregiving issues in the later stages, while McDonald examines end-of-life care scenarios between care recipient, family and doctors to highlight key implications for end-of-life caregiver and family interventions. Finally, Hepburn, an expert in translational and caregiver research, will serve as discussant to synthesize findings and chart future directions for research on intervention development and implementation. After attending this symposium, participants will gain knowledge about the development and effectiveness of novel caregiver interventions and will gain insight into how future interventions can optimally serve the distinct and progressive needs of care dyads across the health continuum.

### SUPPORTING FAMILIES IN EARLY STAGES OF MEMORY LOSS

R. Blieszner, K.A. Roberto, *Virginia Tech - Center for Gerontology, Blacksburg, Virginia*

Relatives of persons diagnosed with mild cognitive impairment (MCI) do not find interventions aimed at families coping with advanced memory loss helpful or useful. In fact, our research with 125 families dealing with MCI showed that attending Alzheimer's support groups was frustrating and upsetting to them. Instead, relatives and friends of persons with MCI need basic information on brain changes and associated symptoms of cognitive deficits, help with recognizing signs of early memory loss, guidance on when and why to seek a medical diagnosis, assistance in dealing with the diagnosed person's reactions as well as those of family and friends, suggestions of strategies to compensate for early memory loss, help with managing their own emotional responses, and direction related to planning for potential future care needs. We present evidence-based recommendations for public education and interventions targeting individuals and families facing MCI.

### CREATING CONFIDENT CAREGIVERS: FINDINGS FROM A COMMUNITY-BASED IMPLEMENTATION OF SAVVY CAREGIVER

C.W. Sherman<sup>1</sup>, S.C. Steiner<sup>2</sup>, *1. Institute for Social Research, University of Michigan, Ann Arbor, Michigan, 2. Michigan Office of Services for the Aging, Lansing, Michigan*

This paper will present findings from a community-based implementation of the evidence-based dementia caregiver intervention, the Savvy Caregiver Program (SCP). The SCP is a six session, group-format psychoeducation program that seeks to enhance family caregiver knowledge, skills and outlook to enable high quality care for the person with dementia and caregiver self-care. Survey data is collected at baseline and six-months post-program. Participant evaluation data is collected in the final session. Preliminary analyses (n=500) reveal that caregivers evaluate the SCP highly and report they better understand the effects of dementia on their family member and feel more confident and less distress in the caregiving role. Associations between caregiver characteristics (age, gender, relationship), disease stage with caregiver outcomes will be presented. Discussion will highlight the value of teaching strategies and skills that can be adapted across the caregiving career to meet the evolving needs of the person with dementia.

### THE BENEFITS OF AN ADVANCED CAREGIVER PROGRAM FOR SAVVY CAREGIVERS

L. Samia<sup>1</sup>, A. O'Sullivan<sup>2</sup>, K. Cole Fallon<sup>2</sup>, L. Nichols<sup>1</sup>, *1. University of Southern Maine, Portland, Maine, 2. Southern Maine Agency on Aging, Scarborough, Maine*

We tested the implementation of an advanced Savvy Caregiver Program (SCP-II) with previously trained community dwelling family caregivers in the later stages of their caregiving trajectory (N= 62). The SCP-II is a 4-week group psychoeducation intervention designed to strengthen caregivers' knowledge, skills, and outlook. The program emphasizes problem-solving current challenges and planning for the future. Survey data was collected at baseline and 5 months after the completion of the SCP-II. Analyses reveal that 42% of SCP-II participants have been caregiving for six or more years (n=26). Caregivers are more confident in their role, they have strengthened their support team, and they have fewer negative reactions to behavior. Study findings support the benefit of progressive interventions to address the changing circumstances of the caregiving dyad and transitions within the caregiver role.

### DEATH IN THREE MOVEMENTS: EFFECTS OF PROGNOSIS DELIVERY TIMING AND STYLE ON END-OF-LIFE AND BEREAVEMENT EXPERIENCES

C. Macdonald, *Sociology, Univ of Wisconsin, Madison, Wisconsin*

Existing research suggests (e.g. Christakis 1999) that physicians are often unable or unwilling to accurately predict terminal status. Yet little is known about how this problem unfolds over time or affects patients and their families. Based on a longitudinal study of thirty cancer patients and their primary caregivers (n=64), this paper closely analyzes the process of disclosing a terminal diagnosis in three distinct, yet representative cases. The vignettes, based on tape-recorded office visits, home and hospital visits with the patient and family and fieldnotes of observations, unfold over time, from the moment the physician disclosed to the researcher that the patient was not likely to live, to the post-mortem interview with surviving family. The paper demonstrates show how each physician's approach dictates a more or less negative outcome for the patient and survivors, and proposes interventions at the point of terminal diagnosis and disclosure of prognosis.

## SESSION 20 (SYMPOSIUM)

### LIVING APART TOGETHER IN LATER LIFE: QUALITATIVE RESEARCH FINDINGS FROM NORTH AMERICA AND EUROPE

Chair: *D. Brothers, Miami University, Oxford, Ohio*

Discussant: *D. Carr, Rutgers University, New Brunswick, New Jersey*

Living apart together (LAT), an arrangement where a couple is in a committed and romantic relationship while maintaining separate households, is quickly becoming a relationship option in many countries. Changing demographic composition of family and households and increasing longevity of men and women help to set the stage for the occurrence of LAT relationships in later life. Living apart together provides many older adults with an alternative to marriage, cohabitation, or remaining unpartnered. An established area of research in many European countries, North American scholars are now beginning to study these relationships in earnest. This symposium brings together researchers from the United States, Canada, and the Netherlands to explore in-depth the topic of LAT in later life based on data from four qualitative studies. The first presentation considers life-stage and cohort factors to theorize how and why men and women form and maintain LAT relationships in the United States. The second presentation presents the strategies U.S. couples utilize in LAT relationships to sustain independence and minimize obligations by developing and maintaining boundaries surrounding their time, space, and emotions. The third presentation provides a gender analysis of the reasons why Canadian women live apart together by discussing the ways this type of relationship provides protection from possible emotional, financial, or other harms. The final presentation, based on data from the Netherlands, explores the topic of caregiving, and how couples plan for and negotiate giving and receiving care within the unique relationship context of living apart together.

### NOT ALL RELATIONSHIPS ARE SHAPED THE SAME: THEORIZING FORMATION AND MAINTENANCE OF LAT RELATIONSHIPS

*D. Brothers, Miami University, Oxford, Ohio*

The aim of this presentation is to describe a theoretical framework highlighting the different patterns of formation and maintenance of LAT relationships in later life, and to discuss the implications of this framework for the future study of living apart together. Data for this research come from semi-structured in-person interviews in the Midwest with 13 women and 7 men (age 59 to 89) conducted in 2010 and 2011. Grounded theory analyses is used to understand how the motivation for pursuing a relationship and the desire to continue in a LAT relationship (as opposed to the alternatives of marriage and cohabitation) vary in ways related to gender, life-stage, and cohort. Participants' gender, life-stage, and cohort membership play a role in different aspects of the relationship including: their desire for and level of physical intimacy, openness to cohabitation and/or marriage, likelihood of cohabiting or marrying, and expectations about giving and receiving care.

### OLDER ADULTS MAINTAINING INDEPENDENCE WITHIN THE CONTEXT OF A LIVING-APART-TOGETHER RELATIONSHIP

*J.J. Benson, Human Development and Family Studies, University of Missouri, Columbia, Missouri*

This study explores living-apart-together (LAT) relationships among Midwestern men and women between the ages of 59 and 85. Twenty-one men and women, (8 couples, 3 women), completed genograms and unstructured interviews addressing decision-making processes leading to living apart together, and strategies for maintaining LAT relationships. Preliminary grounded theory analyses suggest that the goals of LAT relationships are to maintain freedom of choice and independence, and minimize feelings of obligation for self and partner. Participants

reported varying strategies for meeting these goals: for some, independence was upheld by developing and adhering to routine visitation schedules and activities; others reported the need to create emotional boundaries, disallowing themselves from developing expectations of their partner or the relationship itself. Overall, most participants reported being satisfied with their current relationship status, and preferred a living-apart-together relationship to marriage or cohabitation.

### “PROTECTING WHERE I LIVE AND WHAT I HAVE”: A GENDER FRAMEWORK FOR THE ANALYSIS OF LIVING APART TOGETHER (LAT) RELATIONSHIPS

*K. Kobayashi<sup>1</sup>, L. Funk<sup>2,1</sup>, 1. University of Victoria, Victoria, British Columbia, Canada, 2. University of Manitoba, Winnipeg, Manitoba, Canada*

In this paper, we use a gender lens to analyze data from a study of LAT (Living Apart Together) relationships: in which partners in a long-term, committed romantic relationship make a conscious decision to live in separate households. Thirty-one couples from Vancouver or Victoria, Canada, were interviewed separately, in-person. Findings indicate that women in particular become involved in LATs to protect themselves (and sometimes their children) from emotional, financial or other harms they may have experienced in past relationships or break-ups. LATs made it easier for them to avoid replicating patterns of always putting someone else's needs first or feeling guilty when they did not do so. Women spoke of not wanting to replicate “dependent” roles, or to be responsible for yet another person (e.g., in addition to work and childcare responsibilities). We discuss the personal advantages yet broader structural limitations of individual responses to gendered relationship experiences.

### THE PARADOX OF COMBINING INDEPENDENCE AND LONG-TERM CARE ARRANGEMENTS IN THE CONTEXT OF LAT PARTNER RELATIONSHIPS

*J. Gierveld, Social Demography, NIDI, The Hague, Netherlands*

Older adults involved in LAT relationships intend to live independently for as long as possible. They are satisfied with the realization of a LAT intimate partner relationship, in which both partners have their one person household and share living quarters for less than 7 days per week. In case of serious illnesses and being in need of daily care, how do LAT partners arrange their lives? In this study results of qualitative interviews with 23 older adults in LAT relationships are presented (Netherlands Kinship Panel Study, mini panel). Many of the interviewee's mentioned that they expect their LAT partners to take care of them, but a not negligible minority insists on not accepting care from their partners. However, nearly all of the LAT interviewees expect to support their partners. The interpretation of the paradoxical association between giving and receiving care is the aim of this study.

## SESSION 25 (SYMPOSIUM)

### PUBLIC HEALTH IMPLICATIONS OF HEALTHY & SUCCESSFUL AGING: LOOKING BACK AND THINKING FORWARD

Chair: *L. Poon, Inst. of Gerontology, Athens, Georgia*

Discussant: *R.A. Pruchno, Univ. of Med & Den of New Jersey,*

*Stratford, New Jersey* Discussant: *A. Jette, Boston University, Boston, Massachusetts*

Healthy and successful aging is possibly the most important research outcome and policy decision related to aging and the aging population. It was 23 years ago that Jack Rowe and Robert Kahn (1987) revitalized research and discussion on the concept of usual and successful aging. This effort through the MacArthur Foundation and other research networks created one of the most sustained and energetic research enterprises in the history of aging and the National Institute on Aging. Owing to the overwhelming public health implications of healthy and successful

aging, recent research has made significant advances on definitions, approaches, and methodologies. We propose that the time is ripe to examine, evaluate, and consolidate these findings toward new directions to focus on implementing the public health mandate to improve individual and population health and successful aging. We have assembled a nine-member interdisciplinary gerontology team who had collectively contributed to significant thinking in the field and capable of implementing new directions. This symposium will highlight this effort with the goal of soliciting peer input. The first paper (Poon) summarizes the current effort and procedure. The second paper (Martin) provides a brief history of successful aging research. The third paper (Fry) focuses on the role of contexts, the fourth (Kahana) on intervention research, and the final paper (Willcox) summarizes the application of findings in geriatrics and nursing. Three discussants (Morrow-Howell, Jette, and Pruchno) critique and extend the review and ideas in this project.

### THE HEALTHY AND SUCCESSFUL AGING PROJECT

L. Poon<sup>1</sup>, N. Morrow-Howell<sup>2</sup>, 1. *UGA Institute of Gerontology, Athens, Georgia*, 2. *Washington University in St Louis, St. Louis, Missouri*

Owing to the overwhelming public health implications of healthy and successful aging, recent research has made significant advances on definitions, approaches, and methodologies. We propose that the time is ripe to examine, evaluate, and consolidate these findings toward new directions to focus on implementing the public health mandate to improve individual and population health and successful aging. We have assembled a nine-member interdisciplinary gerontology team who had collectively contributed to significant thinking in the field and capable of implementing new directions. This paper will provide a short update of the project as well as comments on the current progress.

### REVITALIZING SOCIAL STRUCTURE

C.L. Fry, *Loyola University Chicago, Chicago, Illinois*

Investigations into the experiences of growing old and successful aging have resulted in a bifurcation of perspectives: that of the individual and that of the society in which they are aging. Although clearly not mutually exclusive, a need is apparent in bridging the contrasting points of view. The intent of this paper is to revitalize conceptualizations of social structure. Social engagement means connections to a social world of interdependency. With advanced age integration into that world is seen as opposing processes of “aging-in” and “aging-out.” Aging-in consists of the pathways used by individuals to learn about and use a cultural context and participate in the interdependencies of social life. Threats to participation in a context brought on by disabilities and illness; initiate a process of aging-out. Diversity in contexts to which individuals are balancing aging-in and aging-out increases the meanings of successful aging.

### THE PAST, PRESENT AND FUTURE OF INTERVENTIONS TO PROMOTE SUCCESSFUL AGING

E. Kahana<sup>1</sup>, B. Kahana<sup>2</sup>, 1. *Case Western Reserve University, Cleveland, Ohio*, 2. *Cleveland State University, Cleveland, Ohio*

Gerontologists generally consider successful aging as referring to individual achievements, reflecting positive outcomes, adaptive processes or self-appraisals. Provocative questions thus arise about need for and value of interventions to help elders achieve success in the face of personal, environmental and social challenges. We argue that targeted interventions can facilitate successful aging by reducing stress exposure, enhancing coping resources and promoting proactive adaptations. Older adults are eager to participate in diverse intervention programs implemented by professionals, service organizations and through community efforts. Such desire to seek help in the face of stressors attests to resilience among elderly persons, as they cope with stressful life situations. Existing interventions will be discussed based on their goals, approaches and congruence with alternative models of successful aging.

Limited evidence base for current interventions reflects methodological challenges, but this field also holds great promise for practice and policy.

### DEFINING SUCCESSFUL AGING: AN ELUSIVE OR TANGIBLE CONCEPT?

P. Martin<sup>1</sup>, N. Kelly<sup>1</sup>, E. Kahana<sup>2</sup>, B. Kahana<sup>2</sup>, L. Poon<sup>3</sup>, 1. *Iowa State University, Ames, Iowa*, 2. *Case Western University, Cleveland, Ohio*, 3. *University of Georgia, Athens, Georgia*

The term “successful aging” has been used in the gerontological literature to cover processes of aging throughout the life span and implies positive aging processes for some while provoking criticisms of failing to either be not comprehensive enough or too over-arching for others. Sometimes successful aging is called “vital aging” or “active aging” with the implication that later life can be a tie of sustained health and vitality. The emphasis for many may be on maintaining positive functioning as long as possible but others have suggested that successful aging can also be discussed under more adverse health conditions. This paper will highlight those who have popularized the topic of successful aging, present some of these definitions and outline their commonalities and differences.

### BIOGERONTOLOGICAL, GERIATRICS AND NURSING PERSPECTIVES ON SUCCESSFUL AGING

D.C. Willcox<sup>1,2,3</sup>, M. Wykle<sup>4</sup>, B. Willcox<sup>2,4,5</sup>, 1. *Okinawa International University, Ginowan, Okinawa, Japan*, 2. *Department of Research, Kuakini Medical Center, Honolulu, Hawaii*, 3. *Okinawa Research Center for Longevity Science, Urasoe, Okinawa, Japan*, 4. *Case Western Reserve University, Cleveland, Ohio*, 5. *Department of Geriatric Medicine, University of Hawaii, Honolulu, Hawaii*

The biogerontological literature suggests that there is much that we can do to slow age-related decline in physical and mental function. Much of the decline experienced by older adults is caused by lack of attention to primary and secondary prevention rather than aging itself. However, as we achieve longer survival, and modern medicine keeps ever more frail individuals alive, at some point the Rowe and Kahn criteria for successful aging will be untenable for the majority of older persons. This presentation will explore what human populations might realistically achieve in terms of healthy aging given current biomedical knowledge and present some geriatrics and nursing perspectives on how to help our elders cope with challenges and find their own definitions of success as they age. Data from studies on healthy aging and longevity, such as the Kuakini Hawaii Lifespan/Healthspan Studies and the Okinawa Centenarian Study, will be highlighted and examples of “successful-agers” provided.

## SESSION 30 (SYMPOSIUM)

### RELIGION, SPIRITUALITY, AND FLOURISHING: LIVING WELL OR LIVING A GOOD LIFE?

Chair: *J.H. Patrick, Psychology, West Virginia University, Morgantown, West Virginia*

Discussant: *C. Fahey, Millbank, New York, New York*

Over the past few decades, a large body of empirical and theoretical work has examined the religion — illness link. This collection of papers focuses on the role religion and spirituality in living the good life, or at least in living a good life. Thus, from a variety of perspectives, these papers ask: Whether and in what ways religion and spirituality help one to live better. Henrie and colleagues present data examining the associations among religiousness, spirituality, and a variety of virtues, drawn from across the world’s major religious traditions. Glicksman and Glicksman address these questions from a non-theistic perspective. Bengtson and colleagues draw on rich, multi-generational data. Finally, Moody discusses the idea of gero-transcendence. Together, these

papers move the field toward a richer, deeper understanding of the roles of religiousness and spirituality in the lived lives of older adults.

### **RELIGION & SPIRITUALITY: ONE, BUT NOT THE ONLY, PATH TO THE “GOOD” LIFE**

J. Henrie, A.S. Graf, J.H. Patrick, *West Virginia University, Morgantown, West Virginia*

In the U.S., being religious is often equated with being “good” or leading a virtuous life. However, whether religion or spirituality truly inspires people to do and/or be “good” is empirically testable. Data from 117 adults (71.9% female, M age = 36.98 years, S.D. = 14.33 years, range = 18 to 71) were used to investigate religious/spiritual differences in several virtues. A series of MANOVAs revealed that there were few differences. Religious individuals reported higher levels of prudence ( $F(3, 75) = 3.24, p = .027$ ), curiosity ( $F(3, 75) = 5.06, p = .003$ ), and forgiving ( $F(3, 75) = 4.78, p = .004$ ), but not virtues like generosity ( $F(3, 75) = 1.14, p = .340$ ) or compassion ( $F(3, 75) = 0.28, p = .837$ ). Results are discussed in terms of religion having a positive influence, but not a monopoly, on promoting virtuous behavior.

### **GODLESS RELIGION AND ATHEISTIC SPIRITUALITY AS FORMS OF JEWISH IDENTITY AMONG OLDER ADULTS**

A. Glicksman<sup>1</sup>, G. Glicksman<sup>2</sup>, 1. *Research, Phila Corporation for Aging, Philadelphia, Pennsylvania*, 2. *Temple University, Philadelphia, Pennsylvania*

Surveys show that up to half of American Jews consider themselves to be secular in some sense of the term, which can mean not believing in God, not having an active involvement in the Jewish community, or identifying as Jewish through cultural, ethnic or national identity rather than through traditional, religious belief. This is also true for older American Jews, who are much less likely than most other Americans to attend regular, religious services or to report believing in God. At the same time, many of these secular Jews report that their Jewishness is important to them and shapes their values and worldview. Using memoirs and other sources we will explore the ways in which these identities are formed and expressed in old age by using religious forms for a non-theistic faith system, through cultural expression of Jewish identity, and by using Jewish values to participate in the wider world.

### **CONTINUITY AND DISCONTINUITY IN SPIRITUAL CAPITAL ACROSS GENERATIONS**

V. Bengtson, *Roybal Center on Aging, School of Social Work, University of Southern California, Los Angeles, California*

It appears that there have been remarkable changes in the American religious landscape recently, over the lifespans of those becoming elderly, which would suggest that spiritual and religious capital is being shared across generations with decreasing frequency. In this presentation I draw on 35 years of longitudinal data from some 2,500 individuals to look at variations in intergenerational transmission of spirituality. That parents do influence their young adult children religiously, and that grandparents are independently influential, is documented by survey data from 1970 to 2005. Even more intriguing are the styles or mechanisms of such influence, which can be observed in the qualitative data.

### **DISILLUSIONMENT AND WISDOM: THE GOOD LIFE IN OLD AGE**

H. Moody, *AARP, Washington, District of Columbia*

W. B. Yeats once said, “Life is a long preparation for something that never happens.” Does his aphorism express wisdom or disillusionment? What is the relationship between the two? One image of the “good life” in old conjures up images of contentment (“life-satisfaction”) and positive life-review (“ego integrity”). Seemingly, the opposite of this attainment would be disillusionment or, perhaps, existential depression. Yet disillusionment and wisdom may be dialectically related. Buddha could not begin his search for wisdom until he had experi-

enced radical disappointment with what ordinary life could offer. Along with the Stoic ideal of detachment (apatheia), the Buddhist goal nirvana represents “seeing through” the illusions of life. Something similar is the message of Ebenezer Scrooge in Dicken’s Christmas Carol. This presentation builds on the argument offered in my book, *The Five Stages of the Soul*, and seeks to understand late-life wisdom as an achievement of “positive disillusionment.”

## **SESSION 35 (SYMPOSIUM)**

### **WISDOM AND MEANING IN AGING: EXPLORING AN ANCIENT FRONTIER THROUGH CONTEMPORARY PARADIGMS**

Chair: *H. Nelson-Becker, School of Social Work, Loyola University Chicago, Chicago, Illinois*

Discussant: *A. Achenbaum, University of Houston, Houston, Texas*

Classical views of wisdom held it to be knowledge or “sophia” accumulated throughout history. Modern views have focused on exploring expert knowledge (Baltes & Staudinger, 2000), while more recent literature is beginning to investigate everyday wisdom and the role of meaning for older adults. These latter two perspectives emphasizes “techne” or skill leading to just acts and well-reasoned practices that achieve the best outcomes for all. This session will present practical and professional views of wisdom expressed by and about older adults. The papers included here discuss varying perspectives of wisdom and meaning and thus seek to inform each other. Two papers explore parallel conceptions of applied wisdom in US and Hong Kong contexts using focus group methodology with older adults. The first paper discusses findings from five focus groups (US) that define wisdom across multiple dimensions. The second paper presents data from three focus groups (Hong Kong) that highlight individual and collective distinctions about wisdom. Both underscore the value of lived experience in leading to a satisfying life. The third paper considers life meaning as it is expressed in four cases detailing different spiritual and cultural considerations of illness. A value dimension of wisdom is emphasized in finding a course of action that both conforms to client desires and balances family and professional perspectives. The fourth paper returns to a philosophical approach to discuss wisdom and meaning in the work of Viktor Frankl as recognition of the need to solve existential anxiety and accept the limits of finitude.

### **WISDOM IN THE SECOND PART OF LIFE: DESCRIBING THE PRAGMATICS**

H. Nelson-Becker, *School of Social Work, Loyola University Chicago, Chicago, Illinois*

Examination of wisdom in everyday life can identify behavior leading to a satisfying life quality for older adults. Although expert wisdom has been investigated (Baltes, 1993), implicit or lay wisdom is an under-explored area (Sternberg & Jordan, 2005). This qualitative focus group study used a semi-structured interview guide to explore perceptions of wisdom across cognitive, biological, social, practical, and spiritual dimensions. Participants from senior nutrition sites and Area Agency on Aging programs in one diverse metropolitan area were solicited. Five focus groups with a total of 44 adults over age 60 participated. Although focus groups were ethnically diverse, four of the five were homogeneous. Analysis involved a constant comparative method. Findings included practical understandings of wisdom developed through life experience, and family members and mentors who modeled a wisdom approach. Applying patience, respect, gratitude, learning from mistakes, and care for others were all viewed as markers of wisdom.

## MANIFESTATION OF WISDOM IN HONG KONG CHINESE OLDER ADULTS

E.O. Chow, *Applied Social Studies, The University of Hong Kong, Kowloon, China*

The study aims to explore conceptions of wisdom in elderly and the characteristics of wise elders in a Hong Kong context. Three focus groups of 26 Hong Kong Chinese elders were conducted. In contrast to the Berlin model (Baltes & Staudinger, 2000), the findings showed that wisdom was not viewed as exceptional human excellence that requires a high intellectual level. Chinese wisdom conceptions focus on the personality characteristics of wise elders, with an emphasis on a 'lived wisdom' manifested in elders' own life. Accumulation of life experiences, including both favorable and unfavorable life circumstances, is viewed as a dominant determinant of elderly wisdom. Furthermore, the findings showed a distinction between individual wisdom and collective wisdom. The former concerns wisdom in one's own life, while the latter impacts and contributes to the entire race. Understanding of elderly wisdom has implications for social work practice to promote a supportive and age-friendly society.

## LIFE MEANING AMONG PERSONS WITH SERIOUS ILLNESS AND THEIR CAREGIVERS

F.P. Hopp<sup>1</sup>, H. Nelson-Becker<sup>2</sup>, T.R. McCormick<sup>3</sup>, A.L. Ai<sup>4</sup>, 1. *Social Work, Wayne State University, Detroit, Michigan*, 2. *Loyola University, Chicago, Illinois*, 3. *University of Washington, Seattle, Washington*, 4. *Florida State University, Tallahassee, Florida*

Issues related to life's meaning are central for persons facing life-limiting illness and their caregivers. We present three composite case studies involving spiritual issues derived from our clinical experiences and from qualitative interviews. These cases include: 1) an older Caucasian man hospitalized with a serious illness; 2) an older Korean woman whose children had conflicting end-of-life religious views; and 3) an older African American woman with heart failure. Through these case studies, we show how life meaning is expressed differently depending on racial and cultural background, family dynamics, and illness trajectory. We will also discuss similarities across cultures and illnesses, the way in which common experiences of meaning impact the illness experience, and implications for health care providers.

## WISDOM AS KNOWLEDGE PLUS

J.W. Ellor, *Baylor University School of Social Work, Waco, Texas*

Viktor Frankl notes, "Wisdom is knowledge plus: knowledge – and the knowledge of its own limits." (Unconscious God, p. 142) In the context of existential approaches to counseling the work of Viktor Frankl is a critical witness to both our basic human nature as well as our relationships with the world around us and even to God. In the writing of Viktor Frankl the concept of wisdom is an important reflection of the existential issue of finite being. Existential anxiety is that stress one feels whenever confronted with an existential context, beginnings and endings of things that are important. Yet, where older adults are very aware of death as the ultimate ending, not all are able to grasp and accept the world in which we live to be finite in nature. When one has accepted our finite nature then she or he has found the wisdom of the heart.

## SESSION 40 (PAPER)

### ACTIVITY & COGNITIVE FUNCTIONING

#### OBJECTIVELY MEASURED PHYSICAL ACTIVITY IS RELATED TO COGNITIVE FUNCTION IN OLDER ADULTS

J. Kerr<sup>1</sup>, S. Marshall<sup>1</sup>, D.E. Rosenberg<sup>2</sup>, 1. *UCSD, San Diego, California*, 2. *Group Health, Seattle, Washington*

Background Previous studies have demonstrated a significant relationship between physical activity (PA) and cognitive functioning among older adults, but relationships are based on self-reports of PA which are

likely to co-vary with cognitive function. No studies have assessed relationships between objectively measured PA intensity using hip worn accelerometers and cognitive function. Methods Older adults (n=112; mean age = 83; 69% female) wore a hip-mounted ActiGraph 3TX+ accelerometer for 7 days. Data were aggregated to 60 second epochs and non-wear time was determined as 90 consecutive minutes of zero counts. Accelerometer counts were converted into min.dy-1 of light and moderate intensity PA using validated thresholds. Participants also completed Trails A and B tests, measures of executive function. Results Participants engaged in 203.4 (±62.8), and 31.2 (±26.1) min.dy-1 of light and moderate intensity PA, respectively. Mean time to complete Trails A and B was 55.4 (±23.6) and 150.0 (±77.8) seconds, respectively. Min.dy-1 of light intensity PA was negatively correlated with time to complete Trails B (r = -.22, p<.02), whereas min.dy-1 of moderate intensity PA was negatively correlated with time to complete Trails A (r = -.26, p<.005) and Trails B (r = -.25, p<.008). Conclusion Previous studies have related aerobic activity to executive functioning. This study found that older adults who participate in both light and moderate intensity activity complete Trails B tests more quickly. Light activity may be a feasible lifestyle activity for older adults to adopt to improve their cognitive functioning.

#### EFFECTS OF TAI CHI ON HEALTH OUTCOMES IN ELDERLY WITH COGNITIVE IMPAIRMENT AND OSTEOARTHRITIC KNEE

J.Y. Chang<sup>1</sup>, P. Tsai<sup>1</sup>, C. Beck<sup>1</sup>, Y. Kuo<sup>2</sup>, F. Keefe<sup>3</sup>, 1. *University of Arkansas for Medical Sciences, Little Rock, Arkansas*, 2. *University of Texas Medical Branch, Galveston, Texas*, 3. *Duke University, Durham, North Carolina*

This pilot randomized trial tested the efficacy of a Tai Chi (TC) program in improving health outcomes in community-dwelling elders with knee osteoarthritis (OA) and cognitive impairment (CI). Eight sites participated in either the TC group (4 sites, 28 participants) or the Control group (4 sites, 27 participants). Measures included the Western Ontario and McMaster (WOMAC) OA pain, physical function and stiffness subscales, the "Get up and Go" test, the "Sit and Stand" test and the Mini Mental State Exam (MMSE), administered at baseline, every 4 weeks during the intervention and at the end of the study (posttest). The WOMAC pain (p= 0.006) and stiffness scores (p= 0.010) differed significantly between the two groups at posttest while differences between the two groups in the WOMAC physical function score (p= 0.071) and the MMSE (p=0.096) showed borderline significance at the posttest. WOMAC pain (p= 0.001), physical function (p= 0.021) and stiffness (p< 0.001) scores improved significantly more over time in the TC group than in controls. No adverse events were found in either group. In conclusion, practicing TC can be efficacious in reducing pain and stiffness in elders with knee OA and CI.

#### A 20-WEEK SUN STYLE TAI CHI FOR OSTEOARTHRITIC KNEE PAIN IN ELDERLY WITH COGNITIVE IMPAIRMENT

P. Tsai<sup>1</sup>, J.Y. Chang<sup>1</sup>, C. Beck<sup>1</sup>, Y. Kuo<sup>2</sup>, F. Keefe<sup>3</sup>, 1. *University of Arkansas for Medical Sciences, Little Rock, Arkansas*, 2. *The University of Texas Medical Branch, Galveston, Texas*, 3. *Duke University, Durham, North Carolina*

This pilot cluster-randomized clinical trial with two arms tested the efficacy of a 20-week Sun style Tai Chi (TC) program in reducing knee osteoarthritis (OA) pain in community-dwelling elders with cognitive impairment (CI) and tested whether elders' cognitive function affects the efficacy of TC on pain relief. Each site was randomly assigned to participate either in a TC program (4 sites, N=28) or a Control program (4 sites, N=27). Pain was measured by the Western Ontario and McMaster (WOMAC) OA Index pain subscale, Verbal Descriptor Scale (VDS), and observed pain behaviors. Analgesics intake during the study period was also determined. Results indicated that WOMAC pain subscale, VDS, and observed pain behaviors were significantly different at posttest

between groups ( $p=.004-.048$ ). Analgesics intake showed a marginal trend of reducing use over time in TC group when compared to controls ( $p=.062$ ). The results further indicated that the beneficial effects of TC were not affected by the cognitive ability in this study population. These results suggest that TC could be used as an adjunct to pharmacological intervention to relieve osteoarthritis pain in elders with CI.

### PHYSICAL HEALTH PREDICTS VARIANCE IN LATE-LIFE COGNITIVE, MOOD AND FUNCTIONAL OUTCOMES BEYOND DEMOGRAPHICS

A. Rahman<sup>1</sup>, J.L. Woodard<sup>1</sup>, L. Miller<sup>2</sup>, P. Martin<sup>3</sup>, A. Davey<sup>4</sup>, L. Poon<sup>2</sup>, 1. *Psychology, Wayne State University, Redford, Michigan*, 2. *University of Georgia, Athens, Georgia*, 3. *Iowa State University, Ames, Iowa*, 4. *Temple University, Philadelphia, Pennsylvania*

**Introduction:** Demographic variables are commonly used to predict cognitive and functional outcomes across the lifespan. Research suggests that late life is characterized by a decline in physical abilities, increased risk of malnutrition and higher BMI, but the contribution of these health indicators to cognitive, mood, and functional status changes in late-life is not well-researched. **Methods:** Eighty octogenarians and 244 centenarians from the Georgia Centenarian Study completed measures of cognitive, mood, and functional status, demographics, and health factors. Hierarchical regressions were performed to examine the incremental predictive value of physical health factors beyond demographic variables. Age, gender, race, and years of education were entered on the first step. Probabilistic Physical Performance Mobility Exam (PPME), Mini-Nutritional Assessment (MNA) score and Body Mass Index (BMI) were entered on the second step. Outcome measures included the Mini Mental State Examination (MMSE), Fuld Object Memory Evaluation Retention Estimate (FOME), Geriatric Depression Scale (GDS), and the Direct Assessment of Functional Status (DAFS) Instrumental and Basic Activities of Daily Living (IADLs, BADLs). **Results:** The inclusion of PPME, MNA and BMI to the prediction equation including only demographic predictors accounted for significantly more variance in global cognitive, memory, mood and functional status measures. Physical health measures accounted for more variance in GDS score than did demographic factors. **Conclusions:** Inclusion of physical health predictors allows for more accurate prediction of late-life cognitive functioning, mood symptoms, and basic and instrumental functional abilities. Physical health factors may be better predictors of late-life mood functioning than demographic predictors.

## SESSION 45 (PAPER)

### AGE BIAS AND DISCRIMINATION

#### PERCEIVED DISCRIMINATION IN EUROPE: RESULTS FROM THE EUROPEAN SOCIAL STUDY

L. Ayalon, *Bar Ilan University, Ramat Gan, Israel*

The present study evaluated the role of individual level variables (e.g., age, gender, ethnicity) and contextual level variables that represent the numeric size of the minority vs. majority group (e.g., the percent of individuals over the age of 60, male to female ratio, and the percent of the ethnic majority group) as predictors of perceived age, gender, and ethnic discrimination in Europe. Analysis was based on the fourth round of the European Social Survey (ESS). The present analysis is based on data from 54,988 respondents from 28 countries. Hierarchical linear modeling was conducted. In most countries, there was a general trend towards a higher incidence rate of perceived age discrimination (mean incidence rate across countries=34.5%; SE=.002), followed by gender (mean incidence rate across countries= 24.9%; SE=.002), and ethnic discrimination (mean incidence rate across countries=17.3%; SE=.002). In countries of low percent of individuals over 60, both the youngest and the oldest age groups were more likely to report perceived age discrimination. In countries of medium and high

percent of individuals over 60, younger respondents were more likely to report perceived age discrimination. Younger respondents were also more likely to report perceived gender and ethnic discrimination. Ethnic minorities were more likely to report perceived gender and ethnic discrimination and women were more likely to report gender discrimination. Countries with a lower percentage of a numeric ethnic majority group were more likely to report perceived ethnic discrimination. The most notable findings of the present study concern the relatively moderate incidence rates of perceived discrimination in light of low to medium cross-country variations. The role that younger age plays in all three types of perceived discrimination is another important finding of the present study. Results provide limited support to the social threat theory and to the social contact theory.

#### AGEISM: A META-ANALYSIS

P. Nash<sup>1</sup>, I. Stuart-Hamilton<sup>2</sup>, P. Mayer<sup>2</sup>, 1. *Centre for Innovative Ageing, Swansea University, Swansea, Wales, United Kingdom*, 2. *University of Glamorgan, Cardiff, Wales, United Kingdom*

Steffens, Schulze & Konig (2006) demonstrated that the Implicit Association Test (IAT) is a stable predictor of spontaneous behaviour where explicit measures predict only planned. Pervasive, ingrained implicit ageism is found in the general (Levy & Banaji, 2002) and professional medical (James and Haley, 1995) populations, negatively affecting older peoples health care (Duerson, Thomas, Chang & Stevens, 1992; Filipp & Schmitt, 1995). A bespoke ageing IAT (Greenwald, McGhee & Schwartz, 1998) and the Fraboni Scale of Ageism (Fraboni, Saltstone & Hughes, 1990) measured implicit and explicit attitudes. Data from 203 participants over six study populations demonstrated consistently negative implicit attitudes, where explicit attitudes were largely positive. Spanning each population, there were significant differences reported on both implicit ( $F(7,162)=8.352$ ,  $p<0.001$ ) and explicit ( $F(7,162)$ ,  $p<0.05$ ) measures illustrating the measurement of distinct constructs. Further, results demonstrated a negative societal ageist bias, increased self-presentational bias in-line with educational level and internalisation of negative attitudes. By 2051 it is estimated that 17% (115.4 Million) of the global population will be living with, and requiring some form of support for dementia (US Census, 2010). As a large and ever growing cause of contact between the medical professional and older people, dementia care should be prioritised. The negative attitudes and consequential prejudicial behaviour need to be addressed to ensure proper treatment and dignity in care. Westmoreland et al. (2009) demonstrated that through well structured training based on psychological principles, attitudes towards older people can be changed.

#### AGE RELATED ATTRIBUTION BIASES IN ERRORS INVOLVING INSTRUMENTAL ACTIVITIES OF DAILY LIVING

K.J. Kimbler, A.N. Harris, *Social & Behavioral Sciences, Florida Gulf Coast University, Fort Myers, Florida*

A growing body of research has examined how age may relate to causal attributions, suggesting that older age is associated with an increased likelihood to exhibit the correspondence bias (e.g., Horhota & Blanchard-Fields, 2006). Research, however, indicates that the domain of the behavior being examined can be predictive of these age differences (e.g., Blanchard-Fields, Baldi, & Stein, 1999). Previous studies have also experimentally manipulated the age of the target by describing different aged individuals in vignettes (e.g., Erber, Szuchman, & Rothberg, 1990). This research suggests that in certain domains, individuals tend to judge older adults as more cognitively impaired compared to younger individuals. Although the previously mentioned research has somewhat consistently found evidence of age differences (related to both participants' and targets' age) in causal attributions, studies also suggest that these findings are dependent on the domain of the task being studied as some domains tend to demonstrate larger age dif-

ferences in causal attributions (e.g., Blanchard-Fields, Baldi, and Stein, 1999). The current study extended this research to domains involving instrumental activities of daily living (i.e., health, finances, cooking, housekeeping / home maintenance, and transportation). The target age used in the vignettes was experimentally manipulated and the sample consists of young (18-39), middle aged (40-64), and older (65+) adults. Preliminary analyses suggest that errors committed by older adults were attributed more to mental difficulty ( $p < .05$ ) while participants were more likely to judge mistakes made by younger adults as being due to lack of effort ( $p < .05$ ).

### RELATIVE AGE BIAS IN THE WORKPLACE

E. Besen<sup>1</sup>, N. Sarkisian<sup>1</sup>, M. Pitt-Catsouphes<sup>1</sup>, M. Kidahashi<sup>2</sup>, 1. Boston College, Chestnut Hill, Massachusetts, 2. Institute of Economic Research, Tokyo, Japan

It is well known that age-based stereotypes exist in the workplace for both younger and older workers. However, research has often focused solely on perceptions made based on absolute age, such as what are your perceptions of 25 year olds, compared to relative age, such as what are your perceptions of workers that are younger than you. Further researcher is needed to understand whether perceptions are dependent on absolute or relative age. The purpose of this study is to assess whether there are age-based stereotypes about both younger and older workers at the workplace from the viewpoint of relative age and to examine how these stereotypes may vary based on the perceiver's age. In a sample of over 500 workers, ages 31-59, from two worksites in the U.S., we examine stereotypes about relatively younger, relatively older, and relatively same age workers. Results indicate that there are certain attributes that relatively older workers are perceived to be lower on than relatively younger or same age workers and that there are certain attributes that relatively younger workers are perceived to be lower on than the other two groups. These perceptions are found to remain stable with age suggesting that stereotypes are based more on relative than absolute age. After attending this presentation, participants will have a clearer understanding of the attributes younger and older workers are thought to be lower on, respectively. Additionally, participants will be able to define the differences between absolute and relative age in regards to age-based stereotypes.

## SESSION 50 (PAPER)

### HISPANIC AND LATINO AGING

#### DIFFERENCES IN PHYSIOLOGICAL STATUS BETWEEN MEXICANS AND THE MEXICAN-ORIGIN POPULATION IN THE U.S

H. Beltrán-Sánchez<sup>1</sup>, E. Crimmins<sup>2</sup>, L.F. Berkman<sup>1</sup>, 1. Harvard University, Cambridge, Massachusetts, 2. Ethel Percy Andrus Gerontology Center, USC, Los Angeles, California

There is ample evidence in the U.S. suggesting that the health status of the Mexican-origin population is better than expected for their low socioeconomic status (the Hispanic health paradox). The evidence strongly suggests a health advantage of the Mexican-origin population in a variety of outcomes including health behaviors and mortality, but few studies have addressed life course associations in the general Mexican population. This research uses the National Health and Nutrition Examination Survey (NHANES 2005-2006) in the U.S. and the National Health and Nutrition Survey (ENSANUT 2006) in Mexico to investigate how age-specific patterns in physiological status (e.g., C-reactive protein and glycosylated hemoglobin) differ between Mexicans living in Mexico and their counterparts living in the U.S. We use different statistical techniques to adjust our prevalence estimates of physiological status by age, early life factors and adult socioeconomic status, and further stratify our analyses by sex and age at migration into the U.S. in the NHANES data. Preliminary results show that Mex-

icans have higher prevalence in a number of risk factors (e.g., hypertension, obesity and high risk waist circumference) than the Mexican-origin population in the U.S. This research provides additional evidence for understanding the health status of the Hispanic population in the U.S.

### DETERMINANTS OF DISPARITIES IN SELF-RATED HEALTH AMONG NON-HISPANIC WHITE, HISPANIC, AND ASIAN AMERICAN OLDER ADULTS

J. Min<sup>2</sup>, S. Rhee<sup>1</sup>, 1. School of Social Work, California State University, Los Angeles, Los Angeles, California, 2. San Diego State University, San Diego, California

The main purpose of this study is to investigate disparities in self-rated health among non-Hispanic White, Hispanic, and Asian groups of older Californians aged 65 and older. This study is based on House's (2002) model of social inequality in health and aging. This study utilized secondary data drawn from the 2005 California Health Interview Survey (CHIS). The factors that either mediate or moderate the relationship between ethnicity and self-rated health were examined by developing five multivariate analytical models. Major findings include that there were remarkable differences in self-rated health among three groups of older adults. Hispanics and Asians reported poorer health than non-Hispanic Whites in general. Results showed that socioeconomic status, acculturation, health access, and health behavioral factors significantly accounted for an association between ethnicity and self-rated health. However, the magnitudes of their effects on self-rated health varied depending on a series of factors and ethnicity.

### CONSEQUENCES OF UNHEALTHY ALCOHOL USE IN AGING LATINO DAY LABORERS AND THE IMPACT OF FAMILY VALUES TO MOTIVATE BEHAVIOR CHANGE

H.E. del Pino<sup>1,2</sup>, G. Bostean<sup>3</sup>, K. Ramirez<sup>2</sup>, C. Mendez-Luck<sup>4</sup>, A.A. Moore<sup>2</sup>, 1. Charles R. Drew University of Medicine and Science, Los Angeles, California, 2. University of California, Los Angeles, Los Angeles, California, 3. University of California, Los Angeles, Los Angeles, California, 4. Oregon State University, Corvallis, Oregon

**PURPOSE:** A study of Los Angeles day laborers showed that 20% reported ever being an excessive drinker; 15% reported drinking more than 7 drinks daily; and 26% reported drinking a fifth of liquor in one day. Rates of heavy drinking do not decline in Latinos until they are in their 60s, yet there have been no studies testing interventions to reduce drinking among aging Latino day laborers. The purpose of this study was to plan an intervention to address unhealthy alcohol use in this population. **METHODS:** Using a non-probability purposive sample design, we recruited 14 Latino day laborers aged 50 and older from a community-based organization in Los Angeles. We used the Comorbidity-Alcohol Risk Evaluation Tool (CARET) to identify participants' unhealthy alcohol use and comorbidities and conducted semi-structured interviews. **RESULTS:** The study found high levels of social disadvantage, alcohol use, and symptoms and conditions exacerbated by alcohol use, e.g., depression, gastrointestinal problems. All were concerned with the consequences of alcohol use on their health, the impact on their family relationships, and reported that family members and health educators who treated them like family could motivate behavior change. **CONCLUSION:** Interventions should (1) leverage family values to motivate behavior change, even for men who are separated from their families, by integrating participants' family values into staff training, and (2) increase knowledge of unhealthy alcohol use and comorbidities. Further studies are needed to elucidate how family relationships facilitate or hinder decision-making and motivational processes of aging Latino day laborers who wish to reduce or stop their alcohol consumption.

## SMOKING IN THE US AND LATIN AMERICA: HOW DIFFERENT ARE SMOKERS' SURVIVAL EXPECTATIONS FROM OBSERVED MORTALITY?

B. Novak, A. Palloni, *UW-Madison, Madison, Wisconsin*

Context: Since 1980s increases in life expectancy at age 50 have slowed down in the US, primarily due to the contribution of lung cancer and COPD. Smoking is the most likely explanation for the observed deceleration of life expectancy increases. With nearly thirty years of delay, low income countries are going through the same stages as high income countries did before them. Future mortality trends will depend on whether smoking behavior is accompanied by appraisals about its impact on individual survival that are similar to those in place in high income. Objectives: For the US, Mexico and Chile: (a) To compute and compare estimates of potential survival losses after age 50 and (b) To contrast objective losses in survival with those expected from subjective survival expectation in the population of smokers and non smokers. Data: 2004 Health and Retirement Study (N=5498), 2005 Mexican Family Life Study (N=3036) and 2004 Chilean study Social Protection Survey (N=2695). Subjects: Individuals aged 50-60. Method: We use standard estimation procedures to assess potential life expectancy losses at ages above 50 and accelerated failure time models to parameterize subjective survival expectations. Results: Preliminary results for the US show that, unlike Black females, White females, both smokers and non-smokers, are pessimistic regarding their future survival though non-smokers are much more so. Male smokers are optimistic and Black males that are obese and current smokers are the most optimistic of all: they expect to live around 7 years more than observed mortality for smokers predicts.

## IMPLEMENTATION AND EVALUATION OF AN EVIDENCE-BASED INTERVENTION FOR LATINO DEMENTIA CAREGIVERS

D. Gallagher-Thompson<sup>1</sup>, R. Velasquez<sup>3</sup>, K. Buske<sup>3</sup>, V. Cardenas<sup>2</sup>, M. Crane<sup>2</sup>, L. Van Tilberg<sup>3</sup>, 1. *Psychiatry & Behavioral Sciences, Stanford University, Stanford, California*, 2. *University of California San Diego, San Diego, California*, 3. *Southern Caregiver Resource Center, San Diego, California*

Through funding from the California Mental Health Services Act (MHSA), San Diego County enlisted Southern Caregiver Resource Center (SCRC) to implement the evidence based intervention, Resources for Enhancing Alzheimer's Caregiver Health (REACH). This multi-component, personalized intervention teaches Latino dementia caregivers techniques aimed at decreasing caregiver depressive symptoms and improving overall quality of life and decreasing patient problem behaviors and delaying institutional placement. Most of the caregivers seeking services are monolingual Spanish speaking transient females, of low socioeconomic status with urgent survival needs (e.g., housing, unemployment). These challenges made it difficult for many clients to access traditional support services which led to adaptations to the REACH model. These adaptations included offering two distinct versions of the REACH model, utilizing Promotoras (community health workers) for recruitment and psychoeducation and developing an accelerated one month program. A total of 168 clients completed the pre- and post-assessments. Results indicate that caregiver burden was significantly reduced as measured by the Zarit caregiver burden index ( $t=12.038$ ,  $p<.001$ ) as were depressive symptoms as measured by the CES-D depression scale ( $t=12.974$ ,  $p<.001$ ). In addition, there were significant reductions in patient problem behaviors (the frequency of each of the 24 behaviors was reduced; 19 of 24 with  $p<.05$ ), and an improvement in self-reported caregiver health ( $t=-4.338$ ,  $p<.001$ ). Overall, over 99% of participants reported that they were satisfied with the services they received. After attending this session, participants will be able to identify methods of implementing an evidence-based program to meet the needs of ethnically diverse caregivers.

## SESSION 55 (SYMPOSIUM)

### ADVANCES IN NURSING SCIENCE FOR DELIRIUM CARE

Chair: *A.M. Kolanowski, Penn State University, University Park, Pennsylvania*

Discussant: *D.M. Fick, Penn State University, University Park, Pennsylvania*

Delirium is common and deadly in older adults. Those with dementia are at greatest risk: 89% experience delirium when hospitalized and studies report that between 24 and 76% die within one year of the index episode. Delirium is not easily recognized because its clinical manifestations are commonly attributed to aging or cognitive impairment. Interventions that treat delirium are not well-developed because we are just beginning to understand the mechanisms involved in its etiology. This symposium brings together preliminary findings from NIH-funded clinical trials and other studies conducted by leading nurse scientists on innovative approaches for improving clinical recognition and interventions for delirium. The Canadian team, headed by Philippe Voyer, describes the development and psychometric properties of RADAR, a new instrument for the recognition of delirium by bedside nurses. Andrea Yevchak and colleagues present data from the ongoing END- DSD trial that illustrate barriers and facilitators to staff rounding with unit champions in three diverse acute care settings. Pam Cacchione presents data that demonstrate an association between sensory impairments and delirium in residents of long-term-care facilities, and recommends interventions for practice. Nikki Hill and colleagues use data from year one of the RESERVE For DSD trial to describe the pattern of indicators of cognitive reserve across the life span in persons who experience delirium in post-acute care settings, and compare these data to those obtained in cognitively intact populations. The discussant, Donna Fick, will reflect on the work presented and suggest directions for future research in the area of delirium care.

### RADAR : A NEW SCREENING TOOL TO IMPROVE THE RECOGNITION OF DELIRIUM SYMPTOMS AMONG OLDER PERSONS

P. Voyer<sup>1,5</sup>, J. Desrosiers<sup>2</sup>, P. Landreville<sup>1,5</sup>, J. McCusker<sup>3</sup>, N. Champoux<sup>4</sup>, J. Monette<sup>3</sup>, S. Richard<sup>5</sup>, P. Carmichael<sup>5</sup>, 1. *Laval University, Quebec City, Quebec, Canada*, 2. *Sherbrooke University, Sherbrooke, Quebec, Canada*, 3. *McGill University, Montreal, Quebec, Canada*, 4. *Montreal University, Montreal, Quebec, Canada*, 5. *Centre for Excellence in Aging-Research Unit, Quebec City, Quebec, Canada*

The RADAR was developed to facilitate recognition of delirium symptoms based on nursing observations made during distribution of medication. The 5-items RADAR was tested among 105 patients with and without dementia in an acute care setting. Percentage of agreement between the items of the RADAR administered by bedside nurses and those administered by research assistants varied from 87 to 99%. The combination of the best 3 items to predict a CAM+ for delirium has yielded a sensitivity of 69% and a specificity of 75%. The tool was very well received ( $\geq 94\%$ ) by the participating nursing staff. The tool is now being tested among residents in long-term care (LTC) settings. At the end of this first cycle, the best items to predict a CAM positive for delirium will be selected and further tested in a second cycle involving both acute and LTC settings.

### DELIRIUM IN SENSORY IMPAIRED LTC ELDERS IMPLICATIONS FOR PRACTICE

P. Cacchione<sup>1,2</sup>, K. Culp<sup>3</sup>, A.L. Hanlon<sup>1</sup>, 1. *University of Pennsylvania School of Nursing, Philadelphia, Pennsylvania*, 2. *Saint Louis University School of Nursing, St. Louis, Missouri*, 3. *University of Iowa College of Nursing, Iowa City, Iowa*

Sensory impaired long-term care elders are at risk for delirium. Preliminary data from 135 visually and/or hearing impaired LTC elders participating in the attention control arm of an Intervention study eval-

uating the efficacy of a nursing intervention for sensory impaired LTC elders (I-SEE Study) [NR 008777] were evaluated for delirium using the NEECHAM Confusion Scale and the Confusion Assessment Method three times a week for 16 weeks. The participants were primarily female (73%) and Caucasian (95%), with a mean age of 86.4. They had mean baseline MMSE scores of 23.3 and mean GDS scores of 8.5 out of 30. Delirium episodes were defined as NEECHAM Confusion Scale scores of 24 or less and/or a positive Confusion Assessment Method score. The merits of the two delirium assessment instruments will be discussed as well as interventions for sensory impaired LTC elders to decrease the risk of delirium.

### **BARRIERS AND FACILITATORS TO IMPLEMENTING UNIT CHAMPION ROUNDS IN A CLINICAL TRIAL ACROSS THREE DIVERSE HOSPITAL SETTINGS**

A. Yevchak<sup>1</sup>, D.M. Fick<sup>1</sup>, L. Mion<sup>2</sup>, J. McDowell<sup>1</sup>, L. Grove<sup>1</sup>, T. Monroe<sup>2</sup>, K.N. May<sup>2</sup>, S.K. Inouye<sup>3</sup>, *1. School of Nursing, The Pennsylvania State University, University Park, Pennsylvania, 2. Vanderbilt University, Nashville, Tennessee, 3. Aging Brain Center, Boston, Massachusetts*

Delirium occurs in over half of hospitalized older adults with dementia, substantially worsening outcomes. The use of multiple strategies and a local opinion leader, unit champion, have cumulative and lasting effective compared to single-strategy interventions. The purpose of this paper is to describe the early barriers and facilitators to rounding with unit champions in a cluster randomized clinical trial in year two of a 5 year trial (5R01NR011042-02). Advance practice nurses from three diverse hospital sites round at least once per week across all shifts. Descriptive and comparative statistics were analyzed on n=192 nursing rounds. On average rounds lasted 25.24 minutes (SD=13.18) and were conducted with the unit champion 64% of the time. Additional quantitative and qualitative data will be discussed. Clinical trials for delirium in dementia have the potential for significant health and economic benefits. Understanding the barriers and facilitators to interventions is critical to advancing nursing science.

### **LIFETIME PATTERN OF COGNITIVE RESERVE IN PERSONS WITH DELIRIUM AND DEMENTIA**

N.L. Hill<sup>1</sup>, A.M. Kolanowski<sup>1</sup>, M. Litaker<sup>2</sup>, D.M. Fick<sup>1</sup>, *1. School of Nursing, Penn State University, University Park, Pennsylvania, 2. University of Alabama, Birmingham, Alabama*

Cognitive reserve, the concept that individuals with more effective or compensatory neural processing are better able to cope with brain damage, has been linked to risk for dementia and, recently, to delirium in older adults. Educational attainment, occupation, and leisure activity engagement have been associated with increased cognitive reserve and are often utilized as proxy measures. Using data from an ongoing clinical trial, we measured engagement in complex cognitive activities over the lifetime of individuals (N= 50) who developed both dementia and delirium using informant reports for the Lifetime of Experiences Questionnaire (LEQ). Compared to healthy older adult samples, participants in this trial had considerably lower total scores on the LEQ (48.9±13.8 vs. 75.5±20.0; Valenzuela & Sachdev, 2007). The pattern of reserve scores from young adulthood (14.7±5.8), middle age (16.4±7.2), through late life (17.8±5.4) are discussed for their potential impact on the expression of cognitive impairment in older adults.

## **SESSION 60 (SYMPOSIUM)**

### **HARTFORD INSTITUTE FOR GERIATRIC NURSING HIGHLIGHTS EMERGING GERIATRIC NURSING SCHOLARS**

Chair: *T.A. Cortes, Nursing, NYU, New York, New York*

Discussant: *M. Mezey, Nursing, NYU, New York, New York*

Since 1996, the Hartford Institute for Geriatric Nursing, NYU College of Nursing, has set a national agenda for improving care of older

adults by promoting the significant role that nurses can play in the care of older adults. The Hartford Institute has sought to initiate, sustain and expand activities in the four areas of Education, Practice, Research, and Policy. The Hartford Institute's primary objective in research has been to foster innovative clinical geriatric nursing research and to recognize the contribution of geriatric nurse researchers. One initiative has been a week-long Hartford Institute Geriatric Nursing Scholars Program, an intensive mentoring workshop. In addition, the Hartford Institute works to engage and facilitate the work of emerging scholars in geriatric nursing research. In this symposium, the Hartford Institute highlights the work of emerging geriatric nursing research scholars looking at risk factors for hospitalization and inpatient mortality of home healthcare patients; hospitalization and cancer diagnosis and comorbidity patterns in long term care services and supports; and risks factors for glucose metabolism alterations in cancer patients.

### **HOME HEALTHCARE PATIENT CHARACTERISTICS ASSOCIATED WITH INCREASED RISK OF HOSPITALIZATION AND INPATIENT MORTALITY: A NATIONWIDE SAMPLE**

A. Brody, M. Rosenberg, A. Bacic, *Nursing, NYU, New York, New York*

The increase in the population of older adults is expected to overwhelm the healthcare system; the supply of hospital and long term care beds are not expected to keep pace with the demand. Thus, these complex patients will be forced to return to the community in sicker condition than currently seen, after shorter lengths of stay in the hospital, which will place a great strain on home healthcare agencies. However, few studies have examined the characteristics of older adults receiving home healthcare, nor how those characteristics effect hospitalization. This study uses data from the Outcome and Assessment Information Set and MEDPAR from 2006-2008 to examine those characteristics that are most associated with hospitalization and inpatient mortality. It also examines whether there are certain characteristics within subgroups (dementia, cancer, heart failure, COPD) that place the patient at greater risks for hospitalization and inpatient mortality.

### **CANCER DIAGNOSIS, COMORBIDITY PATTERNS, AND NUMBER OF HOSPITALIZATIONS AMONG OLDER ADULTS RECEIVING LONG-TERM SERVICES AND SUPPORTS**

J.H. Van Cleave<sup>1</sup>, B.L. Egleston<sup>2</sup>, K. Abbott<sup>3</sup>, A. Rao<sup>3</sup>, M.D. Naylor<sup>3</sup>, *1. New York University College of Nursing, New York, New York, 2. Fox Chase Cancer Center, Biostatistics Facility, Philadelphia, Pennsylvania, 3. University of Pennsylvania School of Nursing, Philadelphia, Pennsylvania*

We explored association of cancer diagnosis, comorbidity patterns, and hospitalizations over one year among older adults receiving long-term services and supports using data from Health Related Quality of Life: Elders in Long Term Care study, MD Naylor, PI (n=470). Using latent class analysis and regressions, we found cancer diagnosis was not associated with hospitalizations. However, three classes of comorbidity patterns were identified. Sixty-seven percent of participants had low comorbidity burden with dementia (31.4%) most prevalent major condition. Fifteen percent had moderate comorbidity burden with cerebrovascular disease (72.1%) most prevalent. Eighteen percent had high comorbidity burden with congestive heart failure (90.6%) most prevalent. Participants with high comorbidity burden had 1.06 greater number of hospitalizations per 10% increase in probability of class membership than those with low comorbidity burden (p=0.002). Findings suggest comorbidity pattern rather than cancer diagnosis influences number of hospitalizations by older adults receiving long-term services and supports.

## GLUCOSE METABOLISM IN OLDER ADULTS WITH CANCER

M.J. Hammer, *Nursing, NYU, New York, New York*

Individuals 65 years and older account for over 50% of cancer incidence. Additionally, >26% of older adults have diabetes (unregulated hyperglycemia) compared to 8.2% in the general population, and up to 18% of patients with cancer have pre-existing diabetes. Furthermore, diabetes is a known risk factor for certain types of cancer. Hyperglycemia also occurs in cancer environments independent of diabetic history. Hyperglycemia impairs immune function, preventing immune cells from being able to effectively detect and arrest aberrant cell formation and eliminate foreign microorganisms. The immunosuppression increases the risk for infections and related complications including non-malignancy-related death. Older adults with cancer are at particular risk for alterations in glucose metabolism due to nutritional imbalances and decreased physical activity, medications, and stress. Understanding these events can lead to enhanced protocols for better glycemic control and in turn, reduced rates of both cancer onset and adverse outcomes in older adults with cancer.

## SESSION 70 (SYMPOSIUM)

### UNDERSTANDING DECISION-MAKING IN DEMENTIA

Chair: *L.P. Gwyther, Duke University Medical Center, Durham, North Carolina*

Co-Chair: *K. Samsi, Social Care Workforce Research Unit, King's College London, London, United Kingdom*

Discussant: *J. Manthorpe, Social Care Workforce Research Unit, King's College London, London, United Kingdom*

Understanding how and when people with dementia make decisions is becoming a crucial to health care systems and practice, as this can inform everyday care as well as long-term care needs. Although decision-making is seen as part of providing routine care, the impact of making decisions can be tremendous – on individual autonomy of the person with dementia and levels of strain experienced by carer. Long-term future care needs can also be impacted by perceived level of autonomy and dependency. The focus of this symposium is to explore this new thinking by looking at decision-making at various stages of dementia. Buron starts by presenting the theoretical context to decision-making by examining the difference between emotional and intellectual decision-making. Samsi and Manthorpe use qualitative methodology to explore everyday independent and shared decision-making between people with dementia and caregivers. Menne and Whitlatch look at how everyday decision-making can change over time and the implications of this for long-term care needs. Morhardt and Spira's study focuses on training staff to recognise dementia and equip them with skills to make everyday decisions. Hirschman and Hanlon look at the implications of medical decision-making on caregiver burden and strategies to engage the person with dementia in order to manage this better.

### BALANCING RESPECT FOR AUTONOMY WITH SAFETY: CONSIDERING EMOTIONAL DECISION-MAKING WHEN CARING FOR PEOPLE WITH PROGRESSING DEMENTIA

*B. Buron, University of Arkansas for Medical Sciences Northwest Campus, Fayetteville, Arkansas*

Personal decision-making is a fundamental human right that must be nurtured and respected prior to and throughout the progression of dementia. While it is well established that progressing dementia is associated with depression, anxiety, frustration/anger, and suspicion, it is unknown how emotions, combined with memory loss, might impact decision-making as dementia progresses. Emotional decision-making is particularly important in relation to personal decisions that can negatively impact future quality of life. A case study is used to explore the potential effects of emotions, combined with memory loss on some negative consequences of decision-making. Suggestions for healthcare

providers, including ideas about how to 1) differentiate emotional from intellectual decision-making and 2) prevent and respond to highly emotional decision-making will be discussed. The implications of future research may include the development of practice protocols and policy changes to protect persons with progressing dementia from the potentially negative consequences of emotional decision-making.

### EVERYDAY DECISION-MAKING AMONG PEOPLE WITH DEMENTIA AND CARERS

*K. Samsi, J. Manthorpe, Social Care Workforce Research Unit, King's College London, London, United Kingdom*

Qualitative interviews with 12 dyads of people with dementia and caregivers were conducted over 10 months to understand everyday independent and shared decision-making in England. We explored relevance of new legal frameworks in England, the Mental Capacity Act 2005, for people making everyday decisions. Findings revealed that everyone valued decision-making autonomy, and everyday conversations contextualised decision-making. Some caregivers described using cues to assist relatives with dementia, such as presenting fewer options. Caregivers found proxy decision-making frustrating, but lifelong preferences, habits, and dislikes of their relatives were used as schema to help. Principles of 'best-interests' underlay many decisions, although challenges remain in understanding how these can be best weighed up, especially if the well-being of one depends on the well-being of the other. We explore these and other challenges faced by people with dementia and caregivers and report on ways in which some conceptualised their decision-making by reference to legal principles.

### DECISION-MAKING INVOLVEMENT OF PERSONS WITH DEMENTIA: CAREGIVER PERCEPTIONS AND CHANGE OVER TIME

*H.L. Menne, C.J. Whitlatch, Margaret Blenkner Research Institute, Benjamin Rose Institute on Aging, Cleveland, Ohio*

It is important to engage a person with dementia (PWD) in decision making about daily care while he/she is still able to communicate his/her wishes. This study analyzes data from 81 PWDs and their family caregivers to explore the everyday decision-making involvement of PWDs, and the family caregiver's perceptions of the person's decision-making involvement over 1 year. Results demonstrate that persons with mild to moderate dementia can participate in making decisions about their daily care. The doubly repeated-measures ANOVA results indicate that the Person X Time interaction for decision-making involvement trended toward significance ( $p=.064$ ). Significant effects by Person and by Time were found ( $p=.000$ ) with PWDs reporting significantly more decision-making involvement at T1 (38.29) and T2 (36.28) compared to caregivers' perceptions (T1=31.87, T2=27.41). These findings add to the growing research documenting that care partners do not share the same perceptions about the PWD's daily care involvement and preferences.

### DEMENTIA TRAINING: ENHANCING EVERY DAY DECISION-MAKING OF STAFF WHO WORK WITH THE COGNITIVELY IMPAIRED

*D.J. Morhardt<sup>1</sup>, M. Spira<sup>2</sup>, 1. Northwestern University Feinberg School of Medicine, Chicago, Illinois, 2. Loyola University Chicago, Chicago, Illinois*

Focus groups conducted with multilevel staff in a low-income housing consortium revealed that staff had little knowledge about dementia. Consequently concerns were raised about older people in low-income housing who may demonstrate changes in behavioral and cognitive function, yet go undiagnosed, ignored or responded to with insensitivity. An educational director of a NIA-designated Alzheimer's disease center and a university professor combined resources to create training modules for staff, working in low-income housing units. Preliminary reports from administrators, social service workers and maintenance/security personnel reported increased levels of knowledge following the train-

ing and intentions to respond more sensitively to the changes observed in residents. An anticipated result of the training is to increase the options for support of residents, including referrals to medical treatments, social supports and other options to enhance day-to-day decisions regarding care.

### **RELATIONSHIPS BETWEEN DEMENTIA SEVERITY AND PATIENT PARTICIPATION IN MEDICAL CARE DECISIONS DURING A HOSPITALIZATION**

K.B. Hirschman, A.L. Hanlon, *School of Nursing, University of Pennsylvania School of Nursing, Philadelphia, Pennsylvania*

The goal of this study was to explore the relationship between patient participation in medical decisions and dementia severity. Caregivers (n=78) rated the degree to which their hospitalized relative with dementia is involved in medical decisions. The majority of caregivers reported that they make the final decisions (n=41, 53.9%), 31.6% (n=24) collaboratively make decisions, and 14.5% (n=11) said their relative makes final medical decisions. Caregiver burden was lowest for caregivers who reported their relative is involved in medical decision-making either independently or collaboratively. Only 12 (16%) caregivers' of hospitalized dementia patients in the normal-to-mild range (Mini Mental State Examination >19) indicated their relative is involved in medical decision making either independently or collaboratively. Using multivariate ordinal logistic regression, dementia severity and caregiver burden were the most significant predictors of patient involvement in medical decision-making during a hospitalization. Implications of these findings will be discussed.

## **SESSION 75 (SYMPOSIUM)**

### **EMERGING ISSUES IN AGING AND DISABILITY: INTERSECTING PRACTICE AND POLICY**

Chair: *N. Ruggiano, School of Social Work, Florida International University, Miami, Florida*

Co-Chair: *M. Putnam, Simmons College, Boston, Massachusetts*

Discussant: *A. Horowitz, Fordham University, New York, New York*

Over the past several decades, policies and service systems have evolved to address disability and aging separately. Within the disability system, policies and services for non-elderly individuals with disabilities have traditionally emphasized autonomy, social integration, and person-centeredness. Contrary to gerontological research findings, policymakers and practitioners within the aging service system have historically viewed older adults as vulnerable service users, focusing primarily on avoiding institutionalization, only recently embracing more consumer-driven service models. Within the next several decades, the population of older adults with disabilities will be comprised of both individuals who experienced their disability during later life and individuals whose onset of disability occurred at an earlier age, raising questions about these separate systems. Scholars, practitioners, and policymakers alike have questioned if and how the disability and aging systems should be integrated, which would require parity in treatment for all individuals with disabilities and chronic conditions who receive ongoing care and support in home and community-based settings. This dialogue has particularly centered on the growing number of non-elderly individuals with disabilities who are moving from the disability system into the aging system. This session highlights current dialogue on aging and disability. Individual presentations will focus on policy and practice implications of providing disability-related services to older adults in the community that emphasize person-centeredness, independence, and social-integration, similar to those that have become commonplace for non-elderly individuals with disabilities. The discussion will also present recommendations for practitioners and policymakers in addressing the needs of adults with disabilities as they age.

### **POLICY IMPLICATIONS OF DIFFERENCES IN ASSISTIVE DEVICE PREFERENCES IN MEXICAN AMERICAN AND NON-HISPANIC WHITE WOMEN WITH MOBILITY IMPAIRMENT**

T. Harrison<sup>1</sup>, S. Blozis<sup>2</sup>, B. LeGarde<sup>1</sup>, *1. The University of TX at Austin, Austin, Texas, 2. University of California, Davis, Davis, California*

The purpose of this two phase mixed-method study was to explore preferences for assistive device (AD) use among Mexican American (MA) and Non-Hispanic White (NHW) women with mobility impairments and to discuss implications for home and community based service providers implementing person centered planning (PCP). The sample consisted of 122 MA and NHW women, ages 55 to 75, with mobility impairments. First, the women completed questionnaires and were interviewed multiple times (n=464). Content analysis and descriptive statistics were performed. Second, the women completed a newly developed questionnaire on the frequency and meaning of AD use (Cronbach's alpha = .82). The MA women's attitude toward AD use was significantly lower [t (83) = 2.00, p < .05], and they reported higher levels of disability [t (108) = 3.62, p < .00] than did the NHW women. Recommendations are provided to improve PCP with culturally varied aging groups.

### **AGING SERVICE PROVIDER CAPACITY TO SERVE OLDER ADULTS AGING WITH INTELLECTUAL DISABILITIES: CASE STUDY REPORT**

*M. Putnam, School of Social Work, Simmons College, Boston, Massachusetts*

Case study findings are presented from a study of aging service providers in one county in Missouri aimed at understanding current capacity and existing professional training and development needs and interests to serve older adults with developmental/intellectual disabilities. Three study components including an inventory of service providers, mail survey, and best practices review identifying replicable models programs are presented along with discussion of the aims of the local study funder to build capacity within the county's aging network. Study outcomes find more than 500 aging service providers, but limited interest in responding to survey inquiry building professional and organizational capacity. Survey data suggests a modest pool of professionals may be available to engage in capacity building activities. Model programs are described and are reviewed against potential for adoption. Successes and limitations of the study are discussed in relation to next steps for building aging service provider capacity in this county.

### **INTEGRATING PERSON-CENTEREDNESS INTO HOME CARE: CONCEPTUAL, PRACTICAL, AND METHODOLOGICAL ISSUES**

*N. Ruggiano, School of Social Work, Florida International University, Miami, Florida*

Person-centered care has become increasingly emphasized in health and institutionalized long-term care systems, though its adoption in home care for older adults has lagged. The aim of this presentation is twofold. First, it provides an analysis of the conceptual, practical, and methodological issues that stem from integrating dimensions of person-centeredness into home care services for older adults. Then, it will present preliminary findings from a study that examined home care case managers' (N=10) and service recipients' (N=40) perspectives of person-centeredness in home care. The methodology for this study involves in-depth interviews where participants identified aspects of home care that reflect dimensions of person-centeredness as well as unmet needs in person-centered home care. Content analysis was performed to identify themes. Findings from this study provide a framework for conceptualizing and developing best-practices in person-centered home care. Implications and recommendations for policymakers, practitioners, and researchers are provided.

## **BUILDING CARE INTELLIGENCE SYSTEMS TO DRIVE PERSON-CENTERED AND COST EFFECTIVE SERVICE DELIVERY FOR PEOPLE WITH INTELLECTUAL DISABILITIES AS THEY AGE**

P. McCallion, *University at Albany, SUNY, Albany, New York*

There is a sizeable and growing population of older persons with ID but we know little about their ageing and there are concerns that mortality is higher, health problems are greater, access to services and health promotion is poorer and quality of life is often compromised. For some this is likely to mean the potential to be returned to more restrictive living situations or the provision in community setting of levels of support that are costly and/or mean that people are maintained in the community rather than living there. An approach will be described in one state of utilizing emerging electronic health record strategies to support better care, better health and lower costs through the use of predictive models, analytics, data driven alerts and reporting to create a proactive, evidence-based approach to driving quality of care, managing costs, and fundamentally reorganizing service delivery, monitoring, management and outcomes. Data will be presented on several high use/high cost and low person driven planning cases where both cost and person-centeredness have been improved. Implications for larger systems change will be discussed as well as implications for care for other aging populations.

## **SESSION 80 (SYMPOSIUM)**

### **LONG-TERM CARE SERVICE USE IN ASIAN COUNTRIES: INFLUENCE OF CULTURE ON SERVICE UTILIZATION AND HEALTHCARE OUTCOMES**

Chair: *F. Ejaz, Benjamin Rose Institute, Cleveland, Ohio*

Discussant: *K. Chee, Texas State University, San Marcos, Texas*

This symposium addresses various issues and challenges related to long-term care service use in Asian countries using data from three different research projects. The types of long-term care settings ranged from adult day care centers, "old-age" homes, and home and community-based service agencies. The methodologies used to collect data in these studies ranged from participant observations and/or in-person interviews with residents/clients, staff and available records. Dr. Balaswamy will discuss how residents of 20 "old age" homes in India perceived their health and utilized healthcare services. Residents overwhelmingly reported that access and affordability of healthcare services were major barriers. Despite these similarities, perceptions of health problems (physical/mental illnesses, disability) and quality of life differed by demographic characteristics and type of home. Dr. Liou will demonstrate how an ecological systems approach best explained how an adult day care center in Taiwan was designed and managed. Taiwanese culture and the agency's mission influenced how residents were treated, how staff dealt with them and how these influenced clients' perceived health and quality of life. Drs. Lou and Kwan will discuss the healthcare status of clients using integrated and enhanced home and community-based, and adult day care services in Hong-Kong. The study suggests that clients' healthcare needs are complex, indicating the need for on-going assessment and staff training to monitor changing needs. Drs. Ejaz and Chee will generate a discussion on the similarities and differences between the studies and how the findings can be used to influence practice and policy in Asian countries.

### **HOW A DEMENTIA CARE SETTING OPERATES AND INFLUENCES A VARIETY OF CLIENTS AND STAFF OUTCOMES IN TAIWAN**

C. Liou, *Virginia Tech, Blacksburg, Virginia*

Studies on the development, management and evaluation of care settings for clients with dementia in the United States use a holistic approach to ensure environmental safety, promote independence and address behavioral issues. However, current evaluations of dementia care settings in Taiwan have predominately focused on the physical environ-

ment and ignored using a holistic approach. This study used an ecological systems (Bronfenbrenner, 1977) approach and the concept of place (Moore, 2004) to examine one dementia adult day care center in Taiwan. Data collection methods involved participant observation, client and staff interviews, and existing records. Findings showed that the social context of Taiwanese culture, the agency's mission and the local community influenced how the center was designed and managed. These processes, in turn influenced staff attitudes and clients' perceived quality of life. Findings are useful to guide the design and development of care settings for people with dementia in Taiwan.

### **HEALTH STATUS OF COMMUNITY LONG-TERM CARE SERVICE USERS IN HONG KONG**

V. Lou<sup>1,2</sup>, C. Kwan<sup>3</sup>, *1. Department of Social Work & Social Administration, The University of Hong Kong, Hong Kong, Hong Kong, 2. Sau Po Centre on Ageing, The University of Hong Kong, Hong Kong, Hong Kong, 3. Department of Statistics and Actuarial Science, The University of Hong Kong, Hong Kong, Hong Kong*

Objective: The study examined the health status of community long-term care service users in Hong Kong. Method: A cross-sectional survey design using a structured questionnaire was utilized to collect data. The sample was recruited from three types of long-term care settings, i.e., Adult-day Care Centers, Integrated Home Care, and Enhanced Home and Community Services. A total of 808 service users participated. The mean age of the sample was 79 years old; 37% were male, 43% were widowed, and 21% were receiving social security assistance. Findings: In terms of health status, 73% had ADL impairments, 71% visual impairments, 87% cognitive deterioration, 22% depressive symptoms, 55% had oral health concern, 56% had pain experiences, and 35% medication management difficulties. Implications: The findings suggest that the healthcare needs of community long-term care service users are complex and complicated, indicating the need for on-going assessment, monitoring, and staff training to address changing needs. Acknowledgement: This study was supported by The Hong Kong Council of Social Services.

### **HEALTH AND HEALTH SERVICE UTILIZATION OF RESIDENTS IN OLD-AGE HOMES IN INDIA**

S. Balaswamy<sup>1</sup>, S. Diwan<sup>1,2</sup>, *1. Ohio State University, College of Social Work, Columbus, Ohio, 2. San Jose State University, San Jose, California*

Health problems of older persons are of major concern to society from the perspective of cost and healthcare quality of life. This cross-sectional study used mixed methods to assess the health and healthcare service utilization of residents of old-age homes in two southern cities in India. Using a list of existing old age homes, 20 old age homes were randomly selected. Between 10-20 men and women were interviewed from each selected facility to discuss their health status and healthcare utilization. Findings indicate access and affordability to healthcare are dilemmas for all residents irrespective of living in a governmental or paid old-age home. Perceptions of health problems (physical/mental illnesses, disability) differed by gender, education, religion, and type of residential facility and influenced perceived quality of life. Implications of the findings in terms of developing practical and policy-level solutions to healthcare issues will be discussed for old-age homes and governmental action.

## **SESSION 85 (SYMPOSIUM)**

### **MEDICARE-MEDICAID ENROLLEES: AN EXAMINATION OF NEW MARYLAND ENROLLEES AND PATHWAYS TO COVERAGE**

Chair: *D.C. Folkemer, The Hilltop Institute, Baltimore, Maryland*  
Discussant: *C.J. Milligan, Department of Health and Mental Hygiene, Baltimore, Maryland*

Medicare-Medicaid enrollees are more likely to be frail, have disabilities, or have multiple chronic conditions, including cognitive impair-

ments, than persons enrolled in either Medicare or Medicaid alone. Enrollees generate a disproportionate share of costs for both the Medicare and Medicaid programs. While sharing a likelihood of high health needs, they are a heterogeneous group. To better understand their diversity, this research examined the experience of Maryland enrollees before their eligibility for both programs. The research identified and cataloged significant differences between those persons who first enroll in Medicaid and then in Medicare and those who first enroll in Medicare and then in Medicaid. To gather data, researchers matched records from Maryland's MMA State File with Medicaid Eligibility and Claims files and used these records to identify demographic and programmatic characteristics of 15,654 new Medicare-Medicaid enrollees in Maryland for 2008. The researchers then applied existing Chronic Condition Data Warehouse algorithms to Medicare and Medicaid administrative files to identify chronic conditions and analyzed Medicare and Medicaid expenditures for the enrollees during the year before they became enrollees in both programs. Researchers will share the results of their analyses along with findings from a background paper about pathways to eligibility for both programs. The Centers for Medicare and Medicaid Services will offer context and background for the research presentations through an overview of their current initiatives focused on persons eligible for both programs. Maryland's Deputy Secretary for Health Care Financing will talk about the federal and state policy implications of the research.

#### **MEDICARE-MEDICAID COORDINATION OFFICE OVERVIEW**

S. Donovan, *Centers for Medicare & Medicaid Services, Baltimore, Maryland*

The Medicare-Medicaid Coordination Office, established by the Affordable Care Act, will describe its current efforts to ensure full access to seamless, high quality health care and to make the system as cost-effective as possible. The office works with the Medicaid and Medicare programs, across Federal agencies, and with States and stakeholders to align and coordinate benefits between the two programs effectively and efficiently. It partners with States to develop new care models and improve the way Medicare-Medicaid enrollees receive health care. The office will describe its work on a variety of initiatives to improve access, coordination and cost of care for Medicare-Medicaid enrollees in the following areas: program alignment, data and analytics, and models and demonstrations.

#### **PATHWAYS TO MEDICARE-MEDICAID ELIGIBILITY: A LITERATURE REVIEW**

C.H. Woodcock<sup>1</sup>, S. Cannon-Jones<sup>2</sup>, A.M. Tripp<sup>2</sup>, B.J. Holt<sup>2</sup>, *1. Impaq International, LLC, Columbia, Maryland, 2. The Hilltop Institute, Baltimore, Maryland*

The Hilltop Institute conducted a literature review to identify pathways to Medicare-Medicaid eligibility. The review described the various pathways; presented examples of programs aimed at delaying functional decline and/or poverty, and reviewed enrollment barriers faced by individuals who need both Medicare and Medicaid coverage. The review found pathways to Medicare-Medicaid eligibility are dependent on a complex interplay of age, health, disability, and socioeconomic status, as well as an intricate web of eligibility requirements, application procedures, and waiting periods. The review includes recommendations for policy changes.

#### **NEW MEDICARE-MEDICAID ENROLLEES IN MARYLAND: DEMOGRAPHIC AND PROGRAMMATIC CHARACTERISTICS**

A.M. Tripp<sup>1</sup>, K.E. Johnson<sup>2</sup>, D.C. Folkemer<sup>1</sup>, I. Stockwell<sup>1</sup>, *1. The Hilltop Institute, Baltimore, Maryland, 2. National Quality Forum, Washington, District of Columbia*

This study focused on persons in Maryland who became Medicare-Medicaid enrollees in 2008. The research compared and contrasted char-

acteristics of enrollees in both programs with particular attention to identifying differences among various groups. Using matched Medicare and Medicaid records, this research provides detailed demographic and programmatic information about 15,654 persons who acquired dual status in 2008. Approximately 42 percent of these individuals were enrolled in Medicaid first, nearly 56 percent were initially enrolled in Medicare, and 2 percent enrolled in both programs at the same time. Persons initially enrolled in Medicaid are younger and more likely to be non-white and have incomes below poverty than those first enrolled in Medicare. Institutional residence is an important characteristic of persons who first enroll in Medicare and then become eligible for both programs. The study suggests highly individualized interventions will be necessary to manage conditions and circumstances associated with dual status.

#### **NEW MEDICARE-MEDICAID ENROLLEES IN MARYLAND: PRIOR MEDICARE AND MEDICAID RESOURCE USE**

I. Stockwell, *The Hilltop Institute, Baltimore, Maryland*

Researchers examined chronic disease patterns and prior health care expenditures of persons who in 2008 began to receive coverage from both Medicare and Medicaid. The study identified disease characteristics or spending patterns predating enrollment in both programs that could inform service use after enrollment in both programs. Findings identified chronic conditions based on existing condition flags. The three most common were diabetes, ischemic heart disease, and depression. Per member per month costs for persons first on Medicaid and persons first on Medicare were fairly similar, with the Medicare-to-Medicaid group having a \$2,228 PMPM and the Medicaid-to-Medicare group having a \$2,820 PMPM. There were differences in covered services and the distribution of spending between the two groups. This review of health status and Medicare or Medicaid expenditures of individuals before their enrollment in both programs can inform studies of spending patterns and health status for persons subsequently enrolled in both programs.

### **SESSION 90 (SYMPOSIUM)**

#### **MOVING BEYOND TRADITIONAL GERIATRIC ASSESSMENT**

Chair: *S.M. Geron, School of Social Work, Boston University, Boston, Massachusetts*

Co-Chair: *H.Q. Kivnick, University of Minnesota, Minneapolis, Minnesota*

Discussant: *R. Applebaum, Miami University, Oxford, Ohio*

Recent researchers have made great strides in assessing the capacities, attributes, and resources of older adults. Measuring even basic constructs like physical functioning and depression has received renewed attention, and significantly improved tools have become available. At the same time, advances in scoring and data-gathering technology have increased the efficiency of assessment for determining service eligibility, need for long-term living supports and services, and diagnostic conditions. Greater assessment precision has improved our ability to make risk adjustments, refine payment approaches, increase care quality, and more. But these improvements have, paradoxically, highlighted shortcomings in traditional geriatric assessment. This symposium will explore these limitations, driven by the observations that: 1) while the ultimate goal of most geriatric assessment may be broadly construed as improved services and care for older adults, actual connections between assessment and care may be indirect, imperceptible, or nonexistent; 2) established assessment tools may fail to capture the older adult's own experience of conditions being assessed; and 3) strength-based approaches are often overlooked in existing assessments of deficits and disorders. This symposium will review the strengths and weaknesses of existing geriatric assessment approaches, and will present research introducing

the potential of new approaches — considering both process and content. The primary issues addressed include: 1) increasing direct benefits to the older adults being assessed; 2) measurement challenges to developing more clinically useful assessments of older adult strengths and capacities for meaningful engagement; and 3) the importance of including older adults' own perspectives as part of geriatric assessments.

### **THE LIMITS OF TRADITIONAL GERIATRIC ASSESSMENTS**

S.M. Geron, *School of Social Work, Boston University, Boston, Massachusetts*

The strengths and purposes of traditional purposes of geriatric assessment are well established: to identify eligibility for services; to identify needs/deficits/strengths in older adults; to diagnosis conditions; and to serve research purposes. This presentation will highlight some of the weaknesses of standardized assessments currently in use, including: a) the disconnect that frequently occurs between assessment and care; b) the weakness of traditional assessment to capture the strengths and personal experiences of older adults; c) the weakened or changed role of assessment due to emergence of consumer direction; and d) the gulf in geriatric assessment between the clinical or programmatic utility and the personal benefits to older adults. Two questions in particular will be discussed: Is there a way to increase the direct benefits to the older adults who are being assessed? Are the metrics of measurement validity and reliability inconsistent with goals of personal or therapeutic benefit?

### **NARRATIVES OF DEPRESSION AND THE CLINICAL SETTING: FINDING NEW WAYS TO CHANGE THE SCRIPT**

K. de Medeiros, *Sociology and Gerontology, Miami University, Oxford, Ohio*

Conversational exchanges between patients and professionals are governed by unspoken rules regarding appropriate behaviors and responses. Researchers or people in professional cultures (e.g., clinicians) may therefore have an inherent bias toward fitting a patient's experiences into known categories rather than exploring their potential. The purpose of this study was to explore the scripted narratives of depression interviews. Narratives of four older adults enrolled in a qualitative study on attributions of depression were examined. All participants completed the CIDI and CES-D and participated in a semi-structured interview and letter writing exercise. Results revealed that participants adhered to a "clinical script" regarding depression cause and symptoms during the formal CIDI and CES-D interview portions, but presented a different "lay" understanding of depression in the informal interviews and letter writing. Given the importance of correctly identifying and treating depression, especially in older men, findings point to the need for new ways to foster "authentic" narratives of experience rather than recounting clinical scripts.

### **VITAL INVOLVEMENT: ENRICHING GERONTOLOGICAL ASSESSMENT AND PRACTICE**

H.Q. Kivnick, C. Wells, *School of Social Work, University of Minnesota, Saint Paul, Minnesota*

As the elder population expands and diversifies, gerontologists must create new services, programs, opportunities, and supports to meet an extremely wide range of needs — including individuals' needs to contribute and to be needed. Current assessment tools and procedures utilize a narrow range of structured interactions to gather specific, standardized data corresponding to services and evaluation measures. Addressing expanding elder needs and potentials highlights limitations in the existing assessment-to-intervention-to-evaluation paradigm. E.g., person-centered approaches in care facilities and the positive effects of creative arts participation in community settings allow elders to maximize their strengths and commitments; these approaches also challenge existing measures of successful intervention. The construct of vital involvement (VI) (Erikson, Erikson, & Kivnick, 1986) provides a devel-

opmental framework for understanding the dynamics of creative, individually meaningful activity. Ongoing research is developing tools to measure individual VI as part of strength-based assessment, case planning, and evaluation.

## **SESSION 95 (SYMPOSIUM)**

### **SOCIAL SECURITY: POLITICS AND POLICY**

Chair: *J.B. Williamson, Boston Coll-Sociology, Chestnut Hill, Massachusetts*

Co-Chair: *D. Beland, University of Saskatchewan, Saskatoon, Saskatchewan, Canada*

Discussant: *F.L. Cook, Northwestern University, Evanston, Illinois*

The 2012 presidential election may well have major implications for when and how Social Security is reformed. This will be particularly true if either party controls the presidency and both houses of Congress. But are significant changes possible even if the outcome is again a power sharing arrangement between the two parties? To address these and a number of closely related policy questions we have assembled a panel of five experts. Eric Kingson will propose that progressives move beyond their current largely defensive posture and take the offensive in an effort to reform Social Security in ways that increase, rather than decrease the protection provided. Pamela Herd will follow with an assessment of the proposal to increase the retirement age. She will explore the potentially adverse consequences of such efforts with particular attention to the lower disability free life expectancies among African Americans and those with low incomes. David Ekerdt will argue that in debates over Social Security reform most policy analysts put too much emphasis on abstract statistics and too little on the moral and justice related case for social insurance using stories about specific beneficiaries. In his presentation Daniel Beland will provide an historical analysis of how the lessons from the past 30 years shaped the debate during the 2012 presidential campaign. John Williamson will conclude with a discussion of the link between the outcome of the 2012 election and the prospect for enactment of significant changes in Social Security during the next couple of years.

### **SOCIAL SECURITY: CHANGING THE NARRATIVE**

E. Kingson, *Syracuse University, Syracuse, New York*

The inability of the Supercommittee to reach agreement marked the failure of an intense and well-resourced two-year effort by conservatives and their neo-liberal supporters to achieve fast-track legislation that would roll back and possibly radically alter Social Security protections. During this time, Social Security advocates have been on the defense, as they were in 2004-5 (Bush partial privatization effort), 1998, and arguably before that. To prepare for the 2012 "lame duck" session and to lay the foundation for improvements 5, 10 or 15 years from now, many advocates have concluded that it is important to move from defense to offense: to develop a narrative, messages, and strategies that advance a progressive agenda to strengthen and, eventually, expand Social Security protections for today's working persons and their families. This presentation will further describe the need for as well as the intellectual and strategic elements of a progressive strategy.

### **HEALTH INEQUALITIES: A CENTRAL CHALLENGE TO RAISING THE RETIREMENT AGE**

P. Herd, *UW-Madison, Madison, Connecticut*

The debate on retirement age has largely emphasized average increasing life expectancy as a rationale for why individuals should work longer and retire later. But what is generally unacknowledged in current policy debates is nearly three decades of research documenting the fact that the benefits of increased life expectancy have not accrued evenly across the population. Not only do African Americans, those with low educational attainment and low incomes face a short life expectancy, they also have fewer years of disability free life expectancy. In short, they expe-

rience the onset of ill health and disability at much younger ages than do whites and those with higher educational attainment and income. And while there is some evidence that rates of general disability among the older population declined in the 1990s and early 2000s, there is also evidence that gaps in disability prevalence by educational attainment grew.

### **TALKING SOCIAL SECURITY: STORIES BEFORE STATISTICS**

D. Ekerdt, *Univ of Kansas, Lawrence, Kansas*

Anyone conversant with such items as these—2.22% of taxable payroll, 2036, \$110,100—is well-equipped for argumentative rhetoric about Social Security. Public discourse about the program, its features and prospects, is almost wholly conducted with numbers. Policy specialists may find these details compelling or persuasive, but the public has almost no frame of reference for appreciating them. To make the moral or communitarian case for social insurance, effective political rhetoric should bring stories about beneficiaries to the fore. Theorists Walter Fisher and George Lakoff have highlighted the limitations of reason for shifting opinion and contesting self-interest, as compared to the rhetorical power of narrative and framing. Narratives can persuade by giving people a self interest in the interests of others. Among the program's 50 million beneficiaries, advocates can find compelling, one-of-us protagonists in order to create a sense of commonality to counter individualist "money's worth" themes of the program's opponents.

### **REVISITING THE POLITICS OF SOCIAL SECURITY REFORM: LESSONS FROM THE REAGAN, CLINTON, AND W. BUSH YEARS?**

D. Bé land, *Johnson-Shoyama Graduate School of Public Policy, UNiversity of Saskatchewan, Saskatoon, Saskatchewan, Canada*

This paper offers an historical perspective on the politics of Social Security reform in the United States. More specifically, it draws lessons about the role of ideas, institutions, and actor mobilization from the political process leading to the enactment of the 1983 Amendments to the Social Security Act, and from the debate over Social Security privatization that took place during the Clinton and the W. Bush presidencies. The paper is grounded with interviews with federal policymakers as well as a survey of the available historical evidence about the role of key political actors in Social Security reform. This historical analysis is meant to shed light on the current debate on the future of Social Security, especially as it is shaped and reshaped during the 2012 presidential campaign. Campaign discussions over Social Security are analyzed in the mirror of previous presidential races from the last three decades.

### **POLITICS OF SOCIAL SECURITY: IS IT POSSIBLE THAT 2013 WILL BE A GOOD YEAR TO REFORM SOCIAL SECURITY?**

J.B. Williamson, *Boston College, Chestnut Hill, Massachusetts*

If in the 2012 election either the Democrats or the Republicans win the presidency and strong majorities in both houses of Congress, 2013 could be a year a successful effort will be made by the party in power to reform Social Security. However, the basket of reforms made is likely to differ dramatically depending on the party in power. I will focus on the more likely outcome that neither party ends up with a landslide victory. What then? I will discuss why even with that outcome, 2013 may still be a possible year for a grand compromise between Republicans and Democrats on Social Security reform. If Obama wins a deal may be possible. If a moderate Republican with a record of compromising wins, a deal may be possible; but if the Tea Party wing of the party controls, the Presidency, the House, or the Senate, a deal is very unlikely.

## **SESSION 100 (PAPER)**

### **HOUSING SERVICES AND NEIGHBORHOOD EFFECTS ON COMMUNITY DWELLING ELDERLY**

#### **LINKING AFFORDABLE SENIOR HOUSING AND COMPREHENSIVE CARE SERVICES**

C. Flores<sup>1,2</sup>, R. Newcomer, A.J. Caldwell, D. Werdegar, S.C. Tan, K. Skultety<sup>2</sup>, 1. *UC San Francisco, San Francisco, California*, 2. *Institute on Aging, San Francisco, California*, 3. *San Francisco State University, San Francisco, California*

This study investigates the first cohorts of residents in a newly opened Affordable Housing Plus Services (AHPS) model. AHPS links older residents in subsidized multi-unit housing to health and supportive services to promote aging in place. The housing complex consists of 150 apartments and two groups of residents, seniors from diverse backgrounds and of low to moderate income. One group, with significant frailty, consists of residents enrolled in a Program for All-Inclusive Care for the Elderly. The other group consists of seniors meeting age and income qualifications for housing who may or may not be utilizing long-term services and supports such as Case Management, Adult Day Services, or In-Home Supportive Services. The study groups also include comparison groups of eligible seniors not chosen for residency. Data concerning demographics, health status, service utilization, and quality of life were collected from interviews and chart review upon move-in and 6-months later. We compared types and frequencies of services before and after relocation using repeated measures least square regression for service use units and expenditures, and/or logistic regression for use/non-use comparisons of health status, service. This use and quality of life measured at admission and 6 months after relocation. The goal of this project is to advance the knowledge base about the influence of an Affordable Housing Plus Services (AHPS) model on residents' health status, service utilization and quality of life. This study was funded by the SCAN Foundation (grant #11-007).

#### **HOW DO OLDER ASIAN AMERICANS EXPERIENCE THEIR NEIGHBORHOOD? RESULTS FROM AN ACADEMIC-COMMUNITY PARTNERSHIP**

D. Nguyen, S. Park, *New York University, New York, New York*

Study aim: Social capital theory suggests increased social connections can improve health. Given the prominent role of ethnic mutual aid, we investigate the role of neighborhood characteristics and compared its association with overall health status and life satisfaction among Asian-American Older Adults. Method: This study utilized a cross-sectional, mixed method design. In partnership with community-based agencies, face-to-face or phone interviews were conducted with 121 older Asian Americans over the age of 60. A semi-structured interview was used to elicit responses to questions about housing, health and mental health, and service use. Descriptive statistics were used to explore relationships in the data. Open ended items were analyzed qualitatively by two independent coders. Results: Four major themes were emerged from the qualitative analysis: characteristics of neighbors, physical environment, convenience, and safety. Elders living in Asian neighborhoods expressed less satisfaction with their neighbors, and more uncertainty about their surroundings, but they recognized convenient living conditions including transportation and local ethnic supermarkets. Conversely, elders in non-Asian neighborhoods reported positive experiences with their neighbors, while noting the distance to ethnic supermarkets. The quantitative data showed some differences between the two cohorts. Elders in non-Asian neighborhoods endorsed more discrimination due to their English ability, and had fewer income resources than those living in Asian neighborhoods. Conclusion: These findings underscore the tradeoffs that Asian elders face when living in different neighborhoods.

Implications for elder housing policies and health promotion efforts will be described.

### **SYSTEMATIC IDENTIFICATION OF NATURALLY OCCURRING RETIREMENT COMMUNITIES (NORCS) IN OHIO**

M. Rivera-Hernandez, T. Yamashita, S. Kunkel, *Gerontology*, Oxford, Ohio

The term “Natural Occurring Retirement Communities” (NORCs) was first introduced in the 1980s by Michael Hunt, based on his observation of unusually large proportions of older populations in certain neighborhoods. NORCs are unplanned communities with large numbers of residents 60 years and older relative to younger residents (Hunt, & Ross, 1990). Arguably, such communities may face unique challenges and increasing needs/services for older adults. While NORCs have been observed rather sporadically in individual communities, little is known about how NORCs are spatially distributed across large geographical areas. Using GIS, this study systematically identified temporal trends in the emergence and stability of NORCs during the last decade in Ohio. Data are derived from the U.S. census 2000 and 2010 for all Ohio census tracts. Information regarding proportions of older house-owners/renters was visualized and color-coded in time-series thematic maps. Following the definition by the federal government, census tracts with 40% or greater older population are considered as NORCs. Results show that NORCs are consistently observed in urban areas (i.e., Cincinnati, Columbus, Cleveland and Toledo) and their surrounding areas. At the same time, more widely dispersed NORCs are identified across rural areas. In addition, distinctive temporal patterns of NORCs (i.e., consistent, emerging, disappearing over time) between 2000 and 2010 are evident from visual examinations of time-series maps. Using the methods and results from this study, systematic identification strategies for NORCs using GIS and policy implications (e.g., healthcare and social services allocation) are discussed.

### **BRINGING THE CARE HOME: A REVIEW OF FACTORS INFLUENCING THE UTILIZATION OF HOME AND COMMUNITY BASED LONG-TERM CARE AND IMPLICATIONS TO THE NURSING WORKFORCE**

P. Rosenfeld, D. Russell, *Center for Homecare Policy & Research, VNSNY, New York, New York*

Over the past several decades, home and community based services (HCBS) have played an increasingly important role in providing care to patients with complex health problems and functional impairments, and in enabling patients to remain independent in their own homes. This presentation will describe developments in U.S. health care policy during the past three decades that have led to increases in demand for and utilization of home and community-based health care, including the introduction of Medicare Prospective Payment System, the Supreme Court’s Olmstead decision, and the increased role of Medicaid Waivers to support non-institutional long term care. Increased focus on home and community based services provides important opportunities for nurses to practice independently. However, despite the clear growth in non-institutional long-term care, data gleaned from four iterations of the Sample Survey of Registered Nurse (1996-2008) produced little evidence that the nursing workforce, or the education of nurses, has responded adequately to these trends. The data suggests that RNs working in home and community based programs are statistically different than their counterparts in hospitals or nursing homes regarding both demographic and employment characteristics. The presentation concludes with recommendations for policy-makers and nursing leaders in education and service to consider in rebalancing the education and preparation of RNs to meet the growing demand in home and community based settings.

## **SESSION 105 (SYMPOSIUM)**

### **AFFECTIVE EXPERIENCES THROUGHOUT ADULTHOOD: FACETS AND PROCESSES**

Chair: M. Riediger, *Max Planck Research Group “Affect Across the Lifespan”, Max Planck Institute for Human Development, Berlin, Germany*

Co-Chair: A. Rauers, *Max Planck Research Group “Affect Across the Lifespan”, Max Planck Institute for Human Development, Berlin, Germany*

Discussant: S. Neupert, *NC State University, Raleigh, North Carolina*

Adult-age differences in emotional processes are a popular topic in current lifespan research. Yet many important questions still need to be answered. For example, do age differences in emotional experiences and reactivity hold across different distinct emotions? Do they vary across experiential and physiological dimensions of affective experience? What are the underlying mechanisms? This symposium will present recent conceptual and methodological advances concerning these questions. Contributions will address age differences in psychological and physiological facets of emotional functioning, using a wide range of methods, including assessments in daily-life and in well-controlled experimental settings; as well as explicit and implicit measurement approaches. Antje Rauers and colleagues will present evidence that subjective emotional reactivity to film clips eliciting a large number of distinct emotions increases from adolescence to old age for many, but not all, emotions. Ute Kunzmann and Thomas will present convergent evidence from explicit self-reports of daily emotional experience and from implicit association tests that age differences in emotional experience vary across the discrete emotions of sadness and anger. Martin Sliwinski will further demonstrate the fruitfulness of contextualizing emotional experience in participants’ daily lives for understanding age differences in affective experiences. Jennifer Piazza and colleagues will combine evidence from diary assessments and from analyses of ambulatory hormone samples to demonstrate age differences in the co-variation of affective and hormonal processes throughout the day. Shevaun Neupert, finally, will discuss the presented empirical results with regard to their implications for the field of emotional-aging research.

### **MORE, LESS, OR THE SAME? EMOTIONAL REACTIVITY TO 78 FILM CLIPS FROM YOUTH TO OLD AGE**

A. Rauers, M. Studtmann, M. Riediger, *Max Planck Research Group “Affect Across the Lifespan”, Max Planck Institute for Human Development, Berlin, Germany*

Emotional experiences become more positive with age. Age differences in responses to emotional events may contribute to this pattern. To investigate this possibility, past studies have used film clips as standardized emotional events. These studies have yielded mixed findings regarding age effects in emotional reactivity. Reasons for this inconsistency could have been the limited numbers of film stimuli, emotions, and age groups under study. We investigated emotional reactivity to a large number of film stimuli across a wide age range. Ninety-nine participants aged 12-80 years watched 78 film clips and rated how happy, amused, disgusted, fearful, sad, angry, or neutral they felt. Results indicate an age-related increase in emotional reactivity to film clips eliciting happiness, fear, sadness, and anger; but age invariance in reactions to neutral, disgusting, and amusing clips. We discuss the implications of these findings for understanding and studying age differences in emotional reactivity.

### **AGE AND NEGATIVE AFFECT: THE DISCRETE EMOTION MAKES A DIFFERENCE**

U. Kunzmann, S. Thomas, *University of Leipzig, Leipzig, Germany*

Age differences in anger and sadness were explored, focusing on the intensity and frequency of these experiences in everyday life and their implicit associations with the self. 96 young and older adults partici-

pated in the Day Reconstruction Method, in which emotional experiences on a typical day were recorded, and in two implicit association tests, in which implicit self-concepts for anger and sadness were assessed. Older adults experienced anger less frequently and less intensively than young adults did, but there were no age differences in sadness. In comparison with their younger counterparts, older adults showed a greater IAT effect in the implicit anger test, suggesting a weaker association between the self and anger, but there were no age differences in the implicit sadness test, suggesting age-invariant associations between the self and sadness. Together, these findings suggest multidirectional age differences in negative affect and support the usefulness of a discrete emotions approach.

#### **AFFECT AND CORTISOL: AGE MATTERS**

J.R. Piazza<sup>1,2</sup>, S.T. Charles<sup>3</sup>, R.S. Stawski<sup>4</sup>, D. Almeida<sup>2</sup>, 1. *Department of Health Science, California State University, Fullerton, Fullerton, California*, 2. *The Pennsylvania State University, University Park, Pennsylvania*, 3. *University of California, Irvine, Irvine, California*, 4. *University of Michigan, Ann Arbor, Michigan*

The current study examined age differences in the association between daily affective experiences and diurnal cortisol among participants from the National Study of Daily Experiences (N = 1735; age range: 33-84), which is the nightly interview portion of the Midlife Development in the United States Survey. Across four consecutive days, participants reported the negative and positive affect they experienced and provided four saliva samples per day, from which cortisol was assayed. Separate models indicated that higher negative affect (NA) and lower positive affect (PA) were each associated with increased total daily cortisol output (i.e., area-under-the-curve with respect to ground; NA:  $\beta = 1.93, p < .05$ ; PA:  $-.52, p < .05$ ). Moreover, these associations became more pronounced with increasing age. Findings suggest that the link between affective states and cortisol is best understood within the context of age.

#### **EMOTIONAL COMPLEXITY AND STRESS RE-EXAMINED: RESULTS FROM ECOLOGICAL MOMENTARY ASSESSMENT DATA**

M. Sliwinski, S. Scott, *HDFS, Pennsylvania State University, University Park, Pennsylvania*

Zautra's Dynamic Model of Affect (DMA) proposes that during normal conditions, individuals process complex emotional information and experience both positive and negative affect (PA and NA), but during stress PA and NA collapse to a single dimension. DMA predicts that PA and NA will be independent in the absence of stressors and inversely related when stressors are present. We evaluate this model of emotional complexity in ecological momentary assessment data by examining both variability and covariability between PA and NA in both presence and absence of stress. Although results support a central prediction (e.g., increased negative PA-NA covariance under stress), analysis of variance components suggests that this reflects greater, not restricted emotional complexity. An implication is the possibility that PA-NA covariation indices primarily reflect variability in environmental influences rather than individual dispositions.

### **SESSION 110 (SYMPOSIUM)**

#### **BENEFITS AND COSTS OF LATER-LIFE VOLUNTEERING**

Chair: *C. Tesch-Roemer, German Centre of Gerontology, Berlin, Germany*

Co-Chair: *D. Mueller, German Centre of Gerontology, Berlin, Germany*

Discussant: *J.A. Burr, University of Massachusetts Boston, Boston, Massachusetts*

Among gerontologists, later-life volunteering has a rather positive image: It does not only serve the community, but also the individual

volunteer. In various studies it has been shown that volunteering is beneficial for a broad array of ageing well facets like subjective well-being, health, and social integration. However, also potential costs of later-life volunteering should be acknowledged. At higher ages, extensive participation could even harm the well-being of individuals. Moreover, different participation areas might have varying effects for different age groups. Furthermore, organizations play an important role in balancing costs and benefits of volunteering. These considerations raise questions about moderating and mediating factors: Who does benefit from late-life volunteering, and who does not? Which role do socio-demographic factors such as SES and ethnic minority status play? How do personal or social factors like marital status influence benefits and costs of volunteering? What is the role of organizations for the balance of individual benefits and costs of volunteering? These questions will be treated in the submitted symposium, where experts from three continents will present their findings from ten different countries.

#### **EMPIRICAL PATTERNS OF STRAINS AND BENEFITS FROM VOLUNTEERING IN LATER LIFE**

S. Hong, *Social Work, National Univ Singapore, Singapore, Singapore*

**Purpose.** To understand older adults' low participation and unsustainability in volunteering in Singapore, this study aims to (1) structure the empirical pattern of strains and benefits and (2) identify its related factors. **Methods.** One-hour face-to-face interviews were completed by 361 English-speakers aged 55+. Eleven benefit and fourteen strain indicators were measured to classify homogenous volunteers via Latent Class Analysis. As determinants, volunteers' personal characteristics, volunteer experience, and organizational facilitators were measured. **Findings.** Multiple indicators of strain and benefit signified four classes: No Interest Class[NIC] (low strains and benefits; 6.37%), Beneficial Class[BC] (lower strains and highest benefits; 22.99%), Transitional Class[TC] (moderate strains and benefits; 42.94%), and Dynamic Class[DC] (high strains and benefits; 27.70%). Furthermore, organizational facilitators and family function were significant to distinguish such patterns of volunteer strains and benefits. **Implications.** Professional volunteer management and family cooperation are critical to maximize benefits and minimize strains from volunteering in later life.

#### **COSTS AND BENEFITS OF VOLUNTEERING IN OLDER AGE IN EUROPE: ORGANISATIONAL PERSPECTIVES**

A. Principi<sup>1</sup>, R. Lindley<sup>2</sup>, J. Persek-Bialas<sup>3</sup>, G. Lamura<sup>1</sup>, 1. *Centre of Socio-economic Gerontological Research, National Institute of Health and Science on Aging (INRCA), Ancona, Italy*, 2. *Institute for Employment Research, University of Warwick, Coventry, United Kingdom*, 3. *Institute of Statistics and Demography, Warsaw School of Economics, Warsaw, Poland*

**Purpose.** Volunteering in older age is acknowledged to be beneficial at the micro (individual), meso (organizational) and macro (societal) level. The organizational level – i.e. how organizations perceive their own costs and benefits of employing older volunteers – has been so far under-investigated. **Methods.** The ASPA study identified, through 72 case studies in 8 EU-countries, advantages (e.g. in terms of older volunteers' skills, reliability and experience) and disadvantages (e.g. need to pay more attention to match older volunteers to specific tasks) of mature volunteering for organizations. **Findings.** Those organizations interested to minimize disadvantages and maximize advantages, set or planned different strategies to this aim, with quite a different impact on older volunteers, both in positive (e.g. receiving training to maintain/develop skills) and negative terms (e.g. being excluded from specific tasks). **Interpretation.** Organizations can apply strategies to influence benefits and costs of late-life volunteering on both the individual and the organizational level.

## VARIATIONS IN PERCEIVED BENEFITS OF PARTICIPATION IN VOLUNTEER AND EDUCATIONAL ACTIVITIES

J. Teufel<sup>1</sup>, J.C. Greenfield<sup>2</sup>, N. Morrow-Howell<sup>2</sup>, P. Holtgrave<sup>1</sup>, 1. *OASIS Institute, Saint Louis, Missouri*, 2. *Washington University, Saint Louis, Missouri*

**Purpose.** This study examined outcomes of participation in OASIS, a national program with a mission to engage older adults in educational and volunteer activities to enhance healthy aging. The study questions are 1) do certain subgroups of older adults benefit more from participation? and 2) do participants benefit more from educational activities or volunteer activities? **Methods.** Over 3,000 OASIS participants were queried about perceived benefits of participation, including health, emotional, intellectual, and social benefits. Multiple regression was used to test the effects of socioeconomic status, hours of participation, and type of participation. **Findings.** Older adults with lower SES and of ethnic minority status reported more benefits. Caregivers reported higher perceived benefits than non-caregivers; and volunteers reported more benefits than those who were only involved in educational activities. **Implications.** Programs could maximize the benefits of participating in volunteer activities by targeting ethnic minority older adults, lower SES older adults and caregivers.

## BENEFITS AND COSTS OF SOCIAL ENGAGEMENT: LONGITUDINAL RESULTS FROM THE GERMAN AGEING SURVEY (DEAS)

D. Mueller, J.P. Ziegelmann, J. Simonson, O. Huxhold, C. Tesch-Roemer, *German Centre of Gerontology, Berlin, Germany*

**Purpose.** Age-group differences in the relationship between social engagement (volunteering, attendance in social clubs and associations) and well-being (cognitive, emotional) were examined. **Methods.** Longitudinal structural equation modeling was used on the German Ageing Survey 2002 and 2008. 2,980 adults aged 40-81 years were divided into six age groups for multiple group analysis. **Findings.** Throughout all age groups, positive reciprocal longitudinal relationships with well-being were found for time spent in social clubs, but not for time spent volunteering. Reciprocity vanished when analyzing age differences. The longitudinal benefits of social club attendance for well-being declined with age and turned into a negative relationship from age 68 years on. Higher well-being longitudinally predicted higher social group attendance from age 61 years on. **Interpretation.** Not all forms of social participation hold longitudinal benefits for well-being. Social club attendance affects well-being more strongly than volunteering. After retirement, however, the costs of social participation become visible.

## SESSION 115 (SYMPOSIUM)

### BODY AND MIND, HEART AND SOUL: AGEING TRAJECTORIES IN THE VERY OLD FROM THE NEWCASTLE 85+ STUDY

Chair: *C. Jagger, Institute for Ageing and Health, Newcastle University, Newcastle upon Tyne, United Kingdom*

Co-Chair: *T. Kirkwood, Institute for Ageing and Health, Newcastle University, Newcastle upon Tyne, United Kingdom*

Ageing can bring changes in mental, physical and social functioning and the very old are particularly at risk. This symposium seeks to address the breadth of ageing research under the title of 'Body and mind, heart and soul', and cuts across topic areas of three GSA Sections: Behavioral and Social Sciences; Health Sciences; and Social Research, Policy and Practice. The work is from the Newcastle 85+ Study, in which a large, representative cohort (n=852; including community-dwelling and those in institutional care) all born in 1921, underwent extensive medical, biological and psychosocial assessment, with follow up at 18 and 36 months. In 'Body and Mind' we contrast the role of cognitive impairment, compared to other chronic diseases, in terms of the impact

on transitions to severe disability and death between age 85 and 90, highlighting the different experiences of men and women. 'Heart' reports the burden of cardiac dysfunction among the very old and the degree to which this was already known to the medical practitioner. Finally 'Soul' presents patterns of loneliness in the very old as they age and highlights subgroups of individuals who are at particularly increased risk.

### WHY DO OLDER MEN DIE AND OLDER WOMEN BECOME DISABLED? THE ROLE OF DEMENTIA ON TRANSITIONS TO SEVERE DISABILITY AND DEATH IN THE VERY OLD

A. Kingston<sup>1</sup>, K. Davies<sup>1</sup>, C. Jagger<sup>1</sup>, J. Collerton<sup>1</sup>, T. Kirkwood<sup>1</sup>, J. Bond<sup>2</sup>, L. Robinson<sup>2</sup>, 1. *Institute for Ageing and Health, Newcastle University, Newcastle upon Tyne, United Kingdom*, 2. *Institute of Health and Society, Newcastle University, Newcastle upon Tyne, United Kingdom*

Women live longer than men but at the expense of more years with disability. To address this we explore gender differences in the impact of diseases on transitions to disability and death in the very old. We consider eight baseline diseases (arthritis, respiratory disease, hypertension, cardiac disease, cerebrovascular disease, diabetes, cancer obtained from general practice records, dementia from the Mini-mental State Examination). Disability at baseline, 18, 36 months was classified as none/mild (problems with 0-6 IADLs/ADL), or moderate/severe (problems with 7-15 IADLs/ADLs) with death an absorbing state at 18 and 36 months. Multi-state models were fitted adjusted for comorbidity. For men and women dementia had the greatest impact on disability incidence (Hazard rate(95%CI) men:2.4(1.1-5.2), women:3.9(2.0-7.5)) and death from moderate/severe disability (men:HR=1.6(1.0-2.5), women:HR=1.6(1.1-2.3)). In women diabetes (HR=2.0(1.2-3.3) and hypertension (HR=1.6(1.1-2.4) also conferred increased risk of disability incidence. Our findings suggest the disabling effects of diseases may differ for men and women.

### CARDIAC DYSFUNCTION AMONG THE COMMUNITY DWELLING VERY OLD

J. Collerton<sup>1</sup>, F. Yousaf<sup>1</sup>, A. Kingston<sup>1</sup>, A. Kenny<sup>2</sup>, K. Davies<sup>1</sup>, L. Robinson<sup>3,1</sup>, T. Kirkwood<sup>1</sup>, B. Keavney<sup>4</sup>, 1. *Institute for Ageing and Health, Newcastle University, Newcastle upon Tyne, United Kingdom*, 2. *Newcastle Hospitals NHS Foundation Trust, Newcastle upon Tyne, United Kingdom*, 3. *Institute of Health and Society, Newcastle University, Newcastle upon Tyne, United Kingdom*, 4. *Institute of Genetic Medicine, Newcastle University, Newcastle upon Tyne, United Kingdom*

Heart failure (HF) prevalence rises sharply among those aged 85+. Previous community-based studies of left ventricular (LV) dysfunction and HF included only small numbers in this age group. We conducted a community-based study of 376 men and women aged 86-89 years using domiciliary echocardiography to assess LV systolic and diastolic function; findings were cross-referenced to pre-existing HF diagnoses in general practice medical records. Normal LV function (ejection fraction greater than 50% and no diastolic dysfunction) was found in just 8% of participants; 32% had LV systolic dysfunction and 41% had mild and 20% moderate/severe LV diastolic dysfunction with preserved ejection fraction. 62% of those with significant LV dysfunction had limiting breathlessness. 84% of those with symptomatic significant LV dysfunction did not have a pre-existing HF diagnosis in their medical records. LV dysfunction is much commoner in 86-89 year olds than previously suggested and the majority is both symptomatic and undiagnosed.

## LONELINESS IN THE VERY OLD: PATTERNS OVER TIME

K. Brittain<sup>1</sup>, C. Jagger<sup>2</sup>, A. Kingston<sup>2</sup>, J. Collerton<sup>2</sup>, K. Davies<sup>2</sup>, L. Robinson<sup>1</sup>, T. Kirkwood<sup>2</sup>, J. Bond<sup>1</sup>, 1. Newcastle University - Institute of Health & Society, Newcastle upon Tyne, United Kingdom, 2. Newcastle University - Institute of Ageing & Health, Newcastle upon Tyne, United Kingdom

Old age is often perceived as a time in life when we feel most lonely or are most at risk of experiencing loneliness. Little is known, however, about the level of loneliness in the very old or how this changes overtime. 90% (N=764) of the Newcastle 85+ Study were living independently at baseline and over half (56%) were always or often alone though only 2% always felt lonely. However 41% reported feeling more lonely than ten years previously. Women spent more time alone than men, reported more loneliness currently and than in the past. Over the period of the study the prevalence of loneliness changed from 2% at baseline to 1.9% (18 months) and 1.3% (36 months). This presentation will further explore transitions to and from loneliness and to death in this age group over a 3-yr period alongside key life events and the sub-groups most at risk.

## SESSION 120 (SYMPOSIUM)

### CHARTING NEW FRONTIERS IN AGING FAMILY RESEARCH: ADDRESSING SOCIETAL AND FAMILIAL TRANSITIONS

Chair: V.H. Bedford, University of Indianapolis, Indianapolis, Indiana  
Co-Chair: R. Blieszner, Virginia Polytechnic Institute and State University, Blacksburg, Virginia

Five papers will address societal, familial, or personal life course transitions that have an impact on the well being of older adults; in addition, they will address how family relationships impact the quality of the transitions themselves. Presenters will identify other influences on the transitions as well, such as an increasingly diverse and older population, and describe current research addressing these transitions, including their own research. Specifically, Agree and Hughes focus on the challenges that new cohorts of old adults will face given a radical shift in what kinds of family relationships will be available, such as more former, partial, and fictive relatives. Focusing on couples, Bookwala defines the many new forms of nontraditional partnering and compares their relationships in terms of quality, satisfaction, and conflict. Carr focuses on the broader family's influence and specifically on death-related transitions. She examines the impact of the quality of these relationships on preparing for one's own end-of-life as well as one's adjustment to widowhood in particular. De Vries examines the experience of the death transition across a wide range of family relationships. He compares the grief process among them, identifying similarities and differences. Teaster et al. zero in on the vulnerabilities to abuse that aging in general and aging of disabled populations in particular are subject to and the transitions the abused person experiences on multiple levels. Each presenter will identify future research challenges and ways to address them.

### WAVES OF CHANGE: DEMOGRAPHIC TRENDS AND THE 21ST CENTURY FAMILY

E.M. Agree, M. Hughes, Johns Hopkins School of Public Health, Baltimore, Maryland

Changes in the timing of demographic events over the life course have led to increasingly complex family structures in later life. We have always known that older persons as a group are heterogeneous. Yet, in family terms, new cohorts will age with more diverse family structures and norms than ever before. Today's older adults have benefited from large numbers of children and long-term marriages. As the baby boom enters old age, the effects of the divorce revolution, serial partnerships, and lower fertility will lead to fewer traditional sources of family support (spouses and biological children), but more ex-spouses, step-child-

ren, and surviving siblings. These trends have not been equally adopted across all socioeconomic groups. In this presentation we discuss the development of this plethora of current and former relationships and the ways that research can inform policies by investigating late life well-being in different family configurations.

### EMERGING TRENDS AND A COMPARATIVE REVIEW OF COUPLE RELATIONSHIPS IN MID AND LATE LIFE

J. Bookwala, Lafayette College, Easton, Pennsylvania

Given transitions in social norms and roles, society is witnessing a growing diversity in couple relationships among middle-aged and older adults. While marriage remains the most widely prevalent type of couple relationship, cohabitational relationships, same-sex partnerships, and living apart-together (LAT) relationships in mid and late life are on the rise in the United States and Europe. This presentation will review emerging trends in couple relationships among middle-aged and older adults and provide a comparison across relationship types on the nature of the relationship and its characteristics including relationship quality and satisfaction, sexual intimacy, and disagreement and conflict; the challenges experienced in the face of life transitions such as retirement and caregiving and; differences in health and wellbeing. To conclude, the presentation will discuss the societal and clinical implications of these changing trends in couple relationships and offer suggestions for further research.

### FAMILIES AT THE END OF LIFE: HOW FAMILY RELATIONSHIPS SHAPE DEATH PREPARATIONS AND ADJUSTMENT TO LOSS

D. Carr, Rutgers University, New Brunswick, New Jersey

Death and its aftermath are shaped by and subsequently affect family relationships. Prior to death, caregiving, negotiating end of life care, and end-of-life decision making are shaped by long-standing marital and parent-child relations. Following death, the bereaved survivor's psychological adjustment is affected by warmth, support, and conflict in family relations. I use data from three surveys of older adults (Changing Lives of Older Couples, New Jersey End of Life Study, and Wisconsin Longitudinal Study) to explore the impact of positive and negative family relationship attributes on two important aspects of end-of-life experiences: preparations for one's own end of life care (via the use of living wills, health care proxy appointments, and discussions); and widowed spouses' psychological reactions to loss. I find that warm and supportive relationships do not uniformly protect against problematic end-of-life preparations and smooth psychological adjustments to widowhood. I discuss implications for research, policy, and practice.

### DEATH IN THE LATER LIFE FAMILY

B. de Vries, San Francisco State University, San Francisco, California

The study of later life families and the study of later life losses have flourished but remain largely parallel fields of inquiry, rendering our knowledge of both incomplete; after all, grief is the study of people and their most intimate relationships. Widowhood has assumed the leading role in this area, but families, in their multiple forms, suffer losses of many (and sometimes multiple) members: grandparents, grandchildren, parents, siblings, children, and chosen/fictive kin comprise a partial list. These many relationship types will be briefly highlighted informing both the particular and shared characteristics of relationships in later life families as well as the unique and shared processes of grief. Embedded in such considerations are issues of interest/relevance to many disciplines focusing on diversity (e.g., family form, relationship type and meaning), entitlements to grief (the social recognition of families and relationships), as well as grief trajectories (e.g., the recognition of growth through grief).

## ELDER ABUSE IN AGING FAMILIES IN TRANSITION: APPLICATION OF THE ECOLOGICAL MODEL

P.B. Teaster<sup>1</sup>, T. Wangmo<sup>2</sup>, F.B. Vorsky<sup>1</sup>, 1. *University of Kentucky, Lexington, Kentucky*, 2. *University of Basel, Basel, Switzerland*

By 2030, 72.1 million older adults will live in the US and represent approximately 20% of the population. Most older adults, both now and in the future, will live longer, enjoy better health, and remain independent for a longer period of time than earlier cohorts. However, some older adults will live longer with chronic illnesses. Others will experience dementia, and some may experience both maladies, all situations that may create vulnerability to abuse. Individuals with mental retardation, developmental disabilities, and mental illnesses are also living longer than ever before and present new health and social support challenges, including vulnerability to abuse. The authors discuss elder abuse from an ecological framework, with attention to incidence and prevalence, victim and perpetrator characteristics, micro- to macro-level causes, and prevention and intervention efforts. Using the framework, we explore micro and macro level transitions for abused older adults and recommend future research and collaborative efforts.

## SESSION 125 (SYMPOSIUM)

### LAWTON'S VALUATION OF LIFE: SIMILARITIES AND CULTURAL DIFFERENCES IN MEAN LEVELS AND PREDICTORS

Chair: *D.S. Jopp, Fordham University, Bronx, New York*

Discussant: *M.S. Moss, Arcadia University, Glenside, Pennsylvania*

Powell Lawton's concept of positive valuation of life (VOL; Lawton, 1999) refers to the extent to which individuals appreciate their existence and are actively attached to life. VOL is a cognitive-affective schema that integrates the positive and negative features of life and is considered important in predicting how long individuals wish to live. In recent years, the concept has been studied less frequently, despite its theoretical and empirical value. The present symposium seeks to revitalize the discussion on VOL by presenting studies from around the world that investigate VOL in old and very old age. All studies used the same questionnaire and address mean-level and predictors of VOL. At the same time, these studies employ comparable (e.g., health) as well as unique predictors (e.g., personality). Rott and colleagues present data from Heidelberg, Germany highlighting the importance of health. Oswald and colleagues offer findings from Frankfurt, Germany examining environmental aspects as predictors of VOL. Ribeiro and colleagues discuss data from Portugal, stressing the role of personality as predictors. Nakagawa and Gondo present data from Japan, showing that social and spiritual factors are strongly related to VOL. Jopp and colleagues report on findings from US centenarians, suggesting predictive value of personality and coping. Study findings will be discussed by Miriam Moss, a collaborator of Lawton involved in the development of VOL. In sum, the symposium offers recent research on the fascinating construct of VOL, and draws attention to the importance of specific predictors that may vary depending on cultural context and age.

### VALUATION OF LIFE IN THE THIRD AND THE FORTH AGE: DOES HEALTH MATTER OR NOT?

C. Rott<sup>1</sup>, D.S. Jopp<sup>2,1</sup>, U. Bullinger<sup>3</sup>, 1. *Institute of Gerontology, Heidelberg University, Heidelberg, Germany*, 2. *Fordham University, Bronx, New York*, 3. *University of Applied Sciences, Darmstadt, Germany*

Lawton conceptualized valuation of life (VOL) in sharp contrast to health related quality of life. Thus health should play no or only a minor role for VOL. Previous studies demonstrated some relation between health and VOL. Beyond that activities emerged as important predictors. A sample of 158 young-old and 142 old-old community dwelling individuals filled out the PosVOL questionnaire and various scales assessing sociodemographic, health, and activity indicators. As expected,

many individuals depicted high levels of VOL regardless of age. In the total sample, the domain-specific health model had the highest explanatory value for VOL. When including all predictor groups, health remained the strongest predictor. Again, paralleling other studies health seems to be more important than originally stated by VOL theory. Results suggest that in the young-old having a disease has an impact on VOL while in the old-old the consequences of a disease are more influential.

### VALUATION OF LIFE AND AGING IN PLACE IN VERY OLD AGE

F. Oswald, R. Kaspar, *Interdisciplinary Ageing Research, Goethe University Frankfurt, Frankfurt, Germany*

The aim of this presentation is to test the assumption that valuation of life (VOL) mediates between health and the number of desired life years in old age. Moreover, we examine the role of person-environment (P-E) exchange indicators (e.g., accessibility, neighborhood efficacy, place attachment) in this regard. Data are drawn from a survey with targeted 600 community-dwelling urban citizens (Frankfurt, Germany) stratified by age (70-79 vs. 80-89) and household composition (living alone vs. with partner). Findings indicate different relationships between perceived health (SF-12) and VOL among young-old ( $r = .30^{***}$ ) versus old-old ( $r = .41^{***}$ ) participants. Moreover, VOL appears to become relevant with respect to years of desired life only in very old age ( $r = .28^{***}$ ) and the relationship between health and VOL is moderated by place attachment. Presented data underpin the need to address VOL with respect to P-E exchange to better understand aging in place processes.

### POSITIVE VALUATION OF LIFE: POSVOL SPECIFICITIES AND PREDICTORS FOR A PORTUGUESE SAMPLE OF OLDER ADULTS

O. Ribeiro<sup>1,2,4</sup>, L. Araújo<sup>1,3</sup>, L. Teixeira<sup>1</sup>, C. Paúl<sup>1</sup>, 1. *UNIFAI / ICBAS - University of Porto, Porto, Portugal*, 2. *University of Aveiro, Aveiro, Portugal*, 3. *ESE - Instituto Politécnico de Viseu, Viseu, Portugal*, 4. *ISSSP, Porto, Portugal*

Assessing the way old people think about the value of their lives and feel attached to life is receiving an increasing scientific attention worldwide. The purpose of this study is to examine the factor structure of the Portuguese version of Lawton's positive Valuation of Life measure (VOL) and to determine the predictive role of personality, meaning in life, social resources, depression and demographic factors on VOL. A sample of 207 community-dwelling seniors aged between 65 and 96 years (mean = 77.2, SD = 7.5) were interviewed. Factor analysis on the VOL scale yielded two factors accounting for 49% of the variance, suggesting that the construct may be more complex. Regression analysis predicting the overall valuation of life score indicated that extraversion, conscientiousness, meaning of life and depression explained 57% ( $R^2=0.565$ ). Findings highlight the complexity of the construct and the importance of intrapersonal factors regarding the way people appraise their life.

### THE FACTOR STRUCTURE AND PREDICTORS OF VALUATION OF LIFE AMONG THE YOUNG-OLD IN JAPAN

T. Nakagawa, Y. Gondo, *Osaka University, Suita, Osaka, Japan*

Previous studies suggest that some facets of well-being differ in importance across cultures, and that there are both universal and culture-specific predictors of well-being. However, valuation of life (VOL) has not been examined in nonwestern cultures. The present study investigated the factor structure and predictors of VOL among the elderly in Japan. Participants were 1000 septuagenarians aged 69-72 (479 males, 521 females). They responded to a questionnaire including the 13-item positive VOL scale, sociodemographic, social, and health predictors. First, we conducted a factor analysis, and identified two factors: positive VOL and spiritual well-being. These factors related to positive mental health moderately and weakly, respectively. Second, we examined

sociodemographic, social, and health predictors for VOL. The role of social factors was stronger than that of health factors, and spiritual well-being was more related to moral or religious activities than positive VOL. These results suggest that predictors for VOL vary by culture.

#### **VALUATION OF LIFE IN CENTENARIANS: PRELIMINARY RESULTS FROM THE FORDHAM CENTENARIAN STUDY**

D.S. Jopp, M. Park, A. Cavanagh, Y. Meschian, M.M. De Feo, M.E. Paggi, S. Raghavan, R. Weiss, *Psychology, Fordham University, Bronx, New York*

Valuation of life (VOL; Lawton et al., 1999) indicates how strongly individuals appreciate their lives. The extent to which very old individuals feel that their life is worth living, and which factors contribute to this phenomenon, has rarely been investigated. This study examined personal resources (i.e., sociodemographic, social, health) and psychological factors (i.e., personality, coping) as predictors of VOL in a sample of US centenarians. Analyses were based on 58 participants of the Fordham Centenarian Study (Mage = 98; range 95-102 years). Reflecting gender-specific survival, 70% were female. Correlational analysis indicated that sociodemographic and health indicators had no relationship to VOL, social indicators had weak links. Instead, extraversion, agreeableness, positive reappraisal and religious coping predicted VOL. Findings suggest that resources such as health may become less important in very advanced age, whereas psychological factors may help individuals to maintain a high sense of value with respect to their lives.

#### **SESSION 130 (SYMPOSIUM)**

##### **SENIOR MENTORS FOR HEALTH PROFESSIONS STUDENTS: A COMMUNITY-UNIVERSITY PARTNERSHIP**

Chair: *E. Idler, Emory University, Atlanta, Georgia*

Discussant: *E. Roberts, University of North Carolina Chapel Hill, Chapel Hill, North Carolina*

Providing opportunities and encouragement for the mentoring of beginning students is an important function of most academic and professional schools. But those mentoring relationships are usually conceived of and remain within the academy. A new program at Emory University, supported by its Office of University and Community Partnerships, and the Atlanta Regional Geriatric Education Center, gives community-dwelling seniors the opportunity to form a one-on-one relationship with first-year students in the schools of nursing and medicine. There are a small number of Senior Mentor programs in medical schools around the country, but this is one of the first to take an interdisciplinary approach, involving both medical and nursing students; plans are to expand the program to include physician assistants in coming years. Students complete one module per month to frame their discussions, on topics such as health history, values, function, advance directives, social networks, and community and volunteer activities. Nursing and medical students engage with each other, within and across disciplines, by contributing to online group blogs about their experiences. Mentors are recruited from diverse neighborhoods and housing types in metropolitan Atlanta. Students visit mentors in their homes and communities, and accompany them on a visit to a physician. The relationships the students form with the mentors continue throughout their course of study, to promote a deeper sense of the continuity and multiple determinants of health and well-being than can be gained by clinical experience gained solely in acute care, outpatient, or long term care settings.

##### **PERSPECTIVES FROM THE SCHOOL OF NURSING FACULTY**

C. Clevenger, *1. Birmingham/Atlanta GRECC, Department of Veterans' Affairs Medical Center, Grayson, Georgia, 2. Emory University, Atlanta, Georgia*

Carolyn Clevenger will speak about the program's commitment to simultaneously broadening and deepening inter-professional relation-

ships and university-community relationships. She will describe the arenas where interactions take place across these divides: the face-to-face meetings the students have with the mentors; the online group blogs; and the large meetings where students from the different programs and mentors get together. She will describe initial indicators of students' attitude change and development.

##### **PERSPECTIVES FROM THE SCHOOL OF MEDICINE FACULTY**

J. Flacker, *Emory University, Atlanta, Georgia*

Jonathan Flacker will speak about the concept of seniors as mentors, the structure of the program, and the modules that have been developed. He will address the challenges in finding a place for a new program within the demands of the first-year medical curriculum, and more broadly, the place of geriatrics in medical education and the promise of senior mentor programs for making it more central.

#### **SESSION 135 (SYMPOSIUM)**

##### **TODAY'S INTERGENERATIONAL FAMILY**

Chair: *L.L. Barrett, AARP, Washington, District of Columbia*

Co-Chair: *T.A. Keenan, AARP, Washington, District of Columbia*

Discussant: *L. Morgan, University of Baltimore, Maryland, Maryland*

Our family is a key source of support and a critical factor in our identity at all ages. The purpose of this symposium is to report new and innovative research on the family in later life conducted by AARP's Health, Home and Family Strategic Issues Research (SIR) Team. Dr. Teresa Keenan begins with a review of findings from AARP's Family Study which updates and enhances our understanding of contemporary intergenerational families in the U.S. Next, Dr. Cheryl Lampkin reports on her research on modern grandparents including a snap shot of their triumphs and challenges. Finally, Dr. Linda Barrett discusses the role technology can play in keeping family members in touch with each other regardless of distance. We are especially interested in understanding how technology shapes interactions among family members and family norms that are developing as a result of technology. Moderator: PBS (TBA) Discussant Dr. Leslie Morgan, Ph.D., Co-Director Doctoral Program in Gerontology / Professor of Sociology University of Maryland, Baltimore County

##### **AARP'S FAMILY STUDY TERESA A. KEENAN, PH.D. TEAM LEAD HEALTH, HOME AND FAMILY TEAM**

*L.L. Barrett, AARP, Washington, District of Columbia*

Qualitative and quantitative results from a recent study of U.S. families will be presented in this session. With information obtained through 16 focus groups and a national survey of midlife and older adults ages 50 and older, participants will hear the latest research how satisfied individuals are with various family relationships, the ways they'd like to improve them, and the role of distance on such relationships. Participants will also learn about how family members communicate with one another and how a critical member—the family “connector”—aids in maintaining and strengthening family relationships among immediate and extended family members. After attending this session, participants will be able to: 1. Identify the family “connector” in their family 2. Have a clearer understanding of individuals' satisfaction with their family relationships 3. Understand the role of distance on various family relationships

##### **CONTEMPORARY GRANDPARENTS CHERYL LAMPKIN, PH.D., SENIOR RESEARCH ADVISOR, AARP AARP HEALTH, HOME AND FAMILY TEAM**

*L.L. Barrett, AARP, Washington, District of Columbia*

This session will highlight the results in-depth interviews with grandparents age 50+ (including those who are the primary caregivers for their

grandchildren) as well as a national survey of grandparents age 50+. Participants will hear about the latest research in the roles grandparents play in raising their grandchildren, how grandparents communicate with their grandchildren, what grandparents and grandchildren talk about and how they enjoy each other's company as well as the challenges grandparents face. After attending this session, participants will be able to: 1. Provide a snap shot of experiences, triumphs and challenges of grandparents age 50+ as described by in-depth interview participants. 2. Summarize current research on grandparents age 50+, including topics such as the importance of grandparents in family life, the types of assistance grandparents provide the extended family and the increasing role of the grandfather in raising grandchildren.

#### **CONNECTING GENERATIONS LINDA L. BARRETT, PH.D., SENIOR RESEARCH ADVISOR AARP'S HEALTH, HOME AND FAMILY TEAM**

L.L. Barrett, *AARP, Washington, District of Columbia*

In this study, we explore how on-line and social media connect family members, their concerns about internet safety, and what they wish they knew more about related to online safety. We also explore the rules families have about online communication, and how family members feel about such practices. Ultimately we look at where family members would like these practices to move in the future. AARP and Microsoft worked together to conduct qualitative focus groups and survey to study teens (13-17 years), young adults (19-25 years), adults (39-58 years) and older adults (59-75 years). The results include findings from parents and grandparents. Key results include: A large majority overall (83%), including at least eight in ten in each age group, considers going online to be a "helpful" form of communication among family members. Although more and better communication does not necessarily close the generation gap, sizable numbers say that going online actually helps them to better understand other family members or to help other family members better understand them. Respondents in all surveyed age groups cite staying in touch with friends and family they do not see regularly as their number one reason for using social networking sites. After this session, participant will be able to: 1. Describe how technology is influencing and shaping how contemporary, multi-generational families communicate. 2. Explain how different family members feel about the role of technology and how they would like to influence how other members of their family communicate with them. 3. The importance of family rules (norms) and agreements about the safe use of technology.

#### **SESSION 140 (SYMPOSIUM)**

##### **UNDERSTANDING DISPARITIES IN END-OF-LIFE AND TREATMENT DECISION MAKING AMONG DIVERSE RACE GROUPS**

Chair: *T. Baker, University of South Florida, Tampa, Florida*

Discussant: *R. Thorpe, Johns Hopkins University, Baltimore, Maryland*

The concept of treatment decision making and care at the end-of-life focuses on respect for the patient, while tending to their physical, social and emotional well-being. While there is advancing research specific to decision making with regards to end-of-life care treatment in majority populations, little is known of these views among diverse race and ethnic populations. Our speakers will discuss the connecting pathways between race, culture, psychological and social factors in treatment decision making and end-of-life care. Dr. Bronwynne Evans will discuss the influence of psychosocial, cultural and spiritual disparities in palliative and end-of-life care. Dr. Irida Carrion's presentation will explore treatment decision making among older Latino males diagnosed with cancer, and the role of culture and gender in guiding cancer treatment decisions. Dr. Monique Williams will discuss disparities in end-of-life care in dementia, with a specific focus on factors that mediate the persistence of disparities among minority patients diagnosed with

Alzheimer's disease. After attending this symposium, participants will be able to identify and explain reasons for disparities in treatment decision making and end-of-life care among diverse race and ethnic populations. The audience will also be able to understand explain the factors that impact end-of-life and treatment decision making across a continuum of chronic-related illnesses among diverse race and ethnic groups.

##### **OLDER LATINO MEN WITH CANCER: A STUDY OF THEIR TREATMENT DECISIONS**

I.V. Carrion<sup>1</sup>, F. Nedjat-Haiem<sup>2</sup>, D.X. Marquez<sup>3</sup>, *1. Social Work, University of South Florida, Tampa, Florida, 2. VA Greater Los Angeles Healthcare System, Los Angeles, California, 3. University of Illinois at Chicago, Chicago, Illinois*

Latinos account for 22.5% of the population in Florida of which 19.2% are foreign born (FB). Addressing the health disparities and oncology needs of older FB Latino men diagnosed with cancer residing in Central Florida is essential, given the increased population and the urgency to provide effective cancer care. This study explored treatment decisions of 15 (FB) Latino men from Cuba, Mexico, Colombia and Venezuela diagnosed with cancer within the past five years. Data were collected using in-depth interviews, tape-recorded, transcribed in Spanish and translated into English. The median age of the participants was 55.4 years. Salient themes were derived using a grounded theoretical approach and constant comparison method. The findings support the role of culture and gender in guiding cancer treatment decisions, changing family roles due to the disease process, unknown expectations of health providers to participate in the selection of treatment options and advance care planning.

##### **A NEW FRONTIER: PSYCHOSOCIAL, CULTURAL, AND SPIRITUAL DISPARITIES IN END OF LIFE AND PALLIATIVE CARE**

B.C. Evans<sup>1</sup>, E. Ume<sup>2</sup>, *1. Arizona State University, Phoenix, Arizona, 2. Arizona State University, Phoenix, Arizona*

Although health disparities are well-documented, the extent to which they affect end-of-life care is unknown. Limited research funding leads to sparse and often contradictory palliative care literature, with few studies on causal mechanisms. This presentation will explore the extant psychosocial, cultural and spiritual health disparities in palliative care and end-of-life care, with the goal of identifying future research needs. Although little is known, minorities make little use of hospice, often because of lack of knowledge about hospice or palliative care, family-centered cultures, and preferences for more aggressive end-of-life care than hospice allows. Future research should avoid assumptions about decision-making models across minority groups; reflect the influence of socioeconomic, geographic and political contexts; and recruit adequate numbers of participants for meaningful analyses. It also should include a search for theoretical and causal mechanisms; prospective longitudinal investigations; diverse patients, conditions, contexts, and settings; methodological diversity and rigor; and interdisciplinary, culturally sensitive interventions.

##### **PERSISTENT DISPARITIES IN DEMENTIA END OF LIFE CARE**

M.M. Williams<sup>1</sup>, B. Goebel Jones<sup>2</sup>, B.L. Austin<sup>3</sup>, A.N. Dentino<sup>2</sup>, *1. Medicine/Geriatrics, Washington University, St. Louis, Missouri, 2. Texas Tech Health Sciences Center, Lubbock, Texas, 3. Barnes-Jewish Hospital, St. Louis, Missouri*

Factors that mediate the persistence of disparities in dementia end-of-life care are not understood fully. Alzheimer's disease, the most common cause of dementia, affects 5.4 million people in the United States; the prevalence is projected to increase to 13 million by 2050. Awareness of dementia as a terminal disease remains limited. Although underreported, Alzheimer's disease is the sixth leading cause of death. In

recent decades, provision of end-of-life care in the United States has improved substantially. Despite considerable improvements in end-of-life care and the increasing prevalence of Alzheimer's disease and other dementias, people with dementia have not experienced equitable advances in end-of-life care. In conjunction with the pervasive inequities observed in end-stage dementia, minority race and ethnicity present a dual disparity. Minority patients with advanced dementia are more likely to have indicators of suboptimal end-of-life care including tube feedings, lack of advance directives, and terminal hospital admissions

## SESSION 145 (PAPER)

### AFFECT AND AGING

#### FROM STATIC TO SIGNAL: EXAMINING THE SOCIAL PATTERNING OF INTRINDIVIDUAL VARIABILITY IN TRAJECTORIES OF DEPRESSIVE SYMPTOMS AMONG ADULTS AGED 50 AND OVER

J. Lin, J. Kelley-Moore, *Case Western Reserve University, Cleveland, Ohio*

Intraindividual variability in trajectories of health in later life constitutes a key source of information on patterns of health and aging. Yet scholars have largely missed the opportunity to discover important social dynamics that govern these variations, mainly due to standard practice in both conceptual framing and statistical analysis of such trajectories. Age effects in trajectory models are often presumed to represent biological aging, rendering socially-produced patterns to organismic processes. A methodological tradition that focuses exclusively on the population mean trajectory relegates intraindividual variability over time to random errors which further reinforces an ontogenetic assumption to age-related change. Using 8 waves of data from the Health and Retirement Study (1994-2008), we estimate trajectories of depressive symptoms (CESD-8). A substantial amount of intraindividual variability, as indicated by level-1 residuals in multilevel mixed models, is present and heteroscedastic. Further, this variability is significantly associated with a variety of social indicators. Women, those who have ever applied SSI/SSDI, and those with more chronic conditions have greater intraindividual variability in depression over time. On the other hand, those with more education and household wealth are less variable over time. The social patterning of intraindividual variability is indicative of mechanisms that influence late-life health outcomes operating at the individual rather than the group level. Such patterning also weakens the explanatory power of chronological age in long-term health changes. Our findings suggest that intraindividual variability should be considered systematically as manifestations of structural forces that organize human aging, rather than presumed "static" in the investigations.

#### AGE DIFFERENCES IN POSITIVE AND NEGATIVE AFFECT AMONG OLDEST-OLD ADULTS: FINDINGS FROM THE GEORGIA CENTENARIAN STUDY

J. Cho<sup>1,2</sup>, P. Martin<sup>3</sup>, M.G. Ory<sup>2</sup>, L. Poon<sup>4</sup>, *1. Scott & White Healthcare, Temple, Texas, 2. School of Rural Public Health, Texas A&M Health Science Center, College Station, Texas, 3. Iowa State University, Ames, Iowa, 4. University of Georgia, Athens, Georgia*

**Background.** The developmental adaptation model (Martin & Martin, 2002) provides insights into how current experiences and resources (proximal influences) and past experiences (distal influences) contribute to outcomes (well-being) in later life. Applying this model, this study examined significant proximal and distal influences for positive and negative affect among oldest-old adults, examining age differences. **Methods.** Data from 306 octogenarians and centenarians who participated in Phase III of the Georgia Centenarian Study were used. Proximal influences included physical functioning, cognitive functioning, self-rated health, number of chronic conditions, social resources, and perceived economic status; distal influences included education, social

activity experiences, management of personal assets, and other learning experiences. Analysis of variance and block-wise regression analyses were conducted. **Results.** Octogenarians showed significantly higher levels of positive emotion than centenarians,  $F(1, 169) = 9.63, p < .01$ . Cognitive functioning was significantly associated with positive affect ( $\beta = .27, p < .05$ ) and number of chronic conditions was significantly associated with negative affect ( $\beta = .25, p < .01$ ) after controlling for gender, ethnicity, and residence. Furthermore, there were significant interaction effects between age and cognitive functioning ( $\beta = -.84, p < .000$ ), between age and physical functioning ( $\beta = -.49, p < .05$ ), between age and number of chronic conditions ( $\beta = .62, p < .01$ ), and between age and learning experiences ( $\beta = .39, p < .05$ ) for positive affect. **Conclusion.** Findings suggest that it is important for researchers and practitioners to consider both proximal and distal influences for improving the quality of life in very old age.

#### TRENDS IN DEPRESSIVE SYMPTOM BURDEN AMONG OLDER ADULTS IN THE UNITED STATES FROM 1998 TO 2008

K. Zivin<sup>1,2</sup>, P. Pirraglia<sup>4</sup>, R.J. McCammon<sup>3</sup>, K.M. Langa<sup>3</sup>, S. Vijan<sup>3,2</sup>, *1. University of Michigan Department of Psychiatry, Ann Arbor, Michigan, 2. Department of Veterans Affairs, HSR&D/SMITREC, Ann Arbor, Michigan, 3. University of Michigan Department of Internal Medicine, Ann Arbor, Michigan, 4. Department of Veterans Affairs, Providence, Rhode Island*

**Background:** Whether the prevalence of depressive symptoms among older adults has decreased concurrently with expanding diagnosis and treatment is unknown. **Objective:** After attending this activity, participants will know about trends in depressive symptoms between 1998 and 2008 in a nationally-representative sample of older adults. **Methods:** We performed a serial cross-sectional analysis of depression symptom burden among Health and Retirement Study respondents using six biennial survey waves. The eight-item Center for Epidemiologic Studies Depression scale (CES-D8) assessed depressive symptoms; multivariable logistic regression analyses controlled for demographic and clinical characteristics of the study sample (N=90,024). The primary predictor of interest was year, which could capture depressive symptom trend. We repeated the analysis including an age-by-year interaction term to test whether trend was age-dependent. **Results:** There was a 7% decrease in odds of an elevated depressive symptom burden (CES-D8 of 4+) over the ten-year period (adjusted odds ratio: 0.93, 95% CI 0.86, 0.99) across all age groups. The addition of the age-by-year interaction terms demonstrated a significantly greater rate of decline in symptom burden over the study period among ages 65-74 and 80-84 compared to the change observed in those aged 55-59. **Conclusions:** We observed a significant decline in odds of elevated depression symptom burden from 1998 to 2008 in older adults in the US. This change appeared to be driven by greater declines in depressive symptoms in the oldest old. This suggests an age-dependent downward trend in depressive symptom burden, extending previous findings of increased depression treatment over time among older adults.

#### DEPRESSION IN MODERN TIMES: EFFECTS OF MODERN COMMUNICATION TECHNOLOGY ON DEPRESSIVE SYMPTOMS AMONG THE JAPANESE ELDERLY

Y. Minagawa<sup>1,2</sup>, Y. Saito<sup>2</sup>, *1. Sociology, University of Texas at Austin, Austin, Texas, 2. Nihon University, Tokyo, Japan*

Drawing on the well-established literature on the health effects of social integration, this paper examines how the use of information and communication technologies (ICTs) – computers and cell phones – are associated with the levels of depressive symptoms among older adults aged 65 and over in Japan. Results are based on ordinary least square (OLS) regression analyses of data from the Nihon University Japanese Longitudinal Study of Aging (NUJLSOA). Although the use of computers is related to lower levels of depressive symptoms, controlling for

socio-demographic and health factors wipes out the effects. On the other hand, cell phone usage's protective effects against depression persist despite controls for all the covariates among men and women. Moreover, the impact of using cell phones is not explained by social relationship measures, suggesting that cell phone use exerts influences on the mental health status of the Japanese elderly that are independent from their levels of social integration. More research and policy attention should be given to identifying the wide range of social factors which promote the health status of the Japanese elderly.

## SESSION 150 (SYMPOSIUM)

### CARE PROVISION IN SMALL-SCALE, HOMELIKE LONG-TERM CARE SETTINGS – IMPACT ON RESIDENTS OUTCOMES

Chair: *J. Gräske, Alice Salomon University of Applied Sciences Berlin, Berlin, Germany*

Co-Chair: *E. van Rossum, Maastricht University, Maastricht, Netherlands*

Discussant: *M. Boltz, New York University, New York, New York*

Providing person-centered care for persons with dementia (PwD) in a small-scale and homelike setting is a worldwide trend. Staff play key roles in improving PwDs health related outcomes and quality of life (QoL). Small-house long-term care arrangements are homelike, and care is oriented on residents needs and choices. This symposium provides an overview of various international small-scale long-term care arrangements, focusing on staff and their impact on residents health related outcomes. Presenters discuss organizational and staff characteristics as a way to improve care for PwD. Beside socio-demographic characteristics, attitude, empathy as well as work satisfaction and the relationship to residents QoL, need-driven behavior, satisfaction with care and psychotropic drugs are investigated. The first presenter evaluates the impact of staff attitude and empathy on residents outcomes, using data from a cross-sectional study investigating German Shared-Housing Arrangements. The second presenter addresses a study from US Greenhouse Models, in which care is delivered in response to the caregivers deep and profound understanding of who the care depended person is. This creates an environment of resident and family satisfaction. The third presenter studied the relationship between characteristics of the work environment (job demands, decision authority and social support) on psychotropic drug use and physical restraints in Dutch small-scale living arrangements. The last presentation investigates different perceptions of residents QoL by family and staff in Dutch small-scale nursing homes. It Shows, that their QoL ratings differ, which may be influenced by the degree of small-scale homelike care provision.

### ATTITUDE AND EMPATHY OF PRIMARY CAREGIVERS IN GERMAN SHARED-HOUSING ARRANGEMENTS – RESULTS FROM THE WGQUAL STUDY

*J. Gräske, S. Meyer, A. Worch, K. Wolf-Ostermann, Alice Salomon University of Applied Sciences Berlin, Berlin, Germany*

Objectives Care in German shared-housing arrangements (SHA) is considered to be especially person-centered. However, it is unclear, whether staffs knowledge, attitude and empathy affect outcomes of persons with dementia (PwD). Methods In a cross-sectional study, nursing staff members (NSM) of 30 SHA were examined concerning their attitude (ADQ) and empathy (JSPE) towards PwD. In addition residents' QoL (QUALIDEM) and need-driven behavior (NPI) and further secondary outcomes were evaluated. Results 130 NSM (mean age 40 years, 77.7% female) showed a moderate attitude and empathy. Attitude correlates with empathy moderately. Nurses with a longer work experience have a more positive attitude towards PwD which also leads to slightly better outcomes of residents in terms of QoL and need-driven behavior. Further results will be presented. Conclusion Caregiving is not only a

question of either attitude or profession but of sensibly combining both. Our results add new knowledge in terms of an improved dementia care.

### THE SMALL HOUSE MODEL OF CARE: BRINGING INDIVIDUALS WITH COGNITIVE IMPAIRMENT HOME

*J. Rabig, MHS Institute, Masonic Health System, Leeds, Massachusetts*

The Small House model of care is the generic name for deinstitutionalized small residential homes which may be licensed as skilled nursing homes or assisted living. The author has implemented this model in a variety of configurations including the registered trademarked Green House. These environments have as their hallmarks : small easily navigated spaces with 10 or fewer elders, and consistent, highly trained caregivers. All of the rhythms of a home are present - meal preparation, laundry, cleaning are moved from the institutional "back of the house" to within the elders space. The outcomes of this model include fewer elders who exhibit agitation, pacing and crying out and restlessness, and an environment that has been qualitatively described as calm, serene, inviting and warm. The elements of the model and the outcomes will be discussed.

### QUALITY OF LIFE IN SMALL-SCALE HOMELIKE CARE: FAMILY AND STAFF'S VIEWS COMPARED

*H. Verbeek, S.M. Zwakhalen, E. van Rossum, G.I. Kempen, J. Hamers, CAPHRI School for Public Health and Primary Care, Maastricht, Netherlands*

In Small-scale Living Facilities (SSLFs) in the Netherlands Approximately Six Residents Live Together in a Homelike Environment. Residents Are Encouraged to Participate in Normal Daily Activities and Staff is Part of the Household, Having Integrated Tasks. We Investigated Effects of the Care Environment on Quality of Life (QoL) For Residents (n=259) As Rated By Family and Staff, Comparing SSLFs With Regular Wards. Multi-level Analyses Showed That Family Caregivers in SSLFs Rated Residents' QoL Significantly Higher Than at Regular Wards Regarding Feeling at Home (p=.023), Having Something to Do (p=.018) and Social Relations (p=.020). However, Staff Ratings Were Different: Staff in SSLFs Rated Residents' QoL Higher Regarding Having Something to Do (p<.001) But Lower Regarding Negative Affect (p=.01) Compared With Regular Wards. Our Results Show That More Knowledge Is Needed On Active Ingredients of Care Settings and How They Exert Their Effect On QoL For Effective Implementation in Daily Care Practice.

### THE RELATIONSHIP BETWEEN THE PSYCHOSOCIAL WORK ENVIRONMENT IN DEMENTIA CARE AND THE USE OF PSYCHOTROPIC DRUGS AND PHYSICAL RESTRAINTS

*B.M. Willems<sup>1,2</sup>, D. Smit<sup>1,2</sup>, W. Dasselaa<sup>1</sup>, J.D. Lange<sup>1</sup>, A. Pot<sup>1,2</sup>, I. Program on aging, Netherlands institute of mental health and addiction, Utrecht, Netherlands, 2. Department of Clinical Psychology, Faculty of Psychology and Education, VU University, Amsterdam, Netherlands*

Psychotropic drugs and physical restraints are still frequently used in some living arrangements providing nursing home care for people with dementia, despite their strong adverse effects. Other living arrangements don't use or hardly use any of these methods. Staff may have an impact on the decisions to use physical or pharmacological restraints. The purpose of this study is to explore to what extent psychosocial working conditions of healthcare staff - job demands, decision authority and social support -, explain the variations in the use of a wide range of psychotropic drugs and physical restraints. Data were used from the LAD-study, including 996 healthcare workers and 1138

people with dementia in 111 arrangements in the Netherlands. Preliminary analyses showed that both high job demands and low decision authority are related to the use of more physical restraints. Low supervisor support is found to be associated with the use of more psychotropic drugs.

## **SESSION 155 (SYMPOSIUM)**

---

### **NAVIGATING THE COMPETENCY MAZE: GEROPSYCHIATRIC NURSING AND INTERPROFESSIONAL COLLABORATIVE PRACTICE**

Chair: *M. Harris, Harding University, Carr College of Nursing, Searcy, Arkansas*

Co-Chair: *A.M. Mayo, University of San Diego, San Diego, California*

Discussant: *B. Buron, University of Arkansas for Medical Sciences Northwest Campus, Fayetteville, Arkansas*

A number of contemporary social, professional, and pedagogical trends are simultaneously converging and transforming health care delivery in the United States. An aging society with significant mental health needs, the dearth of geropsychiatric healthcare professionals, and demand for interprofessional mental and behavioral health programs are important factors influencing nursing education. Therefore, Geropsychiatric Nursing Competency Enhancements and Interprofessional Education Collaborative Competencies were developed to improve the mental health of older adults. The overarching goal of these competencies is to prepare students entering health care professions to effectively work together as a team with the common goal of building safer, higher quality, patient-centered systems that will meet the physical and mental health needs of older adults. The purpose of the symposium is to describe the importance and implications of incorporating the recently released Geropsychiatric Nursing Competency Enhancements and Interprofessional Education Collaborative Competencies into nursing education. We secondarily aim to provide examples of how these competencies could be applied in undergraduate and graduate classroom and clinical experiences. There is a demand for access to high quality GPN care and nurses must be prepared to meet these challenges. The transformative leadership of nursing educators to recognize, incorporate, and implement these competencies will prepare the next generation of nurses for practice.

### **GEROPSYCHIATRIC NURSING COMPETENCY ENHANCEMENTS**

*C.S. Aaron, Menmonite College of Nursing, Illinois State University, Normal, Illinois, Illinois*

The forecasted changes in the United States demographics in older adults with mental health conditions suggest an unprecedented need for all nurses to be educated to care for older adults with common psychiatric disorders. Therefore, geropsychiatric nursing competency enhancements (GPNCE) were developed for undergraduate and graduate nursing curriculum. The GPNCE are based on four domains: assessment, management, approach to older adults, and role. The purpose of this presentation is to explain the GPNCE, resources for GPNCE and geropsychiatric nursing content including the Portal of Geriatric Online Education (POGOe) website, and content mapping for smooth transitions in nursing education. After attending this session, participants will be able to discuss how to integrate GPNCE into nursing curricula.

### **CONVERGING THE GEROPSYCHIATRIC NURSING COMPETENCY ENHANCEMENTS AND INTERPROFESSIONAL EDUCATION COLLABORATIVE PRACTICE COMPETENCIES IN UNDERGRADUATE AND GRADUATE NURSING EDUCATION**

*A.M. Mayo<sup>1</sup>, M. Harris<sup>2</sup>, 1. Hahn School of Nursing & Health Science, University of San Diego, San Diego, California, 2. Harding University, Searcy, Arkansas*

An aging population presents challenges to the health care community, not the least of which is managing co-morbid complex conditions such as those in the geropsychiatric domain. It is incumbent upon the academic community to prepare skilled clinicians in interdisciplinary geropsychiatric mental health care. Using a visual model for undergraduate and graduate nursing education, this portion of the seminar will illustrate how the Geropsychiatric Nursing Competency Enhancements (GPN) and the Interprofessional Education Collaborative Practice Competencies (IPEC) converge. Strategies will be presented to address the importance of increasing awareness for needed curriculum changes, recruiting faculty champions, mentoring faculty, and identifying resources. Finally, a sample curriculum will be presented. After attending this session, participants will be able to discuss strategies for integrating GPN Competency Enhancements and IPEC Practice Competencies into a nursing curriculum.

### **ENHANCING COLLABORATIVE PRACTICE THROUGH INTERPROFESSIONAL EDUCATION COMPETENCIES**

*B. Buron, University of Arkansas for Medical Sciences Northwest Campus, Rogers, Arkansas*

Interprofessional education (IPE) is often defined as students from two or more professions coming together to learn with, from and about each other. The World Health Organization adds that IPE involves collaborating to provide "...promotive, preventative, curative, rehabilitative, and other health-related services". In 2011, following two years of collaborative work on an expert panel, six nationally recognized educational health-care associations released core competencies to guide the development of interprofessional collaborative practice. These core competencies include: 1) values/ethics for interprofessional practice, 2) roles/responsibilities for collaborative practice, 3) interprofessional communication, and 4) interprofessional team work and team-based care. The purpose of these four competencies is to direct and enhance education and professional practice among all disciplines, with the goal of working collaboratively to provide for the wellness of others. These shared interprofessional competencies promote patient-centered, culturally sensitive and outcome-driven care.

### **INFUSING GEROPSYCHIATRIC NURSING COMPETENCY ENHANCEMENTS AND INTERPROFESSIONAL EDUCATION COLLABORATIVE COMPETENCIES INTO CLINICAL EXPERIENCES**

*M.C. Balas<sup>2</sup>, M. Harris<sup>1</sup>, 1. Carr College of Nursing, Harding University, Searcy, Arkansas, 2. University of Nebraska, Omaha, Nebraska*

Nurse educators play a critical role in designing, integrating, and implementing both the Geropsychiatric Nursing Competency Enhancements (GPNCE) and Interprofessional Education Collaborative Competencies (IPECC) into theory and clinical experiences at undergraduate and graduate levels. Geropsychiatric collaborative care needs to be addressed across all settings including the community, hospital, assisted living, and nursing homes. Partnerships with deans from colleges within universities can facilitate recommendations for interprofessional education. The purpose of this presentation is to provide participants with examples of how the GPNCE and IPECC can be infused into clinical experiences on geropsychiatric units, Acute Care for Elders units, nursing homes, teaching hospitals, and simulation laboratories. Successful integration of these experiences will improve the mental health care of older adults and change the culture of practice for the next generation

of nurses. After attending this session participants will be able to identify strategies for infusing GPNC and IPECC into clinical experiences.

## SESSION 160 (SYMPOSIUM)

### QUALITY INDICATORS IN DEMENTIA CARE - AN INTERNATIONAL PERSPECTIVE

Chair: *K. Wolf-Ostermann, Alice Salomon University, Berlin, Germany*

Co-Chair: *E. Capezuti, New York University College of Nursing, New York, New York*

Discussant: *E. Tanner, Johns Hopkins University, Baltimore, Maryland*

In most parts of the world the number of older care-dependent adults with dementia is increasing rapidly. A high proportion of people with dementia are living at home in the community, and hence likely to receive formal as well as informal care. This places a great demand on developing and evaluating indicators to identify high quality care for persons with dementia in different settings and care situations. Quality indicators (QI) should be multiprofessional and focus on specific needs and care situations in order to identify best practice person-centered care. Bringing together academic researchers from multiple disciplines in the US, the Netherlands and Germany, this symposium will examine example of QI tailored to different settings and care situations. The first presentation will analyze nurses' perceptions of quality of care for people with dementia in the hospital setting in the US. The second presentation will focus on incorporating QI into primary care practice by reviewing the guidelines, recommendations, and results from two primary care settings for older persons, identifying key areas needing improvement and potential strategies to do so. The third presentation will describe the development and implementation of QI in shared-housing arrangements in Germany and relate these to health outcomes of older, care-dependent people with dementia. In the fourth presentation, we will discuss a set of unique QI that aims at assessing the quality of psychosocial dementia care and will assist dementia care professionals to individualize and tailor psychosocial interventions.

### CAN QUALITY OF LIFE BE IMPROVED BY ENHANCING QUALITY OF CARE? - RESULTS FROM A STUDY ON QUALITY INDICATORS FOR PEOPLE WITH DEMENTIA LIVING IN GERMAN SHARED-HOUSING ARRANGEMENTS

*K. Wolf-Ostermann, S. Meyer, A. Worch, J. Gräske, Alice Salomon University, Berlin, Germany*

Objectives Quality indicators (QI) concerning the care of people with dementia in German shared-housing arrangements (SHA) are missing. It is unclear if a guided quality development process in SHA leads to better health outcomes and quality of life (QoL) of residents. Methods Using a longitudinal cluster-randomised design, residents of 36 SHA in Berlin/Germany were surveyed for one year, half of them undergoing a guided quality development process. We developed and examined QI for SHA and surveyed health outcomes/QoL of residents. Results Residents in SHA are mostly female (73%) with a mean age of 79 years, living in SHA for nearly three years on average. No statistically significant differences between intervention and control group could be established at baseline. Further results will be presented. Conclusion The study results will add some clarification as to whether or not claims of improvement of health outcomes/QoL in SHA due to quality development processes are viable.

### INCORPORATING DEMENTIA QUALITY INDICATORS INTO PRIMARY CARE PRACTICE

*P.D. Sloane<sup>1</sup>, D.I. Kaufer<sup>1</sup>, C. Lathren<sup>1</sup>, M. Dulin<sup>2</sup>, 1. Family Medicine, Univ North Carolina Chapel Hill, Chapel Hill, NC, North Carolina, 2. Carolinas Medical Center, Charlotte, North Carolina*

A document from the Physician Consortium for Performance Improvement of the American Medical Association recommends that primary care providers of persons with dementia document performance in 10 domains, including cognitive and functional assessment, staging, neuropsychiatric symptom assessment and management, depression screening, caregiver education and support, and counseling regarding safety, driving risks, and advance care planning / palliative care. A quality improvement program addressing these domains should conduct an assessment of current practice, recommend changes in practice systems that will enhance performance, implement the changes, and re-evaluate performance. This presentation will review the guidelines, recommendations, and results from two primary care settings for older persons, identifying key areas needing improvement and potential strategies to do so.

### NURSE PERCEPTIONS OF QUALITY OF CARE FOR PEOPLE WITH DEMENTIA IN US HOSPITALS

*E. Capezuti, M. Boltz, L. Denysyk, J. Shuluk, L. Wagner, New York University College of Nursing, New York, New York*

Cognitive impairment (CI), whether due to dementia and/or delirium, can complicate the hospital stay of older patients. This secondary analysis examines nurse perceptions of the specialized needs of hospitalized persons with dementia (PWD) and other forms of CI. The sample of US nurses (N= 6,429; x age=43.31, x=15.97 years of experience) from 46 hospitals, completed the Geriatric Institutional Assessment Profile (GIAP) between January and June 2011 prior to implementation of NICHE (Nurses Improving Care for Healthsystem Elders). Among 3,139 nurses who responded to an open-ended question regarding pressing issues in their work, 19% (n=575) specifically addressed dementia, delirium and related behavioral issues. Many recognized the added complexity of these patients ("acuity of caring for the confused"), including the need for specific resources and sensitive, well-trained staff. Barriers to quality care included overuse of sedatives, lack of baseline mental status, absent familial support, and ethical dilemmas related to treatment decisions.

### QUALITY INDICATORS ON PSYCHOSOCIAL DEMENTIA CARE

*M. Vernooij-Dassen<sup>1,2</sup>, E. Vasse<sup>1</sup>, A. Spijker<sup>1</sup>, N. Vries<sup>1</sup>, R. Koopmans<sup>1</sup>, L. Schoonhoven<sup>1</sup>, 1. Radboud University Nijmegen Medical Centre, Nijmegen, Netherlands, 2. Kalorama Foundation, Nijmegen, Netherlands*

Objectives Quality indicators (QIs) are measurable key elements of care. The objective is to develop and evaluate quality indicators to assist dementia care professionals to individualize and tailor psychosocial interventions. Methods Search on literature, dementia guidelines and sets of quality indicators on psychosocial dementia care; development of a set of potential quality indicators by a multidisciplinary panel (n=7); panel of healthcare inspectors (n=7) to achieve content and face validity; Consensus conference meeting of the two panels to discuss measurability and applicability of the QIs. Results Consensus has been reached on a set of eight QIs. They include psychosocial care (treatment of behavioural symptoms, individual care plans for patients and their carers) and organisation of care (case-management, education of professionals, and professional collaboration). Conclusion QIs provide simple guidance in complex care. They can be used as outcome measures in psychosocial intervention studies.

## SESSION 165 (SYMPOSIUM)

### SAFETY AND SECURITY FOR OLDER ADULTS: ARE WE CREATING UNINTENDED FEAR?

Chair: *E. Galik, University of Maryland, Baltimore, Maryland*  
Co-Chair: *B. Resnick, University of Maryland, Baltimore, Maryland*  
Discussant: *K.K. Mangione, Arcadia University, Glenside, Pennsylvania*

Every year, one in three older adults experiences a fall. While it is critical to continue to work towards fall prevention, careful consideration has to be given to how health care providers respond to falls and how we work with older individuals and their caregivers in fall prevention. In response to an increased focus on safety, nurses and other health care providers are all the more focused on “watching over” patients to protect them from falls and other adverse events. The response to this focus is a tendency to encourage what are believed to be risk-free activities such as staying in bed, using a urinal versus walking to the bathroom, providing activities for long term care residents that are in the seated position only, and limiting recommendations for engagement in physical activity. This type of protective, custodial, task oriented care facilitates functional decline, decreases physical activity and contributes to deconditioning and disability. Conversely, care by the interdisciplinary team in which older individuals are taught, cued, positioned, and helped to perform functional tasks as independently as possible and encouraged to engage in physical activity across all settings is what is needed to optimize clinical outcomes. This symposium will provide a review of five different studies that demonstrate the association between falls and function and the devastating impact of fear of falling on function and physical activity and show that implementation of a function focused care approach versus a solely safety focused approach maintains and improves function and does not increase falls.

### FEAR OF FALLING CONTRIBUTES TO DISCHARGE FUNCTIONAL STATUS IN HOSPITALIZED OLDER ADULTS

M. Boltz<sup>1</sup>, B. Resnick<sup>2</sup>, *1. New York University, New York, New York, 2. School of Nursing, University of Maryland, Baltimore, Maryland*

A secondary analysis of data used to evaluate function-promoting activity in the acute care setting examined the impact of fear of falling upon discharge functional status in hospitalized older adults. In a sample of 168 patients  $\geq$  age 70, 62% (n = 104) rated fear of falling as “2” or more on scale of 0 to 4 with 4 being the most fear. Further, 54% (n=90) did not return to baseline function. Stepwise multiple regression showed that controlling for age, baseline ADL, admission ADL, and having a prior fall, fear of falling influenced discharge functional status ( $t=-2.6$ ,  $p=0.01$ ). Interviews with participants described the following factors as issues influencing fear of falling: a) intrapersonal (symptoms of the acute illness, fear, depression); interpersonal (staff and family engagement); the physical environment, and institutional policy that limited physical activity. Future research should investigate approaches that address these factors in tandem with individualized function-focused interventions.

### FALLS, FUNCTION AND SAFETY IN NURSING HOME RESIDENTS WITH DEMENTIA

E. Galik, B. Resnick, *School of Nursing, University of Maryland, Baltimore, Maryland*

The purpose of this study was to consider the relationship of physical and psychosocial variables on falls among 103 nursing home residents with dementia. The majority of residents were female (77%), black (65%), and not married (85%). The average age was  $83.74 \pm 9.97$  and MMSE was  $8.71 \pm 4.02$ . A total of 27(26%) of the participants had at least one fall over three months. Five individuals (19% of all falls) sustained injury associated with the fall and 5 individuals were sent to the emergency room due to the fall. Based on a multivariate analysis of variance and controlling for gender, cognition and race, there were significant

differences among fallers versus non-fallers. Fallers had worse underlying physical capability, more agitation, lower functional abilities, and were more sedentary compared to those who did not fall. Fall prevention should focus on increasing physical activity and functional activity and on decreasing the associated psychological symptoms of dementia.

### FALLS EFFICACY AFTER TREADMILL TRAINING IN STROKE

M. Shaughnessy, K. Michael, *School of Nursing, University of Maryland, Baltimore, Maryland*

Stroke survivors with hemiparesis are at high risk for falls due to central and peripheral balance disturbances, and may consequently self-limit ambulatory activity to mitigate fall risk. This study reviewed falls efficacy scale data in 64 stroke survivors randomized to either a 6-month treadmill training program or a stretching program. Lower scores indicate increased confidence in ability to navigate ambulatory challenges safely. Generalized estimation equations were used to compare difference in treatment groups over time. Controlling for baseline differences, the stretching group dropped from a mean of 16.39 (SD  $\pm 1.61$ ) to 12.18 ( $\pm 0.97$ ) and the treadmill group dropped from a mean of 21.2 ( $\pm 2.41$ ) to 18.30 ( $\pm 2.62$ ). A treatment by time effect was noted with a significant difference between the groups after 6 months participation. While the goal of the treadmill training program was to enhance cardiovascular fitness, it also had a beneficial impact on ambulatory confidence.

### THE IMPACT OF FEAR OF FALLING ON PHYSICAL ACTIVITY IN ASSISTED LIVING RESIDENTS

B. Resnick, E. Galik, *School of Nursing, University of Maryland, Baltimore, Maryland*

This study considered the impact of fear of falling on functional ambulation and overall physical activity among 177 assisted living residents who consented to participate in a randomized trial testing a Function Focused Care Intervention. Analyses were done using baseline data. The residents were mostly female [n=136 (80%)], white [n=160 (94%)] and widowed [n=136 (80%)]. Twenty-six percent had no fear, 11% had a little fear, 50% had some fear and 13% had a lot of fear that they would fall. Using a stepwise multiple regression and controlling for age, gender, cognition and having a prior fall, fear of falling was the only variable to influence ability to walk a functional distance ( $t=-2.7$ ,  $p=.01$ ). Fear of falling was not significantly associated with overall activity. Future research should focus on interventions to eliminate/decrease fear of falling and optimize function among older adults.

### FEAR OF FALLING IN COMMUNITY-DWELLING OLDER ADULTS AND ITS RELATIONSHIP WITH LEVEL OF EXERCISE

E. Nahm<sup>1</sup>, B. Resnick<sup>1</sup>, J. Magaziner<sup>2</sup>, S. Zhu<sup>1</sup>, C. Brown<sup>2</sup>, K. Kim<sup>1</sup>, *1. School of Nursing, University of Maryland, Baltimore, Maryland, 2. University of Maryland School of Medicine, Baltimore, Maryland*

In an ongoing online randomized controlled trial (N = 866), we are testing the impact of two online bone health interventions on selected outcomes in community-dwelling older adults (age > 50). The aim of this study was to examine the association between participants' fear of falling and amount of exercise, number of falls (over the past 3 months), and self-efficacy and outcome expectations for exercise (SEE / OEE) at baseline. More than half of participants reported having a fear of falling “sometimes” (43.9%, n = 380) or “most or all of the time” (8.6%, n = 74). Fear of falling was not associated with age. It was, however, associated with number of previous falls ( $r = .31$ ), amount of exercise (Kcal) ( $r = -.128$ ), SEE ( $r = -.09$ ) and OEE ( $r = -.14$ ). Findings suggest that fear of falling may be important for engaging older adults in exercise activities.

**APPROACHES TO HEALTH FOR OLDER ETHNICALLY DIVERSE POPULATIONS****OBESITY, DIABETES, AND DISABILITY IN OLDER MEXICAN AMERICANS, 1993-2011**

S. Nam<sup>1</sup>, S. Al Snih<sup>2,3</sup>, K. Markides<sup>1,3</sup>, 1. *Population Health Sciences, University of Texas Medical Branch, Galveston, Texas*, 2. *The Division of Rehabilitation Sciences, University of Texas Medical Branch, Galveston, Texas*, 3. *Sealy Center on Aging, University of Texas Medical Branch, Galveston, Texas*

**OBJECTIVE:** To determine the effect of obesity and diabetes on disability in older Mexican Americans over 17 years of follow-up. **METHODS:** 3,050 Mexican Americans aged 65 year and older at baseline (1993-1994) from the Hispanic Established Population for the Epidemiological Study of the Elderly (Hispanic-EPESE). Measures included sociodemographic variables, medical conditions (arthritis, diabetes, heart attack, hypertension, stroke, and cancer), body mass index (BMI), waist circumference (WC), and activities of daily living (ADL). Generalized estimating equations (GEE) and linear mixed models (MIXED method) were used to estimate the effect of obesity and diabetes on disability over time. **RESULTS:** The prevalence of obesity, diabetes, and ADL disability ranged from 20.3%, 27.3%, and 13.8% in 1993-94 to 26.2%, 65.6%, and 51.9% in 2010-2011 respectively. BMI and diabetes were associated with greater disability in the oldest old (85+) group, women, and US-born compared with the young old (65-74) and very old (75-84), men, and the foreign-born. **CONCLUSION:** Subjects with obesity and diabetes were more likely, over time, to develop ADL and mobility disability than subjects with obesity only, subjects with diabetes only, and subjects without obesity and diabetes. **Key words:** Obesity, BMI, Diabetes, ADL, disability, older adults, Mexican-Americans.

**POLYPHARMACY AND POLYHERBACY AMONG ETHNICALLY DIVERSE OLDER ADULT POPULATIONS**

L. Chiang-Hanisko, C.L. Williams, R.M. Tappen, D. Newman, *Nursing, Florida Atlantic University, Boca Raton, Florida*

Polypharmacy is of particular concern in the older adult population. Older adults use more medication on a long-term basis to treat chronic disease. As major consumers of health care and prescription medication, older adults are more vulnerable to drug-related adverse effects and interactions of medications. However, few studies have focused on polypharmacy among diverse ethnic older adults, a population experiencing rapid growth. The purpose of this study was to evaluate the prevalence of polypharmacy among 120 individuals age 55 and older from community settings representing four cultural groups: African American (AA), Afro-Caribbean (AC), European American (EA) and Hispanic American (HA). Data is from the NIH funded Culture Bias in Testing Expressive Ability for Dementia including detailed medication records. A Oneway-ANOVA with a Bonferoni was conducted to compare means among the ethnicities. Results revealed the average number of medications used were 4.61. There were significant differences among ethnicities on OTC ( $F_{3,114}=2.63, p<.05$ ) where Afro-Caribbean used significantly more OTC than Hispanic Americans ( $p=.04$ ). There was also a significant ethnic difference for herb and supplement usage ( $F_{3,114}=5.01, p=0.03$ ) where EA was higher than AA and HA ( $p=.01, p=.003$ ) respectively. A multiple regression examined the factors that impact polypharmacy with a significant prediction ( $F_{9,84}=3.27, R^2=.260, p=.002$ ). Only SF-8 and chronic illness accounted for a significant proportion of unique variance. Income, spirituality, age, sex, education, and ADL accounted for shared variance but were not unique. This study suggests culture was a contributing factor in polypharmacy among ethnic older adults. Ethnoculturally appropriate health management is needed.

**BARRIERS AND FACILITATORS TO THE PARTICIPATION OF AFRICAN AMERICANS IN BIOMARKER STUDIES**

T.A. Schroefer, J. Dykema, G. Groth, W. Gunn, D. Edwards, *University of Wisconsin-Madison, Madison, Wisconsin*

Biomarker research, which involves the collection of tissue and bodily fluids such as blood or cerebrospinal fluid, is increasing the ability of researchers to effectively diagnose, monitor and treat disease. For African Americans and other minority populations who bear a disproportionate burden of chronic diseases and disabilities, participation in biomarker research is essential; yet, their participation remains low. Garnering an understanding of why African Americans choose not to participate in biomarker studies is critical if their burden of disease is to be lifted. This study explores the attitudes and beliefs of African Americans toward clinical research, and the barriers and facilitators to participation in biomarker studies of Alzheimer's disease, cancer, pulmonary disease and cardiovascular disease. Twenty-six African American respondents participated in in-depth, one-time face-to-face interviews regarding their willingness to provide samples of saliva, blood, tissue and cerebrospinal fluid, participate in brain donation and clinical drug trials, and have an MRI, CAT scan or endoscopy. Qualitative analysis of the transcripts revealed mistrust, lack of sufficient information and fear of serious risk to self as key barriers. Mistrust involved fearing lack of confidentiality, not knowing where the information will go or how it will be used, possibility that samples will be manipulated, being used as a guinea pig, and that the African American community will not experience any benefits. Concern was high regarding the risk of medical errors, complications and death. Implications for culturally appropriate outreach procedures and educational materials designed to increase visibility about and increase participation in biomarker studies will be discussed.

**RURAL AFRICAN AMERICANS' EXPERIENCES OF CAREGIVING TRANSITIONS AND LONG-TERM CARE DECISION-MAKING**

Y. Eaves, *University of Alabama at Birmingham, Birmingham, Alabama*

Few studies have examined developmental, situational, and illness related transitions in rural African Americans. Therefore, little is known about the experiences of African American older adults and their family caregivers, how they manage during critical transitions, and how and when they make decisions about long-term care (LTC). The purpose of this ethnographic study was to identify and analyze episodic and/or emergent health events (namely, decision-making about LTC placement) that resulted in caregiving transitions in rural African American families. The sample included eleven caregiving families comprised of 11 care recipients (70-86 years) and 11 caregivers (27-63 years). Semi-structured audio-taped interviews, fieldnotes, and focused observations were used to generate data. Ethnographic analytic techniques were used to code and classify the data and then formulate meaningful categories, themes, and patterns into an explanatory framework. Data analysis and interpretation uncovered patterns (precipitating health events, emotional reactions to nursing home placement, and unrealistic perceptions of self-care abilities) and themes (reasons for placement, anger, mistrust of family members, and returning home) that explained transitional events of caregiving and LTC decision-making. Serendipitous findings included two stories of previous elder abuse, neglect, and violence. Thus, two older adults verbalized satisfaction with care provided by the nursing home staff and viewed their stay at the nursing home as an improvement over previous living conditions and arrangements. A culturally relevant LTC planning (LTCP) intervention was developed based on this ethnographic data. The LTCP intervention provides families with specific strategies for decision-making and LTC planning in response to caregiving transitions.

## COMPARISON OF FRAILTY MODELS IN THE AFRICAN AMERICAN HEALTH (AAH) COHORT

T.K. Malmstrom<sup>1</sup>, D.K. Miller<sup>2,3</sup>, J.E. Morley<sup>1</sup>, 1. *Saint Louis University, St. Louis, Missouri*, 2. *Indiana University, Indianapolis, Indiana*, 3. *Regenstrief Institute, Inc., Indianapolis, Indiana*

Frailty is a condition which places older persons at increased risk for poor outcomes when exposed to stressful events or with advancing age. This study examines frailty models and adverse health outcomes. AAH is a population-based study of African Americans (baseline ages 49-65) from St. Louis, MO. Participants completed in-home assessments at baseline (N=998), 3 years (N=853), and 9 years (N=582). The proportion of surviving participants reassessed was 90% (3 years) and 70% (9 years). Outcomes included activities of daily living (ADLs; 0-7) and instrumental ADLs (IADLs; 0-8) at baseline, 3, and 9 years; and 9 year mortality. Frailty models included the International Association of Nutrition and Aging (FRAIL), Study of Osteoporotic Fractures (SOF), Cardiovascular Health Study (CHS), and Rockwood frailty scales; scores were categorized as frail, pre-frail, or robust. Analyses excluded participants (n=142) with any baseline ADL dependency and adjusted for age, gender, and baseline outcomes. Frail and pre-frail status on FRAIL and Rockwood predicted mortality ( $p < .05$ ), but not SOF or CHS. IADLs were predicted at 3 years for frail and pre-frail by all scales ( $p < .05$ ) except CHS pre-frail; and 9 years by FRAIL and SOF for pre-frail ( $p < .05$ ), and Rockwood for pre-frail and frail ( $p < .01$ ). ADLs were predicted at 3 years for frail and pre-frail by all scales ( $p < .05$ ) except pre-frail for CHS and Rockwood; and 9 years by FRAIL and SOF for frail and pre-frail ( $p < .05$ ) and Rockwood frail ( $p < .001$ ). FRAIL is a simple robust scale that performs as well as or better than more complex scales.

## SESSION 175 (PAPER)

### NUTRITION, OBESITY AND ORAL CARE

#### RELIABILITY STUDY: CAREGIVERS/RESIDENTS INTERACTION DURING FEEDING USING BARNARD'S FEEDING SCALE

C. Beel-Bates, J. French-Rogers, P. Stephenson, *Kirkhof College of Nursing, Grand Valley State University, Grand Rapids, Michigan*

Initial pilot work using Barnard's Feeding Scale (BFS) to measure dyadic interaction between caregivers and residents with dementia during feeding suggests that it is a viable, appropriate alternative to creating a new scale to assess interaction during feeding in this population. The goal of this study was to achieve 80% inter-rater reliability among four certified observers using Barnard's Feeding Scale (BFS) to measure interaction between caregivers and LTC residents with dementia during feeding. The BFS contains 76 specifically defined behavioral items which are coded "yes" if seen during a feeding and "no" if not seen during the feeding. After appropriate written permissions were obtained from nursing homes, guardians, and caregivers, 30 caregiver/resident dyads were videotaped for one meal or no longer than 20 minutes. Videos were labeled and transferred to DVDs. Two feedings were filmed specifically for use as training by the observers. Each rater received a set of DVDs to view and score independently. One observer had extensive experience with the BFS and served as a training leader of the other raters. The average percentage of agreement on the six subscale scores and total score on the BFS for 28 filmed feedings were calculated. The combined scores showed an inter-rater reliability of 85%. Cronbach's Alpha procedure showed a 0.75 correlation coefficient between the items in each of the six subsets of the BFS.

## EFFECT OF A MOUTH CARE INTERVENTION FOR NURSING HOME RESIDENTS WITH DEMENTIA WHO REJECT CARE

R. Jablonski<sup>1</sup>, A.M. Kolanowski<sup>1</sup>, B. Therrien<sup>2</sup>, E. Mahoney<sup>3</sup>, C. Kassab<sup>4</sup>, 1. *School of Nursing, The Pennsylvania State University, University Park, Pennsylvania*, 2. *University of Michigan, Ann Arbor, Michigan*, 3. *Boston College, Boston, Massachusetts*, 4. *By the Numbers, West Decatur, Pennsylvania*

Common reasons for the omission of mouth care include inadequate time and care-rejection behaviors. The purpose of the experimental study was to test a mouth care intervention that combined best oral hygiene practices with behavioral techniques designed to prevent and reduce care-rejection behavior. Twelve nursing home residents with severe dementia and histories of mouth care-rejection behaviors were randomly assigned to a control or experimental group. The majority were female (83%); mean age was 82.7 years. Residents were observed receiving "usual" mouth care by nursing assistants twice daily during a 7-day baseline period. Residents then received mouth care twice daily for 21 days by research assistants, who were blinded to the specific aims of the study and were yoked to either the control or experimental group. Control group research assistants delivered mouth care per the approved protocol, but without care-rejection behavioral techniques. Data from 525 observations were analyzed. The duration of oral hygiene activities during the baseline period was 2.7 minutes (experimental group) and 2.4 minutes (control group). Mouth care was completed 85.7% of the time. During the intervention period, the duration of mouth care was 5.9 minutes (experimental group) and 4.9 minutes (control group) ( $t=2.910$ ;  $df=507$ ;  $p=0.004$ ). Oral hygiene was successfully delivered 92.4% of the time for residents in the experimental group and 59.1% of the time for residents in the control group. Results from this study suggest that the mouth care intervention addressed care-rejection behaviors and resulted in the best rate of mouth care completion.

## IS PERIODONTAL INFLAMMATION ASSOCIATED WITH DEPRESSIVE SYMPTOMS IN OLD AGE?

P. Holm-Pedersen<sup>1</sup>, K. Avlund<sup>1</sup>, D.E. Morse<sup>2</sup>, 1. *Gerodontology, University of Copenhagen, Copenhagen, Denmark*, 2. *New York University, New York, New York*

Objectives: To analyze the association between periodontal inflammation (age 70) and depressive symptoms (age 75). Methods: The study was based on the Glostrup Aging Study, with oral data collected in 1984 when the participants were 70 years old and follow-up 5 years later. Periodontal inflammation was measured using the Community Periodontal Index (CPI) and defined using numerous definitions. Depressive symptoms were measured using the Center for Epidemiologic Studies Depression Scale (CES-D). Periodontal inflammation and depressive symptom data were available for 229 subjects. Analyses were conducted based on data from all 229 subjects, as well as subgroups of participants. Results: After adjusting for covariates, dichotomized CES-D scores ( $16+ / < 16$ ) at age 75 were not consistently positively associated with periodontal disease defined by CPI scores at age 70. Conclusion: Our analyses of data from older adults provide little evidence of a positive association between periodontal disease at 70 and depressive symptoms at 75.

## CHARTING INTERPROFESSIONAL CONNECTIONS TO IMPROVE ORAL HEALTH IN AN AGING AMERICA

J. Haber, D. Shelley, M. Dolce, *NYU College of Nursing, New York, New York*

Millions of Americans have unmet oral health care needs and profound oral health disparities persist in vulnerable and underserved populations, especially older adults. The prevalence of dental caries and periodontal disease increases with age, and older adults are more likely to have chronic conditions such as cardiovascular disease and diabetes, which are associated with poor oral health outcomes. Over 3 million

nurses, including approximately 140,000 nurse practitioners, can play a significant role in improving the quality of oral health for older adults including access to care. The purpose of this paper is to describe New York University College of Nursing's response to this challenge - a national interprofessional initiative aimed at preparing a nursing workforce with the competencies to prioritize oral disease prevention and health promotion, provide evidence-based oral health care in a variety of practice settings, and collaborate in interprofessional teams across the health care system. The overarching goal of this national initiative is to create an educational infrastructure for the nursing profession that advances nursing's contribution to reducing oral health disparities across the life cycle. This presentation describes the development, implementation, and evaluation of a replicable model for integrating oral health in nursing education and best practices in nurse managed primary care settings. Participants will be able to describe a model for charting interprofessional connections between nursing and dental professionals in providing oral health preventive services to older adults. The importance of interprofessional education and collaborative practice in improving oral health for an aging America is underscored.

## SESSION 180 (SYMPOSIUM)

### CLINICAL INTERVENTIONS TO ENHANCE WELL-BEING OF CHINESE ELDERS WITH CHRONIC ILLNESSES

Chair: *T.Y. Lum, Social Work and Social Administration, The University of Hong Kong, Pokfulam, Hong Kong, Sau Po Centre on Ageing, Pokfulam, Hong Kong*

Very few intervention studies have been designed and implemented specially for Chinese older people. As a result, there is very few evidence based interventions that can help improve the well-being of older Chinese. The goal of this symposium is to present the results of three intervention studies that used specific clinical intervention to promote health and well-being of older Chinese people in Hong Kong. Two studies focused on the narrative approach to enhance older Chinese's well-being. Chow investigated the effect of narrative therapy in helping stroke survivors to enhance their self-esteem and coping skills and to find meaning of their life after suffering from stroke. She found that those received narrative intervention had better self-esteem, proactive coping skills and were able to find meaning of their life than those in the control group. Lai and her colleagues supplemented Chow's study by focusing on reasons why some Chinese elders participated in a life story intervention while other refused to participate. They interviewed 25 Chinese elders who joined and 19 who did not join the intervention and found that the participants' perception of what others would think of them after they shared their life stories were the main difference between the two groups. Leung and her colleagues investigated the effect of a program to increase the walking level of older Chinese with chronic illness. They recruited 178 older Chinese to participate in a 10 weeks intervention and found that the program was associated with an increase working and participants' physical health.

### NARRATIVE THERAPY IN RECONSTRUCTING STROKE SURVIVORS' SELF-IMAGE AND MEANING OF LIFE

E.O. Chow, *Applied Social Studies, The University of Hong Kong, Kowloon, China*

Aims: To examine the effectiveness of narrative therapy in helping stroke survivors (SS) to externalize their experiences, reconstruct the identity and their meaning of life. Methods: A randomized controlled trial was conducted to SS who had stroke within 2 years and aged over 59. Fifteen intervention and fifteen control groups were carried out for eight weekly sessions. SSs were assessed at baseline, interim and post-intervention through face-to-face interviews. Repeated-measures ANOVA were used to assess the group changes throughout these three time-points on their self-esteem, proactive coping skills and meaning of life. Findings: 181 SS were randomly assigned to intervention groups

(n= 91) or control groups (n= 90). Significant group and time changes were found in self-esteem ( $F=4.78, p=.01$ ), proactive coping skills ( $F=5.52, p=.004$ ), and their meaning of life ( $F=4.49, p=.01$ ) after the intervention. Conclusion: NT was found effective in enhancing SS' self-esteem, proactive coping skills and the meaning of life.

### SENIORS SHARING THEIR LIFE STORIES WITH OTHERS: WHY AND WHY NOT?

C.K. Lai<sup>1</sup>, A. Chan<sup>1</sup>, W. Shae<sup>2</sup>, Y. Zhang<sup>1</sup>, *1. School of Nursing, The Hong Kong Polytechnic University, Hong Kong SAR, China, 2. Department of Social Sciences, The Hong Kong Polytechnic University, Hong Kong SAR, China*

Few studies explored why some seniors willingly engage in life story work and others do not. This study was conducted in 17 senior centers randomly assigned to an intervention or control group. The seniors who joined (n=25) and those who declined to join the study (n=19) were invited for an in-depth interview. Colaizzi's method is used for data analysis and interpretation. Themes identified from the data included: "sharing my life stories helped me to reflect on my past and release my emotions", "my life stories have been recorded and passed down to the next generation", "I would like to let my family members know more about me", "I share my life stories to benefit others", and "I seldom share my life stories with others because it sometimes causes trouble". If the life story approach can enhance the well being of seniors, then certainly it is worthwhile to promote it further.

### HEALTH ENHANCEMENT AND Pedometer-DETERMINED AMBULATORY (HEPA) PROGRAM: A CAPACITY BUILDING PROGRAM IN HONG KONG

A. Leung<sup>1,2</sup>, M. Tse<sup>3</sup>, W. Shum<sup>4</sup>, J. Lancaster<sup>5</sup>, C. Lam<sup>6</sup>, *1. School of Nursing, The University of Hong Kong, Hong Kong, China, 2. Sau Po Centre on Ageing, The University of Hong Kong, Hong Kong, China, 3. Institute of Human Performance, The University of Hong Kong, Hong Kong, China, 4. SKH Holy Carpenter Church, Hong Kong, China, 5. University of Virginia, Charlottesville, Virginia, 6. Department of Family Medicine and Primary Care, The University of Hong Kong, Hong Kong, China*

Doing regular physical exercise is not an easy task. A 10-week Health enhancement and pedometer-determined ambulatory (HEPA), was developed to build up community-dwelling older adults' capacity in walking in their neighbourhood in Hong Kong. Objectives: This study aims to report the change of health outcomes of the HEPA participants. Method: A pre-and-post intervention design was used. Results: A total of 179 older adults participated in the program. After 10 weeks, participants' average number of steps per day increased from 6591 to 8934 (increased by 36%). Their lower body strength (mean difference, m.d. = 1.71,  $p<0.001$ ), upper body strength (m.d. = 1.29,  $p<0.001$ ), aerobic fitness (m.d. = 20.74,  $p<0.001$ ), quality of life in physical health (m.d. = 2.86,  $p<0.001$ ) were significantly improved. Conclusion. HEPA program seemed to improve participants' walking capacity and other health outcomes. A randomized controlled trial should be carried out to test its effectiveness in future .

## SESSION 185 (SYMPOSIUM)

### EVALUATING THE QUALITY OF LONG TERM CARE: A REVIEW OF SOME RECENT INITIATIVES

Chair: *A. Muma, Abt Associates Inc., Durham, North Carolina*

The Centers for Medicare and Medicaid Services (CMS) has responsibility for overseeing the quality of care provided in the nation's nursing homes and in other long term care settings. Quality of care initiatives, whether designed and implemented by the Federal government, by healthcare researchers, or by other groups, have been developed to assess and improve quality in a variety of domains and for a variety of different topics. This session will provide background on some current

CMS initiatives in evaluating long term care quality. These initiatives cover a broad range of topics including: The Nursing Home Compare 5-Star Rating System, The Quality Indicator Survey (QIS) for health inspection surveys, the impact of therapy staffing on nursing home resident outcomes, and the effectiveness of the CMS Special Focus Facility program.

### **NURSING HOME COMPARE: THE THIRD YEAR OF THE FIVE-STAR QUALITY RATING SYSTEM**

A. Muma, C. Williams, A.J. White, M.R. Plotzke, *Abt Associates Inc., Durham, North Carolina*

In December 2008, the Centers for Medicare and Medicaid Services enhanced its Nursing Home Compare website to include “star” ratings for each US nursing home, measuring multiple dimensions of quality including performance on selected quality measures, outcomes of health inspections, and staffing levels. The five-star rating system has now been in place for over three years. Over this period, we have been examining trends in the ratings each year and across years. Specifically, we examined stability and longitudinal changes in the underlying components of the rating system, and compared the results of each individual year, noting significant changes among the years. We also used qualitative information from the five-star Helpline to aid in understanding the quantitative trend data from the three years of the rating system.

### **THE RELATIONSHIP BETWEEN THERAPIST STAFFING LEVELS AND NURSING HOME RESIDENT OUTCOMES**

B. Morefield, *Abt Associates Inc., Durham, North Carolina*

The Centers for Medicare and Medicaid Services currently uses nurse staffing levels to derive the staffing domain of the five-star quality rating system on the Nursing Home Compare website. This presentation will explore an additional measure of staffing which may impact the quality of resident outcomes, namely therapist staffing. The presentation will describe trends in therapist staffing levels from 2006 to 2011, as reported in OSCAR. Additionally, the presentation will provide the results of analyses of the relationship between facility-level therapist staffing and resident outcomes (i.e. successful discharge to community). Finally, the presentation will discuss the feasibility of including therapist staffing as a measure of nursing home quality, including the generalizability of facility-level therapist staffing measures to describe nursing home quality, and the extent to which nurse staffing levels may serve as a proxy for therapist staffing.

### **EVALUATING THE EFFECTIVENESS OF THE CMS SPECIAL FOCUS FACILITY PROGRAM FOR NURSING HOMES**

C. Williams, A. Muma, *Abt Associates Inc., Durham, North Carolina*

The Special Focus Facility program (SFF) centers on nursing homes with a track record of substandard quality. CMS reviews health inspection data and develops a candidate list of facilities for the program; states select facilities for participation in the SFF program. We analyzed SFF program data from 2005 through 2011. The primary goal was to examine whether participation in the program improved quality in poorly performing nursing homes, as measured by health inspection performance. We compared the experience of SFF facilities to a similar group of candidate facilities not chosen for the program and examined the likelihood of: 1) improved performance, as measured by having a health inspection without citations greater than ‘D’; 2) termination; and 3) enforcement actions, including civil money penalties and denial of payment for new admissions. Early results show the SFF program appears to be associated with faster improvement in quality, but increased likelihood of termination.

### **THE QUALITY INDICATOR SURVEY FROM 2007-2011: HOW DO FINDINGS COMPARE TO TRADITIONAL NURSING HOME SURVEYS?**

A.J. White, C. Williams, *Abt Associates Inc., Durham, North Carolina*

The Quality Indicator Survey (QIS) is intended to improve survey consistency and accuracy by using a more structured process and focusing survey resources on areas within facilities with greater quality concerns. The QIS has been implemented to varying extents in nineteen states, and more than 7,500 QIS surveys were conducted in the years 2007-2011. We used survey results (cited deficiencies) from QIS and traditional surveys to examine how survey findings differ between QIS and traditional surveys. Analyses focused on paired analyses for facilities with multiple QIS surveys. Each year, QIS surveys, on average, cited more deficiencies than traditional surveys, although there was substantial variation across States. QIS surveys were also more likely to cite deficiencies related to quality of life and quality of care. These trends are evolving as states gain more experience with the QIS.

### **IMPLEMENTATION OF NURSING HOME VALUE BASED PURCHASING (NHVBP) DEMONSTRATION – YEAR 1 EXPERIENCE**

A.J. White<sup>1</sup>, A. Edwards<sup>1</sup>, E. Axelrod<sup>1</sup>, A. Laberge<sup>2</sup>, *1. Abt Associates Inc., Durham, North Carolina, 2. CMS, Baltimore, Maryland*

Under NHVBP, performance is assessed based on a set of performance measures, and participants with high performance levels or improvement over time are eligible for performance payments. The size of the performance payment pool is based on an estimate of the Medicare savings achieved by demonstration participants. The demonstration includes 171 providers from 3 States (Arizona, New York, Wisconsin). This presentation reviews results from the first year of the demonstration. Performance is measured based on facility performance across four domains: potentially avoidable hospitalizations, staffing levels and turnover, MDS-based quality measures, and survey deficiencies. Results from the first year show early promise for influencing some dimensions of provider behavior and generating Medicare savings. In all three States, staffing levels were higher in Year 1 than in the baseline. In Arizona and Wisconsin, the demonstration was associated with lower rates of potentially avoidable hospitalizations. There was little impact on MDS-based outcome measures.

## **SESSION 190 (SYMPOSIUM)**

### **POLICY SERIES: POST-ELECTION ANALYSIS: IMPLICATIONS FOR AN AGING SOCIETY**

Chair: *B. Blancato, Matz, Blancato & Associates, Washington, District of Columbia*

Co-Chair: *L.K. Harootyan, The Gerontological Society of America, Washington, District of Columbia*

Discussant: *A. Sarmiento, Senior Service America, Inc, Silver Spring, Maryland*

The 2012 election is now history. What kind of history will those it elected make? Which age group had the greatest impact on the election and what might that mean for future policies? Will Social Security and other entitlement programs be spotlighted or put on the backburner in light of the results? This session will analyze what the election outcomes infer about rising issue priorities, and anticipate how the elected politicians will interpret their election-day victories. In addition, before the 113th Congress convenes and the next President is inaugurated, there is a lame duck session of this Congress to contend with. Will decisions related to tax cut extensions, sequestrations, Medicare physician reimbursement be made or deferred? What other top tier issues will await Washington in 2013? Join in this bipartisan post-election session to gain insights into the political and policy landscape ahead. Find out how the

results will influence your work as a researcher and an advocate. Sponsored by the GSA Public Policy Committee, Bob Blancato, Matz, Blancato & Associates, Moderator Speakers: Tony Sarmiento, Senior Service America, Inc. Thair Phillips, Retire Safe Rep. Susan Davis (D-California) Deb Whitman, AARP

## SESSION 195 (SYMPOSIUM)

### PROMOTING INTERNATIONAL COLLABORATION IN PUBLIC HEALTH AND AGING: THE PAHO AND CDC-HAN EXPERIENCE

Chair: *M. Altpeter, Institute on Aging, UNC at Chapel Hill, Chapel Hill, North Carolina*

Discussant: *B. Belza, University of Washington, Seattle, Washington*  
Discussant: *M.U. Pérez-Zepeda, Médicas del Instituto de Geriatria, Mexico City, Mexico*

The CDC-funded Healthy Aging Network (CDC-HAN) and the Pan American Health Organization (PAHO) share the common mission of increasing visibility of the aging of the population and improving the health and quality of life of older persons. To this end, both organizations have agreed to advance an agenda to: 1) reposition views of aging as a resource and not a burden to society; 2) create age-friendly environments that foster the health and participation of older adults; and 3) collaborate to bring health promotion to scale for older adults through research, practice, policy and educational initiatives. This session will share our collaborative experiences to date and promote international networking among those interested in global public health and aging. CDC-HAN and PAHO presenters will discuss: 1) collaborative efforts to bring researchers, educators and program administrators together from 12 countries to discuss extending the healthy aging initiative in Latin America and the Caribbean; 2) educational approaches for addressing public health and aging competencies to train program administrators and researchers; and 3) areas of common interest with relation to evidence-based health promotion research and programming and the need for a common metric to assess their public health impact. This session will encourage active engagement of attendees to share their experiences and interests in collaborative international work and to identify priorities and next steps for promoting healthy aging initiatives globally.

### LAUNCHING AN INTERNATIONAL ORGANIZATIONAL COLLABORATION: PURPOSE AND LESSONS LEARNED

*M. Altpeter, Institute on Aging, UNC at Chapel Hill, Chapel Hill, North Carolina*

This session will describe the process and steps taken to develop the meeting agenda, activities, and outcomes of the "University Consortium on Public Health and Aging" held in Mexico City that launched the PAHO and CDC-HAN collaboration of researchers, educators and program administrators. Overarching topics presented and discussed included: setting the vision for a healthy aging agenda and collaborative projects for aging; key content areas and competencies to address in public health and aging education across disciplines and borders; building public health and aging curricula at the graduate level and for continuing education; models for conducting collaborative research and collaborative education; theoretical approaches and strategies for translating and disseminating healthy aging research into sustainable programs and policies. Steps taken to create and sustain international collaborations, with attention to cultural and language factors, will be addressed.

### DISSEMINATING EVIDENCE-BASED HEALTH PROMOTION PROGRAMS AND ASSESS IMPACT

*S.L. Hughes, University of Illinois Chicago, Chicago, Illinois*

ing Impact A key objective of the HAN/PAHO meeting was the identification and sharing of evidence-based interventions, with apprecia-

tion of the context and diversity within each country. Currently, several evidence based programs have been recognized by the U.S. Administration on Aging as meeting criteria for broad uptake by aging services providers. The HAN/PAHO meeting provided an opportunity to review the development and testing of these programs, discuss their characteristics, identify existing programs in our respective countries and discuss ways to adapt and adopt these programs across multiple countries. The meeting also sparked the discussion of the need for universal performance-based health metrics that can be used to assess the public health impact of these programs. Ongoing efforts that are taking place to continue this work following the conference include the possible development of a research institute that would foster cross-national collaboration and cross training/development of a workforce that can deliver these programs.

### PREPARING A PUBLIC HEALTH AND AGING WORKFORCE THROUGH INTERNATIONAL ORGANIZATIONAL COLLABORATION

*E. Vega, Pan American Health Organization, Washington, District of Columbia*

A comprehensive strategy for building a public health and aging workforce requires an education and training infrastructure to prepare professionals. As part of the University Consortium on Public Health and Aging, PAHO established an MPH program in Public Health with an aging and health services focus and a specialization certificate for program administrators. The CDC-HAN PAHO collaboration has begun to identify next steps to define and implement an educational mission. These address several needs: 1) supply specific research, education, and practice skills required by the workforce; 2) establish standards and competencies in public health and aging on which to base curricula and training tailored to regional priorities; and 3) challenge negative stereotypes by informing the public about the evidence supporting healthy aging. The session will include discussion of opportunities for mutual assistance in developing curricula, programs, and public awareness.

## SESSION 200 (SYMPOSIUM)

### THE OLDER LABOR FORCE: SUPPLY, DEMAND AND TRAINING

Chair: *B. Harootyan, Research, Senior Service America, Inc., Silver Spring, Maryland*

Discussant: *S.E. Rix, AARP, Washington, District of Columbia*

During 2000-2010, the number of workers age 55+ increased by 60.8 percent (vs. 7.9 percent for the entire labor force). By 2020 they will comprise one-fourth of all workers, double the proportion in 2000. These trends reinforce the need for ongoing job-skill development, retraining for those displaced from certain industries, and educational opportunities for persons seeking new careers. Such training must consider the needs and learning styles of older workers while also responding to employers' requirements for specific skills and credentialing. Presentations address different aspects of older worker supply, demand, experiences, and training. Sum and Harootyan review multivariate results of national data, indicating the plight of low-income older workers, their labor market barriers, and how these affect their well-being. Ejaz, Rose and Bukach present results from a stratified random survey of long-term care providers regarding employment prospects for low-income Senior Community Service Employment Program participants, and providers' OJT training, accommodations for older workers, and awareness of SCSEP as a source of employees. Morgan and Farrar report findings from a mixed-methods evaluation of formal education for later-life careers in health care, documenting learning challenges and lifestyle demands faced by older persons and recommended strategies to respond to them. Cummins and Kunkel review findings from a multi-stage Delphi analysis of 10 community colleges that provide credential-focused

training for older workers, emphasizing the importance of peer mentoring, supportive services, and employer relationships. Rix discusses the relevance and implications of this research for organizations and government agencies involved in older worker programs and advocacy.

### **COMMUNITY COLLEGES AND OLDER STUDENTS: CAN OUTCOMES BE IMPROVED?**

P. Cummins<sup>1,2</sup>, S. Kunkel<sup>1,2</sup>, *1. Sociology & Gerontology, Miami University, Oxford, Ohio, 2. Scripps Gerontology Center, Oxford, Ohio*

Unemployed older adults may not have the skills required for available jobs and may need to acquire new skills in order to become reemployed. For U.S. workers in general, and for older workers seeking employment, credential attainment is a significant trend and community colleges play an important role in that endeavor. Using a multi-stage Delphi method, 10 community colleges were selected for key informant telephone interviews or site visits to gain a better understanding of the role community colleges play in providing credential-focused training for older workers. Areas that were explored during the site visits and interviews include challenges faced by older students, outreach programs, strategies to improve retention rates, educational programs that involve credential attainment, job placement, employer relationships, and student financial support, all related to older students. Findings suggest that peer mentoring, intensive counseling services, financial aid, and strong employer relationships are all important for successful outcomes.

### **PROSPECTS FOR SENIOR COMMUNITY SERVICE EMPLOYMENT PROGRAM (SCSEP) PARTICIPANTS IN LONG-TERM CARE**

F. Ejaz, M. Rose, A. Bukach, *Benjamin Rose Institute, Cleveland, Ohio*

SCSEP provides on-the-job-training for lower-income older adults in non-profit/public organizations. Its goal is for participants to obtain unsubsidized employment. Possible employment opportunities were explored in a cross-sectional study of 248 adult day care centers, assisted living facilities, home health agencies and nursing homes in seven states. Sample selection was based on a stratified random sampling by state, provider type, auspice and capacity, with oversampling of nonprofit/public/governmental organizations. Telephone surveys were conducted with management staff to gauge the extent to which they employed older workers, used volunteers and served as host agencies for SCSEP participants. Findings indicated that providers make accommodations to retain older workers and more than 75% use volunteers of all ages, but the majority was not aware of SCSEP. Of those that reported having been host agencies, most were adult day care centers. Recommendations to improve the hiring of older workers include better marketing and “branding” of SCSEP.

### **EDUCATION AND TRAINING FOR OLDER WORKERS: CHALLENGES AND PROMISING PRACTICES**

J.C. Morgan<sup>1</sup>, B. Farrar<sup>2</sup>, *1. UNC Institute on Aging, Chapel Hill, North Carolina, 2. North Carolina State University, Raleigh, North Carolina*

Delayed retirement, the ever-changing skill and labor needs of industries, and massive layoffs due to the recent recession compel many individuals to pursue formal education later in life to gain the skills and credentials necessary to be competitive in the labor market. Little research has identified education-related challenges for older workers. The purpose of this study is to describe the challenges that older adults face in pursuing formal education and suggest strategies that may address these challenges. Data come from the Jobs to Careers: Transforming the Front Lines of Health Care mixed-method evaluation (583 follow-up surveys, 38 focus groups and 226 interviews). Results show that older workers struggle with education anxiety, advanced technology, and the competing demands of work and family life. Strategies that have the poten-

tial to overcome these challenges include collaborative and active learning methods, formalized social support, explicit instruction on innovative learning technologies, and flexible academic policies.

### **THE PLIGHT OF LOW-INCOME OLDER WORKERS: EMPLOYMENT BARRIERS, ECONOMIC INSECURITY, AND MENTAL HEALTH PROBLEMS**

B. Harootyan<sup>1</sup>, A. Sum<sup>2</sup>, *1. Senior Service America, Inc., Silver Spring, Maryland, 2. Center for Labor Market Studies, Northeastern University, Boston, Massachusetts*

The Great Recession of 2007-2009 had a disproportionately negative effect on the labor market experiences of low-income and less educated workers age 55-74. Based on analyses of Current Population Survey data, this presentation reviews the employment experiences of disadvantaged older workers during 2000-2010, documenting their dramatically higher rates of unemployment and underemployment, and their much longer average time without a job. These difficulties compound their already fragile economic status, making it unlikely that they will have adequate incomes either as workers or retirees. Furthermore, multivariate analyses of the Behavioral Risk Factor Surveillance System's 2010 survey data indicate that these older workers are much more likely than others to suffer from anxiety, depressive symptoms, and other mental health issues. The authors discuss the implications of these findings, stressing the need for person-centered coordination of services to appropriately address the myriad challenges faced by disadvantaged older workers.

## **SESSION 205 (PAPER)**

### **BUILDING MORE SUPPORTIVE ENVIRONMENTS AND HOUSING**

#### **NEIGHBORHOOD AND PHYSICAL ACTIVITY IN COMMUNITY-DWELLING OLDER ADULTS: VALUE OF A MIXED-METHODS APPROACH**

H. Chaudhury<sup>1</sup>, A. Mahmood<sup>1</sup>, Y.L. Michael<sup>2</sup>, M. Campo<sup>1</sup>, *1. Gerontology, Simon Fraser University, Vancouver, British Columbia, Canada, 2. Drexel University, Philadelphia, Pennsylvania*

Although there is increasing evidence to suggest the salience of neighborhood physical environmental features and social support in influencing older adults to stay active, there is a dearth of studies examining the integrated effect of neighborhood-based physical environmental features and social dimensions on active aging. The overarching research question of this three year study was, “How are physical environment and social context of neighborhoods associated with physical activity of older adults?” Eight neighborhoods with varying residential density were selected across Vancouver, British Columbia and Portland, Oregon. The study utilized mixed methods that included — development of a neighborhood environmental audit tool, photovoice engagement of older adults, and a telephone survey. The structured observation method was used to collect comprehensive objective data on neighborhood micro-environment (across the dimensions of safety, destinations, aesthetics and function) that would support walking behaviors in older adults. The photovoice method was a community-participatory process resulting in rich visual and text-based qualitative data on both physical and social aspects. Finally, the survey (based on a structured questionnaire developed for this study) collected quantitative data on health and physical functioning, physical activity levels, neighborhood perceptions and social motivators for older adults' residing in the selected neighborhoods. This presentation will discuss the rationale behind the various quantitative and qualitative methods, interrelationships among them and methodological lessons learned.

## IMPLEMENTATION AND IMPACT OF A GEOGRAPHICALLY-TARGETED NORC-AGING IN PLACE PROGRAM

A.E. Scharlach<sup>1</sup>, L. Pipes<sup>2</sup>, N.E. Cutler<sup>2</sup>, *1. Social Welfare, University of California, Berkeley, California, 2. Motion Picture & Television Fund, Woodland Hills, California*

The Motion Picture & Television Fund (MPTF) provides a range of health and social services for entertainment industry retirees, including residential care on its 40-acre Los Angeles campus, as well as community-based programs for retirees throughout Southern California. Since 2008 MPTF has piloted a neighborhood-based approach, targeting services to four specific geographic communities with relatively high concentrations of entertainment industry retirees. This “NORC-Aging in Place” approach includes social services, volunteerism, home renovation, transportation, and technology. The analysis reported here compares administrative service provision data in the first two targeted MPTF NORC-Aging in Place communities with the two comparable communities where programs have not yet been initiated. The analysis demonstrates that service use increased in these first two targeted NORC areas faster than in the other two. Longitudinally, significantly greater increases were found for home visits (2006 to 2011), numbers of clients served (2010 to 2011) and program referrals (2010 to 2011), whereas assessment growth did not differ significantly. These findings have direct implications for the development of targeted neighborhood approaches for enhancing social support for older adults who choose to age in place. Moreover, the findings are instructive regarding the potential roles that residential care providers and other existing community resources can play as partners in developing community support programs.

## EVALUATING VILLAGE-MODEL PROGRAMS: A CONSUMER-DRIVEN APPROACH TO AGING IN COMMUNITY

C. Graham, A.E. Scharlach, *UC Berkeley, Berkeley, California*

This paper presents both the conceptual framework and findings from a multi-tiered evaluation of Village-model programs. Villages are a new, consumer-driven, “membership” model that aims to promote aging in place for older adults. Authors will present a conceptual model that guides an evaluation strategy for predicting organizational sustainability and effectiveness. This paper presents findings from a multi-tiered evaluation, including: 1) a national survey of 30 Village organizations; 2) results from a single-site evaluation that surveyed 185 members of one Village-model program; and 3) preliminary results from a multi-site evaluation of 9 Villages. The national survey of Village organizations found that Villages are highly consumer-driven, have few stable sources of funding, and their membership tends to be disproportionately better-educated, less frail and more ethnically homogeneous than the general senior population. The single-site evaluation findings include results from a survey of 185 current Village members. The most common services used by Village members were volunteer driving (45%) and grocery shopping (54%). Self-reported, retrospective measures of program impact suggest that the program has reduced financial distress (30%), reduced members’ self care and home care burden (39% and 29% respectively), increased social connectedness (34-44%), and improved members’ quality of life (70%). This paper will also include a discussion of a “scaling up” of this study to the first multi-site evaluation of Villages, and will discuss methodological implications for the evaluation of similar community-based aging-in-place models

## URBAN NEIGHBORHOOD CONTEXTS AND THE INTENTION TO MOVE AMONG OLDER ADULTS

M. Kim, S. Park, *University of Michigan, Ann Arbor, Michigan*

An increasing number of studies indicate that neighborhood environments play a significant role in older adults’ quality of life, such as physical and mental health. However, studies focusing on the association between urban neighborhood contexts and residential mobility are

limited. Using data from the Chicago Community Adult Health Study (2001-2003), this study examined the effect of neighborhood-level physical and social environments and individual-level socioeconomic and demographic factors on the intention to move among the adults aged 50 and older (N=933). Neighborhood environment measures were used as scales, constructed from the Systematic Social Observation data. Logistic regression was applied to capture the association between neighborhood environments and whether they are likely to move from the current neighborhood within five years. Preliminary results indicate that increased risky behaviors at the neighborhood-level and higher physical impairment at the individual-level are significantly associated with increased likelihoods of move-out intention. Increased residential security at the neighborhood-level played a significant role in decreasing the likelihoods of moving-out intention. However, physical disorder (e.g. broken window and graffiti) was not associated with the move-out intention. Older age, having more friend/kin networks, and being married decreased the odds of intention to move. The results suggest, in terms of residential mobility, what matters to older people more are neighborhood safety and personal health status, not the neighborhood physical disorder itself. Also, results reveal potential positive effects of individual’s support network on decreasing move-out intention.

## SESSION 210 (POSTER)

### ADULT PROTECTION AND ELDER ABUSE

#### RESIDENT ABUSE IN ASSISTED LIVING

N. Castle<sup>1</sup>, L. Wagner<sup>2</sup>, S.M. Handler<sup>1</sup>, S. Beach<sup>1</sup>, *1. University of Pittsburgh, Pittsburgh, Pennsylvania, 2. New York University, New York, New York*

Few empirical studies have examined resident abuse in assisted living (AL). In the literature the opinion exists that abuse may be an issue of concern in AL, but few empirical investigations exist. The paucity of information on abuse in AL led us to conduct this research. A survey was sent to Direct Care Workers (DCWs) in 1,500 facilities across the U.S. The survey requested DCWs to provide their opinions of resident abuse in the areas of verbal, physical, material, psychological, caregiving, medication, material, and sexual abuse (a total of 45 items were used). A \$20 gift card was used as an incentive. A total of 12,555 responses from DCWs were received (this gave a response rate of 81%). Overall, we found resident abuse to be uncommon; but, varied according to the type of abuse. For example, verbal abuse and psychological abuse was reported more often than sexual abuse. The highest percent was for staff arguing with a resident (9.65% of DCWs observed this in the past 3 months). Also, we found resident-to-resident abuse to be more common than staff abuse (but again varied according to the type of abuse). The highest percent was for arguing with another resident (12.83% of DCWs observed this in the past 3 months). The observed abuse was also associated with characteristics of the AL settings (such as size and staffing levels). This research gives us one of the first empirical views of resident abuse in AL.

#### IMPACT OF FINANCIAL EXPLOITATION ON THE HEALTH-RELATED QUALITY OF LIFE (QOL) OF OLDER WOMEN

C.P. Mouton, *Meharry Medical College, Nashville, Tennessee*

Background: Financial abuse (FA) and exploitation is a growing problem. Nationally, an estimated 12.3% of elders are victims of FA. Little is known about the effects of FA on the QOL of older women. Objectives: To determine the effect of FA on health-related quality of life in a cohort of functionally independent older women. Design: Cross-sectional survey Setting: The Observational Study Cohort of the Women’s Health Initiative (WHI) recruited at the San Antonio, Texas site. Participants: 1271 women, aged 50-79 years old, enrolled in WHI. Measurements: Baseline assessment of lifetime exposure to FA using 4

questions asked at time of enrollment, demographic variables, and HRQL assessed with the RAND SF-36. Results: Of the 1271 women surveyed, 2.9% reported being made to sign documents they did not understand, 3.6% were pressured to give up property, 32% had money borrowed, and 2% had finances controlled against their wishes. After controlling for (include covariates), compared to women reporting no FA, women with FA had poorer HRQL. Specifically, being made to sign documents was associated with the following subscales of HRAL: lower role-physical, pain, general health and the physical component summary score. Giving up property was associated with lower role-physical, social functioning, role-emotional, mental health, and mental component summary scores. Having money borrowed was associated with lower role-physical, role-emotional, and mental component summary scores. Having finances controlled was associated with lower social functioning, role-emotional, and mental component summary scores (all p-values < 0.05). Conclusion: Experiencing FA is associated with poorer HRQL in older women.

### **PIERCING THE VEIL? THE LINK BETWEEN INDIVIDUAL CONCEPTION/DEFINITION OF ELDER MISTREATMENT AND PHYSICIAN BEHAVIOR**

A.E. Sokan, *Graduate Center for Gerontology, University of KY, Lexington, Kentucky*

Healthcare professionals, in particular physicians, have been identified as one of the professions most likely to encounter elder mistreatment (EM), as they come into contact with older adults seeking healthcare. However studies indicate that physicians are one of the groups least likely to screen for, identify or report elder mistreatment. The reasons posited by a variety of studies range from inadequate training, low levels of confidence in ability to detect EM, to lack of time in the elder patient encounter. A qualitative study of Kentucky based physicians seeking to understand physician behavior in response to EM, found that a more basic and fundamental explanation for physician response is tied to physician knowledge of EM. This study found that physicians generally have a personal conception or definition of EM, which is premised on factors such as knowledge/awareness of EM, education/training, experience, personal values, as well as environment and culture. This finding is important because individual conceptions may act to introduce subjectivity and capriciousness to physician response to EM, especially in the absence of standardized definitions or body of knowledge about EM. Also, it underscores the importance of targeting physician education and training as a viable means to improve knowledge and awareness, key steps in changing response to EM.

### **ELDER MISTREATMENT IN A COMMUNITY-DWELLING POPULATION: FINDINGS FROM A LARGE COHORT OF U.S. CHINESE OLDER ADULTS**

E. Chang<sup>1</sup>, M.A. Simon<sup>2</sup>, E. Wong<sup>3</sup>, B. Wong<sup>3</sup>, F. Huang<sup>1</sup>, Y. Li<sup>1</sup>, X. Dong<sup>1</sup>,  
1. *Rush Institute for Healthy Aging, Rush University Medical Center, Chicago, Illinois*, 2. *Northwestern University, Chicago, Illinois*, 3. *Chinese American Service League, Chicago, Illinois*

Background: Elder mistreatment (EM) is a social, legal, and human rights issue with adverse health consequences. Despite increased calls for rigorous research in EM among racial/ethnic groups, there is very little empirical evidence on the prevalence rate of EM among U.S. Chinese older adults. Methods: This is a cross-sectional study with community-dwelling Chinese older adults over the age of 60. To our knowledge, this is the largest cohort of U.S. Chinese older adults in epidemiological studies. A total of 1,112 participants were recruited through community centers, churches, senior facilities in Chicago. In an interview format, we administered a 10-question elder mistreatment screening instrument (Cronbach's alpha = 0.84). Results: Among surveyed participants, the mean age was 74.8. Sixty-four percent were female. A total of 12.7% of the participants reported positive to elder

mistreatment. 7.5% of the participants have felt uncomfortable with someone in the family, 5.6 % reported having had family conflicts at home. 5.2% reported that they had been called names, been put-down, and felt bad recently, 3.2% of the participants have felt that nobody wanted them to be around, 1.5% of participants had been taking belongings without ok. Conclusion: Our findings suggest that EM is an existing health issue in U.S. Chinese aging population. There exists an urgent need for educational initiatives and community awareness programs that highlight this pervasive public health issue. Population-based study of risk and protective factors are needed to inform future prevention and intervention programs to improve the well-being of this vulnerable population.

### **EVIDENCE OF CONSTRUCT VALIDITY FOR A COMMUNITY-BASED SELF-NEGLECT SEVERITY SCALE: RESULTS OF A CONFIRMATORY FACTOR ANALYSIS**

J. Burnett<sup>1,3,2</sup>, P.M. Diamond<sup>4,3</sup>, A.E. Hochschild<sup>1,3,2</sup>, J. Booker<sup>3,5</sup>, C. Dyer<sup>1,3,2</sup>,  
1. *Internal Medicine, UT Health, Houston, Houston, Texas*, 2. *Harris County Hospital District, Houston, Texas*, 3. *Texas Elder Abuse and Mistreatment (TEAM) Institute, Houston, Texas*, 4. *UT Health, Houston-School of Public Health, Houston, Texas*, 5. *Texas Department of Family and Regulatory Services, Division of Adult Protective Services (APS), Houston, Texas*

Background: Self-Neglect is the most common report to Adult Protective Services (APS) nationwide and is linked with a 6-fold increase in the odds of mortality among older adults. Currently, there is no standardized assessment available for detecting self-neglect in the community. This study provides evidence supporting the construct validity of a community-based assessment for identifying self-neglect among older adults. Methods: The SSS was completed in the homes of 250 community-dwelling adults 65 years of age and older with APS validated self-neglect. The SSS consists 28 observational items rated on a scale of 0 (No Evidence of Self-Neglect) to 4 (Evidence of Severe Self-Neglect). Exploratory Factor Analysis (EFA) and Confirmatory Factor Analysis (CFA) were conducted to identify the underlying factor structure confirm the most parsimonious model that replicated the pattern of latent factors. Fit criteria in the form of the X<sup>2</sup>, Comparative Fit Index (CFI), the Tucker-Lewis Index, the Root Mean Square Error of Approximation (RMSEA) and the Standardized Root Mean Square Residual (SRMR) were assessed to determine model fit. Results: The EFA identified 3 underlying factors: personal appearance (MPA), exterior environment (EE) and interior environment (IE). MPA consisted of usual source of health care, time since the last physician visit, personal hygiene, and untreated medical conditions. IE consisted of odor, cleanliness, clutter, number and condition of pet. EE consisted of structure and exterior of the home. The CFA showed adequate fit based on the X<sup>2</sup> = 53.24, df = 40, p=0.08, CFI = 0.962, TLI = 0.948, RMSEA = 0.041 and SRMR = 0.056. Conclusion: The SSS appears to have construct validity supporting the measurement of the different areas of self-neglect. With further development this tool could potentially be used as a community-based research tool for incidence and prevalence studies as well as providing evidence needed for targeted public health prevention and intervention programs.

### **PROFESSIONALS' PERSPECTIVES ON INTERVENTIONS FOR ELDER FINANCIAL ABUSE: A PILOT STUDY**

S.C. Gibson, E. Greene, *Psychology, University of Colorado at Colorado Springs, Colorado Springs, Colorado*

Introduction. Professionals working with older adults are faced with the challenge of detecting and possibly reporting suspected financial exploitation. This preliminary study examined professionals' perceptions on possible intervention strategies in cases of elder financial abuse. Method. Using vignette methodology, participants (N = 76) from various professions were randomly assigned to one of four conditions portraying a financially exploitative situation involving an older widow

and a recently-befriended caregiver. The vignettes varied by the victim's age (e.g., 60 or 80-years old) and the presence of cognitive impairment (e.g., with or without). Participants rated their perceptions of appropriateness to five help-seeking intervention strategies using a 1-7 Likert scale. Participants also rated the level of potential risk to the elder when no intervention was taken. Results. One-way between-groups ANOVAs revealed no statistically significant differences for age or presence of cognitive impairment on intervention appropriateness ratings. Descriptive findings revealed "Contacting Adult Protective Services" as the most appropriate intervention ( $M = 5.62, SD = 1.55$ ) and "Reporting to the police" as the least appropriate intervention ( $M = 2.92, SD = 1.82$ ). When rating the level of potential risk to the elder when no intervention was taken, statistical results approached significance for age,  $F(1, 72) = 3.48, p = .06$ , with a small effect size (partial Eta squared = .04); whereas greatest risk was perceived when the victim was 60 years old ( $M = 6.08, SD = 0.19$ ) compared to 80 years old ( $M = 5.58, SD = 0.18$ ). Discussion. Findings may be an artifact of vignette methodology in that professionals may need more evidence to endorse intervention strategies. Findings may also be related to the increased advocacy for older adults and support for autonomy that has been shaped by policy and legislation in elder care.

### **ELDER FINANCIAL ABUSE: DECISION CUES INFLUENCING CERTAINTY THAT ABUSE IS TAKING PLACE AND LIKELIHOOD OF TAKING ACTION**

M.L. Gilhooly<sup>1</sup>, M. Davies<sup>1</sup>, D. Cairns<sup>1</sup>, P. Harries<sup>1</sup>, K. Gilhooly<sup>2</sup>, 1. Brunel Institute for Ageing Studies, Brunel University, Uxbridge, United Kingdom, 2. University of Hertfordshire, Hatfield, United Kingdom

In the UK mandatory reporting of suspected elder financial abuse is only required of a small proportion of the professionals likely to encounter such abuse, namely adult safeguarding professionals. Little is known about how other professionals, for example people in banking or health care, make decisions in relation to suspected financial abuse or what prevents them accepting responsibility for intervening in cases of abuse. The research questions for this study were, (1) Which decision cues (case features) are most influential in decision-making? (2) Which characteristics of the decision-maker are most influential in decision-making? Data was collected via the World Wide Web where participants (82 health, 70 social care and 70 banking professionals) were asked to read and rate case scenarios. Data was analyzed quantitatively using two methods: (a) cluster analysis to group participants according to their judgement about the certainty that financial abuse is occurring and likelihood of taking action, and (b) regression techniques to identify the importance of each of the factors in decision-making. Of the many cues that could be used in making a decision, only a few appear to persuade professionals that financial abuse is taking place. Similarly, only a handful of cues influence decision-making in relation to actions taken. The characteristics of the decision-maker appeared to have little influence on the decisions they made; Age, years of experience, gender and living circumstances did not influence certainty of identifying financial abuse or the likelihood they would take action.

### **SESSION 215 (POSTER)**

#### **AGE-RELATED DEPRESSION AND ANXIETY**

##### **PROBLEM-SOLVING THERAPY FROM STROKE SURVIVOR PERSPECTIVE: A PILOT STUDY**

N. Hadidi<sup>1</sup>, R. Lindquist<sup>1</sup>, K.C. Buckwalter<sup>2</sup>, 1. University of Minnesota, School of Nursing, Minneapolis, Minnesota, 2. University of Iowa, College of Nursing, Iowa City, Iowa

Background: Problem solving therapy (PST) is a psychosocial intervention that is effective for treatment of depression in non-stroke patients; however, literature on its impact on stroke survivors is limited. The purpose of this paper is to present the stroke survivors' perspective

on helpfulness and confidence in the use of PST as assessed in a pilot study. Methods: Twenty-two stroke patients ( $n=11$  per group) participated in a randomized controlled, non-blinded pilot study in which treatment group participants received weekly PST, vs. the control group which received weekly phone calls. A questionnaire was administered to the treatment group at a 3-month follow-up to evaluate their subjective perceptions of the impact of PST. Results: Eighty-two percent of participants found PST to be "helpful" or "very helpful" and felt "confident" or "very confident" in using it to resolve issues. Thirty-six percent of participants responded that they used PST to resolve issues "always" or "almost always. Themes were derived from a single-item question asking participants, "In what way, if any has PST, helped you?" Themes included, "accountability," "simplifying problems by breaking them down and considering pros and cons of solutions," "feelings of support," "feeling of not being alone," "motivation to reach goals" and "feeling positive in addressing problems." Conclusion: 3-month follow-up suggests that stroke survivors perceive PST to be a helpful therapy in reducing depressive symptoms and have confidence about using it. Through PST, participants learn and apply the therapy to solve everyday life problems. Considering the small size of this study, future larger-scale research is needed to identify the impact of PST on stroke survivors during recovery.

##### **UNDERSTANDING DEPRESSION IN A COMMUNITY-DWELLING U.S. CHINESE POPULATION: FINDINGS FROM A CROSS-SECTIONAL STUDY OF CHINESE OLDER ADULTS IN CHICAGO**

E. Chang<sup>1</sup>, M.A. Simon<sup>2</sup>, E. Wong<sup>3</sup>, B. Wong<sup>3</sup>, F. Huang<sup>1</sup>, Y. Li<sup>1</sup>, X. Dong<sup>1</sup>, 1. Rush Institute for Healthy Aging, Rush University Medical Center, Chicago, Illinois, 2. Northwestern University, Chicago, Illinois, 3. Chinese American Service League, Chicago, Illinois

Background: The burden of mental health disparities continue to disproportionately affect immigrant older adults. Vast knowledge gaps still persist in understanding the psychological needs of Chinese immigrant older adults – one of the fastest-growing minority communities in the U.S. Methods: We examined psychological-well-being of community-dwelling Chinese older adults in Chicago in a cross-sectional study. In an interview format, we administered PHQ-9 to detect depressive symptoms. Community-based participatory research approach was utilized to partner with Chicago Chinese community. Results: Among surveyed participants ( $N=1,112$ ), the mean age was 74.8 and 64% were female. With respect to depressive symptoms, 32.5% of participants felt trouble falling or staying asleep, 30 % of participants reported tired or having little energy, 19.5% of participants reported little interest or pleasure in doing things, 16.9 % of participants felt left out of life, 16.6 % of participants had trouble concentrating on things, 13.7% of participants reported feeling down or depressed, 10.8 % of participants reported poor appetite or over eating, 7.6% of participants had felt bad about oneself, and 4.4 % of participants had thoughts of better-off dead or hurting oneself at least several days in the past two weeks. Conclusion: To our knowledge, this is the largest cohort of U.S. Chinese older adults in epidemiological studies. Our findings suggest that symptoms of depression are common in Chinese aging population. Population-based study of risk and protective factors are needed to inform future prevention and intervention programs to improve the psychological well-being of this population.

##### **DEPRESSION ON THE MARGINS: THE MEANING VERSUS THE EXPERIENCE OF DEPRESSION**

D.J. Van Dussen<sup>1</sup>, K.L. Culler<sup>2</sup>, 1. Sociology, Anthropology, and Gerontology, Youngstown State University, Youngstown, Ohio, 2. The University of Akron, Akron, Ohio

This presentation covers the experiences of older adults, with depression and the meaning of depression compared to the CES-D. The objective of the presentation is to explore the meaning of depression from

multiple perspectives using mixed-methods research approaches, including the meanings behind and disconnect between quantitative measures and the underlying experiences and meanings of depression. The next part of this presentation examines the roles of stigma and the lifecourse among a sample of older adults with depression. Historic influences of the World War II generation and the sometimes harsh treatment of people with mental health issues are explored to discuss their context in contemporary diagnosis, treatment and experiences of depression. It is important to continue to explore current measures of depression and the measurement characteristics of these measures (e.g. CES-D showing a higher order factor in the current data). The question is how well do these measures capture what it means to be depressed on a qualitative level? The idea behind meaning at the level of measurement is to see how items “behave” across a spectrum of sociocultural variables. This research examines measures of depression with a focus on the CES-D as used among a sample (n= 760) independent living residents of CCRC’s. Major limitations of the CES-D include a lack of perspective (e.g. I feel hopeful about the future) reported by respondents and explored the correlation between age and individual measures within this instrument.

## SESSION 220 (POSTER)

### AGING SUCCESSFULLY

#### PROMOTING COGNITIVE FUNCTION THROUGH CONTINUITY OF ACTIVITY PARTICIPATION

R. Stevens-Ratchford, *Occupational Therapy and Occupational Science, Towson University, Towson, Maryland*

Background. Continuity (Menec, 2003) of longstanding occupation fosters cognitive function and successful aging. Objective. I examined the continuity of longstanding occupation and its relation to cognitive function and successful aging in a sample of 292 community-dwelling older adults. Longstanding occupations are activities in which individuals have devoted time and effort for a prolonged period. Successful aging is ongoing health and mental / spiritual well-being, continued high cognitive and physical function, and engagement with life (Rowe & Kahn, 1999; Stevens-Ratchford, 2008). Cognitive function is essential to continuity of participation in long-standing occupations. Method. I used cross sectional survey procedures to examine cognitively stimulating longstanding occupations. The Longstanding Occupation Measure (LSOM;  $r=0.81$ ) measured the continuity of cognitive activities. The Successful Aging Profile (SAP;  $r=0.84$ ) measured successful aging. Descriptive and correlational analyses were used to describe participation and its relation to successful aging. Results. These participants engaged in a variety of activities that promoted cognitive function. Forty-eight percent ( $n=142$ ) - 65% ( $n=192$ ) of the sample engaged in cognitive activities for 41-60+ years. The continuity of longstanding cognitive occupations had a low but significant correlation to successful aging. Discussion. The study’s findings support Rowe and Kahn’s (1999) notions that engagement with life fosters cognitive function and successful aging. The study also supports Atchley’s (1989) notions of continuity of activity patterns. The results also support the relationship between activity participation fosters cognitive function and successful aging (Holtzman et al., 2004). Conclusion. This sample of community dwelling older adults exhibited continuity in their cognitively stimulating activities.

#### THE ROLE OF LIFE EVENTS IN MEANING-MAKING FOR HEALTHY AGEING PERSONS

W.V. Vaart, *1. University for Humanistics, Utrecht, Netherlands, 2. VU university medical center, Amsterdam, Netherlands*

In scientific literature there is a growing attention for relationships between ageing, health outcomes and ‘meaning in life’. However, while the core of ‘meaning in life’ is commonly seen as a coherence in life

stories that builds on connections between life events, little is known about the role that these life events play in meaning-making by ageing persons. Drawing on a review of empirical research in the fields of psychology, health sciences and related disciplines, this paper presents a theoretical framework that aims to fill that gap. The framework incorporates widely used categories of event characteristics – like the event’s importance, severity, desirability, controllability and the life domain involved – and relates them to dimensions that underlie the concept ‘meaning in life’ in a context of healthy ageing. The paper demonstrates that this theoretical characterization of life events increases our understanding of meaning-making and how this relates to healthy ageing.

#### NEW FRONTIERS IN AGING: INSIGHTS FROM AUTISM APPLIED TO ELDERLY BASED ON “GREEN CARE” FARMS IN EUROPE

R.J. McGovern<sup>1,2</sup>, J.J. McGovern<sup>3</sup>, *1. Clinical Psychology, Argosy University-Arizona School of Professional Psychology, Phoenix, Arizona, 2. Case Western Reserve University-Dept of Psychiatry, Cleveland, Ohio, 3. AT Still University-past president, Kirksville, Missouri*

After learning about the successes of caring for the autistic, elderly, and others at thousands of Green Care farms in Europe, a review of related developmental literature was begun to detect the underlying psychological dynamics. The fact that Green Care (care focused on learning to care) worked for both young autistic children as well as older adults suggested that some common principles might be involved. Green Care settings have residents working with plants, animals, and people in very nurturing environments. Among the positive outcomes reported were improvements in the ability to cope, self-esteem, and empathy. The residents gained an improved sense of their own emotions and a growth in logic and understanding of others by accepting responsibility (meaning) for such tasks as watering plants, feeding animals, and caring for more impaired residents. The characteristics of successful Green Care settings were found to fit the components recommended for healthy human development by Stan Greenspan, M.D., of George Washington University in his highly successful treatment of the autistic. His theoretical framework included the central role of emotional regulation in coding perceptions, controlling movements, and developing empathy and complex thinking. In this presentation, this fundamental framework will be applied to a large number of areas of elder care.

#### THE MOTIVATIONAL POWER OF REGRET: INVESTIGATING THE POSITIVE FUNCTIONS OF REGRET

M. Barreto<sup>1</sup>, L.D. Frazier<sup>2</sup>, *1. Mount Ida College, Newton, Massachusetts, 2. Florida International University, Miami, Florida*

This study aims to shed light on the adaptive function of regrets by exploring how regrets generate positive psychological effects through goal-directed behavior. Regret is both an emotional and cognitive phenomenon; regret includes an element of dissatisfaction and implies counterfactual thinking. Thus, regret involves a comparison of some event or process with another, better event or a process that might have been. Through this process regrets can provide information on why events occurred, the particular causes attributed to events, and the resulting emotional and motivational consequences. We seek to be the first to uncover the processes linking regret to goal-oriented behaviors that result in positive outcomes. Data is being collected through an interview format. The sample consists of both men (32%) and women (68%) across adulthood. Specifically, 36% are young adults between the ages of 18 and 29; 21% are middle-aged adults between the ages of 30 and 59; and 43% are aged 60 or older. Preliminary analyses suggest that regrets can be used as a tool for goal-directed behavior. Our data has shown that regrets present themselves in all periods of adulthood; regrets are incorporated into a future goal; and that the inclusion of a regret into the goal repertoire results in positive psychosocial outcomes. This study paves the way for

important prevention programs aimed at promoting an individual's well-being. This sort of intervention would boost an individual's sense of control, self-esteem, self-efficacy for desired outcomes, and help individuals derive meaning from their experiences in ways that enhance well-being.

#### **IMPACT OF AGE AND RETIREMENT PROXIMITY ON THE RELATIONSHIP BETWEEN SUBJECTIVE WELL-BEING (SWB) AND SELF-EFFICACY**

V. Ryser, *FORS- Swiss Centre of Expertise in the Social Sciences, Lausanne, Switzerland*

Chronological age is a very popular independent variable in developmental research. It is linked with corresponding behaviour and roles, and general expectations over the life course. Chronological age, however, is becoming a less useful variable as people aged because the variability across individual increases over the life course. Consequently, the effect of age is often overestimated in old age research. The aim of our communication is to develop a better understanding of SWB trajectories at the end of life using alternative measures of age. Former research have demonstrated that despite the effectiveness of personal resources and processes of regulation which contribute to the maintenance of a quite good level of SWB in old age, SWB deterioration at the end of life reflects a combination of age, mortality and pathology-related processes. In the present study we will take into account the distance to retirement as a determinant factor for the relation between SWB and self-efficacy. We know that the period of life following retirement is linked with a high level of SWB. After this so-called honeymoon, however, a deterioration of the SWB is often observed which can be explained by a lack of social contact and a loss of personal feeling of being useful. Using a subsample of the Swiss household panel data older than 60 years of age, multilevel analysis will demonstrate how processes of adaptation as self-efficacy help to maintain a good level of SWB in old and very old age taking into account chronological age and distance to retirement.

#### **THE COMPARABILITY OF HAPPINESS AND LIFE SATISFACTION ACROSS COHORTS**

A. Bardo, T. Yamashita, *Sociology and Gerontology, Miami University, Cincinnati, Ohio*

Happiness and life satisfaction are often treated as interchangeable concepts, yet little is known about their comparability across different age groups or cohorts. Underlying conceptual issues make happiness and life satisfaction complex measures to define. The life course perspective suggests that major historical events can affect individual assessments of happiness and life satisfaction disparately. We hypothesize that happiness and life satisfaction are not comparable measures for different cohorts, which previous studies have yet to examine. This study examines the comparability of happiness and life satisfaction across cohorts using the 1973 General Social Survey (GSS: N = 1,504). We selected this earlier wave of the GSS because it includes a wide range of birth cohorts from both before and after the Great Depression. Structural equation modeling was used to test the validity of life satisfaction and its relationship with self-reported happiness. Results show that the life satisfaction measure was valid for our entire sample, as indicated by a series of model fit indices (CFI = .98; TLI = .96; RMSEA = .07). However, this same measure was not valid (RMSEA > 0.1) for older cohorts. Results from multi-group analyses show that the relationship between happiness and life satisfaction is not consistent across cohorts. Interestingly, in this study, the older cohort experienced major historical events (e.g., the Great Depression) during their formidable years (e.g., as children, and young adults). Finally, we discuss more detailed explanations for cohort difference

and the limitations of the interchangeable use of happiness and life satisfaction.

#### **EXPLORING AFFECT IN MIDLIFE AND OLDER ADULTS: COMPARISON OF FACTOR STRUCTURE**

B. Whitehead, C. Bergeman, *University of Notre Dame, Notre Dame, Indiana*

Objective. A substantial literature has established that the experience of affect changes across adulthood; the present study seeks to extend this literature by investigating how the structure of the affective space differs among young midlife (YML; aged 31-50), older midlife (OML; aged 50-64), and later life adults (LL; aged 65+), both globally and on the day level. Methods. 762 midlife and older adults participated in the global and day-level surveys of the Notre Dame Study of Health and Well-Being in Year 1. Affect was measured via the original PANAS supplemented with 22 affect terms tapping a broader arousal spectrum of affective experience. Exploratory factor analyses in each group at each level served to a) provide valence and arousal loadings for each affect term which were then used to plot the affective space, and b) reveal a best-fitting rotated factor structure. Confirmatory factor analyses compared fit for theoretical factor structures and the plot- and EFA-based models; best-fitting models were tested for measurement invariance across groups/levels to better elucidate group differences. Results and Conclusions. A 4-factor model dividing items into 4 valence/arousal quadrants emerged as a best-fitting model for both midlife groups; in the LL group, a 4-factor structure (PA factor and 3 differentiated NA factors) based on the day-level EFA fit best. Measurement invariance tests revealed that the OML group aligned more closely with the YML group in some aspects but with the LL group in others, indicating that this age span is a time of transition in terms of affective structure.

#### **THE DYNAMIC RELATIONSHIP BETWEEN SELF-RATED HEALTH AND LIFE SATISFACTION AMONG RURAL CHINESE OLDER ADULTS: A LONGITUDINAL STUDY USING LATENT GROWTH CURVE ANALYSIS**

L. Xu, I. Chi, *School of Social Work, USC, Monterey Park, California*

Background: Compared with their urban counterparts, rural Chinese older adults were more likely to experience functional impairment and have lower life satisfaction. However, we are unclear about whether health determinate life satisfaction or the other opposite direction. In this study, we tested which one is the leading indicator between self-rated health (SRH) and life satisfaction among rural Chinese older adults. Methods: Four waves of a longitudinal Study of Older Adults in Anhui Province of China were used for this study. A total of 1,715 older adults completed the first wave at 2001 and were followed up in 2003, 2006 and 2009 respectively. Latent difference score (LDS) analyses were applied respectively by using Mplus 5.1 and Amos 5. Results: The results indicated that life satisfaction on average increased over time and SRH followed a decreasing trajectory. The positive correlation between SRH and life satisfaction at each wave meant that the healthier the older adults, the more life satisfaction they have. In addition, the LDS analysis showed that SRH in previous occasion had a significant effect on the subsequent change in life satisfaction ( $\beta = 5.65, p = .000$ ), while life satisfaction slightly predicted subsequent change in SRH ( $\beta = 2.01, p = .065$ ). Therefore, there was almost no lagged effect between SRH and life satisfaction, and SRH thus had a leading role in the prediction effect. Discussion: The results of this study are important for social workers and family practitioners when developing programs and interventions for rural elders.

## AGING VETERANS

**POSTTRAUMATIC STRESS DISORDER AND HELP-SEEKING FROM CLERGY AMONG VETERANS WITH DEPRESSION IN PRIMARY CARE**

L. Bonner<sup>1,8</sup>, A. Lanto<sup>4</sup>, C. Bolkan<sup>2</sup>, G. Watson<sup>1,8</sup>, D.G. Campbell<sup>3</sup>, K. Zivin<sup>5,6</sup>, L. Rubenstein<sup>4,7</sup>, 1. *Veterans Affairs Puget Sound, Seattle, Washington*, 2. *Washington State University, Vancouver, Washington*, 3. *University of Montana, Missoula, Montana*, 4. *Veterans Affairs Greater Los Angeles, Los Angeles, California*, 5. *Veterans Affairs Ann Arbor, Ann Arbor, Michigan*, 6. *University of Michigan, Ann Arbor, Michigan*, 7. *University of California Los Angeles, Los Angeles, California*, 8. *University of Washington, Seattle, Washington*

Although many individuals seek help from clergy for mental health problems, little is known about the prevalence of help-seeking from clergy among Veterans or about the characteristics of VA patients with depression who seek clergy support. We surveyed VA primary care patients (N=761, mean age = 60) with depressed mood and other mental/physical health concerns. Participants responded about preferences for provider type, actual help-seeking from clergy and other providers, and outcomes. Nearly half the sample (47.2%) endorsed being likely to choose clergy for help with emotional problems. Individuals who were likely to consult clergy were also likely to consult physicians and other mental health professionals. A smaller number (11.8%) reported actually consulting clergy within the past 6 months. Controlling for baseline depression, social support, medical comorbidities and alcohol abuse, we found that patients with current PTSD symptoms ( $p=.037$ ) and those with a recent mental health visit ( $p<.001$ ) more frequently endorsed likelihood of seeking help from clergy and actual help-seeking from clergy for emotional problems. A significant number of Veterans surveyed expressed openness to incorporating clergy into their mental health care, particularly older Veterans and those with PTSD. The proportion who actually consulted clergy was smaller, but nonetheless represents a large number of Veterans who could potentially benefit from access to clergy. Further research is needed to determine the treatment preferences of aging Veterans with PTSD. The present data may help inform the role played by clergy within patient-centered care efforts.

**UNIQUE NEEDS AND PREFERENCES OF OLDER HOMELESS VETERANS**

K.A. Frahm<sup>1</sup>, L.M. Brown<sup>1</sup>, S.D. Barnett<sup>3,1</sup>, L. Schonfeld<sup>1</sup>, J. Schinka<sup>2,1</sup>, R. Casey<sup>2</sup>, 1. *Aging and Mental Health Disparities, University of South Florida, Tampa, Florida*, 2. *James A. Haley Veterans Hospital, Tampa, Florida*, 3. *Department of Veterans Administration Center for Excellence, Tampa, Florida*

Objective: Older age is a predictive factor of increased healthcare utilization among veterans. We analyzed data from a large cohort of homeless veterans completing a large transitional program to compare client characteristics and treatment outcomes between older (age  $\geq 55$  years) and younger homeless veterans. Methods: Data for this study consisted of veterans admitted into, and discharged from, the Grant Per Diem (GPD) program during 2003-2009. The VA GPD program provides funds to community-based organizations to deliver housing and supportive services. Information from intake interviews and program discharge was analyzed based on the initial GPD program admission of 40,820 homeless veterans. Results: Older homeless veterans were more likely to be white but comparably male, and recently utilize VA services. A significantly greater number of older homeless veterans reported more serious medical problems including hypertension, cardiovascular disease and emphysema. While older veterans reported decreased use of alcohol and drugs and fewer total days of intoxication, they were less likely to complete the program if they had any

reported current or past alcohol abuse. Despite any alcohol abuse, older homeless veterans were 40% more likely to complete the program compared to younger homeless veterans. Conclusion: Older homeless veterans are at a substantially increased risk of serious medical issues. This older age group is especially vulnerable to experiencing the negative consequences associated with homelessness, including chronic, long-lasting physical and mental health problems and a longer history of homelessness. VA sponsored programs and services may require tailoring to meet their cumulative and complex needs.

**A NEW INSTRUMENT FOR ASSESSING SAFETY CLIMATE IN VA NURSING HOMES: YOU CAN'T IMPROVE WHAT YOU CAN'T MEASURE**

C.W. Hartmann<sup>1,2</sup>, M. Meterko<sup>3,2</sup>, S. Zhao<sup>1</sup>, J.A. Palmer<sup>1,2</sup>, D. Berlowitz<sup>1,2</sup>, 1. *CHQOER, Bedford VA Medical Center, Bedford, Massachusetts*, 2. *Boston University School of Public Health, Boston, Massachusetts*, 3. *VA Boston Healthcare System, Boston, Massachusetts*

A climate of safety—shared values and beliefs regarding patient safety—is recognized as a key to reducing adverse events in hospitals. However, we know little about resident safety climate in VA Community Living Centers (CLCs—i.e., nursing homes), which are undergoing “culture change” to promote resident-centered care. A preliminary version of the CLC Employee Survey of Attitudes about Resident Safety (CESARS) was developed by an expert panel. We conducted two rounds of cognitive interviews and then piloted the revised survey at a national CLC employee conference. A multi-trait analysis (MTA) of these pilot data produced a revised CESARS consisting of 38 items representing 8 dimensions. This version was administered online in 5 geographically diverse CLCs, and exploratory factor analysis (EFA), confirmatory factor analysis (CFA), and MTA were applied to the data. We had an overall response rate of 43% (n=300; range 26%-66%). The EFA replicated the factor structure of the pilot data. Based on the CFA results, we dropped 4 items. The final CFA model indicated satisfactory global data fit: CFI=0.89; TLI=0.87; RMSEA=0.07; SRMR=0.06. All dimensions demonstrated internal consistency reliability of 0.70 or above (range 0.70 to 0.96) except the Culture Change dimension (0.65). A multivariate analysis of variance indicated significant site safety climate differences across sites ( $p<0.000$ ). Overall, sites scored highest on the Shared Importance of Safety dimension (8.04) and lowest on Senior Management's Commitment to Safety (4.04), both 1-9 scales. This is the first instrument to assess safety climate in VA nursing homes, identifying areas for improvement.

**TARGETING ENGAGEMENT ACTIVITIES THROUGH MONTESSORI: EXAMINING FEASIBILITY IN A VA MEDICAL CENTER**

M.M. Hilgeman<sup>1,2</sup>, A. Snow<sup>1,2</sup>, D.J. Vawters<sup>1</sup>, M. Mangrum<sup>1</sup>, J. Biladeau<sup>1</sup>, D. Leonard<sup>1</sup>, B.L. Dinoff<sup>1</sup>, 1. *Tuscaloosa VA Medical Center, Tuscaloosa, Alabama*, 2. *The University of Alabama, Tuscaloosa, Alabama*

Individuals with dementia first benefited from Montessori-based activity programming over a decade ago (Camp, 1999). Montessori activities have documented improvements in basic cognitive abilities (e.g., attention, object permanence), social behaviors/engagement, and decreased behavioral disturbances (e.g., aggression). However, translation to the Veterans Affairs Community Living Centers has not been systematically evaluated. This pilot study examined the feasibility (i.e., implementation, practicality, satisfaction, etc.) of implementing Montessori activities within four diverse units of a VA CLC. Fifty-four CLC staff completed anonymous pre- and post-training questionnaires during a 2-day workshop. Participants included RNs/LPNs (10.8%), CNAs (18.9%), allied health professionals (20.3%), medical providers (1.4%), environmental and dietary support staff (6.8%), administrators (5.4%) and others (9.5%). Staff reported providing M=3.98 direct patient care hours per day (range = 0-8hrs). Prior to training, a minority of staff

reported feeling “mostly” (25.9%) or “completely” (11.1%) able to engage residents with dementia for an extended period of time. Yet 74.5% viewed resident activity engagement as part of their job and 72.7% reported leading a planned activity in the past month. Staff scores on a 12-item pre-training dementia knowledge test revealed satisfactory knowledge about dementia prior to training (i.e.  $M=79\%$  correct, range = 50-100%). Post-training scores revealed improvement on some items though overall scores were not statistically different. Finally 93.9% were satisfied with the training; 89.8% believed it would make them better at their job; and 93.7% reported the training had changed the way they would interact with residents.

#### COMFORT LEVELS WITH CULTURE CHANGE: A SURVEY OF VA NURSING HOME STAFF

J. Palmer<sup>1,2</sup>, M. Meterko<sup>2,3</sup>, S. Zhao<sup>1</sup>, D. Berlowitz<sup>1,2</sup>, C.W. Hartmann<sup>1,2</sup>, 1. Bedford, MA VAMC, Center for Health Quality, Outcomes and Economic Research, Bedford, Massachusetts, 2. Boston University School of Public Health, Department of Health Policy and Management, Boston, Massachusetts, 3. VA Boston Healthcare System, Center for Organization, Leadership and Management Research, Boston, Massachusetts

“Culture change” in nursing homes promotes resident-centered care over medical model care. To assess staff acceptance of culture change principles, we surveyed all employees in a convenience sample of five geographically diverse VA Community Living Centers (CLCs—i.e., nursing homes). The overall response rate was 43% ( $n=300$ ; range 26%-66%). Twelve items inquired about level of comfort with specific culture change scenarios, and two items inquired about the relationship between culture change and CLC residents’ safety. All items used a 9-point response scale, with higher scores indicating greater support for culture change. Overall, staff attitudes about the culture change scenarios tended towards being moderately positive (mean=4.52). Responses to all scenarios varied significantly by site (Wilks’  $\lambda < 0.0001$ ) and by occupation (Wilks’  $\lambda = 0.024$ ). We observed the greatest heterogeneity in staff attitudes on the scenario of staff and residents sharing restrooms ( $CV=101.76$ ). Staff responses were the most homogeneous on the scenario of allowing nursing assistants to access medical records ( $CV=35.18$ ). On the two items regarding resident safety, participants: 1) felt that culture change had a slightly positive effect on resident safety (mean=5.85; s.d.=1.93), but 2) had neutral views about whether safety rules and policies interfered with culture change (mean=5.12; s.d.=2.33). This study identified varying levels of support for culture change among CLC staff. Such information will allow managers, senior leadership, policymakers, and researchers to anticipate specific aspects of culture change for which staff acceptance may be equivocal and for which staff input and/or staff training might be beneficial.

#### EXAMINING RELATIONSHIPS BETWEEN OBJECTIVE AND SUBJECTIVE STRESSORS AND PSYCHOSOCIAL OUTCOMES IN VETERANS WITH DEMENTIA

M. Krestar<sup>1</sup>, D.M. Bass<sup>2</sup>, K. Judge<sup>1,2</sup>, A. Snow<sup>3,4</sup>, N.L. Wilson<sup>5,6</sup>, R.O. Morgan<sup>5,7</sup>, M.E. Kunik<sup>5,6,8</sup>, 1. Cleveland State University, Cleveland, Ohio, 2. Benjamin Rose Institute on Aging, Cleveland, Ohio, 3. Center for Mental Health and Aging and Department of Psychology, Tuscaloosa, Alabama, 4. Veterans Affairs Medical Center, Tuscaloosa, Alabama, 5. Michael E. DeBakey Veterans Affairs, Houston, Texas, 6. Baylor College of Medicine, Houston, Texas, 7. University of Texas School of Public Health, Houston, Texas, 8. Department of Veterans Affairs South Central Mental Illness Research, Education, and Clinical Center, Houston, Texas

Research has consistently found a variety of negative symptoms and psychosocial outcomes associated with living with dementia, such as embarrassment about memory loss and symptoms of depression. However, few studies have examined predictors of well-being outcomes for

individuals with dementia or have utilized self-report data from individuals that assess their perceptions and experiences of their illness. The current study investigated self-report data from 283 veterans with dementia enrolled in “Partners in Dementia Care,” a clinical trial testing a care coordination intervention, to identify salient predictors (e.g., cognitive impairment, difficulty with IADLs) of psychosocial outcomes (e.g., depression). Guided by the Stress Process Model for Individuals with Dementia, the following research questions were addressed: (1) What is the relative importance of primary subjective stressors compared to primary objective stressors in the prediction of psychosocial outcomes in veterans with dementia? (2) Do primary objective stressor measures moderate the relationship between primary subjective stressor measures and psychosocial outcomes? Results will be discussed in terms of the predictive value of objective and subjective reports of individuals with dementia for psychosocial outcomes along with how this information can be used further to understand the illness experience of individuals with dementia.

#### VETERANS HEALTH ADMINISTRATION ADULT DAY HEALTH CARE PROGRAMS: VARIATIONS AND COMMON FEATURES

T. Rivero, J. Hughes, J.L. Martin, B. Kramer, VA Greater Los Angeles Healthcare System Geriatric Research, Education and Clinical Center, North Hills, California

Background: The Veterans Health Administration (VHA) provides non-institutional geriatric and extended care services through a number of programs including Adult Day Health Care (ADHC). VHA ADHC aims to provide interdisciplinary care with the goals of maintaining function and reducing institutionalization for older Veterans. However, there is a paucity of literature that identifies types of mental/behavioral health services provided to Veterans within these programs. Objective: To describe the population served by VHA ADHC and to identify common ADHC program elements with the aim of developing and implementing new mental/behavioral health interventions targeted for VA ADHC programs. Methods: A semi-structured open-ended telephone survey collected data from 7 ADHC site directors in five domains; 1) program background information, 2) screening and admission processes, 3) common patient characteristics; 4) existing mental/behavioral interventions offered, and 5) desirable mental/behavioral health interventions. A comparison of qualitative responses was conducted using note-based analysis. Results: There was substantial variation across programs in services provided. There were also differences in perceptions of mental/behavioral health interventions and the role that these services play in the ADHC setting. Conclusions: Further research is necessary to understand these and other barriers to the implementation of mental/behavioral health interventions for older Veterans in VHA ADHC programs.

#### ASSESSMENT OF A VULNERABLE POPULATION FOR DISASTER PREPAREDNESS

M. Claver<sup>2,1</sup>, T. Wyte<sup>2</sup>, K. Tran<sup>2</sup>, K. Ricci<sup>2</sup>, 1. Gerontology Program, Calif State Univ Long Beach, Long Beach, California, 2. VHA Emergency Management Evaluation Center, Sepulveda, California

This pilot project assessed the role of Veterans Health Administration (VHA) home-based primary care (HBPC) providers in assessing the disaster preparedness of community-dwelling veterans and identified ways in which HBPC policy supports routine assessment of disaster preparedness for its patients. Veterans receiving home-based primary care are especially vulnerable during disasters due to their high rates of chronic diseases, cognitive impairment, and physical disabilities, and their dependence on life-saving treatments and equipment. For many HBPC patients, their functional limitations may also prevent them from being adequately prepared for disasters. Eight HBPC providers from one VA facility participated in face-to-face and telephone interviews about 25 minutes in duration. Transcripts of the interviews were ana-

lyzed using qualitative methods. Results will allow VHA HBPC programs to better understand the role of providers in assessing home-bound patients for disaster preparedness. Future research will expand the study to include several VHA HBPC programs regionally, and then nationally.

### **COLLECTIVE MEMORY IN TESTIMONIES OF THE BATAAN DEATH MARCH**

D. Garst, *University of Texas at Dallas, Richardson, Texas*

Eyewitness accounts of wartime experience are not only essential in historic remembrance of events, but are also valuable resources to explore the collective memory of aging veterans. Reflections of the horrors of war can be used to address topics of collective silence, life review, transmission of legacy, and the development of wisdom in the unique population. American and Filipino soldiers fought to protect Luzon in the Philippines during the Pacific Theater of World War II. The men faced depleted supplies, malfunctioning equipment, disease, and lack of reinforcements and were surrendered to the Imperial Army in April 1942. The prisoners of war (POW) were forcibly marched across the Bataan peninsula in the "Bataan Death March," held in captivity, and ultimately transported via train and ship to Japan for forced labor. The project utilizes oral history testimonies gathered from survivors of the Bataan Death March accessed in archives of the Oral History Project at the University of North Texas, the National World War II Museum, and the Veterans History Project. The project will explore eyewitness testimonies of conditions and physical brutality and cultural/military history in relation to life review and transmission of legacy. Collective memory of the soldiers will also be explored in illustrations of solidarity among the marchers in brutal conditions, silence of the POW experience, post-war reactions, and public memorials to events.

### **SESSION 230 (POSTER)**

#### **ANTECEDENTS AND CONSEQUENCES OF DISABILITIES**

##### **PREDICTORS OF PRECLINICAL DISABILITY IN ADULTS WITH SLEEP COMPLAINTS**

R.A. Lorenz<sup>1</sup>, C.B. Budhathoki<sup>1</sup>, G. Kalra<sup>2</sup>, K.C. Richards<sup>3</sup>, 1. *School of Nursing, Saint Louis University, Saint Louis, Missouri*, 2. *University of Pennsylvania, Philadelphia, Pennsylvania*, 3. *George Mason University, Fairfax, Virginia*

**Introduction:** Preclinical disability, a stage of functional decline, precedes the onset of physical disability. During this stage, older adults have difficulty completing daily tasks, such as walking and climbing stairs, which is associated with increased health care utilization, reduced quality of life, and increased risk for dependency in older age. Because poor sleep may be associated with functional decline, this study examined the relationship between sleep and preclinical disability in adults with sleep complaints. **Method:** Fifty-three community-dwelling adults (38 Females; Mean age=69.6 years; SD=8.9) participated in an ongoing study (1R01AG027778, KC Richards PI) for one night of in-laboratory polysomnography (PSG) and completed the Functional Performance Survey. Preclinical status was constructed by calculating the proportion of tasks for which a change in method or frequency was reported, divided by the total number of tasks. Hierarchical regression analysis was used to estimate the association of sleep variables (mean total sleep time, sleep efficiency, and wake after sleep onset) with preclinical disability after controlling for age, gender, and chronic disease burden. **Results:** In a final multiple regression model ( $R^2=0.202$ ,  $F(2,47)=5.94$ ,  $p=0.005$ ) adjusting for chronic disease ( $p=0.025$ ), total sleep time ( $p=0.01$ ) was the strongest predictor of preclinical disability, such that less sleep was associated with more difficulty completing daily tasks. **Discussion:** Short total sleep time is a potentially modifiable risk factor, which could substantially reduce functional decline and

associated health care costs among the rising population of older adults. Future research should test interventions to improve total sleep time and sleep efficiency.

##### **THE ROLE OF SOCIAL RELATIONSHIPS FOR RECOVERY FROM SEVERE MOBILITY LIMITATION AMONG COMMUNITY-DWELLING OLDER AMERICANS**

K. Latham<sup>1</sup>, P. Clarke<sup>1</sup>, G. Pavela<sup>2</sup>, 1. *Population Studies Center, University of Michigan, Ann Arbor, Michigan*, 2. *University of Florida, Gainesville, Florida*

Recovery from functional health declines is often overlooked in the literature; however, identifying potential facilitators of recovery may highlight opportunities for intervention. Prior research has documented a positive association between social relationships and health, yet there is limited research investigating social relationships and recovery from functional health declines or disease. There is some evidence to suggest that social relationships may be important facilitators for recovery, but the extant literature is very limited including a lack of diverse social relationship measures and measures of recovery as well as a paucity of nationally representative data. Utilizing data from Waves 4 through 9 (1998-2008) of the Health and Retirement Study (HRS), this research examines social relationships and recovery from severe mobility limitation among community-dwelling older adults. Using a more nuanced measure of recovery including complete recovery (severe to no mobility limitation) and partial recovery (severe to mild mobility limitation), a series of discrete-time event history models with multiple competing events were created, which were estimated by using multinomial logistic regression. Robust standard errors were also employed to adjust for clustering at the individual-level. Perceived social support (adjusted odds ratio=1.42,  $p$ -value=0.009) was a strong and consistent predictor of complete recovery, while neighborhood engagement (adjusted odds ratio=1.22,  $p$ -value=0.008) and community engagement (adjusted odds ratio=1.18,  $p$ -value=0.044) were significant predictors of partial recovery. These findings have both theoretical and policy implications.

##### **PREDICTORS OF OLDER ADULTS' MOBILITY BASED ON A COMPREHENSIVE THEORETICAL FRAMEWORK**

M.C. Janke<sup>1</sup>, M. Umstadt Meyer<sup>2</sup>, A. Beaujean<sup>2</sup>, 1. *University of South Florida Polytechnic, Lakeland, Florida*, 2. *Baylor University, Waco, Texas*

Forty-six percent of older adults report limitations in their mobility (Shumway-Cooke et al., 2005), and maintaining mobility is considered an important factor in keeping adults' independent and active in later life. Recently, Webber and colleagues (2010) proposed a theoretical framework identifying multiple domains of mobility, including of five determinants that additively influence mobility (financial, psychosocial, environmental, physical, and cognitive), while also acknowledging the influences of gender, culture and biographical factors. Using data from the Health and Retirement Study ( $N = 6112$ ), this study tests this framework as it relates to older adults' personal and transportation mobility. Our sample had a mean age of 74.74 years, was 84.5% White, 41% male, and 57% married. Structural equation modeling was conducted using MPLUS 6. Using the five determinants, we tested a model of the original framework predicting adults' personal and transportation mobility. This model did not fit the data very well ( $\chi^2 = 1377.15$ ,  $p = .00$ ; RMSEA = .10; CFI = .77; SRMR = .09). Subsequently, we altered the model to include only three determinants of mobility (environment, physical, and psychosocial), which fit the data better ( $\chi^2 = 215.56$ ,  $p = .00$ ; RMSEA = .04; CFI = .97; SRMR = .02). Last, we examined the influence of socio-demographic factors, and found only age and marital status to contribute substantially in predicting mobility. Transportation mobility was predicted by age, marital status and psychosocial and environmental determinants ( $R^2 = .53$ ). Personal mobility was predicted by age, marital status and physical determinants ( $R^2 = .35$ ).

## FACTORS INFLUENCING FUNCTIONAL ABILITY AMONG COMMUNITY-DWELLING ADULTS AGING WITH DEVELOPMENTAL DISABILITIES

B. Hutchings, *Social Work, Marywood University, Scranton, Pennsylvania*

Adults with developmental disabilities are increasingly reaching old age while living in community-based, non-institutional settings. The overlay of cognitive and physical age-related impairments onto existing intellectual and physical disabilities place this generation at risk for premature functional limitations and dependency. This paper presents the results of a study examining individual functional ability in the performance of typical self-care and household activities, personal expectations of competency, and the physical and social environment of the homes of people aging with developmental disabilities. Collecting both quantitative and qualitative data, in-home interviews and observations were conducted with 129 adults aging with developmental disabilities who reside in small, community-based residences. Telephone interviews were also conducted with 20 of their direct care staff. Questions investigated consumers' perceptions of their ability to perform specific self-care and independent living skills in their home environment. An extensive task observation component followed in which consumers were asked to demonstrate how they performed everyday self-care activities. Staff interview topics included how consumers' functional abilities shifted as a consequence of aging, and issues impacting consumers' task performance. Findings indicated that 90 percent of the consumers expected to perform less well than they did during the task observation. Analysis of all data sources suggested factors that may have inhibited functional ability, such as an over-concern with the risks involved, basic home modification and repair needs, and staffs' habitual care-giving behaviors such as performing tasks themselves to improve efficiency. Methods of encouraging and fostering independence and autonomy in the home are discussed.

## INSUFFICIENT HELP FOR ADL DIFFICULTIES AND FUTURE EMERGENCY DEPARTMENT UTILIZATION

G. DePalma, L.P. Sands, *School of Nursing, Purdue Univ, West Lafayette, Indiana*

**BACKGROUND.** Insufficient help for activities of daily living (ADL) disabilities is associated with self-reports of skin breakdown, going hungry, and injuries. Prior research has not determined whether self-reports of health consequences are predictive of need for emergency department (ED) services. We hypothesized that insufficient human help for ADL disabilities is associated with greater risk for ED utilization. **METHODS.** Community-living older adults who responded to the 1994, 1999 and 2004 community interviews of the National Long Term Care Survey (NLTC) were queried about their ADL status, demographic and health characteristics. ED utilization was determined from linked Medicare records. A Cox proportional hazards model was computed to estimate the hazard of ED use for those with insufficient ADL assistance after adjustment for demographics, ADL level, and co-morbidities. **RESULTS.** All subjects had at least one ADL disability; 33% were less than 75 years old, 71% were female, 85% were white, 39% were living alone, and 22% of subjects reported insufficient help for one or more ADL disabilities. Rates of more than one ED admission were 28% and 34%, respectively, for those who did and did not report insufficient ADL help. Compared to those with sufficient ADL help, the hazard of subsequent ED admission for those who reported insufficient help was 1.15 (95% CI = 1.01- 1.44). **CONCLUSION.** Results suggest that self-reports of insufficient help are associated with health events that lead to ED utilization. Future studies are needed to determine whether interventions that reduce reports of insufficient help also reduce ED utilization.

## SOCIO-DEMOGRAPHIC RISK FACTORS AMONG MALAYSIAN OLDER ADULTS

S. Md. Yusof, A. Azhar, M. Zawi, *University of Technology MARA, Shah Alam Malaysia, Shah Alam, Malaysia*

**Background:** Falls are the leading cause of injury among people above 65 years old. Falls and the consequences are the major health-related problems among older adults. Everyone should be aware of fall risk and its contributing factors. **Objective:** This study is aimed to determine the socio-demographic factor variables related to falls among Malaysian older adults. **Methods:** 212 participants represented four zones in peninsular Malaysia were recruited. Participants were divided into three age groups: young old (65-74 years), mid-old (75-84 years) and oldest-old (>85 years). Fall risk was represented by Overall Stability Index (OSI) assessed by Biodex Balance System. Interviews were conducted to acquire factors related to socio-demographic variables. **Results:** A 2x2 ANOVA was performed to ascertain the socio-demographic factors on the fall risk. Significant effect for gender  $F(2, 206) = 185.5, p < .05$ , race,  $F(2, 206) = 165.4, p < .05$ , residency factors,  $F(2, 206) = 179.3, p < .05$  and educational attainment  $F(2, 206) = 137.2, p < .05$  with large effect size (partial eta squared = 0.64, 0.62, 0.64, 0.57 respectively) were observed. Tukey-HSD analysis demonstrated significant difference in all age groups. **Conclusions:** Understanding fall risk factors may provide a better insight in preventing falls among elderly which may promote a modification in activities. A objective national fall risk profiling would be important in addressing quality lifestyle issues among this population.

## UNMET NEED FOR ADL DISABILITY AND RISK OF UNDESIRED TRANSITIONS AMONG COMMUNITY-LIVING OLDER ADULTS

S. He<sup>1</sup>, H. Xu<sup>2</sup>, B.A. Craig<sup>1</sup>, P. Stallard<sup>3</sup>, L.P. Sands<sup>1</sup>, *1. School of Nursing, Purdue Univ, West Lafayette, Indiana, 2. Indiana University, Indianapolis, Indiana, 3. Duke University, Durham, North Carolina*

**BACKGROUND.** To assess whether self-reports of unmet need for ADL disability are prognostic of older adults experiencing multiple transitions from the community including admission to a hospital, skilled nursing facility, or death within one year. **METHODS.** Interview dates, demographics, ADL functioning and health status of community respondents and whether they have unmet need for ADL disability were determined from the 1994, 1999, and 2004 National Long Term Care Survey (NLTC). Dates of admission to and discharge from hospital and skilled nursing home, and dates of death, were obtained from linked Medicare and vital statistics data. **RESULTS.** Among 7226 respondents who reported at least one ADL disability during the NLTC community interview, 80% were 75 or older, 72% were female, 89% were white, 34% were hospitalized within one year prior to the interview, and 21% reported unmet need for ADL disability. The proportion of respondents experiencing at least one transition within one year after interview were 43% vs. 37% for those with vs. without unmet need for ADL disability. Furthermore, a respondent with vs. without unmet need for ADL disability underwent 1.00 vs. 0.78 transitions on average. A Poisson regression model that adjusted for demographics, ADL functioning and health status revealed that unmet need for ADL disability was associated with an increased risk for transitioning from the community (RR = 1.13, 95% CI: 1.01-1.26). **CONCLUSION.** For older adults with at least one ADL disability, self-reports of unmet need for ADL disability are prognostic of experiencing transitions from their community residences.

## PHYSICAL PERFORMANCE VERSUS DISABILITY IN A TRADITIONAL FORAGER-HORTICULTURALIST POPULATION

F. Wheaton, E. Crimmins, *Univ Southern California, Los Angeles, California*

Little is known about physical performance and disability and how these are related in traditional human populations. The Tsimane of

Bolivia are an indigenous forager-horticulturalist group with high physical activity and little obesity, but have high inflammation, low life expectancy, and limited access to medical care. Data on adults aged 50+ from the Tsimane Health and Life History Project (N=602) were used to examine differences in measured physical performance and self-reported disability between remote and more developed villages. Physical measures reflect poor physical functioning, and include a timed 3-meter walk (>9 seconds), a tandem stand with eyes closed (<10 seconds), and standing on one leg (<10 seconds). Disability was defined as having difficulty with or being unable to do one or more of the following activities of daily living (ADLs): dressing, bathing, eating, using the bathroom, or mobility. Controlling for age and sex, logistic regression results indicate that odds of disability did not differ between regions. In contrast, those living near San Borja had 1.97 times higher odds of performing poorly on the timed walk ( $p<.001$ ), and had 2.25 and 1.72 times higher odds of being unable to hold the tandem stand ( $p<.001$ ) and the one-leg stand ( $p=.025$ ). Selective mortality may be higher in remote areas, or those in remote areas may maintain higher levels of physical activity. Finally, the discrepancy between physical performance and perceived disability may be due to a lack of environmental modifications and assistive devices in remote areas and lower access to medical care.

### THE EFFECTS OF HIP FRACTURES ON DEBILITY AND DESTITUTION

M. Kilgore<sup>1</sup>, D.J. Becker<sup>1</sup>, T. Arora<sup>1</sup>, J.R. Curtis<sup>2</sup>, K.G. Saag<sup>2</sup>, E.S. Delzell<sup>1</sup>, M.A. Morrissey<sup>2</sup>, 1. *Health Care Organization and Policy, UAB School of Public Health, Birmingham, Alabama*, 2. *UAB School of Medicine, Birmingham, Alabama*

Hip fractures are devastating, with mortality and costs comparable to heart attacks and strokes. Osteoporosis medications are at least as effective as lipid lowering and antihypertensive medications, but not nearly as well utilized. The impact of hip fractures on functional status and patient costs has not been well characterized. This study estimates fracture effects on debility, as evidenced by subsequent nursing home (NH) residency, and destitution, as evidenced by entry into Medicaid. We obtained data for the 5% sample of Medicare beneficiaries from 1999 through 2009. Eligible subjects were continuously enrolled in traditional fee for service Medicare in the year prior to a hip fracture. We defined NH residency as the receipt of physician service for nursing facility care in the absence of Medicare claims for SNF services. We identified Medicaid enrollment using the Medicare code indicating State Medicaid buy-in for premiums. We identified 98,961 eligible hip fracture cases; of these, 20,100 occurred among individuals already NH residents. Excluding these, 56% of hip fracture cases were alive and community dwelling one year after the fracture, 26% died within the year and 18% had become NH residents. Among those who died, 21% spent some period of the year in a nursing home. Of the 68,027 community dwelling beneficiaries not enrolled in Medicaid prior to the fracture, 4.4% enrolled in Medicaid at some point in the year after the fracture. Of 17,767 beneficiaries already enrolled in Medicaid before the fracture, 39% were NH residents.

### SESSION 235 (POSTER)

#### ASSESSMENT (INCLUDING GERIATRIC ASSESSMENT, FUNCTIONAL ASSESSMENT, FUNCTIONAL STATUS INSTRUMENTS)

#### PREDICTORS OF TRANSITION AMONG OLDER ASSISTED LIVING RESIDENTS

T.B. Piggee, L. Morgan, *University of Maryland Baltimore County, Baltimore, Maryland*

In a longitudinal analysis of data from six assisted living (AL) sites in Maryland, proxy and performance-based measures of physical func-

tion (MDS-ADL, balance, chair rise, gait, and grip strength) and cognitive status (proxy - MDS-COGS, performance - MMSE) were used to examine the link between changes in functioning and transitions from AL. Seventy residents (mean age 85.4 years), were assessed at 6-month intervals over 18 months. Assisted living caregivers provided proxy data. Correlations between proxy-rated physical functions (ADL) and those for performance evaluated tasks found notable discrepancies. While most residents were notably limited in some or all physical functions, proxies rated a majority (80%) as independent in all ADL tasks. For cognition (MDS-COGS and MMSE), proxy and performance-based measures showed strong association ( $r = -.685$ ,  $p = .001$ ) in the expected direction. Neither baseline functioning of either type nor changes over time in physical or cognitive status predicted resident transitions. Findings suggest subjective assessments by proxies may result in inappropriate retention or transfer.

### DEVELOPMENT AND PSYCHOMETRICS OF HOME SAFETY SELF-ASSESSMENT TOOL (HSSAT) FOR COMMUNITY-DWELLING OLDER ADULTS TO PREVENT FALLS AND ITS EFFECTIVE DELIVERY METHODS

M.R. Tomita, *Rehabilitation Science, Buffalo, New York*

One in three older adults who are 65 years and older has a fall in a given year, and nearly half of this population fall again. Although falls can be preventable, an effective tool to identify home hazards and their solutions is lacking. The purpose of this study was to develop the Home Safety Self-Assessment Tool (HSSAT) and establish its psychometrics for the use of community-dwelling older adults. The Transtheoretical model and focus groups involving older adults guided to develop the HSSAT. It includes nine areas of home (illustration, a list of risk factors, corresponding solutions), local resources (home modification service providers, stores, free services), ADA guidelines, newest helpful products, other fall prevention tips, and an action log. Using 107 convenience samples, reliability, validity and responsiveness were tested. The HSSAT had high test-retest reliability (ICC=.99) and interrater reliability (ICC=.86). Construct validity applying hypothesis testing showed that those who fell in the past year removed on average nine hazards in construct to one by those who did not fall ( $p<.001$ ). The HSSAT is an easy-to-use and effective tool to reduce home hazards in older adults who had a fall.

### 'OTHERING' IN NEED ASSESSMENT PRACTICES: HOW UNDERSTANDINGS OF ETHNIC/CULTURAL 'OTHERS' CAN BECOME INSTITUTIONALIZED

S. Torres<sup>1</sup>, E. Forssell<sup>2</sup>, A. Olaison<sup>3</sup>, 1. *Uppsala University, Uppsala, Sweden*, 2. *Linköping University, Linköping, Sweden*, 3. *Ersta Sköndal University College, Stockholm, Sweden*

This presentation departs from the research gaps that exist in the debate on institutional categorization as far as the implications of ethnic 'otherness' are concerned. There is also a gap in the manner in which such understandings affect the political economy of care and there is also a lack of research on the intersection between ethnic 'Otherness' and old age. The project upon which this presentation is based departs from all of these debates and focuses on need assessment practice within the context of Swedish elderly care. As such, it aims to contribute to research on images of old age as these are constructed through welfare sector practices. At stake are the following research questions: do understandings of cross-cultural care interaction and ethnic 'Otherness' affect the manner in which need assessment processes legitimize and restrict access to certain elderly care services and if so, how. The data for this project is comprised of focus group interviews with need assessors (a total of 60 have been interviewed) as well as a total of 200 need assessment journals. The findings suggest that need assessors' understandings

of old age differ depending on which other social positions elderly people 'inhabit'. The presentation will contribute to the debate on institutional categorization and how lack of an awareness of the implications on ethnic/cultural 'Otherness' influence power differentials in old age.

### **COGNITIVE CAPACITY AND FUNCTION ASSESSMENTS IN HEALTHY ELDERLY ADULTS**

S.L. Schandler, J.V. Flowers, M. Bredice, *Psychology, Chapman University, Orange, California*

The burgeoning population of healthy adults aged 60 years through the early nineties places new demands on the assessment of function in these persons. Cognitive function is related directly to the person's ability to maintain acceptable quality of life as physical function reduces with advancing age. Most instruments designed to assess cognitive function in the elderly either provide a general yes/no verification of global deterioration (e.g., dementia) or are more precise existing instruments normed on younger populations and statistically extended to provide a very general idea of cognition function. Four instruments were used to examine cognitive function in two groups each of 50 healthy elderly adults without history of dementia. Using National Institute on Aging criteria, one group was classified as Young-Old (YO, 61-74 years) and the other Old-Old (OO, 75-92 years). The instruments were the Mini-Mental State Examination (MMSE); Blessed Information-Memory-Concentration Test (BIMC); Shipley Institute Living Scale (SILS); and Reynolds Intellectual Screening Test (RIST). RIST possesses norms extending to 94 years while SILS norms are statistically extended beyond 70. All subjects scored in the instruments' normal range. Lacking normative data and precision, MMSE and BIMC yielded similar, very general assessments of cognitive status. With their higher resolution, RIST and SILS showed age-related patterns in function. However, SILS scores were significantly elevated and more variable for OO subjects. The findings demonstrate the viability of assessing cognitive function in the elderly and emphasize the importance of applying assessment instruments with high resolution and actual norms rather than statistical extrapolations.

### **THE FUNCTIONAL ASSESSMENT QUESTIONNAIRE: MEASUREMENT PROPERTIES IN HISPANICS AND NON-HISPANIC WHITES**

P. Sayegh, B.G. Knight, *Department of Psychology, Univ Southern California, Los Angeles, California*

Functional decline is one of the hallmark symptoms of dementia and is frequently assessed as part of the dementia diagnostic process. The Functional Assessment Questionnaire (FAQ) is frequently used as a measure of the ability to carry out independent activities of daily living, yet this scale has not yet been assessed for cross-cultural factorial invariance. The aim of this study was to test the measurement invariance of the FAQ among 444 Hispanic and 11,081 non-Hispanic White outpatients assigned a diagnosis of either normal cognition or dementia at their initial evaluations at 33 Alzheimer's Disease Research Centers across the US. Using confirmatory factor analyses, we tested the cross-cultural measurement properties of our hypothesized one-factor (i.e., dementia severity) model of the FAQ. Results of our analyses confirmed the cross-cultural invariance of the one-factor FAQ structure ( $\chi^2/df = 38.39$ , CFI = .895, TLI = .865, RMSEA = .057), pattern of factor loadings ( $\Delta\chi^2(9) = 10.33$ ,  $p = .32$ ,  $\Delta CFI = .00$ ), and intercepts ( $\Delta CFI < .01$ ). Given this evidence of cross-cultural invariance, we were able to compare the latent mean estimates for the dementia severity factor across groups and did not find a significant difference,  $p = .16$ . Our findings suggest that the FAQ can be used to make meaningful interpretations and comparisons of the dementia severity factor mean estimates across these groups. In addition, the similarity of latent mean estimates across groups in this study suggests that these patients presented with comparable levels of dementia severity as measured by the FAQ.

### **DETERMINING SUICIDE RISK IN GERIATRIC POPULATIONS: A REVIEW OF THE CURRENT LITERATURE**

J. Sibson, N. Porta, S.A. Ogbeide, *School of Professional Psychology at Forest Institute, Springfield, Missouri*

Suicide prevalence rates are higher among adults 65 years of age and older compared to any other age group. In addition to risk factors such as depression, challenges such as age-related physical and cognitive impairments and sudden breaches in family and social support are of particular importance. The current paper proposes that primary care is the most suitable setting to enact suicide prevention strategies with this population. Evidence across many studies reveals that the majority of older adults who die by suicide meet with their primary care providers (PCP) within one year of suicide, and a significant portion of these individuals meet with their PCPs within 1 to 6 months of suicide. Suicidal ideation, however, is rarely reported by the patients or identified by the practitioners during these final consultations. The current paper introduces empirically supported considerations for suicide risk assessment among geriatric populations, and highlights the importance of creating intervention strategies within primary care settings. The potential utility of applying generalized suicide risk assessment models (e.g., the H.E.L.P.E.R. model) to geriatric populations is proposed. The current paper also highlights the current literature on potential measures for preventing geriatric suicide. As the percentage of Americans 65 years of age or older increases significantly, rates of suicides are expected to rise significantly. Increasing awareness of geriatric suicide risk and implementing proper assessment strategies, particularly in primary care settings, can significantly reduce the number of preventable deaths among this growing population.

## **SESSION 240 (POSTER)**

### **ATTITUDES ABOUT AGING**

#### **AN ANALYSIS OF MODELS OF AGING PRESENTED IN A WOMAN'S MAGAZINE**

A.M. O'Hanlon<sup>1</sup>, B. Brookover<sup>2</sup>, *1. University of New Orleans, New Orleans, Louisiana, 2. Xavier University of Louisiana, New Orleans, Louisiana*

Research has shown that older women are rarely featured in fashion magazines. Published statistics of images of older women range from three to nine percent. These kinds of trends have also been found in the MORE, a magazine targeting women aged 40 and older. One study found that MORE, similar to other fashion magazines, included many ads that focused on "anti-aging" products, with the message that aging should be fought. Yet, how does MORE present images of woman over 40 in its editorial content? To address MORE's representation of women, the current study analyzed a series of photos from a monthly feature called "This is What (Actual Age over 40) Looks Like." This feature presents a photo of the woman, her age, and a brief description. The study used a sampling frame of 30 cases from this feature selected and posted on the website by the MORE editors. The women in the photos ranged from 40 to 54 years old. Each photo was coded for type of photo, clothing, and markers of aging. The accompanying text was also analyzed. The two coders had high agreement. Findings indicate that while there was some diversity in images, the majority of the women featured would be considered youthful in appearance (67%), thin (73%), and displayed relatively few outward signs of aging. The feature was also often used to promote and sell beauty products as the women identified which products they used. The implications of these findings are discussed.

## FEELINGS TOWARDS OLDER VS. YOUNGER ADULTS IN EUROPE

L. Ayalon, Bar Ilan University, Ramat Gan, Israel

The present study evaluated the association of modernization (at the macro/societal-level) and modernity (at the micro/individual-level) with feelings towards older vs. younger adults. The European Social Survey is a biennial multi-country, cross-sectional survey. Analysis was based on the fourth wave, which included a rotated module on ageism. The sample consisted of 28 countries and a total of 54,988 respondents. The outcome was based on two affective items measuring explicit feelings towards older vs. younger adults. Hierarchical linear modeling was used in the analysis. Only a small portion of the variance was attributed to cross-country differences. Results suggest that overall respondents tend to report positive feelings towards both older and younger adults, with a general trend towards more positive feelings towards older adults relative to younger adults. More educated and less religious individuals tended to report more negative feelings towards older vs. younger adults. In less urban countries, respondents were more likely to report negative feelings towards older vs. younger adults. The findings provide some support to the claim that modernity is associated with reports of affective ageism, but no support to a relationship between modernization and affective ageism.

## WALK IN THEIR SHOES: AN EXPERIENTIAL LEARNING OPPORTUNITY IN AGING

J. Gossard<sup>1</sup>, M. Dever-Bumba<sup>1</sup>, R. Gajadhar<sup>2</sup>, 1. *Internal Medicine, Div. of Geriatrics, USC School of Medicine, Columbia, South Carolina*, 2. *Palmetto Health Richland, Columbia, South Carolina*

While the population in the United States is aging, there are an inadequate number of geriatric health care practitioners to meet this rising need. How can we educate and sensitize healthcare professionals to the aging process? The "Walk in Their Shoes" experience was first used in conjunction with the Chief Resident Immersion Training (CRIT) in Geriatrics program to allow residents experience "old age", and to create a foundation for understanding the aging process. The participants experience everyday activities and medically-related tasks from the vantage of an older adult with various impairments in several physiological systems. Participants are asked to perform typical activities that older adults carry out on a regular basis - dressing, walking, cognitive tasks, balance, as well as some medical tasks such as mental status evaluation, medical consents, medication management and use of hearing aids. Impairment examples include vision change via "Drunk Goggles" and other limitations from glaucoma and yellowing of the lens; splints to impair mobility; gloves that simulate arthritis; timed up-and-go testing, and an Empathy Belly to demonstrate decreases in muscular strength and changes in balance as well as the threat of falls. Participants have been evaluated on the basis of attitude, knowledge and identification of practice changes. Preliminary data suggests that the training results in a significant change in attitude towards the aging process, improved knowledge of the physiological changes that occur with aging, and a more empathetic understanding of function in older adults. Participants additionally have identified relevance to their personal clinical practice.

## PSYCHOSOCIAL ISSUES OF AGING

D. Ajuluchukwu, HPE & GSS, York College, CUNY, Jamaica, New York

Even though the elderly population currently represents only about 12.5% of the general population, this is the fastest growing segment of our population and by the year 2050 it is projected that they will represent 22.9% of the entire United States population. In this study the investigators have compared four different nursing homes' patients in New York City (private funded and Medicaid funded). Our specific aims were to: Examine psychological issues defined as nutrition, transportation, housing, legal issues, access to primary care, financial and

recreational activities, and obtaining patient's perception on how these variables impact on their daily activities. Chi-squares on the completed questionnaires indicated the following significant findings: The average Nursing Home resident is a white female age 81. The majority of the residents prefer to be in their homes. The average daily cost of a Nursing Home is about \$350.00 per night. The typical widowed resident is not lonely. 97% of the residents agree that their kids and or family members are helping them finance their stay at the Nursing Home. 93% of the residents agree that their life savings have been used to finance their stay at the Nursing Home. Only 44% of the residents interviewed agreed that Medicaid pays for their Nursing Home.

## AS DAYS GO BY: AN EXAMINATION OF INTRA-INDIVIDUAL VARIABILITY IN SUBJECTIVE AGING AND SELECT CORRELATES

A. Stripling<sup>1</sup>, N.D. Dautovich<sup>2</sup>, M.(. Heesacker<sup>3</sup>, 1. *Psychology, Department of Veteran Affairs San Francisco VA Medical Center, California, California*, 2. *University of Alabama, Tuscaloosa, Alabama*, 3. *University of Florida, Gainesville, Florida*

Subjective age is the perception of how old or young people experience themselves to be. This research area has made great strides since the 1950s, when it was first examined. However as the field continues to develop, the issue of the stability in subjective age perceptions has grown in importance. Research has revealed that inter-individual differences in subjective aging are correlated with the circumstances of life transition people undergo. However, advances in understanding subjective aging also require consideration of intra-individual variation, or fluctuations that occur within the same individual on a day-to-day basis. The current study examines the relationship between intra-individual variation in subjective aging, anxiety, aging satisfaction and self-esteem in 78 community dwelling adults ages 18-77 (M=42.84;SD=16.42). A null, predictor-free multilevel model was run to calculate the intraclass correlation coefficient (ICC) for each variable of interest. Based on the ICC, the percent of total variability attributed to fluctuations within-persons ranged from 15-32%. After detrending for time trends (linear, quadratic, cubic), intraindividual standard deviations (ISD) were calculated for each individual representing within-persons variability. Bivariate correlations revealed variability in subjective aging was correlated with variability in: anxiety [ $r(70) = .32$ ,  $p = .006$ ], satisfaction with aging [ $r(70) = .55$ ,  $p < .001$ ], and self-esteem [ $r(70) = .58$ ,  $p < .001$ ]. In short, more variable perceptions of subjective age were associated with greater fluctuations in anxiety, satisfaction with aging, and self-esteem. Implications include an increased understanding of subjective age perceptions, as well as, a more complete understanding of the variability in these perceptions and the relationship this variability has on mood.

## AGING PERSPECTIVE OF A MALE LATINO FORMER GANG MEMBER

D. Lien, California State University, Long Beach, Long Beach, California

**PURPOSE:** This qualitative study aimed to examine the perspective of aging held by a male Latino former gang member. **BACKGROUND:** Research on gangs has focused on violence, the nature, and membership encompassing gangs. The body of knowledge has been significant to the aims of gaining a better understanding of gangs on many different levels. One area of gang research where little attention has been paid to is the aging perspective of gang members. **METHODS:** Purposive, non-random sampling was used in this case study. The interview was guided by a list of question and recorded. It was transcribed verbatim, coded, and analyzed for major themes and concepts. **RESULTS:** Major themes that were prevalent include skipped life stages, early maturation, disjunctive physical and mental age, transitions in life roles, familial influences, gang deviant life style, and religion. **DISCUSSION:** Aging is a continual process defined by many factors like social environment,

biology, and psychology. This process is idiosyncratic for a former gang member, but threads of commonality can still be drawn to general aging concepts. Themes of skipped life stages and early maturation become poignant to his aging process, which itself has definitively changed as he has chronologically aged. As he has “matured out”, major themes in his gang years has changed; family no longer means other gang members, but family comes to mean wife, children, and mother. Aging for this male Latino former gang member is defined by his life experiences and changes, changes that are not exclusive to the numerical age.

### THE UNIQUE JOURNEY OF AGING

J.N. Stone, *University of Southern California, Los Angeles, California*

It is generally thought that all old people are the same. They are slow, set in their ways, and lack that vibrant exciting essence of youth. Our society has a stigma against aging and we have come to believe that “getting old” is something that everyone should try to avoid. This is the very reason ageism exists. However, there is no clear cut answer to what “getting old” actually means. Aging is unique to every individual and there is more heterogeneity in the older population than among the middle aged. As the life-span perspective shows, aging is a lifelong process that continues until the day we die. Each person experiences aging in their own way based on biopsychosocial forces. The purpose of this qualitative study was to interview women over age 45 about their experience of aging. Ten women who varied in ethnicity, social class, and age were asked open-ended questions about their attitudes toward aging. The results revealed that each woman aged in a different way because of differences in culture, socioeconomic status, the cohort they grew up in, and their own personal choices in life. The results also allowed a deeper analysis of aging by looking at how sisters from the same family differed in their views, as well as how caregivers in a nursing home versus private homes viewed aging. The results are discussed in terms of the life course perspective.

### BABY BOOMERS, COMPLEMENTARY/ALTERNATIVE MEDICINE, AND AGING ANXIETY

N. Millman, *1. Columbia University, New York, New York, 2. University of Southern California, Los Angeles, California*

Complementary/Alternative Medicine (CAM) is on the rise in the United States. However, the relationship between CAM and health in the older population is complicated; recent research suggests that the Self-Rated Health (SRH) levels of CAM users in the United States tend to be higher than those of non-CAM users, a trend deeply associated with race, education, income, and age. The association with age is significant in that it shows a distinction along generational lines. This study focuses on the relationship between aging anxiety, CAM use, and the meaning of aging among the members of the Baby Boomer cohort and the Preboomer cohorts. This study seeks to demonstrate whether aging anxiety, self rated health quality, and alternative healthcare seeking are correlated in adults older than 48 years old. The hypothesis, based on research, is that older adult individuals who seek complementary / alternative healthcare approaches seek such healthcare for different reasons. These reasons differ based on ‘whiteness’ / immigration status, generational solidarity, and income, among other factors. The respondents are drawn from UC Irvine’s and CSU Bakersfield’s Osher Lifelong Learning Institutes, and the survey was administered over Qualtrics. The interviews were conducted over the phone. This study’s aim is to form a foundation upon which to build a proposal for a health intervention program and answer these questions: what does aging mean to Baby Boomers who use CAM, and does aging mean something different to Baby Boomers who do not use CAM? And, what role is played by a sense of control over personal health, lay initiative, “magical thinking,” and other aspects that characterize the meaning of illness and health?

## SESSION 245 (POSTER)

### CANCER SCREENING & TREATMENT

#### DECISION-MAKING ABOUT BREAST CANCER TREATMENT AMONG OLDER AFRICAN AMERICAN WOMEN

S.S. Martin<sup>1</sup>, E.L. Csikai<sup>1</sup>, D. Batey<sup>1</sup>, T.L. Peterson<sup>3</sup>, D.K. Harmon<sup>2</sup>, C. Broussard<sup>1</sup>, J.K. Taylor<sup>1</sup>, *1. School of Social Work, The University of Alabama, Tuscaloosa, Alabama, 2. University of West Alabama, Livingston, Alabama, 3. Western Kentucky University, Bowling Green, Kentucky*

Although mortality rates from breast cancer increase for all women with age, the mortality rates are highest among older African American women. The combination of age and ethnicity puts older African American women at high risk for poor cancer outcomes. Treatment decision-making, particularly with a life-threatening illness such as cancer, can be confusing and stressful for patients and families. The primary aims of this study were to understand the treatment experiences and decision making processes among older African American women diagnosed with breast cancer and explore the influence of family on treatment adherence, satisfaction with decision-making processes and overall cancer experience. A qualitative phenomenological approach was utilized in this study. In-depth interviews were conducted with 23 older African American women (45 and older) who had been diagnosed with and received treatment for breast cancer. Interviews were semi-structured, audio-taped, transcribed, and data organized with Atlasti software. Meaning units and themes were extracted from the transcripts illuminating the participants’ lived experiences. Respondents described emotional reactions to discovery/diagnosis of breast cancer, decisions about sharing diagnoses with family and friends; perceptions of discussions with medical professionals; support from family members; and the strong spiritual connection that many depended upon throughout treatment and beyond. Themes that emerged included: Diagnosis Experience; Reactions to Diagnosis; Decisions to Tell Family/Others; Beliefs about Health Care System; Treatment Decisions; Coping; Importance of Church/Higher Being; and Survivorship/Follow-up Care. The experiences of these women may help to develop comprehensive shared decision-making models that account for and incorporate the importance of family.

#### A MIXED METHOD STUDY OF THE RELATIONSHIP BETWEEN MULTIPLE MORBIDITY AND COLORECTAL CANCER SCREENING

N.E. Schoenberg<sup>1</sup>, S.T. Fleming<sup>1</sup>, Y.N. Tarasenko<sup>2,1</sup>, S.H. Bardach<sup>1</sup>, *1. Behavioral Science, University of KY, Lexington, Kentucky, 2. National Center for Health Statistics, Hyattsville, Maryland*

Researchers, providers, and patients have often described the competition between multiple morbidity (MM) management and disease prevention, particularly among vulnerable low SES populations. To empirically examine and explain this relationship, we conducted a telephone survey and follow up focus groups using colorectal cancer screening (CRCS) as an index prevention behavior. In the telephone survey of 1,153 Appalachian residents aged 50–76, 38% reported two-three MM, 25% indicated 4-5 MM, and 15% reported six or more MM. Only 8% had no MM and 15% indicated one MM. Nearly 2/3rds reported receipt of CRCS according to guidelines. White race, post high school education, and perception of having more than enough income on which to survive were associated with higher rates of any guideline concordant CRC screening. Statistically significant trends in the outcome of adjusted odds ratios for colonoscopy with greater number of morbidities ( $P < 0.05$ ) were noted; the higher number of morbidities, the higher rates of screening. To improve our understanding of this dose response relationship, we also conducted 13 focus groups, six with providers and seven with patients. A main explanation offered by both groups involved

greater exposure to medical care resulting in greater opportunity for screening; in a low income population that otherwise may not receive prevention counseling, having chronic conditions requiring medical attention also facilitates exposure to prevention. These results, the first known characterizing the relationship between MM and CRCS among a vulnerable population, provide evidence that multiple morbidity may enhance rather than obstruct but rather prevention behaviors.

### **CANCER SCREENING, INFORMATION SEEKING, AND LIFESTYLES AMONG WOMEN**

Y. Yeo<sup>1</sup>, E. Lee<sup>2</sup>, S. LevKoff<sup>1</sup>, *1. College of Social Work, University of South Carolina, Columbia, South Carolina, 2. University of North Carolina at Charlotte, Charlotte, North Carolina*

Overview: Understanding factors associated with routine cancer screening is critical, given that breast and cervical cancers are both treatable diseases, particularly when detected in early stages. This study examined the factors associated with routine cancer screening in a nationally representative sample of women aged 40 and older. Understanding the factors associated with adherence to cancer screening guidelines is critical, given that breast and cervical cancers are treatable. Given the undisputed value of mammogram and pap test in reducing morbidity and mortality, this study examined characteristics associated with maintaining regular cancer screening in a nationally representative sample of women aged 40 and older (n=2113). Our data source was the National Cancer Institute's 2005 Health Information National Trends Survey (HINTS), a cross-sectional survey that captures cancer-specific items. Logistic regression analysis was used to identify the correlates of two outcome variables: whether respondents have adhered to recommended mammography and pap test. Women were considered adherent to screening guidelines if they had two consecutive, on-schedule screenings and planned to have another within the next 3 years. The most consistent predictor of adhering both pap test and mammography was employment, health insurance, nonsmoking status, and getting health information from community organizations. Women who are older, unmarried, and overweight were less likely to adhere pap test. Women who search health information from health care providers and internet were more likely to meet recommended pap test. Those who lived in urban areas, had family supports to get a ride to visit doctors, and attended religious services were more likely to adhere to their regular mammography. Findings of this study suggest that healthcare providers pay particular attention to the screening needs of older women. Learning about older women's preferred information sources may help to guide future interventions.

### **A YEAR IN THE LIVES OF PATIENTS DIAGNOSED WITH ADVANCED STAGE CANCER**

G. Kyriotakis<sup>1,2</sup>, J. Kelley-Moore<sup>2</sup>, J.H. Rose<sup>2</sup>, *1. Geriatric Research Education and Clinical Center (GRECC), Louis Stokes VAMC, Cleveland, Ohio, 2. Case Western Reserve University, Cleveland, Ohio*

Lack of understanding of trajectories of well-being of patients diagnosed with advanced stage cancer is the Achilles heel of interventions and programs that seek to improve quality of life at end-of-life. In order to become more effective in improving the quality of life we need to provide decision-makers and clinical staff an evidence-based account of how patients traverse the course of their illness. To this end this study aims to: 1. identify trajectories and model the patterns of change of six different domains of well-being; 2. capture variation in well-being outcomes attributed to modifiers such as demographics and utilization; 3. examine the interplay of different domains of well-being over time. Five hundred seventy six patients at baseline are analyzed who have data until death or for up to one year. Longitudinal variables are analyzed using generalized latent growth models. The results from these analyses suggest that patients' well-being is compromised in the first 3-6 months after diagnosis followed by an improvement in the psychoso-

cial domains but not in the physical. Treatment types at baseline (~8 weeks from diagnosis) have differential effects on the initial level and rate of change among the different domains of well-being. Finally, changes in social support and in spirituality are not related to physical or to mood changes throughout the illness experience. On the contrary, changes in the psychological domains are closely related to changes in the physical well-being. Results can be used to identify times of increased need where interventions may be needed most

### **ACTIVE SURVEILLANCE, PHYSICIAN PARTNERED MONITORING OR WATCHFUL WAITING: VARIATION IN LABEL EFFECT OF MONITORING PROSTATE CANCER**

D. Bailey<sup>1</sup>, A. Cooper<sup>1</sup>, M. Luce<sup>1</sup>, K. Weinfurt<sup>1</sup>, M. Kazer (Wallace)<sup>2</sup>, *1. Duke University, Durham, North Carolina, 2. Fairfield University, Fairfield, Connecticut*

The NIH recently convened a State-of-the-Science Conference on the role of Active Surveillance in the management of men with low risk prostate cancer and confirmed that active surveillance is a viable option that should be offered to patients with low-risk prostate cancer. However, many men diagnosed with disease undergo aggressive treatments that have significant, deleterious effects on their quality of life (QoL) but do not necessarily prevent problems or prolong life. Close observation for appropriately selected patients may maintain QoL without increasing the chance of the cancer spreading. However, this option is underutilized and men and their families need support in the decision making process related to acceptance of and adherence to active surveillance. We used a randomized experimental exposure administered via an online questionnaire to examine the way in which three labels made monitoring (rather than invasive treatments) more appealing to 620 men at risk for prostate cancer, and to track how men reacted to potential pros and cons of different treatment options, including monitoring (with the different labels). In this paper we present our findings, which include variation across monitoring labels (active surveillance, physician partnered monitoring and watchful waiting) and between monitoring and more invasive treatments. We will discuss the implications of these findings for further research and clinical practice.

### **QOL AND AFFECTING FACTORS IN PROSTATE CANCER SURVIVORS AND NON-CANCER CONTROLS AND RACIAL DISPARITY**

L. Song<sup>1</sup>, Y. Ji<sup>2</sup>, *1. University of North Carolina-Chapel Hill, Chapel Hill, North Carolina, 2. Asia Research Institute, National University, Singapore*

The adapted Stress-Coping model guided the development of this descriptive, cross-sectional study. Prostate Cancer survivors (N=219) and non-cancer matched controls (N=2,892) were selected from a population representative survey dataset, i.e., Medical Expenditure Panel Survey. Descriptive analysis and multiple regression models were used to achieve the research aims. The outcome variable, QOL, was measured using SF12. The mental and physical component scores (MCS and PCS, respectively) were used in the analysis. Potential influencing factors of QOL, selected based on literature review, included activity of daily living (ADL), depression, co-morbidities, and socio-demographics. Results: MCS was similar between survivors and controls or between Blacks and Whites in bivariate and multivariate analyses. Better MCS was associated with better ADL, less depression, fewer co-morbidities (all ps<.001), being non-Hispanics (p<.05), older age (p<.001), and middle to high income (p<.01), and being married (p<.05). In bivariate analyses, PCS in survivors was worse than in controls (p<.0001); PCS in Whites was marginally better than in Blacks (p=.09) but worse than in Hispanics (p=.08). In multiple regression, PCS did not vary between survivors and controls or between Blacks and Whites. Better PCS was associated with better ADL, less depression, fewer co-morbidities, older age, college or higher education (all ps<.0001), being Hispanics (p<.01), and higher income (p<.0001). About 49% and 36% of the variance of

MCS and PCS, respectively, was explained by these factors. Conclusion: QOL of men 50 years and older is affected by physical, psychological, and social factors (including race) but not by whether having had prostate cancer.

### **IMAGES OF REACTION: CHRONICALLY ILL OLDER ADULTS AND CANCER DIAGNOSES**

S.M. Hannum, R. Rubinstein, *Sociology and Anthropology, University of Maryland, Baltimore County, Baltimore, Maryland*

Chronically-ill older adults (age 65+) who receive a new cancer diagnosis face many unique challenges (e.g., medication management, fractioning of care, etc.), yet little is known about how individuals come to an understanding of and attach meaning to this experience. This qualitative study seeks to describe, in part, how older individuals experience a new cancer diagnosis and the effects this might have on their overall healthcare trajectories and their notions of personal health, well-being, and life satisfaction. Interviews were analyzed thematically to describe how a subsample of individuals in the study presented and described the personal meaning of the cancer experience through descriptions of their diagnosis and the events preceding it: the stories of illness, its meaning, and its consequences. Understanding this enhances illness management quality by eliciting common areas of stress within the diagnosis and illness experience for the older individual, particularly in light of multimorbidity.

## **SESSION 250 (POSTER)**

### **CARE VALUES AND PREFERENCES**

#### **MEASURING PREFERENCE CONGRUENCE FOR RECREATIONAL ACTIVITIES: A FIRST LOOK AT A POTENTIAL QUALITY INDICATOR**

K. VanHaitsma<sup>1,2</sup>, K. Eshraghi<sup>1</sup>, C. Duntzee<sup>1</sup>, M.H. Kleban<sup>1</sup>, S. Crespy<sup>1</sup>, S. Humes<sup>1</sup>, M. VanValkenburgh<sup>1</sup>, *1. Polisher Research Institute, North Wales, Pennsylvania, 2. University of Pennsylvania, Philadelphia, Pennsylvania*

CMS has increasingly embraced person-centered care, encouraging providers to enhance their ability to demonstrate that their care addresses the needs and preferences of frail elders. In addition, new “meaningful use” requirements have emerged out of health care reform encouraging providers to make maximum use of electronic medical records (EMRs). This paper reports on research that attempts to create a new quality indicator (QI) measure that allows providers to document and track their level of person-centered care in recreational activity delivery using EMR data. Pilot study subjects were 40 cognitively impaired skilled nursing residents, selected based on the MDS 3.0 staff assessment for mental status scores. The new QI indicator- “% Activity Preference Congruence (%APC)”- was calculated by extracting the 7 MDS 3.0 Section F “Preference for Activities” items and matching the extent to which activity attendance records were congruent for each resident’s most important preferences. Overall mean %APC for recreational activities was 52.62% (sd= 27.09). Using theories of person-environment fit, we examined hypothesized relationships between %APC and potential barriers to preference fulfillment. Analyses indicated significant relationships between %APC and MDS 3.0 items of “makes self understood” (r=.38, p<.01), “ability to understand others” (r=.31, p<.05), “cognitive skills for daily decision making” (r=.51, p<.001), and overall ADL impairment (r=.36, p<.02). In all cases, more impairment was related to less activity preference congruence. Discussion will include implications for use of this new quality indicator as a tool for measuring one aspect

of person-centered care delivery and the barriers to preference fulfillment

### **INFORMATION MODALITIES FOR OLDER ADULTS: A REVIEW**

J.M. Sjostedt, M. Bull, *Nursing, Marquette University, Milwaukee, Wisconsin*

Background: Communicating information to older adults is a vital aspect of patient education and clinical research. With the advances in technology new modalities are available to aid communication. The questions posed for this literature review were: 1) what are older adults’ attitudes and preferences regarding current modalities and 2) what factors influence older adults’ modality preferences. The answer to these questions is essential to guide clinicians and researchers in obtaining quality information. Method. Data bases searched for the years 2005 to 2011 included PubMed, CINAHL, and Google Scholar. Key terms used were elderly, geriatric, octogenarian, older adults, questionnaire, paper and pencil, computer, computer-assisted, telephone, survey, preferences, reliability, modalities, and disability. Criteria for inclusion were articles in English, and those addressing different methods for evaluating older adults’ performance on questionnaires, response rates, preferences and potential barriers. Results. A total of 28 articles and two books met the inclusion criteria for the review. The majority of studies were descriptive or quasi-experimental cohort studies; and two were meta-analysis comparing different modalities. The four modalities reported in the literature were paper and pencil, in-person interviews, telephone-based interviews, and computers or other electronic devices. Response rate, reliability and validity of the modalities was influenced by multiple factors, including the older adult’s gender, race, presence of a disability, time commitment, information content, compensation, location, and whether or not the modality was self-administered. Conclusions. The findings suggest factors clinicians and researchers might consider in deciding on the most appropriate modality for their projects.

### **PERSONAL PRIVACY AND AUTONOMY: BATHING IN ASSISTED LIVING**

R. Hrybyk, A. Frankowski, A.D. Peebles, *Center for Aging Studies, UMBC, Baltimore, Maryland*

In assisted living (AL) residents’ preferences may be at odds with management’s policies. This becomes problematic when considering preferences in personal activities such as bathing. In some AL settings, shower enclosures are not included in residents’ private bathrooms, and having to bathe in a centralized shower room becomes a public activity as residents walk through the AL in their slippers and robes. Combining this with the presence of a care aide while showering can contribute to a resident’s discomfort. Increasing frailty of older adults often necessitates giving up independence for assistance. The gradual erosion of control over one’s body heightens vulnerability making it difficult to hold onto one’s sense of self. Dignity, autonomy, and privacy are often compromised in collective living settings. In this poster we explore the relationship between bathing and autonomy in AL. We examine: (1) the range of personal choice related to showering permitted to residents; (2) facility rules on bathing and how these rules are interpreted by staff; and (3) acceptance or resistance by residents to assistance with bathing. We conclude with practical suggestions for direct care staff. Data are drawn from an on-going, multi-year ethnographic study. Textual analysis using the software program Atlas.ti identified thematic codes relating to body care, decision making, home operations, personal preferences, and power and control. Extensive fieldnotes and in-depth interviews offer an insider’s view of the lived experience of assisted living. Literature related to person-centered care and its emphasis on autonomy of the individual also informs this poster.

CAREGIVING

**ATTITUDES AND KNOWLEDGE ABOUT ALZHEIMER'S DISEASE AMONG ASIAN INDIAN SERVICE PROVIDERS, CAREGIVERS AND ELDERLY**

R. Gupta, V. Pillai, *School of Social Work, San Francisco State University, San Francisco, CA, California*

Objective: The purpose of this study was to gauge the attitudes and knowledge about Alzheimer's disease from primary care physicians, caregivers and the older adults. Methods: Eight primary care physicians, 30 caregivers and 29 older adults participated in in-depth interviews. These in depth interviews were conducted by first author and trained graduate students from Allahabad University. Results: Asian Indian caregivers, older adults as well as the physicians viewed memory loss as normal part of aging. Participants who had witnessed older adults with AD viewed it as a mental illness. Most of the participants lacked knowledge about the diagnosis, and treatment of AD. A large proportion of the caregivers and older adults did not make health care decisions and left it for the physicians. Conclusions: There is a need to expand the education about AD to Asian Indian physicians as well as the general public. The normalization as well as stigma combined with Asian cultural norms can be barriers to early assessment and intervention with AD patients and the caregivers. Further research on symptom recognition by the disease stages and causal attitudes is needed to better understand the existing knowledge about AD among Asian Indians.

**HEALTH IMPACT OF CAREGIVING: RESULTS FROM THE SINGAPORE SURVEY ON INFORMAL CAREGIVING**

C. Malhotra, A. Chan, R. Malhotra, J. Rush, T. Ostbye, *Duke-NUS Graduate Medical School, Singapore, Singapore*

Caregivers of older adults with limitations in Activities of Daily Living (ADLs) often experience significant health problems themselves. The purpose of this study was thus to compare the prevalence of clinically relevant depressive symptoms, self-rated health and number of outpatient visits between caregivers and non-caregivers. Data from Singapore Survey on Informal Caregiving (2010-2011), involving interviews with 1190 older adults (>75 years) with at least 1 ADL limitation and their caregivers, and 379 older adults (>75 years) with no ADL limitations and their potential caregivers, was used. Depressive symptoms assessed using the 11-item CES-D (Center for Epidemiologic Studies) scale, self-rated health and number of outpatient visits in the last one month was compared between caregivers and non-caregivers. Binary logistic regression model was used to compare clinically relevant depressive symptoms, ordinal logistic regression model compared self-rated health and zero-inflated negative binomial model was run for comparing number of outpatient visits among caregivers and non-caregivers adjusting for various characteristics of the caregiver/non-caregiver and care-recipient/ potential care recipient. Analysis showed that caregivers were more depressed, had poorer self-rated health and had greater number of outpatient visits compared to non-caregivers. The study indicates the need for support services to the family caregivers of older adults with ADL limitations.

**CHINESE DAUGHTERS' EMPLOYMENT OF FOREIGN HELPERS AS SURROGATE CAREGIVERS FOR AGEING PARENTS: IMPLICATIONS**

P. O'Neill, *Sociology, University of Oxford, Oxford, United Kingdom*

Historically, Chinese normative values have deprived daughters of education, freedom of choice and financial independence, relegating them to the roles of housekeeper, cook and caregiver within a rigid family hierarchy. Today however, that paradigm has shifted. Chinese daughters are widely educated, working outside the home, and are often self-sufficient. Though independence is on the ascent, obligations associated

with family membership have, nonetheless, not abated. Domestic activities remain within the woman's purview. However, because time is at a premium, many Chinese women employ foreign domestic workers (FDWs) to manage these responsibilities. This construct has, in turn, generated its own set of problems and complaints on both sides. The purpose of this paper is to explore issues related to the employment of FDWs with respect to caregiving of ageing parents. Thirty-eight Chinese women age 31-65 and six FDWs participated in semi-structured interviews in Singapore and Hong Kong during 2011-2012. Fourteen of the women interviewed currently employ FDWs. Qualitative analysis is being conducted using the Critical Incident Technique and Thematic Analysis to identify the issues and their implications. Initial analysis suggests there is discontent with this arrangement by both employers and FDWs. In this sample, mistrust and unmet expectations were issues for employers and their elderly parents. Mistreated FDWs were resentful, angry, exhausted, underpaid, homesick, dealing with a high degree of stress and living in fear.

**POSITIVE EMOTIONS AND PSYCHOLOGICAL RESILIENCE IN ADAPTATION TO DEMENTIA CAREGIVING AMONG FAMILY CAREGIVERS IN SOUTH KOREA**

Y. Kwon<sup>1</sup>, I. Park<sup>2</sup>, E. Kim<sup>3</sup>, *1. Stanford University, Los Altos Hills, California, 2. Chungnam National University, Daejeon, Republic of Korea, 3. Daejeon University, Daejeon, Republic of Korea*

The present study examined the stress-adaptation process of dementia caregiving over time using a weekly follow-up design. This adopted design (once a week over a month, a total of 4 times) was a good fit with the characteristics and demands of family dementia caregiving. Eighty-eight Korean family caregivers who were providing hands-on care for a family member diagnosed with dementia-related disease (e.g., Alzheimer's disease), were recruited through the District Public Health Center Registries in South Korea. They were mostly adult children or daughter-in-laws (90%; spouse and other 10%), ages 25-78 years (M = 52.8, SD = 9.1), mostly women (80%; men, 20 %). In regression analyses, we investigated the effects of chronic and daily caregiving-related stress on caregivers' depressive mood, and the role of psychological resilience and positive emotions in adaptive process to dementia caregiving. Across all caregivers, chronic caregiving-related stress (e.g., severity of dementia symptoms, perceived caregiving burden) was significantly related to caregivers' depressed mood. However, daily-level depressive mood was only marginally related to the daily exposure to caregiving strain (e.g., care receivers' problem behaviors). As between-person variables, positive emotions and psychological resilience seemed to have an adaptive benefit to caregiving stress. Positive emotions mediated the effect of daily stress on daily depressive mood. Higher level of psychological resiliency significantly predicted lower caregiving-related stress, more daily positive emotions, and lower depressive mood scores. These results support the important role of positive emotions in adaptation to life stress.

**END OF LIFE FOR OLDER ADULTS: FAMILY MEMBERS' EXPERIENCES**

S. Izumi, C.R. Van Son, *College of Nursing, Washington State University, Spokane, Washington*

End-of-life (EoL) trajectories of older adults with chronic conditions are difficult to anticipate posing challenges for involved family members. The purpose of this presentation is to describe the experiences of family members of older adults facing the last months, weeks and/or days of their life. Twenty-three family members of deceased older adults were interviewed. All family members described their persistent pursuit of information to discern the fluctuating status of their loved one. Information was needed so that they could plan for their older adult's care and continue to manage their own lives. Once the older adult was

in the health care system, the course of care was often based on institutional protocols or common practice of the care providers. Family members expressed frustration that care providers often failed to acknowledge the individuality/independence of the older adult. On the other hand, family members needed to keep the delicate balance between respecting older adults' autonomy and advocating for them while steering the nuances of their older adults' condition, providers' recommendations and institutional settings. Due to uncertain trajectories, palliative care options and EoL plans of care were frequently not brought up until death was imminent leaving family members feeling unprepared and angry. Family members felt that not being included in the process made them passive observers and then regretting later that they "could have or should have done more."

#### **SELF-EFFICACY FOR SURROGATE DECISION MAKING: A NEW FRONTIER FOR SUPPORTING FAMILY CAREGIVERS**

R.P. Lopez<sup>1</sup>, K. Rose<sup>2</sup>, I. Canty Williams<sup>2</sup>, A.J. Guarino<sup>1</sup>, 1. *School of Nursing, MGH Institute of Health Professions, Boston, Massachusetts*, 2. *University of Virginia School of Nursing, Charlottesville, Virginia*

Surrogate decision making is an arduous task for many families caring for individuals with dementia. While self-efficacy for managing dementia may shelter against burden and depression, there is paucity on self-efficacy for surrogate decision making. The primary purpose of this study was to assess the following correlates to Surrogate Decision Making Self-Efficacy: (a) age, (b) education, (c) income, (d) advance directive, (e) family support, and (f) family resources. Participating surrogate decision makers (N = 125) ranged in age from 27 to 91 and were mostly Caucasian, female, and college educated. Approximately half reported incomes above \$50,000 and had Advanced Directives. This study employed the following instruments, (a) The Family APGAR, (b) The Family Resource Scale, and (c) The Surrogate Decision Making Self-Efficacy Scale. Four demographic items were included, (a) Age of the Caregiver, (b) Household Income, (c) Education level, and (d) Presence of an Advance Directive. Results of the simultaneous multiple regression analysis indicated a coefficient of .58,  $p < .001$ . Whereas Family Resource, Family APGAR, and Advanced Directives were positively correlated, Household Income was inversely related to Self-Efficacy. These findings strongly suggest that families who lack social support, resources, and cannot rely on an Advance Directive are less likely to feel efficacious in their role as surrogate decision maker. Further studies are needed to explore the negative relationship with household income and the influence of self-efficacy on measures of quality of care, quality of decision making, and psycho-social outcomes for surrogate decision makers.

#### **SUPPORTING INFORMAL CARE PROVIDERS THROUGH EDUCATIONAL CONFERENCES**

D. Martin<sup>1</sup>, N. Ensor<sup>2</sup>, M. Fennelly<sup>1</sup>, 1. *The Center for the Study of Aging, McDaniel College, Westminster, Maryland*, 2. *Carroll County Department of Aging & Disabilities, Westminster, Maryland*

While much of the focus on our growing senior population has centered on the economic costs of providing healthcare to this group, little attention has been paid to educating informal care providers about the aging process. As a result, family care providers suffer from burn-out and often become isolated, depressed and lose some sense of self due to the care needs of their loved one. Although there are alternatives to familial care, the vacancy and turnover rates in the direct care industry are high. Poor wages and benefits are the primary reasons for industry turnover; however, another commonly cited reason is the lack of understanding of the unique challenges presented by older adults (physical, mental health, and social challenges) while completing the care tasks. In response to these concerns, a day-long conference on the bio-psycho-social processes of aging was held. Eighty-five informal care

providers attended the conference and completed surveys regarding their reasons for attending, satisfaction with content presented and suggestions for future conferences. The primary reason identified for attending the conference was "lack of knowledge about the aging process." This was followed by "a lack of resources available/resources unknown to me that support me in my care-giving role." The attendees reported high rates of satisfaction with all of the material presented, expressed an interest in future events and provided a laundry list of topic suggestions for future conferences. The results underscore the need to provide age-related education to family and direct care workers.

### **SESSION 260 (POSTER)**

#### **CAREGIVING IN FAMILY CONTEXT**

##### **IN-HOME CARE COORDINATION AND INTENSIVE CAREGIVER SUPPORT FOR CAREGIVERS OF VETERANS WITH DEMENTIA**

J. Tomko, A. Lloyd, J.G. Hennon, S.B. Hall, J. Husted, K. Zana, D. Sykes, *VA Pittsburgh Healthcare System, Pittsburgh, Pennsylvania*

Caregivers of persons with dementia are often at significant risk for depression, burden, declining physical health, and cognitive impairment. Caregiver support interventions have been shown to increase the caregiver's knowledge about the disease, decrease the care recipient's disruptive behaviors, lessen the negative effects on the caregiver, as well as delay nursing home placement and reduce overall healthcare costs. The current study within the VA Pittsburgh Dementia Caregiver Support Program examines the effects of a caregiver support intervention delivered utilizing an interdisciplinary team approach and a telehealth device. The participants during the first year of the program included 118 informal caregivers living with veterans with dementia. Measures assessing caregiver burden, depression, self-reported health, cognition, satisfaction with the program, care recipient's behavior, and care recipient's functional status were obtained at baseline and 6 month intervals. Caregivers were provided educational information disseminated by the telehealth device, ongoing case coordination by registered nurses, optional individual and group psychotherapy, and resource identification by a licensed clinical social worker. Preliminary findings indicated that after six months, caregivers (n=56) reported a high degree of satisfaction with the program, significant decrease in burden, and improved cognitive status. Despite reports of ongoing experiences with disruptive behaviors, caregivers endorsed a reduction in associated distress. Challenges and limitations in implementing the program are reviewed.

##### **THE NEEDS OF GRANDPARENTS RAISING GRANDCHILDREN AS PORTRAYED BY THE POPULAR PRESS**

E.L. Houston, C.A. Fruhauf, *Human Development and Family Studies, Colorado State University, Fort Collins, Colorado*

Grandparents raising grandchildren have received great attention in the gerontological literature. Researchers' have explored the service needs of grandparents raising grandchildren. Despite researchers' interest, little is known about the focus on grandparents raising grandchildren in popular press articles. This is important, as most grandparents read popular press articles instead of referred journal articles. The purpose of this research was to analyze online popular press articles to answer the research question - What areas do journalists address related to the service needs of grandparents raising grandchildren? We examined online articles from the years 2010 and 2011 from *Generations United*, *AARP*, and *USA Today's*. All articles were accessible to the general public, were not password protected, and did not require a subscription to access. A total of 35 articles from 2010 and 43 articles from 2011 were collected. Using grounded theory techniques, we analyzed articles to develop patterns and codes. Findings revealed there were

three categories addressing service needs of grandparents who parent grandchildren: (a) services for grandparents, (b) financial support, and (c) statewide initiatives. Overall, there is a lack of accessible services and financial support to help grandparents and service providers. Journalists should consider increasing awareness about grandparents raising grandchildren through writing about the supports and services that are needed or are already available in their community. Future researchers examining online articles addressing grandparents raising grandchildren might consider looking at different popular press venues (e.g., other newspapers and websites) and consider examining grandparent blogs to understand what grandparents are discussing.

#### **MASTERY: A COMPARISON OF WIFE AND DAUGHTER DEMENTIA CAREGIVERS**

C. Simpson, P. Carter, *School of Nursing, University of Texas, at Austin, Austin, Texas*

**Purpose:** To understand the female dementia caregiving experience in the context of kinship. **Aims:** 1) describe the differences and similarities in wife and daughter caregivers; 2) analyze global and caregiving mastery as moderators of stressors and caregiver's perceived stress and depression. **Methods:** Sixty-four female caregivers participated in a cross-sectional study. Student *t* tests identified differences between wives and daughters. Correlations explored the relationships between stressors (frequency of symptomatic behaviors and dementia severity), mastery (global and caregiving), stress and depression. Multiple linear regression tested moderating effects of mastery on the relationship between stressors and stress and depression. **Findings:** Wives spent more hours per week caregiving. Daughters reported higher levels of dementia severity. Daughters reported more days of poor mental health. Mastery, stress, and depression scores were not statistically different between wives and daughters. Global mastery had a direct effect on perceived stress and depression for both wives and daughters. Caregiving mastery contributed to the variance in wives' stress and depression but only for daughter's stress in relation to frequency of symptomatic behaviors. Global mastery approached significance in moderating the effects of behavioral symptoms on wives' depression. Caregiving mastery did not demonstrate a moderating effect in this sample. **Conclusions:** This study provides new information on the moderating effect of mastery and the differences between wife and daughter caregivers. Recognizing differences in the caregiving experience is important for effective interventions. Interventions building on both types of mastery would benefit wives, while interventions focusing on developing caregiving mastery could decrease daughters' stress.

#### **FAMILY CAREGIVERS' APPRAISAL OF AGGRESSIVE BEHAVIOR**

H. Hirata<sup>1</sup>, T. Harvath<sup>1</sup>, L. Miller<sup>2</sup>, *1. Oregon Health & Science University, Portland, Oregon, 2. University of California, Davis, California*

**Background:** Caring for elderly people with dementia can be burdensome for family caregivers (CGs), especially when an elderly person exhibits aggressive behavior (AB). Caregivers' appraisal of the cause of ABs and whether they think the person with dementia can control these behaviors may have an impact on how upsetting the behaviors are to CGs. **Purpose:** The purpose of this secondary analysis was to examine the relationship between CG's appraisal of how upsetting ABs were, whether a care receiver (CR) can control AB, and what CGs think is the cause of ABs. **Method:** CG's appraisal of dementia-related AB was examined using the Caregiver Appraisal of Behavioral Symptoms in Dementia (Harvath & Miller, 1999). ABs included in the analysis were: "curse or use other foul language," "tear things or destroy property," "making threatening statements," "become aggressive," and "accuse you." **Findings:** There was a significant relationship between 1) the frequency of ABs and the level of caregiver's distress, e.g., "cursing" ( $\beta = 6.41, p < 0.001$ ), and 2) appraisal that the CR could control

the AB and the level of CG upset e.g., "become aggressive" ( $\beta = 0.93, p < 0.001$ ). CG who thought that CRs could not control AB such as "cursing" were 63% more likely to think that the cause of AB came from dementia (OR = 0.37,  $p < 0.01$ ). **Discussion:** Findings illuminate the importance of interventions for CGs' appraisal of ABs.

#### **THE EFFECT OF CAREGIVING ON THE MARITAL SATISFACTION OF ARMENIAN-AMERICAN WOMEN**

G. Mkrtchian, R. Giarrusso, *Sociology, California State University, Los Angeles, Los Angeles, California*

While research has shown that caregiving negatively influences the marital satisfaction of white women, little is known about the link between caregiving and marital satisfaction of Armenian-American women. Among traditional Armenian women, caregiving is an expected part of the marital role; consequently, caregiving may not have a negative impact on their marital relationship. The purpose of this research was to examine the relationship between caregiving and marital satisfaction for Armenian women in the U.S. who were either acculturated or non-acculturated. A convenience sample of 110 Armenian women, between the ages of 35 to 65, who are married and providing care to a parent and/or a parent-in-law, was selected from two Armenian Christian churches in southern California. The results of the study revealed that acculturation had less of an effect on caregiving and marital satisfaction that would have been expected. Acculturation did not have a direct effect on women's evaluation of their marital quality; however, it did have an indirect effect on marital quality through its effect on caregiving. Caregiving that involved direct physical contact (assisting with ADLs) led to increased perceptions of inequity and stress; however, contrary to prediction, even less intrusive forms of caregiving (assisting with IADLs and providing emotional support) were also associated with increased perceptions of inequity and stress. Only feelings of stress had a direct effect on marital quality. The results are discussed in terms of their implications for stress theory.

#### **MALE CAREGIVERS OF OLDER ADULTS: THEIR FINANCIAL STRAIN, EMOTIONAL STRESS, AND SELF-REPORTED HEALTH**

A. Schwartz, *Boston College, Graduate School of Social Work, Chestnut Hill, Massachusetts*

Women have traditionally assumed the role as primary caregiver in families (Delgado & Tennstedt, 1997), but as the number of older adults and their needs increase, and within the context of changing gender roles (Sanders, 2007), it is expected that more men will become primary caregivers. Between 1990 and 2050, the ratio of potential caregivers is projected to decrease from 11:1 to 4:1 (RWJF, 1996), and joined with the continued increases of women in the work force (Galinsky, Aumann, & Bond, 2011), there is a growing demand for male caregivers. Therefore, further exploration of the men's needs is warranted. This study examined age, race, and employment status as predictors of self-reported health, financial strain, and emotional stress of male caregivers of individuals age 50 and over. Potential moderators tested included: choice in becoming a caregiver, co-residence, relationship to the care recipient, and if the care recipient received paid help. Data was from the Caregiving in the U.S. Study: 2009, conducted by the National Alliance for Caregiving in collaboration with AARP, with funding from MetLife. The present sample included 463 male caregivers, with a mean age of 49 years. In regard to self-reported health, ordinal regression analyses revealed that the older a participant was, the poorer their self-reported health. Moderation analyses revealed minority caregivers as having higher self-reported health when caring for someone other than a parent or parent in-law compared to whites caring for a parent or parent in-law. Underlying cultural differences influencing the outcomes of interest are explored.

## EFFECTS OF COMMUNITY CARE RESOURCE ENVIRONMENTS ON CAREGIVING BURDEN

T. Wakui<sup>1,2</sup>, T. Saito<sup>2</sup>, E.M. Agree<sup>1</sup>, I. Kai<sup>2</sup>, *1. Population, Family and Reproductive Health, Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, 2. School of Public Health, the University of Tokyo, Tokyo, Japan*

Long-term care services and support networks are important for family caregivers as individual resources. However, the effects of the community care resource environments on the caregiver's burden remain overlooked. In this study, we examine how the community environments impact caregiving burden with a multilevel analysis after controlling for the individual risk factors. Cross-sectional data was collected from a family caregiver survey conducted in 17 municipalities in north-western Japan in 2010 (N = 2405). Community environments were measured as aggregated mean scores in each municipality based on individual self-reports about the efficiency of long-term care services, caregiver support, support networks, and information. The Zarit Burden Inventory was used to assess the caregiving burden. The final sample comprised caregivers who were spouses (N = 703), daughters (N = 516), sons (N = 375), and daughters-in-law (N = 704) of the care recipients. The community environments did not have significant effects on the burden of spouse and daughter caregivers. However, son caregivers reported lower burden in areas where long-term care service, caregiver support, and support networks were deemed more than adequate. Contrastingly, daughters-in-law with a better support network environment reported higher burden. Findings suggest that improving the community environment would mitigate the burden of the individual caregiver, particularly when the caregiver is the family's son. The details of our findings not only provide an in-depth look at the current state of the community environment, but also provide policy makers with the information to create a more efficient community support environment.

## CONCERNS OF JAPANESE CAREGIVERS WAITING PLACEMENT OF FAMILY MEMBERS IN LONG-TERM PUBLIC FACILITY

T. Ikeuchi, H. Komiya, H. Osada, *J. F. Oberlin University Graduate School, Tokyo, Japan*

Japanese older adults who require care often rely heavily on informal supports of their family members at home. Many caregivers become overburdened with the care and contemplate moving their family members into a long-term public facility. However, due to a shortage of such facilities, there are approximately 420,000 older adults on the waiting list across the nation. This study focuses on family caregivers and investigates necessary social support in providing long-term care during the period of waiting and transition to a long-term public facility. We used a grounded theory approach and audio recorded interviews with six female caregivers aged 46-77 who self-identified as the primary caregiver. We asked about difficulties in providing informal care. The following three concerns were revealed: (a) financial strain of managing the long-term care expenses; (b) insufficient resources for social and instrumental support; and (c) toileting assistance. All participants reported serious financial concerns due to the lingering care, while three of them were living on the pension themselves and two of them were on welfare. All participants also reported a lack of resources and the accessibility of existing formal supports, including the benefits of the national long-term care insurance (LTCI). Further, toileting was considered the most difficult physical support in care. It is concluded that developing a system to provide sufficient social and instrumental support for family caregivers will be necessary in order to lighten the burden and the cost of care.

## HISTORICAL CHANGES IN FAMILY TRANSNATIONAL CAREGIVING: THE CASE OF NEW ZEALAND SETTLERS

D.B. Bradley, *Center for Gerontology, Western Kentucky University, Bowling Green, Kentucky*

Viewed historically, family policy, as well as policy for older people, has often been analyzed within a national or regional framework,

concerning itself with state legislation and the provision of services. Significant social, political and economic changes on the global level challenge this national focus. Given that more people 'permanently' migrate than in the past, migration has taken on greater policy prominence. But beyond families relocating from 'here to there' and generating new social needs and issues, an important consideration is how increased migration has contributed to a family being extended beyond national boundaries to become dispersed, global, or transnational families. This poster explores family communications undertaken in a transnational context within a perspective that accounts for multiple exchanges between migrants and non migrants, and between historical generations. Data for this presentation are drawn from the correspondence records (1852 – 1900) of the Heath and McBride families held in the Hocken Collection Archives, University of Otago, New Zealand. Qualitative methods focused on the 'actors point of view' was used to analyze these historical records between relatives who lived in New Zealand and their relatives who migrated between 3 countries. Families were challenged by the financial, practical, and emotional support aspects of caregiving and employed diverse strategies to manage caregiving over great geographic distances. The most common strategy, present in 65% of the correspondence, was to pay another individual to provide care. Others either moved their older relative in closer proximity (15%) or provided emotional support through correspondence exchange.

## TRANSLATIONAL RESEARCH: DOING IT BEST IN THE COMMUNITY FOR CAREGIVER HEALTH

L. Easom, L.B. Granberry, *Rosalynn Carter Institute for Caregiving, Georgia Southwestern State University, Americus, Georgia*

Translational research drives the improvement of health for caregivers who are caring for the older adult population today. In clinical research, substantial headway has been made in developing interventions that result in improved caregiver outcomes. Translational research involves moving these positive outcomes to benefit individuals in a community while maintaining fidelity to the original research. This poster will portray the successful experience of the Rosalynn Carter Institute for Caregiving (RCI) in identifying the elements that are necessary for taking an evidence-based caregiving intervention from a randomized control trial into community use effectively, and with fidelity. Over the past 4 years, the RCI has directed translational projects across the country utilizing the NIRN (National Implementation Research Network) model for evidence-based implementation in varied community settings such as hospitals, rehabilitation facilities, and aging services. Lessons learned from this unique experience plus best practices and tips for both clinical and practice researchers will be shared.

## RELIABILITY AND VALIDITY OF THE SPANISH VERSION OF THE REVISED COGNITIVE FUSION QUESTIONNAIRE IN DEMENTIA CAREGIVERS

R. Romero-Moreno<sup>1</sup>, M. Marquez Gonzalez<sup>2</sup>, A. Losada<sup>1</sup>, D. Gillanders<sup>3</sup>, V. Fernández-Fernández<sup>1</sup>, *1. Universidad Rey Juan Carlos, Madrid, Spain, 2. Universidad Autónoma de Madrid, Madrid, Madrid, Spain, 3. University of Edinburgh, Edinburgh, Edinburgh, United Kingdom*

Introduction Cognitive fusion or the extent to which we are psychologically tangled with and dominated by the form or content of our thoughts has been proposed as a key psychopathological dimension from the Acceptance and Commitment therapy perspective. The objective of this study is to explore the psychometric properties of the Spanish Version of the Cognitive Fusion Questionnaire (SRCFQ). Method and results The SRCFQ consists of 13 items with responses ranging from 1 "never true" to 7 "always true". Individual interviews were conducted with 102 family caregivers. Principal components analyses were conducted and two factors were obtained for the SRCFQ, namely, cognitive fusion and cognitive defusion, which explained 43.61% and 11.69% of the variance, respectively. The total scale and the subscales pres-

ent appropriate internal consistency (Cronbach's  $\alpha = .76$ , for the total scale, .91 for cognitive fusion, and .58 for cognitive defusion). Additionally, significant associations in the expected directions between cognitive fusion (global scale) and other coping and outcome variables related theoretically and have been found, such as experiential avoidance ( $r = .63$ ,  $p < .001$ ), rumination ( $r = .56$ ,  $p < .001$ ), depression ( $r = .35$ ,  $p < .001$ ), anxiety ( $r = .44$ ,  $p < .001$ ), guilt ( $r = .43$ ,  $p < .001$ ) and satisfaction with life ( $r = -.38$ ,  $p < .001$ ), suggesting an adequate construct validity. No associations between CF and care-recipient functional capacity ( $r = .06$ ,  $p = .57$ ) were found, suggesting an adequate discriminant validity. Discussion The SRCFQ may be a useful questionnaire to assess cognitive fusion in dementia caregivers. Results suggest that cognitive fusion seem to be a maladaptive coping strategy which may influence negatively in the caregiving stress process.

#### **FACTORS AFFECTING CAREGIVING BURDEN OF FEMALE CAREGIVERS CARING COMMUNITY DWELLING FRAIL OLDER ADULTS USING POULSHOCK AND DEIMLING MODEL**

Y. Ahn<sup>1</sup>, Y. Lim<sup>2</sup>, 1. Department of Nursing, Yonsei University Wonju College of Medicine, Wonju, Republic of Korea, 2. Yonsei University Wonju College of Medicine, Wonju, Republic of Korea

The purpose of the study was to examine a staged causal model as a theoretical base to explain caregiving burden of female caregivers caring community dwelling Korean frail older adults. The model contained three stages including antecedents (Stage 1), burden perception (Stage 2), and impact (Stage 3). The antecedents included gender, ADL impairment, cognitive impairment, self-efficacy, and familism. Stage 2 focused on disruptive behavior burden and social functioning burden. In Stage 3, the outcome variable was social activity restriction and negative change of family relationships. The total sample was 157 primary female caregivers caring community dwelling frail older adults over 65 year-old. Instruments were Caregiving Burden Scale, Self-Efficacy and Family Scale. Results show that ADL impairment ( $\beta = .14$ ,  $p < .05$ ), cognitive impairment ( $\beta = -.30$ ,  $p < .01$ ), self-efficacy ( $\beta = -.31$ ,  $p < .01$ ), and familism ( $\beta = .25$ ,  $p < .01$ ) explained 33.3% of the variance in disruptive behavior burden. For social functioning burden, ADL impairment ( $\beta = .36$ ,  $p < .01$ ), cognitive impairment ( $\beta = 0.25$ ,  $p < .01$ ), self-efficacy ( $\beta = -.31$ ,  $p < .01$ ), and familism ( $\beta = .18$ ,  $p < .01$ ) explained 39.2% of the variance. ADL impairment ( $\beta = .47$ ,  $p < .01$ ), self-efficacy ( $\beta = -.17$ ,  $p < .01$ ) and social functioning burden ( $\beta = .35$ ,  $p < .01$ ) explained 45.7% of the variance in social activity restriction. Only disruptive behavior burden ( $\beta = .64$ ,  $p < .01$ ) explained 64.6% of the variance in negative change of family relationship. Results indicate that physical and cognitive impairment of older adults, self-efficacy and familism of caregivers had an indirect influence on social activity restriction of female caregivers through social functioning burden, and had an indirect influence on negative change of family relationship through disruptive behavior burden. The findings showed that burden perception mediates the relationship between burden impact as a negative outcome and older adults' impairment as well as caregivers' belief and values.

#### **PREDICTING PERMANENCY PLANNING BEHAVIOR IN PARENTS OF ADULTS WITH INTELLECTUAL DISABILITIES**

H. Layton, S. Qualls, University of Colorado Colorado Springs, Colorado Springs, Colorado

Most adults with intellectual disabilities (ID) living in their home in the state of Colorado are not receiving government-funded services and face a crisis in care if and when their families become unable to care for them. Aging of the person with ID and the family caregiver both increase the probability that aging-related changes or death will provoke the transition in care from the family home to government funded housing and other services. One variable identified to off-set a crisis is long-term or permanency planning for the individual with ID. Along

with age, a profile of risk factors relating to the parent caregiver and the individual with ID were created to predict permanency planning. Ninety-seven family caregivers of persons with ID identified their individual risk factors, as well as their adult child's risk factors previously found to be related to long-term planning. These factors included demographic variables, health status, functional abilities, caregiver burden, level of ID, and problem behaviors. Hierarchical multiple regression was used to predict planning, and parental age was the only variable that predicted permanency planning for the individual with ID. Functional and health variables associated with old age, such as poor health and frailty, were not significant predictors to permanency planning, suggesting that awareness of age rather than health risks may induce planning. Service providers need to consider what prompts long-term planning, especially when other factors relating to old age do not signal a time to plan.

#### **FACTORS ASSOCIATED WITH FATIGUE IN DEMENTIA FAMILY CAREGIVERS**

Y. Chang<sup>1,4</sup>, H. Jing<sup>1</sup>, L. Hsu<sup>2</sup>, I. Chen<sup>3</sup>, L.O. Wray<sup>4,1</sup>, 1. School of Nursing, The State University of New York, University at Buffalo, Buffalo, New York, 2. Kaiser Permanente, Santa Clara, California, 3. University of Wisconsin- Madison School of Nursing, Madison, Wisconsin, 4. Buffalo VA Medical Center, Center for Integrated Healthcare, Buffalo, New York

Background: Family caregivers often take primary responsibility and manage all aspects of the care for their care-recipients with dementia. Family caregivers are at high risk of experiencing physical and psychological health issues. Fatigue is a prevalent symptom reported by cancer family caregivers. Family caregivers under uncontrolled fatigue for long time may have poor health, low quality of life, and poor functional status. However, little is known about fatigue and factors associated with fatigue in dementia family caregivers. Purpose: This study aimed to examine factors associated with fatigue in dementia caregivers. Methods: This study used a cross-sectional design. Participants were recruited from San Francisco Bay Area and the Alzheimer's Association Northern California and Northern Nevada Chapter. Measures included the Lee Fatigue Scale (fatigue and energy scales), burden (Caregiver Burden Inventory) and depression (Center for Epidemiologic Studies Depression), and a demographic questionnaire. Results: A total of 112 family caregivers participated in the study. Participants reported experiencing a moderate level of fatigue. Significant associations were found between fatigue and caregiver burden ( $r = 0.55$ ,  $p < 0.01$ ), fatigue and depression ( $r = 0.63$ ,  $p < 0.01$ ), energy and caregiver burden ( $r = -0.31$ ,  $p < 0.01$ ), and energy and depression ( $r = -0.48$ ,  $p < 0.01$ ). However, caregiver age and health problems were not associated with fatigue and energy. Conclusion: The findings revealed that fatigue is a common symptom in dementia caregivers. Due to the high inter-correlations between depression, burden, and fatigue, clinicians should routinely screen those issues when working with family caregivers.

#### **SESSION 265 (POSTER)**

##### **CHRONIC DISEASE MANAGEMENT**

##### **CONCORDANCE IN VASCULAR HEALTH TRAJECTORIES AMONG MARRIED OLDER ADULT COUPLES**

N. Dmitrieva<sup>1</sup>, C.F. Pieper<sup>1</sup>, M.C. Norton<sup>2</sup>, 1. Center for the Study of Aging and Human Development, Duke University Medical Center, Durham, North Carolina, 2. Utah State University, Logan, Utah

The lifespan developmental perspective posits that spouses play an important role in individual development of older adults (Baltes, 1996). Indeed, previous research had established cross-sectional within-couple concordance on a number of chronic illnesses, particularly within the domain of vascular health. To extend this work, we examined spousal concordance on an aggregate measure of vascular health conditions and

risk factors and change over time over 12 years from 1,369 older adult couples participating in the Cache County Memory Study. At each of four waves of data collection, self-reports of the following eight conditions and risk factors were summed (0-8 possible): myocardial infarction or coronary artery bypass surgery, cerebrovascular accident, diabetes mellitus, hypertension, obesity, hyperlipidemia, smoking, and use of antihypertensive medications. Results of multilevel models demonstrated that at the initial wave of the study participants reported nearly two vascular conditions and risk factors ( $B=1.91$ ,  $SE=0.16$ , 95% CI [1.60, 2.22]). Decomposition of variance showed that the average correlation between residuals for an average couple in the study was .38, indicating that over one-third of the variance in initial vascular burden level was due to differences between couples. Moreover, every additional decade of life corresponded to a gain in 1 vascular condition or risk; however, there was minimal evidence for correlated change within couples over time, and no significant effect of spouse gender on level or change in vascular conditions. These results underscore the role of within-couple processes in vascular health among married older adult couples.

### **MARITAL QUALITY AND SELF-EFFICACY: INFLUENCE ON DISEASE MANAGEMENT AMONG INDIVIDUALS WITH RHEUMATOID ARTHRITIS**

S. Tewary, *NovaSoutheastern University, FtL, Florida*

**Purpose:** The results presented here are part of the dissertation that examined the overarching research question: What is the direction of relationships between marital quality and disease management self-efficacy controlling for the moderation of age, household income, education, disease severity, and marital age? **Methods.** Ninety-one married participants; above age 30, diagnosed with RA completed a survey including demographic profile and 4 standardized instruments. Sample was recruited from hospitals and private practitioners from Florida and South Carolina. Data was collected from 2006-2007 and analyzed through Multiple Regression using SPSS software. **Results:** Relationships were not observed between marital quality, length of marriage and disease management self-efficacy as predicted by the first hypothesis. Additional regression analysis examination found that marital quality, length of marriage, pain, and health assessment together reported significant variance in disease management self-efficacy. However, only health assessment significantly predicted disease management self-efficacy. Other nonexamined variables could have influenced the independent marital quality effects. In brief, from this data it cannot be argued marital quality predicts perceived self-efficacy. **Implications for Education, Research and Practice:** The findings of this study were underpowered due to limited sample size of 91 participants and low statistical power of 0.54. Future studies with larger sample size can further validate the current findings. Health care providers should evaluate other available support systems that can help patients with RA. A mixed method approach with qualitative assessments is recommended for measuring marital quality for individuals with RA as they have modified their day-to-day activities due to the disease.

### **IMPROVING ACCESSIBILITY TO TECHNOLOGICAL DEVICES FOR PEOPLE WITH DISABILITIES IN UPPER LIMBS: IMPLICATIONS FOR PEOPLE WHO BECOME OLDER WITH A PHYSICAL DISABILITY**

E. Urdaneta<sup>1</sup>, U. Diaz-Orueta<sup>1</sup>, A. Garcia<sup>1</sup>, B. Morales<sup>1</sup>, C. Veigl<sup>2</sup>, K. Pecyna<sup>3</sup>, R. Ossmann<sup>4</sup>, G. Nussbaum<sup>4</sup>, 1. *Fundacion INGEMA, Donostia-San Sebastian, Gipuzkoa, Spain*, 2. *FHTW, Vienna, Austria*, 3. *HARPO, Poznan, Poland*, 4. *KI-I, Linz, Austria*

**Objective:** In Europe, development of technical solutions for people with long-term motor disabilities is increasing, but little attention is put to those with a disability approaching old age. The EU-funded AsTeRICS project is developing a supporting PC-based platform to help people with upper limbs disabilities, regardless of their age, access any

type of technological device (computers, cell phones, domotic devices), by means of personalized combinations of sensors-actuators. **Methods:** From a sample of 50 users from Austria, Poland and Spain, eight participants (5 male, 3 female) were above 50+ years old (age range: 50-61,  $x=54.63$ ,  $SD=3.92$ ), hence, they will face old age together with a physical disability. Three had a diagnosis of multiple sclerosis, three had cerebral palsy, and the others had hemiplegia and Parkinson disease. They controlled the computer mouse using a 5-switches combination, a blowing device, or a webcam tracking their head movement, and controlled Radio CD Player by means of a virtual keyboard and an IR transmitter. **Results:** PC cursor control using a webcam tracking head movement was the preferred device and suggestions were made to combine it for controlling other electronic devices. However, users still able to move hands would use it only when no other options were available for them. **Conclusions:** AsTeRICS is an open flexible platform adaptable to any motor disability and may also address needs for those people with disabilities who enter older age. Further in-depth studies are required to integrate older people with severe physical disabilities in the ageing society.

### **MEDICATION ORGANIZERS AND NON-ADHERENCE AMONG OLDER ADULTS**

A.N. Vidrine<sup>1</sup>, K. Insel<sup>1</sup>, K.M. Koerner<sup>1</sup>, G.O. Einstein<sup>2</sup>, J.C. McHenry<sup>1</sup>, D. Morrow<sup>3</sup>, 1. *University of Arizona, Tucson, Arizona*, 2. *Furman University, Greenville, South Carolina*, 3. *University of Illinois, Urbana-Champaign, Illinois*

Only 55 to 60% of older adults take medication as prescribed. Medication organizers are recommended, but there is little evidence that organizers improve adherence. This analysis is based on 249 older adults (age  $\geq 65$  years) taking at least one anti-hypertensive medication in the study, "Multifaceted Prospective Memory Intervention to Improve Medication Adherence." Self-report was used to obtain information on organizer use and number of prescribed medications. Physical function was determined with the SF-36 subscale. Medication electronic monitoring was used to obtain adherence to the inter-dose interval. Mean age was 76.2 years, with 188 women and 61 men. Organizer users had lower adherence ( $M_{users}=73.6\% \pm 31.1$ ,  $M_{non-users}=84.5\% \pm 22.4$ ,  $t(247)=3.22$ ,  $p<.01$ ), took more prescription medications ( $M_{users}=8.67 \pm 4.66$ ,  $M_{non-users}=6.99 \pm 4.00$ ,  $t(247)=-2.98$ ,  $p<.01$ ), and had lower physical functioning ( $M_{users}=59.0 \pm 26.4$ ,  $M_{non-users}=70.4 \pm 24.7$ ,  $t(247)=3.47$ ,  $p<.01$ ) than non-organizer users. Medication organizer use does not indicate adherence.

### **CHRONIC CARE AND OLDER BREAST CANCER SURVIVORS: HOW DO HEALTH BELIEFS AFFECT SELF-CARE DECISIONS?**

M. Rosenthal<sup>1</sup>, A. Tan<sup>2</sup>, E.A. Leventhal<sup>2</sup>, S. Hudson<sup>2</sup>, 1. *Institute for Hlth, Hlth Care Pol, Aging Rsch, New Brunswick, New Jersey*, 2. *University of Medicine and Dentistry of New Jersey, New Brunswick, New Jersey*

The U.S. has an increasing number of cancer survivors over age 65, including over 800,000 breast cancer (BC) survivors. Older BC survivors live with an average of four additional chronic conditions. Their feelings of vulnerability or vigilance may cause survivors to neglect preventive and health maintenance behaviors for their cancer and other comorbid conditions. They and their doctors face the complex challenge of managing these conditions and health beliefs affecting patients' decisions. We use Leventhal's Common Sense Model, a self-regulation behavioral model, as a framework to investigate how cancer experiences of older BC survivors influence their health beliefs and decisions. We surveyed BC survivors over 65 who are hypertensive (a prevalent chronic condition), their family members and physicians ( $n=95$ ). We also interviewed a subsample of patients and family members ( $n=30$ ), triangulating data to compare patients' beliefs, decisions and behaviors with expectations of family members and physicians. Examining beliefs,

survivors perceive different timelines for BC vs. hypertension, for themselves vs. others with these conditions, and differently from family members. Examining self-care behaviors, women who think they can affect their condition are more likely to use diet and exercise, but differently for hypertension from BC, and rarely see it as a physician's recommendation. Examining preventive care decisions, survivors say they have family support, but family members say the survivor doesn't need it. This research will provide an evidence-based foundation for a future intervention with providers to optimize survivors' overall health behaviors.

### **THE RELATIONSHIP BETWEEN PAIN SEVERITY, SELF-EFFICACY AND PERSONALITY IN OLDER CANCER OUTPATIENTS**

J. Krok, T. Baker, *School of Aging Studies, University of South Florida, Tampa, Florida*

It is well-established that personality not only affects physical health and longevity, but also mental health and preferred coping mechanisms. One area of limited research is the relationship between cancer pain severity, self-efficacy, and personality among older adults. This study aimed to examine how personality traits and self-efficacy affect cancer pain severity in older patients receiving outpatient treatment at a comprehensive cancer center. Symptom data was collected from the Brief Pain Inventory (BPI) and the Chronic Pain Self-Efficacy Scale (CPSE), while personality data was gathered from the Ten Item Personality Inventory (TIPI) and the Positive and Negative Affect Scale (PANAS). The mean age of the sample was 65.4 years ( $SD \pm 7.72$ ). Eighty-two percent of the sample was white. Preliminary data indicated that the average pain was 4.15 (0-10 scale; with 10 being worst pain), with the sample recording as mean of 6.53 and 2.45 on worst and least pain, respectively. Regression analyses showed that lower education ( $\beta = -.22, p < .05$ ), more chronic conditions ( $\beta = .21, p < .05$ ), and greater pain interference ( $\beta = .54, p < .001$ ), was associated with greater pain severity ( $F(18, 108) = 4.14, p < .001$ ). Higher agreeableness ( $\beta = .20, p < .05$ ) and better mental health ( $\beta = .30, p < .01$ ) were also found to be associated higher self-efficacy. These findings indicate that different personality types may influence perceptions of pain while receiving outpatient cancer treatment. More empirical research is needed to understand the impact of pain and its relationship with personality in more diverse cancer populations across the age continuum.

### **OLDER PARTICIPANTS IN A REGIONAL INTERDISCIPLINARY PROGRAM FOR CHRONIC PAIN**

C. Poon, R.L. Schmidt, R.L. Southerland, B.J. Wilson, *Department of Pain Management, The Nebraska Medical Center, Omaha, Nebraska*

Purpose: Despite the benefits of interdisciplinary programs in treating chronic pain, few older adults participate in these programs. This study examined the pattern of referral and participation of older adults in one such program in Nebraska. Design and Methods: Administrative records of 1,431 referrals between June 2003 and January 2012 were matched to 414 clinical records. Sociodemographic variables, pre- and post-program pain behaviors, pain beliefs, depressive symptoms, and internal locus of control were recorded. Reasons for non-participation were coded. Percentages were calculated to identify referral patterns. Dependent t-test was performed to examine program effectiveness. Results: Only 9% of referrals involved adults aged 60 and above. Pre-treatment evaluation completion rates were comparable among younger and older adults (45% vs. 49%). Appropriateness for admission and program attendance were higher among younger than older adults (86% vs. 73%; 66% vs. 53%). Program completion rate was significantly higher among older than younger adults (83% vs. 74%). The primary reason of non-participation among older adults was medical or cognitive problems. Upon program completion, there was a significant reduction in pain behaviors ( $t(27) = 8.24, p < .001$ ), pain beliefs ( $t(27) = 6.86, p < .001$ ), depressive symptoms ( $t(27) = 6.40, p < .001$ );

and a significant increase in internal locus of control ( $t(27) = 4.30, p < .001$ ). Implications: Interdisciplinary pain management programs should be tailored to meet the specific physical and cognitive needs of older adults. More healthcare providers need to be made aware of the potential benefits of these programs to older adults.

### **PRESSURE ULCER OCCURRENCE AMONG HOSPITALIZED OLDER ADULTS: DOES RN JOB SATISFACTION MATTER?**

J. Choi, S. Bergquist-Beringer, *University of Kansas School of Nursing, Kansas City, Kansas*

Purpose: Little is known about the effect of RN workgroup satisfaction on pressure ulcer occurrence in acute care hospitals. The study purpose was to examine the relationship between RN workgroup job satisfaction and the rate of hospital-acquired pressure ulcers among older adults on six types of acute care units. Methods: Linked 2009 data on pressure ulcers in adult patients (age 65 and over) and RN survey from the National Database of Nursing Quality Indicators® (NDNQI®) were used. Random-intercept negative binomial regression analyses were performed at the unit level. The sample consisted of 3,329 units in 561 NDNQI hospitals (126,032 patients; 77,826 RNs). The included unit types were critical care, step-down, medical, surgical, combined medical-surgical, and rehabilitation units. Results: Controlling for unit (nurse staffing, education, experience) and hospital (Magnet status, teaching status, bed size) characteristics, RN workgroup job satisfaction was negatively associated with pressure ulcer occurrence. The relationship varied by unit type. Higher RN satisfaction was associated with fewer pressure ulcers on critical care, medical, and rehabilitation units. No relationship, however, was found in step-down, surgical, medical-surgical units. The pressure ulcer rates were lower in Magnet than non-Magnet hospitals. Conclusions: Findings from this study provide evidence that RN workgroup job satisfaction is related to better pressure ulcer outcomes. Nursing administrators and managers wishing to reduce pressure ulcer rates should consider developing strategies to improve RN workgroup satisfaction based on unit types.

## **SESSION 270 (POSTER)**

### **COGNITIVE AGING**

#### **CNS THE RELATIONSHIP BETWEEN COGNITION AND GAIT FUNCTION IN LATINO ADULTS**

H. Nguyen, *Wake Forest School of Medicine, Winston-Salem, North Carolina*

Dual-task methodology that assesses the connection between cognition and gait has expanded rapidly. Cognitive impairments in executive function, attention, and psychomotor speed tasks have been linked to gait disturbances including slow gait speed, which has been found to predict future falls, disability, and dementia. While our knowledge about the link between cognition and gait has grown markedly, what we know about cognition and gait and racial/ethnic groups has not kept pace. The goal of this study is to identify specific cognitive tasks (Speed, Inhibition, Attention/Memory) that are related to gait velocity and other gait parameters performed with and without secondary verbal interference tasks (Serial 7 and Walking While Talking). A sample of 40 Latino men 18 and older was recruited from North Carolina. The mean age for the sample was 33.1 (range 18 – 72). Participants underwent a gait assessment using the GAITRite system, a computerized walkway with embedded pressure sensors (GAITRite, CIR systems, Havertown, PA, USA). Older age was significantly related to increased double limb support with and without verbal interference. Multiple linear regressions were performed to examine the relationship between cognitive function and gait performance, adjusted for key confounders including age and education. Cognitive tasks were not associated with gait velocity without

verbal interference. However, the Attention/Memory task was significantly associated with gait velocity in the verbal interference conditions. Findings from this study are generally consistent with previous general population studies, and suggest associations of gait with age and distinct cognitive processes.

### **METAMEMORY ACCURACY IN HEALTHY AGING AND EARLY ALZHEIMER'S: THE EFFECT OF GENDER**

J. Szajer, C. Murphy, *San Diego State University, San Diego, California*

Metamemory, or the ability to monitor, judge, and control our memories, is an important aspect of cognition because it helps to determine cognitive and behavioral self-regulation involved in overall judgment and decision-making (Marquie & Huet, 2000). Much research has focused on how age might affect metamemory abilities but findings have been highly inconsistent. However, recent research suggests that more complex tasks, such as those measuring episodic memory performance and challenging recognition memory, rather than recall, are better at revealing age-related deficits in metamemory accuracy (Daniels, Toth, & Hertzog, 2009; Dahl, Allwood, & Hagberg, 2009). The main aim of the current study was to examine the effect of gender on variation in metamemory accuracy among both healthy aging individuals and those with AD using an episodic recognition memory task. Data from 158 patients diagnosed with possible or probable AD were compared with data from 138 non-demented elderly controls ( $n = 296$ ). Since prior research suggests that memory-based olfactory tests are equally, if not more sensitive than more semantic, visual tasks when examining cognitive decline in normally aging individuals and those with AD, in particular (Murphy et al., 1999), recognition memory was assessed using a signal-detection based olfactory recognition memory task which included self-reported ratings of confidence in each recognition response. A univariate analysis of variance revealed a significant main effect of gender on the accuracy of confidence ratings,  $p < .05$ , with females reporting significantly more accurate confidence assessments than males. Applications and implications are discussed. Supported by grant # AG04085-25 from NIA.

### **MILD COGNITIVE IMPAIRMENT: A CONCEPTUALIZATION**

J.M. Sjostedt, M. Bull, *Nursing, Marquette University, Milwaukee, Wisconsin*

**Background.** Mild cognitive impairment (MCI) is often viewed as a transitional state to dementia and other neurocognitive disorders. A conceptual framework for MCI might help to guide research; but one does not appear to exist. Most published studies use only diagnostic criteria and do not specify a framework as the basis for their research. The purpose of this analysis is to explore the concept of MCI in order to provide a framework for future research and broaden the understanding of older adults' potential experiences with MCI. **Method.** Google-scholar and PubMed databases were searched for years 2000-2010. The search was limited to publications in English. Search terms focused on the attributes, sociocultural, temporal, and discipline variations of MCI among older adults. **Results.** A total of 52 articles and 2 comprehensive books were reviewed. The antecedents and consequences of MCI from the older adults' perspectives were identified, leading to the definition of MCI as a state of unstable limbo weighted by heterogeneity between a person's normal and abnormal continuums. Antecedents included attributes that were modifiable (lifestyle factors, dietary deficiencies, medications, and stress), potentially modifiable (chronic conditions, neuropsychiatric disorders, and a lack of awareness of deficits), and non-modifiable (sociodemographic and neuropathologic factors). The consequences of MCI were identified as being complex and enveloped by ambiguity, confusion, variability and uncertainty. **Conclusions.** The analytic synthesis of the literature resulted in a conceptual model of

MCI. The model illustrates the complexity and nature of MCI and provides a framework to guide future interventions and research.

### **WHAT'S IN A NUMBER? AN ANALYSIS OF AGE, CO-MORBIDITY, COGNITION, AND SELF-CARE IN ASSISTED LIVING RESIDENTS**

E.K. Smith<sup>2</sup>, R.E. Herman<sup>1</sup>, K.N. Williams<sup>1</sup>, *1. University of Kansas Medical Center, Kansas City, Kansas, 2. University of Kansas, Lawrence, Kansas*

Older adults in Assisted Living (AL) facilities have range of cognitive abilities. Cognitive abilities have a large impact on an older adults' ability to provide self-care (Njegovan et al., 2001). Declines in the ability to provide self-care often result in further institutionalization to a skilled nursing facility (Banaszak-Holl et al., 2004). The impact of increasing age and increasing number of co-morbidities is commonly thought to be a factor in declining cognition and self-care (Salthouse, 2009; Deary et al., 2009). Medical, cognitive, and functional data were collected from AL Residents ( $n=83$ ). This analysis examines the difference between three models. The first model shows age and co-morbidities predicting cognition and cognition, age, and co-morbidities predicting self-care. A nested model shows age predicting cognition and age and cognition predicting self-care. An alternative nested model shows co-morbidities predicting cognition and co-morbidities and cognition predicting self-care. The analysis utilized structural equation modeling (SEM) to determine which model provided a better fit and explained more of the variance. The results suggest age has a stronger causal relationship with declining cognition and declining self-care. All three models suggest a causal relationship between declining cognition and declining self-care. These results suggest as age increases and cognition declines the need for self-care increases. The implications of these findings are consistent with previous findings: (1) Age impacts cognition and self-care, (2) Declining cognition impacts self-care.

### **AGE AS A MODERATOR OF FATIGUE SEVERITY ON A TASK OF COGNITIVE SWITCHING**

K.R. Thomas<sup>1</sup>, M. Marsiske<sup>1</sup>, D. Marra<sup>1</sup>, J. Jones<sup>1</sup>, D. Bowers<sup>1,2</sup>, *1. Clinical and Health Psychology, University of Florida, Gainesville, Florida, 2. McKnight Brain Institute, Gainesville, Florida*

This study investigated the effect of fatigue on the cognitive performance of older adults, with a particular focus on whether persons in advanced old age ("old-old") might be disproportionately disadvantaged by fatigue. We investigated the separate and interactive effects of cross-sectional age and self-reported fatigue severity on executive functioning. Thirty-six healthy older adults completed neurocognitive, mood, and self-reported functioning measures. Participants were non-demented (mean MMSE=29.42), 75% female, with a mean education of 16.50 years. Their ages ranged from 62 to 93 years (mean=80.58) and they were, on average, not depressed (Geriatric Depression Scale=2.78). Participants were classified as young-old (62-80,  $n=17$ ) or old-old (81-93,  $n=19$ ). Self-reported fatigue was measured using the Fatigue Severity Scale; levels did not differ significantly between age groups. A difference score for the Trail Making Test (TMT) was obtained by subtracting the time to perform TMT part A from time to perform part B. Higher scores represented poorer cognitive switching ability. This difference score was significantly related to age category ( $\beta=.336, p<.05$ ), fatigue ( $\beta=.549, p<.01$ ), and the age by fatigue interaction ( $\beta=.467, p<.05$ ),  $R^2=0.325$ . These results suggest that very-old adults and those with greater self-reported fatigue evince poorer performance on a measure of cognitive switching. Above and beyond the separate age and fatigue effects, old-old persons with higher fatigue demonstrated disproportionately lower executive control. Future work with larger samples must examine whether these fatigue effects generalize to other measures of executive functioning, and whether fatigue effects persist after controlling for education, mood and sleep variables.

## FEASIBILITY OF NEUROPSYCHOLOGICAL TESTING IN THE OLDEST OLD: IT CAN BE DONE!

S.L. Andersen, L. Feldman, T.M. Neary, J.D. Gass, T.T. Perls, *Medicine/Geriatrics, Boston University School of Medicine, Boston, Massachusetts*

**Objective:** In light of prevalent sensory deficits and frailty amongst the oldest old, we sought to evaluate the feasibility of in-home cognitive function testing in this group. **Methods:** Long Life Family Study (LLFS) probands, their siblings and a referent age-matched cohort participated in a 2.5-hour battery of neuropsychological tests of memory and executive function that for the most part have been used in other studies and have low demands on vision, hearing, and motor abilities (tasks involving writing and drawing). Vision, hearing, and motor capacities were each rated from 1 (excellent) to 5 (deafness, blindness, or inability to use hands). Presence of environmental and dispositional (fatigue and willingness) factors were also noted. **Results:** 86 participants, age range 80-103 years were tested. 1 participant refused to complete the test battery. 91% of 32 octogenarians completed the testing in one visit compared to 70% of 50 nonagenarians and 100% of 4 centenarians. Mean visual, hearing and motor capacity ratings ranged from 1.4 to 1.6 for octogenarians, 1.7 to 2.3 for nonagenarians, and were 1 for the centenarians. Environmental factors may have affected testing in 66%, 46% and 25% of the sessions for the respective age groups. Disposition of the participant may have been a factor in 22%, 34% and 25% of the sessions. **Conclusions:** Extensive neuropsychological testing is feasible in the oldest old. Tests with minimal demands on hearing, vision, and motor ability should be selected and organized to allow for multiple testing sessions. Test difficulty does not need to be minimized.

## ASSOCIATION OF DIABETES WITH INCREASED RISK OF MILD COGNITIVE IMPAIRMENT IN THE AGING, DEMOGRAPHICS, AND MEMORY STUDY

H. Salman<sup>1</sup>, C.E. Gould<sup>2</sup>, S.A. Beaudreau<sup>1,3</sup>, *1. VA Palo Alto & the Sierra Pacific Mental Illness, Research Education and Clinical Centers (MIRECC), Palo Alto, California, 2. Stanford University School of Medicine, Department of Psychiatry and Behavioral Sciences, Palo Alto, California, 3. VA Palo Alto & Geriatric Research Education and Clinical Center, Palo Alto, California*

Diabetes increases the risk of dementia, but it is not clear whether diabetes is associated with mild cognitive impairment (MCI) in older adults. We aimed to determine whether the presence of diabetes is associated with MCI or dementia and whether diabetes increases the risk of developing MCI or dementia over a 7-year follow-up period. To address these questions, we conducted secondary analyses in a sample of 856 participants (M = 77.7 years) from the Aging, Demographics, and Memory Study (ADAMS). Three logistic regression analyses were used to determine predictors of (1) normal versus cognitive impairment but not demented (CIND) at baseline, (2) CIND versus dementia at baseline, and (3) conversion from normal or CIND to dementia at follow-up. We adjusted for age, gender, years of education, race, and ethnicity. Diabetes was associated with 2.23 times increased risk of CIND versus normal cognition (CI = 1.03 to 4.83). Age, education, and ethnicity were also significant predictors in this model. In the second model, only age predicted increased risk of dementia versus CIND. In our third model, only age and education predicted conversion to dementia. In the present study we determined that diabetes is associated with CIND, but not associated with conversion to dementia in middle-old and old-old adults. Although regular maintenance of diabetes is essential for adults of all ages, such care may not be necessarily preventative against cognitive decline due to dementia in middle-old to old-old adults. Future studies should determine the age at which diabetes is predictive of dementia.

## MEMORY DECLINES IN OLD AGE: BENEFIT OF SPACING IMPROVES CHANCES OF RETENTION

J. Zigterman, P. Simone, M. Bell, *Santa Clara University, Santa Clara, California*

Studies have been trying to figure out how to level the playing field between older adults and younger adults when it comes to memory retention and forgetting. Older adults clearly have difficulty remembering items in simple memory tasks. When items to be recalled are spaced apart instead of learned in one massed learning episode, adults see a benefit from the spacing and have better retention rates. Reducing the total number of items to be recalled also levels the playing field for older adults, but in reality, this accommodation is not practical. The current study compared performance on a simple word-pair memory task between young children ages 7 to 11, college aged students ages 18 to 22, and older adults ages 60 and older. Massed learning, spaced learning, and a control group were assessed for each age group. Consistent with previous findings, older adults performed the worst in all conditions, but significant differences between young children and older adults were especially large in the massed and spaced conditions. The control condition performed worst in all age groups, reinforcing the concept that repetition increases retention. Massed performance was the worst of the experimental conditions in all age groups. In light of these findings, older adults should utilize repetition when trying to remember things. For more complicated learning tasks, such as continuing education classes, older adults should practice spacing out the learning and studying episodes instead of cramming the information into one sitting. Through spacing, older adults can improve their memory.

## SESSION 275 (POSTER)

### COGNITIVE FUNCTIONING AND IMPAIRMENT

#### GRANT SUBMISSION AND REVIEW: APPLICATION OF COGNITIVE AGING AND DISTRIBUTED COGNITION

J.W. Elias, *UC Davis School of Medicine, Sacramento, California*

Changes in the page limitations for NIH grants and accompanying and continuing changes in the reviewers' approach to review have placed significant weight on not only strong and innovative ideas, but easily understood applications. A study of grant application strengths and weaknesses via the roles of: study section participation, CSR Scientific Review Administrator, NIA Program Officer, Director of Grants Coordination (UC Davis SOM), and cognitive researcher finds much to be gained by applying a "distributed cognition" approach to the goal-directed behavior of competitive grant writing. Distributed cognition places an emphasis on the process by which personal knowledge is socially transmitted and coordinated to form an external representation. Much is made of the elements of style and active vs. passive communication, but advice on grant writing and the review/scoring process in its current iteration, significantly overlooks specific application of cognitive research and heuristics. The study of cognitive aging in particular has much to contribute to the tool box of the writer who must transmit knowledge concisely, socially, and competitively in the distinct sections of specific aims, significance, innovation, and approach. In this presentation participants will be directed toward: 1) the application of principles from such cognitive areas as: working memory, reading, numeracy, neuro-economics, decision fatigue, heuristics, visual presentation. Participants will, 2) receive examples of how cognitive aging research and a distributed-cognition approach can facilitate ease of reader understanding in grant submission.

## A 5-YEAR FOLLOW-UP OF MILD COGNITIVE IMPAIRMENT INITIALLY ASSESSED AT AGE 55

W.S. Kremen<sup>1,2</sup>, M.S. Panizzon<sup>1</sup>, K.M. Spoon<sup>1,3</sup>, C.E. Franz<sup>1</sup>, A. Jak<sup>4,1</sup>, W.K. Thompson<sup>1</sup>, K.C. Jacobson<sup>5</sup>, M.J. Lyons<sup>6</sup>, 1. *University of California, San Diego, La Jolla, California*, 2. *VA San Diego Center of Excellence for Stress and Mental Health, La Jolla, California*, 3. *San Diego State University/Claremont Graduate School, San Diego, California*, 4. *VA San Diego Healthcare System, La Jolla, California*, 5. *The University of Chicago, Chicago, Illinois*, 6. *Boston University, Boston, Massachusetts*

Early identification of Alzheimer's disease is a major public health concern, and early identification of mild cognitive impairment (MCI) is important for addressing that concern. Using extensive testing not subject to ceiling effects, we previously showed that neuropsychologically-defined MCI could be identified in midlife (ages 51-59) in the Vietnam Era Twin Study of Aging (VETSA). As with older adults, prevalence rates varied widely depending on MCI definitions. Here we analyzed longitudinal data for the first 663 participants (ages 56-64) in our ongoing wave 2 follow-up. Six cognitive domains were assessed, and 4 definitions of MCI were tested. Analyses were non-twin, mixed-model analyses (units of analysis are individuals, not pairs) adjusted for clustering of observations. We compared wave 2 cognitive performance in MCI versus non-MCI groups, adjusted for wave 1 performance. For each definition, the multiple-domain MCI group was worse at wave 2 than the non-MCI group in all domains (results were less consistent for language). The amnesic MCI group was worse than the non-MCI group on processing speed and visual-spatial function for all 4 definitions, executive function for 3 of 4, and memory for 2 of 4 definitions. The results provide validation of our early diagnoses; the MCI group at wave 1 appears to have manifested greater declines than the non-MCI group, given their lower wave 2 performance even after adjusting for their already poorer wave 1 performance. Continued follow-up will be important, but the results suggest that it is indeed possible to identify MCI earlier than in previous studies.

## RESPONSES TO A DIAGNOSIS OF MILD COGNITIVE IMPAIRMENT

T. Kruger<sup>1</sup>, L.X. Blonder<sup>2</sup>, G.D. Rowles<sup>2</sup>, F.A. Schmitt<sup>2</sup>, R. Guttman<sup>3</sup>, F. Zanjani<sup>2</sup>, 1. *Indiana State University, Terre Haute, Indiana*, 2. *University of Kentucky, Lexington, Kentucky*, 3. *University of Western Florida, Pensacola, Florida*

Individuals with mild cognitive impairment (MCI, which involves a cognitive complaint with evidence of impairment on objective testing or longitudinal evidence of decline on cognitive tasks; generally intact global cognition; no functional impairment; and not being demented) have an elevated risk of developing dementia. Research on how older people respond to being told that they possess these early signs of cognitive decline, which may be linked to neurodegenerative diseases, is limited. Taking a grounded theory approach, 15 adults (6 women, 9 men; age range 64 to 91; mean education 15.9 years) participated in in-depth qualitative interviews to explore: a) reactions to being diagnosed with MCI, b) contextual factors affecting reactions, and c) how receiving a diagnosis of MCI influences emotions and behaviors. Findings indicated that, after experiencing initial reactions to receiving an MCI diagnosis, individuals negotiate the meaning of their diagnosis and reestablish equilibrium in their lives. These processes are influenced by several dynamics, including one's motivation for being cognitively evaluated, interactions with other people (physicians and significant others), and knowledge of MCI and dementia. Perceptions of uncertainty (regarding the diagnosis and the future), the influence of others in one's life, and the temporal framing of the anticipated implications of a diagnosis of MCI affect the way people responded to their diagnosis. This study extends the evolving research on the meaning of a diagnosis of MCI by exploring contextual, personal, and social factors that influence people's responses to their diagnosis.

## COGNITIVE FUNCTIONING AND PROBABILISTIC CLASSIFICATION LEARNING ACROSS THE LIFESPAN

H. Davis, S.M. Miranda, K.M. Beitz, *Psychology, University of Colorado at Colorado Springs, Colorado Springs, Colorado*

The Weather Prediction Task (WPT), a popular measure of habit learning, may be learned normally in amnesic populations and has been taken as support for intact implicit learning in amnesic patients. WPT deficits appear in individuals over the age of 60, but it is unclear if this deficit is due to cognitive declines with age. In the present study, participants are presented with 1-3 cards of a four card set assigned probabilities on the occurrence of either rain or sunshine in two sessions of 200 trials. The current study examines performance on a modified weather prediction task across the lifespan. Specifically, an explicit single card presentation is assigned a probability of 100% sunshine and another single card presentation is assigned a probability of 100% percent rain. Children and adolescents who are not often assessed for probabilistic classification learning on WPT were included in order to assess development of probabilistic classifications as well as its dissolution in the elderly. Thus, the current study examines performance on a modified weather prediction task across the lifespan, from 5 to 89 years of age. A 3-way mixed ANOVA revealed performance increases in children and adolescents, and declines in older adults. WPT explicit performance and explicit memory tasks were found to be moderately related. However, performances on purported implicit components were not above chance levels. This study suggests that an explicit component during probabilistic classification is more important than originally believed in unimpaired populations.

## THE EFFECTS OF MEMORY PROBLEMS AND DEPRESSIVE SYMPTOMS ON PHYSICAL FUNCTIONING IN ADULTS

M. Wood, E. Wayde, S.R. Black, F. Scogin, *University of Alabama, Tuscaloosa, Alabama*

As we age, our physical and cognitive functioning decline. A number of factors might contribute to physical decline among diabetics. There is evidence that diabetes affects cognitive functioning. We attempted to examine the relation between depression, and cognitive functioning by conducting analyses through the National Health and Nutrition Examination Survey (NHANES). The NHANES is a database of surveys assessing the health and nutritional status of individuals across the United States. Initial analyses indicated that there was a link between depression, memory, and physical functioning for individuals in the data set. In fact, our secondary data analysis of the 2009-2010 NHANES data set shows that memory problems and depressive symptoms explain a significant amount of variance of physical functioning in adults aged 20. The variables account for 16.3% of the variance,  $F(2, 2401) = 233.24, p < .001$ . Interestingly, additional analyses indicated that individuals who were 40 – 60 yrs endorsed significantly more problems with physical functioning than all other aged groups including groups over 80yrs  $F(3, 2401) = 48.43, p < 0.001$ . These results have implications for the relation between age, depression, and physical functioning across the lifespan.

## PATTERNS OF PERFORMANCE WITHIN FIBROMYALGIA: IDENTIFYING SUBGROUPS

B. Follick, B. Cherry, L. Zettel-Watson, E. Grandfield, D.N. Rutledge, J. Jones, *California State University, Fullerton, Placentia, California*

Fibromyalgia (FM) is a multisystem disorder characterized by widespread musculoskeletal pain and a host of other symptoms. Although FM was originally conceptualized as a musculoskeletal disorder consisting primarily of physical symptoms, it is now understood that individuals with FM experience a host of concordant symptoms including a decline in cognitive functioning, and difficulty with psychological health (Bennett, Jones, Turk, Russell & Matallana, 2007). This study sought to investigate the possible existence of subgroups within an FM

sample based on behavioral data gathered through the administration of physical and cognitive performance measures, as well as self report psychological symptom measures (e.g., pain, stiffness, fatigue, depression). Participants (N=57) were recruited from the general community and were required to provide documentation of having met the criteria for diagnosis of FM. Analysis was completed using Ward's method of hierarchical cluster analysis (Ward, 1963). A four cluster solution was chosen for its level of interpretability. Cluster I participants exhibited high physical and cognitive performance and low psychological symptoms. Cluster II participants exhibited low physical and cognitive performance and high psychological symptoms. Cluster III participants exhibited moderate physical and cognitive performance and low psychological symptoms. Cluster IV participants exhibited moderate and cognitive performance and high psychological symptoms. The results of this experiment suggest that subgroups exist amongst fibromyalgia patients based on their psychological symptoms and levels of cognitive and physical performance. These results provide a better understanding of the variability of symptoms experienced by fibromyalgia patients.

## **SESSION 280 (POSTER)**

### **CRITICAL APPROACHES TO GERONTOLOGY**

#### **CLASS AND SOCIAL PARTICIPATION IN LATER LIFE**

I.R. Jones, *Social Sciences, Bangor University, Bangor, Gwynedd, United Kingdom*

Studies of later life have increasingly focused on examining different measures of socio-economic status in older groups incorporating indicators of class, status, income, wealth and deprivation and examining how these interact with other important structuring factors including retirement status, gender and ethnicity. At the same time research has shown that participation in social activities and social networks are viewed as key elements of successful ageing. Pathways to retirement and the material circumstances experienced prior to and in retirement are also considered important for social participation and well-being in later life. They also contribute to the maintenance of individual capacities to engage in social activities and participate in social networks. There has, however, been a relative neglect of wider debates about class and class culture and how these relate to the literature on social participation and later life. Studies of successful and active ageing need to take account of the importance of the role of class, material circumstances and retirement pathways in influencing the capacities of individuals to participate in social life. This paper considers ways of linking these two important areas of research and the theoretical and methodological issues that arise from this.

#### **YOUTUBE: A CASE STUDY OF GERIATRIC1927 USING SELECTIVE OPTIMIZATION WITH COMPENSATION**

P. Sauer, A. Bardo, *Miami University, Oxford, Ohio*

YouTube, the interactive online video sharing platform founded in 2005, has rapidly become an essential online medium. Gerontological research on YouTube has overwhelmingly focused on the digital divide. The purpose of this study is to broaden the gerontological perspective of social media as a medium which encourages intergenerational exchange and can compensate for aging related losses. We conducted a case study of Peter Oakley, an 84-year-old English widower, who started posting autobiographical videos entitled "Telling It All" on YouTube in August of 2006 under the pseudonym geriatric1927. His first video entitled "First Try" quickly went viral and turned him into a media sensation over a matter of days. By 2012, geriatric1927 had posted 334 videos with more than 9 million total views. Our case study is guided by the theoretical framework of selective optimization with compensation which suggests that older adults can overcome aging related challenges through technological and social resources. We find that Peter

utilizes YouTube to compensate for his social isolation that he relates to his position as an older widower in an ageist society. He optimizes his role as a YouTube sensation to engage in personal growth through reminiscence in his "Telling It All" series. Through the progression of his YouTube videos, he engages in intergenerational exchange that promotes and encourages a critical examination of existing age stereotypes throughout and beyond the YouTube community.

#### **RAPE, HIV, AND AGING: IS PUBLIC HEALTH PART OF THE PROBLEM?**

S. Roher, *New York Academy of Medicine, New York, New York*

In the 1970s, feminists recognized that a major obstacle to preventing rape was the ubiquitous stereotype of women as sexual objects and associated beliefs that women desired or deserved to be raped. Similarly, in the 1980s, pervasive views of homosexuality as inherently 'diseased' and/or 'sinful' stymied efforts to mount a vigorous public health response to AIDS. In both cases, the cultural construction of women and homosexuals strongly inhibited an adequate public health response to critical challenges; the situations did not change until feminist and gay activists used the "politics of authenticity" to legitimize the voices of women and gay men and challenge 'experts'. Today's social construction of aging remains rooted in largely negative stereotypes and stigma. History suggests that this may compromise the ability of public health to act responsibly towards the older population. This presentation, using historical comparisons, examines how the cultural construction of aging may be influencing the public health response to aging-related public health issues, critiques the concept of 'healthy aging' as promoted by aging experts, and suggests that the absence of an authentic aging movement creates a significant challenge to the development of an effective public health response to population aging.

#### **ETHNIC DIFFERENCES IN CONCERNS, KNOWLEDGE, AND BELIEFS ABOUT ALZHEIMER'S DISEASE: RESULTS FROM A NATIONAL SAMPLE**

L. Ayalon, *Bar Ilan University, Ramat Gan, Israel*

**OBJECTIVES:** To evaluate ethnic group differences in concerns, knowledge, and beliefs about Alzheimer's disease (AD) in three ethnic groups of older adults (White, Latino, and Black). **METHODS:** The Health and Retirement Study is a U.S. national representative study of older adults over the age of 50. The study is based on the 2010 wave. **RESULTS:** Analysis is based on data from 939 White respondents, 120 Latino, and 171 Black respondents who completed a special module about AD concerns, knowledge, and beliefs. There were significant ethnic differences on 7 of 13 items. However, after adjustment for education, gender, age, and having a family member with AD, only 4 items showed significant ethnic group differences; relative to White respondents, Black respondents were less likely to report that having a parent or a sibling with AD, increases the chance of developing AD and that genetics was an important risk for AD. In addition, relative to White respondents, both Black and Latino were more likely to perceive stress as a potential risk for AD and less likely to perceive mental activity as a protective factor. **CONCLUSIONS:** The study found only limited ethnic group differences, with most items showing a similar pattern across groups. Given their limited scope, it is unlikely that the ethnic differences identified in the present study are responsible for the ethnic gap in service use and AD diagnosis documented in past research.

#### **MENTAL CAPACITY IN THE (CIVIL) LAW: CAPACITY, AUTONOMY AND VULNERABILITY**

M. Hall, *1. Law, Thomspon Rivers University, Kamloops, British Columbia, Canada, 2. Interdisciplinary Studies Graduate Program, Vancouver, British Columbia, Canada*

This paper examines "mental capacity" as a medico-legal social construct and concludes that, while the construct works reasonably well in

the contexts of property-related transactions and health treatment decisions, it is deeply problematic and a source of dysfunction in the context of guardianship and guardianship-type interventions. There is nothing natural, compelling or necessary about mental capacity, and the author proposes an alternate construct more consistent with the purpose of guardianship and guardianship-type interventions: vulnerability. As the capacity construct is deeply enmeshed with a traditional liberal theory of autonomy (the capacity/autonomy equation or paradigm), so the vulnerability construct described here is more consistent with a theory of relational autonomy.

## SESSION 285 (POSTER)

### DIVERSE POPULATIONS

#### PAIN TREATMENT OUTCOMES AMONG AFRICAN-AMERICANS AND WHITES: EVIDENCE OF AGE-RACE DISPARITIES

S.H. Meghani, A. Hanlon, D. Bruner, *Biobehavioral and Health Sciences, University of Pennsylvania, Philadelphia, Pennsylvania*

Chronic pain afflicts 116 million Americans with a cost of up to 635 billion annually. Racial disparities in both prescription of analgesics for pain and their adherence by minority patients are widely documented. We investigated if the heuristics regarding patients' decisions to use analgesics for cancer pain and their actual adherence to prescribed around-the-clock (ATC) analgesics vary among older versus younger African-Americans and Whites. African-Americans (n=102) and Whites (n=139) diagnosed with solid tumors having at least one prescription for ATC analgesics were recruited from outpatient oncology clinics in the Mid-Atlantic region. Choice-based-Conjoint (CBC) Analysis was used to elicit analgesic treatment preferences. Analgesic adherence (i.e., total number of correct doses of prescribed ATC analgesics taken over 3-month period) was assessed using Medication-Event-Monitoring-System, (MEMS®). When compared to Older Whites, older African-Americans reported higher levels of cancer pain (p=.000) and lower pain relief (p=.000), more analgesic barriers (8 v. 5, p=.000), more pain-related functional interference (35 v. 30, p=.008). Regardless of age-group, the most important factor for Whites in deciding to use analgesics was "pain relief" (p=.000) whereas for African-Americans it was "side-effects" (p=.000). MEMS® adherence was significantly lower among older African-Americans versus older Whites (54% v. 75%, p=.000). Using GLM, race was a strong independent predictor of MEMS adherence (p<.000). An age\*race interaction was not significant (p=.993) in this analysis. Minority patients' past experiences with pain treatment may reflect in their subsequent adherence to analgesics. Findings indicate the need for provider education and more aggressive pain and symptom management among African-Americans. Acknowledgements: NIN/NINR grant [NIHRC1NR011591] PennMARCH [1P30AG031043-01]

#### ETHNICITY AS A MODERATOR OF THE RELATION BETWEEN DISABILITY AND PSYCHOLOGICAL DISTRESS AMONG ELDERLY ASIAN-AMERICANS AND NON-HISPANIC WHITES

C. Huang<sup>1,2</sup>, M.R. Crowther<sup>1</sup>, G. Kim<sup>3,1</sup>, J. DeCoster<sup>4</sup>, 1. *Department of Psychology, University of Alabama, Tuscaloosa, Alabama*, 2. *Center for Community-Based Partnerships, University of Alabama, Tuscaloosa, Alabama*, 3. *Center for Mental Health and Aging, University of Alabama, Tuscaloosa, Alabama*, 4. *Center for Advanced Study of Teaching and Learning, University of Virginia, Charlottesville, Virginia*

Objectives: The present study aims to examine whether ethnicity moderates the relation between disability and psychological distress (PD) in elderly Asian-Americans and non-Hispanic whites. Methods: Data were drawn from the 2009 California Health Interview Survey

(CHIS). Respondents included non-Hispanic whites and five Asian-American subgroups (Chinese, Japanese, Korean, Filipino, Vietnamese) who were aged 60 and older (N=18,127). A generalized linear model (GzLM) analysis was conducted to examine the overall relation of disability with PD, as well as how the relation was moderated by ethnicity. Results: Ethnicity was found to be a significant moderator of the relation between vision/hearing disability and PD among elderly Koreans, Filipinos and non-Hispanic whites (Wald Chi-Square= 79.14, p < .001). Ethnicity also moderated cognitive disability in all Asian subgroups and whites (Wald Chi-Square= 1071.38, p < .001). Having an ADL functional disability led to more distress among Chinese, Filipinos Vietnamese, and whites (Wald Chi-Square= 304.68, p < .001) than among those from other Asian subgroups. When the five Asian subgroups were treated as an aggregated group, the moderating effect of ethnicity was no longer significant for ADL functional disability and PD. Conclusions: This study sheds light on understanding ethnicity as a moderator of the relation between disability and PD. The findings revealed greater group differences between older Asian-Americans and non-Hispanic whites when subgroup differences were taken into account. It is recommended that health care professionals offer culturally-sensitive mental health services for disabled older adults to enhance their emotional wellbeing.

#### INFORMATION-SEEKING BEHAVIORS OF CAREGIVERS: FINDINGS FROM MULTINOMIAL LOGISTIC REGRESSION ANALYSES

K. Kim, B.L. Casado, *University of Maryland, Baltimore, Maryland*

Limited empirical evidence is known on how family caregivers seek health information to take care of older immigrants. Understanding of their information-seeking behaviors is important to build a better way of connecting immigrant families to relevant health services. To fill the existing gap, this study examines what factors relate to health information-seeking behaviors of caregivers. This study employs data collected from 146 caregivers who take care of frail older Korean immigrants. The sample was recruited by collaboration of a local government, Korean social service organizations, and faith-based organizations. A dependent variable is information-seeking behaviors indicating a main source(s) of health information used to care for the care recipient: (1) none, (2) formal, (3) informal, and (4) both formal and informal sources. Independent variables include caregiver's characteristics (gender, education, relationship to care-recipient, and acculturation); care-recipient's characteristics (functional dependency and cognitive impairment); social network and perceived usefulness of services. Multinomial logistic regression is conducted to take into account four different types of information-seeking behaviors. The overall model significantly fits the data. Most variables are significantly associated, and different mechanisms are also found. For instance, compared to using "none", the odds of using "formal source" significantly increase with additional social network (OR=1.13) or a higher level of functional dependency (OR= 2.84); other significant predictors are no college education (OR= .001), acculturation (OR= .02), cognitive impairment (OR= .04). The results suggest useful insights on different information-seeking behaviors. Health policy and practice should address them to facilitate access to health resources.

#### ACCULTURATION AND UNHEALTHY BEHAVIORS AMONG OLDER ASIANS: FINDINGS FROM THE CHIS STUDY

S. Wang, P. Xu, H. Lee, P. Huffman-Oh, E. Dugan, *Gerontology, University of Massachusetts Boston, Boston, Massachusetts*

Previous research has explored Asian immigrants' positive health behaviors; however, less well understood are predictors of negative health behaviors. This study aimed to explore the associations between acculturation and unhealthy behaviors in older Asians residing in California. The data source utilized in this study was the 2009 wave of the

California Health Interview Survey (CHIS). The analytic sample included 2597 Asian adults age 50 or older (1141 males, 1456 females). Descriptive, bivariate and multivariate statistics were conducted. Among the subjects, 17% were born in the U.S., 90.9% were citizens; 52.3% spoke English or both English and other languages at home, while 38.4% spoke with friends; 48.5% reported exposure to English-language TVs, radios, and newspapers. Three multiple regressions were conducted on: 1) unhealthy diet, 2) unhealthy behavior (smoking and binge drinking), and 3) physical activities. Results showed that those who were younger, males, employed, in college, born in the U.S., and used more English ate significantly more unhealthy diets ( $F = 13.02, p < .0001$ ); those who were younger, males, not citizens and had higher education were significantly more likely to smoke and binge drink ( $F = 17.81, p < .0001$ ); and those who had less education did significantly less physical activities ( $F = 4.71, p < .0001$ ). Asian males, especially those in their 50's, may be a group needing targeted health education outreach. Further research to understand why these unhealthy behaviors are prevalent in this group is needed.

#### **DEPRESSIVE SYMPTOMS AMONG AGING AFRICAN AMERICAN MEN: A MIXED METHODS STUDY OF SOCIAL AND CULTURAL CONTEXTS**

D.C. Watkins, B. Kawaii-Bogue, *University of Michigan, Ann Arbor, Michigan*

Age differences in health are often explained using the "healthy survivor effect," which suggests that cohorts of older African American men who do not have serious mental health problems are a unique subgroup of African American men who are mentally healthier and more likely to live longer. However, it is not clear whether this effect is the result of longevity or specific strategies that older African American men use to maintain lower levels of depression than their younger counterparts. The purpose of this study was to examine issues relevant to the interpretive context within which social and cultural factors of depression in older African American men takes place. A triangulation multilevel model approach was employed to examine the correlates of depressive symptoms, psychological distress, and major depressive disorder among African American men ages 55+ using qualitative data from the Depression care in African American Church Elders study and quantitative data from the National Survey of American Life. We found that several social ecological factors underscored the etiology and symptomatology of depression in our sample, such as intrapersonal (age, education, household income, employment status), interpersonal (marital status, seeing a regular doctor, social support networks), organizational (health insurance), and community- (church membership and fellowship) level influences. Implications for depression programs in aging African American men are discussed.

#### **ASSOCIATIONS BETWEEN HEALTH CONDITIONS AND OVERNIGHT HOSPITALIZATION IN OLDER ADULTS WITH DIABETES**

O.J. Clay<sup>1</sup>, F. Ovalle<sup>2</sup>, M. Crowe<sup>1</sup>, *1. University of Alabama at Birmingham - Department of Psychology, Birmingham, Alabama, 2. University of Alabama at Birmingham - Department of Medicine, Division of Endocrinology, Diabetes, & Metabolism, Birmingham, Alabama*

Background: Older adults with diabetes are often hospitalized for acute metabolic complications of uncontrolled diabetes, chronic complications of diabetes, and comorbid medical conditions. Andersen's Behavioral Model conceptualizes an individual's likelihood to use medical services in terms of predisposing characteristics, enabling factors, and need for care as assessed by illness level or health conditions. This investigation focuses on the relationships between health conditions and overnight hospitalization in older adults with diabetes. Method: Data from the baseline telephone interview of the University of Alabama at Birmingham Diabetes and Aging Study of Health (DASH) were uti-

lized. Logistic regression models adjusted for age, education, income, gender, and race were utilized to assess the individual associations between health conditions and overnight hospitalization. Results: The sample consisted of 234 older adults with diabetes (mean age = 73.46) with 46% being male, 50% Caucasian, 45% African American, and 5% from other racial backgrounds. Of the participants, 43 (18%) reported spending at least 1 night in a hospital. Results of the covariate-adjusted models revealed that neuropathy (OR = 2.166; 95%CI = 1.084-4.327), stroke (OR = 9.582; 95%CI = 2.725-33.315), and congestive heart failure (OR = 3.578; 95%CI = 1.523-8.406) were among the medical conditions associated with an increased risk of overnight hospitalization within the last 6 months. There were no racial differences observed for the odds of overnight hospitalization. Conclusion: Results of this investigation suggest that among older adults with diabetes, comorbidity is associated with an increased risk of negative health outcomes and potentially higher health care costs.

#### **HEALTH AND WELL-BEING OF AGING BABY-BOOMERS IN AN APPALACHIAN REGION**

M. Iwasaki<sup>1</sup>, E.E. Grinnan<sup>2</sup>, L.P. Meyer<sup>3</sup>, *1. West Virginia University, Morgantown, West Virginia, 2. West Virginia University, Morgantown, West Virginia, 3. West Virginia University, Morgantown, West Virginia*

Due to the immense size of the baby-boomer population, the culture of older Americans will become more diverse and complex. Appalachian culture represents the largest and poorest rural population which faces disparities in health and health care access (Keefe, 1998; Hartley, 2004; & Smith, 2001). There is a paucity of research on health and well-being of rural residents, especially the baby-boomer generation. The present study was designed to examine self-reported health and well-being among baby-boomers living in the State of West Virginia. We selected a total of 26 qualitative interviews conducted by graduate students in a human development course in 2010 and 2011. Two doctoral students and a psychology faculty member conducted data analysis based on a modified consensual qualitative research (CQR; Hill et al., 2005) approach. All 26 interviewees were White and 18 were female. The average age was 56 and 12 had high school degree or less. Some degree of migration was evident as only 12 were lifelong residents of West Virginia. Major study themes found included positive view of self and aging and having basic health care for their existing conditions. Regarding the issue of mental health, the majority denied current needs despite acknowledging past mental health conditions and treatment. The majority expressed health and loss of independence as major concerns related to aging. Present study findings added helpful information for assisting future seniors in the Appalachian region. Implications of the findings and recommendations for future health care field will be discussed.

#### **THE IMPACT OF MARITAL STATUS ON FOREIGN-BORN WOMEN'S ECONOMIC WELL-BEING IN THEIR LATER LIFE**

N. Xie, *UMASS at Boston, Billerica, Massachusetts*

A fair amount of research exists on the association between economic well-being and marital status among native-born women. Women's marital status is always viewed as a major factor affecting their economic well-being, and being married is financially beneficiary for women. However, research about the impact of marital status on foreign-born women's economic well-being is still scarce. Foreign-born women, a fast-growing subpopulation, may experience a double-negative effect of being women and immigrants. Due to possible discrimination against foreign-born women and other factors, the impact of marital status on economic well-being may be stronger for foreign-born women than for native-born women. This study addresses the questions of whether unmarried foreign-born women are more likely to be in

poverty than their native-born counterparts, and whether economic disparities between married and unmarried women are greater among the foreign-born. Using data from the 2004 Health and Retirement Study, the study estimates the effects of marital status on the household incomes of women who are 50 years old or older. The findings show that foreign-born unmarried women are more likely to be in poverty than their native-born counterparts. The findings also show that married foreign-born women generally achieve higher economic status than unmarried foreign-born women. Moreover, the impact of marital status is stronger on foreign-born women than on the native-born, so the economic difference between married and unmarried women is greater among foreign-born women. The results suggest that unmarried foreign-born women are at a high risk of poverty in their later life. Public policy needs to pay more attention to the economic vulnerability of this foreign-born subpopulation.

#### **CULTURAL IDENTITY AND FAMILY INTERGENERATIONAL RELATIONSHIPS AMONG LATINO AND ASIAN AMERICANS**

K. Hoshino<sup>1</sup>, W. Tseng<sup>1</sup>, N. Hikoyeda<sup>2</sup>, D. Gallagher-Thompson<sup>2</sup>, J. Ventura<sup>3</sup>, H. Inoue<sup>4</sup>, 1. *University of California, Berkeley, Berkeley, California*, 2. *Stanford Geriatric Education Center, Stanford, California*, 3. *East Bay Asian Youth Center, Oakland, California*, 4. *Synarc, Inc., Nowmark, California*

1. Purposes: This research addresses three issues. First, the research examines cultural identity among Latino and Asian Americans based on Cultural Identity theory (Banks, 2006). Second, it analyzes their family intergenerational relationships according to Family Intergenerational Solidarity theory (Silverstein, Gans, Bengtson et al., 2010). Third, the research clarifies the relationships between cultural identity and family intergenerational relationships. 2. Methods: The participants (N=60) were 20 Peruvian, 20 Chinese, and 20 Japanese American first generation adults. Their age range was between 40 and 59 years old. In-person interviews based on a semi-structured interview protocol were conducted. The consistency rate of a content analysis was 86%. 3. Results and Discussions: As a result of a content analysis, no participant was evaluated as Stage 1 (Cultural Psychological Captivity), Stage 5 (Multiculturalism and Reflective Nationalism), and Stage 6 (Globalism and Global Competency). Peruvian (75%), Chinese (90%), and Japanese (75%) were evaluated as Stage 3 (Cultural Identity Clarification) and Stage 4 (Biculturalism). Regarding relationships between children and adults, Peruvian (70%), Chinese (38.89%), and Japanese Americans (30%) were evaluated as a positive type (i.e., Amicable Type). As for relationships between adults and elderly parents, Peruvian (58.33%), Chinese (47%), and Japanese Americans (50%) were evaluated as an Amicable Type. With regard to relationships between children and adults, those who were evaluated as Stage 2 (55.55%) were regarded as an Amicable Type more than those who were evaluated as Stages 3 and 4 (37.84%). As for relationships between adults and elderly parents, those who were estimated as Stage 2 (55.56%) were regarded as an Amicable Type more than those who were evaluated as Stages 3 and 4 (50%). Health care professionals should appropriately assess cultural identity and family intergenerational relationships in order to provide more culturally-generational sensitive social and health services for under-represented populations.

#### **GENETICS, PARENT HEALTH, AND EDUCATION: A MISSING LINK BETWEEN EDUCATION AND HEALTH?**

F. Yong, K.E. Whitfield, *Duke University, Durham, North Carolina*

The impact of education on later health is well documented. Yet this link often does not include estimates of familial influences or parent health, which could influence educational attainment through genetic influences or family environment. We examined the estimates of education to health before and after adding genetic influences and parent health. We applied a multilevel model for behavior genetic analysis,

using data from Carolina African American Twin Study of Aging (n=428). Genetic influences were measured by estimating additive genetic effects. Parent health and education were a subjects' self-reported measure. Outcomes were a count of chronic illnesses, ADLs, and self-rated health. Covariates included income, social support, age, gender, and BMI. The link of education to all health outcomes was significant before considering genetic influences and parent health ( $p < 0.05$ ). Yet, the link became unrelated after adding these variables. The genetic effect was still high (47% - 50%) even in the full model that includes both genetic and non-genetic influences. Parent health had both main effect ( $p < 0.05$ ) and interaction effect with education ( $p < 0.05$ ). Our findings showed a possible link of genetics, parent health, education, and later health outcomes, implying that it is important to consider the contributing factors of educational attainment to better address health variations. Further studies aimed to identify specific genes and polymorphisms underlying the health outcomes would advance our understanding of the possible link.

#### **SESSION 290 (POSTER)**

#### **EDUCATIONAL INTERVENTIONS**

#### **NURSING HOME LEADERSHIP PERCEPTIONS OF STAFF QUALITY IMPROVEMENT TRAINING NEEDS**

K. Zakoscielna<sup>1</sup>, S. Lichtenstein<sup>1</sup>, P.A. Parmelee<sup>1,2</sup>, 1. *University of Alabama, Tuscaloosa, Alabama*, 2. *Center for Mental Health and Aging, Tuscaloosa, Alabama*

The Minimum Data Set (MDS) quality indicators (QI) are commonly used for quality improvement in skilled nursing facilities (SNF). However, little is known about staff's perception and understanding of this system. This qualitative and quantitative study surveyed 289 leadership staff in Department of Veterans Affairs SNF units inquiring why they thought staff do (or do not) understand the MDS QI's, what could be done to improve staff's understanding of them, and specific perceived training needs. Respondents rated staff understanding of QI computations and meaning, and their general QI skills, as fair to good. Content analysis of open-ended responses regarding influences on staff understanding of the QIs yielded the following categories: Involvement, Staffing/staff roles, Education/Training, Mechanics, Big Picture, Lack of Interest/Motivation, Lack of Time, and Problems with the MDS itself (listed in order of frequency). For how to improve understanding, respondents recommended Education/Training, Involvement, Reinforcement, Meaningful Application, and Simplification (listed in order of frequency). Of specific training strategies/needs, the most frequently identified were "using the MDS as a clinical assessment tool," "basic quality improvement principles," and "individualizing care plans based on the RAPs." Frequencies of response categories differed as a function of position at the facility ( $p=.051$ ) and size of the unit ( $p<.05$ ). These results highlight the range of causes identified by managers for line staff's understanding of (or lack of) the QIs, and their clear preference for ways to improve staff understanding of what the MDS means.

#### **STATEWIDE TRAINING FOR ASSISTED LIVING AND ADULT DAY CENTERS: SIX YEAR IMPACT**

T. Gendron, J. Pryor, E. Welleford, *Virginia Commonwealth University, Richmond, Virginia*

The Department of Gerontology at Virginia Commonwealth University is responsible for training direct care staff from Assisted Living Facilities (ALF's) and Adult Day Centers (ADC's) throughout the state of Virginia. Direct care staff directly and critically impacts the health outcomes of the older adults they serve. In a continued effort to address the shortage of trained staff, a 6 year impact analysis of training sessions was completed. From 2006-2011, over 10,000 direct care staff employed in ALF's and ADC's attended statewide training sessions focused on building core competencies for working with older adults.

This poster presents results on program efficacy and impact by training topic, site and trainer obtained from pre and post test analysis. Systematic observations were also completed to assess training quality, trainer consistency and participant engagement. Future directions for curriculum revision based on evaluative data will be presented.

### **BENEFITS OF AN ORAL HISTORY PROJECT: A WIN, WIN, WIN ENDEAVOR**

M.B. Ligon<sup>1</sup>, K. Ehlman<sup>2</sup>, G. Moriello<sup>3</sup>, E. Welleford<sup>4</sup>, 1. *York College of Pennsylvania, York, Pennsylvania*, 2. *University of Southern Indiana, Evansville, Indiana*, 3. *The Sage Colleges, Troy, New York*, 4. *Virginia Commonwealth University, Richmond, Virginia*

Oral history, a method of recording historical information through in-depth interview, can provide multi-faceted benefits when embedded in gerontology classrooms. Students who interview and record elders' narrative responses, older adults who describe their experiences, and societies interested in preserving historical information while supporting development across the lifespan, can all benefit from such projects making it a win, win, win endeavor. This session chronicles a seven-year, multi-pronged project outlining outcomes of original research carried out by these authors demonstrating benefits to students, elders, and society. Findings show that students' attitudes toward older adults and the aging process improve after students interview older adults as part of an oral history assignment. Furthermore, findings from another study reveal that attitudes improve if that oral history project is given in a traditional or an on-line gerontology course. Two additional studies show that older adults who serve as interviewees also benefit as there may be a change in their life satisfaction and perceived generativity. Finally, oral history is undertaken as a way of benefitting others by informing the interviewer and the broader society about past historical and cultural events and eras. Therefore, this session culminates by illustrating ways in which oral history projects contribute not only to society's need to preserve historical information but also to society's need to cultivate cultural demand for elders to be contributing, vital members of our communities. By charting these connections, a richer understanding of the potential impact of oral history can be attained.

### **SHARP GERONTOLOGY CERTIFICATE PROGRAM COMPETENCY BASED EVALUATION METHODS AND OUTCOMES**

J. Frank<sup>1</sup>, R. Price<sup>1</sup>, C. Manning<sup>2</sup>, A. Lupa<sup>1</sup>, P. Robinson<sup>3</sup>, 1. *University of California, Los Angeles, Los Angeles, California*, 2. *Goodman Research Group Inc, Cambridge, Massachusetts*, 3. *College of the Canyons, Santa Clarita, California*

Background: Evidence Based Health Promotion and Disease Management Programs (EBHP) are defined as a process of planning, implementing, and evaluating programs adapted from tested models or interventions to address health issues in individual and community settings. With federal funding, most states have developed new systems to deliver and sustain these programs. However, the content and opportunities provided by these programs are a well-kept secret in higher education. Further, the personnel working in community based service organizations tasked with delivering these programs are often not prepared for their new roles. With support from the U.S. Dept of Education, Funds for Improvement of Post Secondary Education (FIPSE), we developed a short training program to increase the capacity of the workforce (present and future) to plan and deliver these programs. Methods: The Skills for Healthy Aging Resources and Programs (SHARP) certificate program was developed for community colleges utilizing a competency-based educational approach. This poster will describe the curricula development, faculty training, competency-based tools and present Cohort 1 student evaluation data. Competencies were measured by self-report using a 5-point scale from 0 (not skilled at all) to 4 (expert skill), and compared using paired-sample t-tests (n=17). Results: Findings document statistically significant improvements pre-post program in all 44

gerontology competencies at either  $p < .05$  or  $p < .001$  levels. Implications: Preliminary results indicate that short focused curricula can be delivered effectively through community colleges to increase the workforce preparedness to deliver community-based EBHP for older adults.

### **WILL THEY TEACH WITH AN IPAD? TECHNOLOGICAL DISCONTINUITY AND GERONTOLOGY FACULTY**

J. Cotter, *Virginia Commonwealth University, Richmond, Virginia*

Gerontological educators face new frontiers in a changed learning environment. The growth of mobile learning devices and distance education requires new approaches to teaching, learning and student engagement. New cohorts of students demand educational systems adapted to current methods of information transfer. Mobile learning devices will continue to disassemble traditional educational methods. The ability to enhance interactivity, speed up feedback, encourage collaboration and use multiple learning platforms become essential skills for gerontological and aging studies educators. This technological discontinuity will require a greater reaching out to faculty to find new ways to enhance student learning. The purpose of this poster session is to highlight issues of new technological imperatives and to propose the Transtheoretical model as a viable framework for assessing faculty readiness to implement and to involve faculty in implementing technological innovations. Although information technology infrastructure and student experiences and needs are two key elements of successful on-campus and distance education programs in gerontology, faculty involvement and support may be the most critical factor. As faculty have varying levels of interest, proclivity, and experience regarding new educational technologies, an adaptation of the framework of the Transtheoretical Model of Behavior Change may be helpful in understanding how best to involve and support faculty (Prochaska & Velicer, 1997). This session suggests appropriate strategies for facilitating behavior change in faculty who are at any of the six stages of the model: pre-contemplation, contemplation, preparation, action, maintenance, and termination.

### **MAPPING GERIATRIC COMPETENCIES IN CONCEPT BASED UNDERGRADUATE NURSING CURRICULA**

C. Madden, *University of Utah, Salt Lake City, Utah*

Aging of the U.S. population is a major challenge for the 21st century. Population projections indicate that by 2030, the number of those age 65 and over will double and account for more than 20% of the U.S. population. Implications for nursing education are intensified by statistics indicating older adults will comprise the majority of a new nurses' patient population. Geriatric competencies established by the American Association of Colleges of Nursing and Hartford Institute have been established and aligned with baccalaureate nursing education essential competencies; however there is little information about how they are specifically incorporated in baccalaureate nursing curricula. A recent trend in baccalaureate nursing education toward a concept-based approach provides a useful and timely educational pedagogical framework for mapping geriatric competencies within a curriculum. Mapping geriatric competencies from concept to learning activity provides a method for detailed identification of curricular integration of geriatric competence at the levels of process and content. The resulting curricular map provides clear assessment of opportunities for strategies to enhance the integration of geriatric competencies. It is hoped that the process for mapping competencies will be a first step in the rigorous evaluation of concept based curricula, with the ultimate goal of ensuring that new nurses are being appropriately prepared to meet the demands of the current and future work environment.

## EMOTION WORK

## FACIAL EMG AS A MEASURE OF COGNITIVE REAPPRAISAL SUCCESS IN YOUNGER AND OLDER ADULTS

J. Harris<sup>1</sup>, C. Platzek<sup>2</sup>, D. Isaacowitz<sup>1</sup>, 1. *Northeastern University, Boston, Massachusetts*, 2. *Brigham and Women's Hospital, Boston, Massachusetts*

Cognitive reappraisal is an emotion regulation strategy in which individuals alter their thoughts about a situation in order to change their affective experience. While some studies have investigated aging and reappraisal, few have differentiated between positive and detached reappraisal, and most have used subjective (self-report) measures of regulation success. The present study used a within-subjects design in order to assess reappraisal success in younger ( $N=23$ ) and older adults ( $N=20$ ) as they viewed negative images while implementing instructions to view the images naturally, positively reappraise the images, or to use detached reappraisal with the images. Specifically, participants' facial muscle movements in the corrugator muscle (frown) were recorded and examined using facial Electromyography (EMG) as an objective indicator of regulation success. Both reappraisal instructions led to lessened frown activity compared to the natural viewing condition; there was no main effect of age or interaction between age group and instruction condition. This suggests that when presented with negative stimuli, both younger and older adults were able to regulate their emotions successfully by using either detached reappraisal or positive reappraisal, and that these strategies may have advantages compared to viewing the images naturally regardless of age.

## AGE DIFFERENCES IN SELECTIVE ATTENTION TO TASK-IRRELEVANT POSITIVE AND NEGATIVE FACES

R. Neumann, U. Kunzmann, *University Leipzig, Leipzig, Germany*

Proceeding from past evidence for a diminished processing of negative vs. positive stimuli in old age, we tested the predication that older adults' performance in a visual detection task will be less distracted from task-irrelevant negative faces than from task-irrelevant positive faces, whereas the opposite pattern should occur in young adults. In a computer task young and old adults were asked to detect short intervals of coherent motion of randomly moving dots while ignoring negative, neutral, and positive emotional background faces. By individually adjusting the level of motion coherence, the task was sufficiently difficult; allowing competition for visual processing resources between detection task and emotional distracters to occur. In both age groups detection rates decreased immediately after onset of emotional vs. neutral background faces, indicating that emotional faces automatically capture attention. Older adults' performance in the detection task improved earlier during the presentation of negative vs. positive faces, whereas younger adults were more persistently distracted by negative relative to positive faces. These results are consistent with the idea that positivity effects are due to strategic top-down processes.

## EXPRESSING ANGER INCREASES RISK FOR METABOLIC SYNDROME IN OLDER ADULTS

J.A. Boylan, C. Ryff, *University of Wisconsin, Madison, Madison, Wisconsin*

Building on prior work linking anger to cardiovascular and metabolic related diseases (Chida & Steptoe, 2009), this study addressed whether high levels of anger expression exacerbated age-related risk for metabolic syndrome (MetS) in a national sample of adults. MetS is a constellation of risk factors associated with increased risk for coronary heart disease, type II diabetes, and all-cause mortality (Cornier et al., 2008). Participants ( $N = 1,054$ ; 54.7% female; Mage(SD) = 58.0(11.6)) were from the Survey of Midlife in the U.S. (MIDUS). Self-reported

anger expression was obtained via survey assessments, and MetS components (waist circumference, systolic and diastolic blood pressure, triglycerides, HDL cholesterol, and fasting glucose) were measured during an overnight clinic visit. Unadjusted MetS prevalence (according to the International Diabetes Foundation definition) was 40.9%. Age was significantly related to greater waist circumference, higher systolic blood pressure, lower diastolic blood pressure, higher fasting glucose, and a greater likelihood of having MetS in bivariate analyses. Anger expression did not predict MetS in main effects models, but a significant interaction emerged between age and anger expression in predicting MetS. As hypothesized, anger significantly predicted greater risk of MetS in the middle (50-65 years) and oldest (66-86 years) age groups, and this relationship was strongest in the oldest adults (50-65 years:  $\beta = .17$ ,  $p < .001$ , 66-86 years:  $\beta = .38$ ,  $p < .001$ ). Results highlight that anger expression is most pernicious to metabolic health for older adults.

## THE INFLUENCE OF ATTACHMENT STYLE ON AFFECT WITH SOCIAL PARTNERS

P. Goodwin, R.C. Intrieri, *Western Illinois University, Macomb, Illinois*

One hundred six older adults (72 women and 34 men; average age of 67.68) participated in a study examining attachment style, context, and affective experience. Participants completed a modified version of the Day Reconstruction Method (DRM), a stepwise procedure which asks participants to recall the previous day through construction of a diary consisting of a sequence of episodes. For each episode, participants provided information regarding the objective situation (activity, location, companion). The Positive Affect Negative Affect Scale (PANAS) was embedded within each episode report to assess affect. Participants also completed a measure of adult attachment style (Collins & Read, 1990). The current analysis explores attachment style and affect within the context of intimate relationships by comparing affect when with a spouse/partner as opposed to when with a social companion other than a spouse/partner. ANOVA for positive affect was significant ( $F(7,1458) = 8.950$ ;  $p = .000$ ). Fearfully attached participants had the lowest positive affect when with other social companions (20.82) while the highest positive affect for other social companions was obtained by dismissing participants (24.89). ANOVA for negative affect was also significant ( $F(7,1458) = 3.606$ ;  $p = .001$ ). Fearfully attached participants were the only group for whom negative affect was higher when with a spouse/partner (16.50) than when with social companions other than a spouse/partner (15.52). Dismissing participants had the lowest level of negative affect when with a spouse/partner (16.23) while securely attached individuals had the highest level of negative affect when with a social companion other than a spouse/partner (16.97).

## REMEMBER THE GOOD TIMES: LINGUISTIC CHARACTERISTICS OF RELATIONSHIP-DEFINING MEMORIES FROM YOUNG ADULTHOOD TO OLD AGE

N. Alea, *University of the West Indies, St. Augustine, Trinidad and Tobago*

Relationship-defining memories (RDMs) are vivid, emotional recollections about specific events that occur during the course of an interpersonal relationship (Alea & Vick, 2010). The current study examined whether the linguistic characteristics of positive and negative defining memories of adults' marriages would follow a pattern predicted by socioemotional selectivity theory (Carstensen, Isaacowitz & Charles, 1999). Men and women ( $N = 242$ ) ranging in age from 20 to 81 years-old completed an online survey which asked them to write about a positive and negative RDM. The content of the memory narratives were analyzed for the frequency of positive emotion, negative emotion, cognitive processes, sensory imagery words, and self and unit-oriented pronouns. A 5 (age-group by decade, e.g., 20-29 years-old, 30-39 years-old, etc.) x 2 (RDM valence) MANOVA was conducted. There was a multivariate effect for RDM valence,  $F = 37.43$ ,  $p < .001$ , and an age group x valence interaction,  $F = 2.20$ ,  $p < .05$ . Positive

RDMs contained more positive emotion words and unit-focused pronouns compared to negative RDMs, which had more negative emotion and cognitive process words, and more self-focused pronouns. The interaction with age existed for positive emotion words only,  $F = 2.76$ ,  $p < .05$ . People over the age of 60 had more positive emotion words in their positive RDMs compared to people 40 to 49 years-old. There were no age group differences for negative RDMs. The robustness of the positivity bias in older adults' recollections for positive RDMs is discussed.

### THE INFLUENCE OF TIME PARAMETERS ON THREAT PRIMING

C. Kappes, C. Bermeitinger, *Department of Psychology, University of Hildesheim, Hildesheim, Germany*

Recent research results show that old and young adults do not differ in detecting threatening information. However, other findings demonstrate that old adults are better at inhibiting threatening information than young adults, which is interpreted in the framework of the positivity bias. In three experiments, we tested whether information processing of threatening information differs between age groups by employing an evaluative priming paradigm with threatening and secure words as primes and targets. Participants evaluated target words regarding their threat value (threatening vs. nonthreatening). In experiment 1 ( $N(19-30 \text{ years}) = 40$ ,  $N(59-80 \text{ years}) = 37$ ), no significant age difference in the priming difference following secure prime words were obtained. However, there was a significant age difference in the priming difference following threatening prime words, indicating a smaller influence of threatening primes on target responses in the older age group ( $M(\text{young}) = 39 \text{ ms}$ ,  $M(\text{old}) = 15 \text{ ms}$ ). Yet, older participants had slower mean response times. In experiment 2 ( $N(19-27 \text{ years}) = 37$ ,  $N(56-87 \text{ years}) = 27$ ), we limited the response window. Consequently, no significant age differences in the priming differences were obtained anymore (both  $ps < .35$ ). We delayed the response time in experiment 3 ( $N(18-32 \text{ years}) = 78$ ), which resulted in no significant priming differences in the young age group, mirroring the results of the older participants in experiment 1. Results are discussed in terms of the time course of priming processes and regulation mechanisms.

### RECONSTRUCTING YESTERDAY: EXAMINING AGE AND COGNITIVE INFLUENCES ON MEMORY FOR EMOTIONS

L.H. Ryan, T.L. Queen, J. Smith, *Institute for Social Research, University of Michigan, Ann Arbor, Michigan*

It is critical to understand whether age differences in reports of emotion reflect true experiential differences or potential secondary explanations, such as memory deficits. The current study aims to investigate this questions using a newly collected sample of adults (aged 50–96;  $N=968$ ) who were first asked about a set of overall emotions yesterday and then rated the same emotions within specific activities yesterday. To investigate age-related versus memory-related differences in emotional reports, scores were created to identify whether individuals' reports of specific emotions overall yesterday matched reports within an activity yesterday. For example, if a participant reported no sadness overall yesterday, but report any experience of sadness in an activity yesterday, s/he would be coded as a mismatch on sad. A series of logistic regression models were run independently for each emotion predicting the likelihood of matching overall to within-activity yesterday. Age, recall, and an age by recall interaction were included as predictors of interest, along with covariates related to emotion. Results indicate differential patterns depending on the emotion adjective. Differing interpretations will be considered based on existing theory on aging and emotion.

### LONGITUDINAL RELATIONS OF POSITIVE AFFECT AND ACTIVITIES OF DAILY LIVING IN A FUNCTIONALLY HETEROGENEOUS SAMPLE OF VERY OLD ADULTS

P.M. Drapaniotis<sup>1</sup>, H. Wahl<sup>1</sup>, V. Heyl<sup>2</sup>, O.K. Schilling<sup>1</sup>, *1. Department of Psychological Aging Research, Heidelberg University, Institute of Psychology, Heidelberg, Baden-Württemberg, Germany; 2. University of Education, Heidelberg, Institute of Special Needs Education, Heidelberg, Baden-Württemberg, Germany*

Previous research suggests a positive relationship between functional competence (ADL) and positive affect (PA) in later life and a respective robust causal direction. However, recent findings point towards an inverse causality between ADL and PA, particularly over longer time intervals, i.e. higher PA may also contribute to the maintenance of functional competencies. Moreover, most studies in the past have focused on the young-old and thus functionally rather unimpaired samples. The present study examines the causal direction between PA and ADL in a functionally heterogeneous sample of 169 very old adults, which were followed across 4 years (mean age at T1: 85.73 years; only community dwelling participants without cognitive impairment at T1). In particular, our sample contained functionally unimpaired as well as visually and hearing impaired older adults. Using cross-lagged panel analysis, we found a clear confirmation of the previously reported relationship between ADL and PA, but no substantial hints for a reverse direction in both the overall sample and the functionally different subsamples. Our findings indicate that interventions targeting functional competencies may help improve late-life emotional adaptation in oldest-old persons.

### UNDERSTANDING THE EMOTIONS OF AFRICAN AMERICAN CAREGIVERS IN KENTUCKY

A. Carter, D. Danner, J.F. Watkins, C. Smith, *Univ of Kentucky, Lexington, Kentucky*

With over 5.1 million Americans suffering from some form of dementing illness, Alzheimer's disease (AD) caregivers are at a particularly high risk for both emotional and physical strain (Alzheimer's Association, 2010). Most primary caregivers deal with tremendous strain of balancing their own responsibilities (e.g. work and family) with the duties (e.g. financial, legal, social) to their family member suffering from AD. As an increase public health crisis or "Silent Killer" in the African American community, the caregiving experiences is complicated for many African American families due to various issues such as: lack financial resources, denial about the disease, caregiver health, late diagnosis, lack of social and community support as just a few issues which increase the burden for this segment of the population. This pilot-study examines the impact of positive and negative emotions on the caregiving process of both African American and Caucasian caregivers in Kentucky. Guided by the Facial Action Coding System, this study seeks to understand the emotional process of caring for dementia patients, observation of feelings before and during the caregiving process, and both positive and negative aspects of caring for loved ones with Alzheimer's disease and its impact on the caregiving process. Qualitative methods and descriptive statistics are used to generate thematic meanings of the experiences of these caregivers living in Kentucky.

### ARE YOU IN THE ZONE? EXPLORING PSYCHOLOGICAL COMFORT ACROSS ADULTHOOD

S.J. Kohn, M.M. Willis, T.B. Butenshon, C.W. Fendig, S.E. Spivey, *Psychology, Valdosta State University, Valdosta, Georgia*

Health care practitioners typically portray comfort in terms of pain (discomfort) relief. Yet, a firm definition of psychological comfort among social and behavioral scientists may have contributed to the scarcity of research on this topic – especially in terms of life-span development and the psychology of aging. An ancient description of comfort, however, pertains to the Japanese concept of *Ibasho*, which abstractly means "being in a place." The closest Western developmental paradigm for

this might be Erikson's (1959) notion of a niche regarding identity. In this study, 616 older (n=191; M-age=73), middle-age (n=164; M-age=49), and younger (n=261; M-age=21) adults were surveyed on their feelings and perceptions regarding the importance of having Ibasho (comfortable place); and the degree to which diverse life situations and environments impacted their feelings of comfort. Our measures were based on current Ibasho metrics (Herleman, et al., 2008; Kunikata, 2011), and focus group-based pilot data. Comfort was operationalized in terms of discrete variable clusters related to concrete physical locations; interpersonal relationships; abstract meta-physical (spiritual and time/space) issues; and lifestyle-related behaviors. A series MANOVAS revealed significant differences between the three age groups. Noteworthy among these findings, were significantly higher comfort levels for older adults compared to young and middle-agers regarding death and end of life issues; and thinking about the future. Compared to older adults, young and middle-agers reported greater comfort associated with moving or relocating; and thinking about the past. Younger participants compared to older and middle-age adults, however, were more comfortable looking at themselves in a mirror.

## SESSION 300 (POSTER)

### END-OF-LIFE HELPING

#### PALLIATIVE CARE COMPETENCY IN MENTAL HEALTH: NEEDS ASSESSMENT ACROSS DISCIPLINES AND LEVEL OF TRAINING

K.H. Sorocco<sup>1,2</sup>, J. Whalen<sup>1</sup>, 1. *University of Oklahoma Health Sciences Center, Oklahoma City, Oklahoma*, 2. *Oklahoma City VAMC, Oklahoma City, Oklahoma*

There is a paucity of research on the competency level and specific training needs of providers across disciplines and levels of training surrounding mental health care at end of life. A recent review of the literature yielded no formal publications on the training needs of providers on mental health issues at end of life. A training needs assessment for mental health issues at the end of life was conducted at a Mid-Western Health Sciences Center (N = 154). Participants, who included medical students, psychology trainees, and interdisciplinary providers, completed an anonymous survey prior to classes, seminars, or conference presentations. Participants were asked if they had formal training in any of 10 areas specific to mental health and palliative care (e.g. Grief/Bereavement) and to rate their competency level for providing care in each of the 10 areas (1 = Not competent, 10 = Absolutely competent). Average competency level across the 10 areas was 5.7 out of 10 (providers), 4.0 (psychology trainees), and 2.3 (medical students). All three groups felt the most competent in grief and bereavement. Brief treatment was the lowest rated area of competence for both the providers and medical students. Lastly, preferred teaching modality to enhance competency of providing mental health care at end of life was determined to be conferences/seminars and websites. Findings suggest a significant need for more training in mental health care at end of life. A discussion outlines a training program to meet the training needs of trainees and professionals in the field.

#### STRATEGIES FOR SUCCESSFUL IMPLEMENTATION OF A HOSPICE RANDOMIZED CLINICAL TRIAL: THE ACTIVE INTERVENTION

D. Parker Oliver<sup>1</sup>, G. Demiris<sup>2</sup>, E. Wittenberg-Lyles<sup>3</sup>, K. Washington<sup>4</sup>, R.L. Kruse<sup>1</sup>, 1. *Family and Community Medicine, University of Missouri, Columbia, Missouri*, 2. *University of Washington, Seattle, Washington*, 3. *University of Kentucky, Lexington, Kentucky*, 4. *University of Louisville, Louisville, Kentucky*

Much has been written on the challenge of doing clinical trial research in the hospice setting. Concerns regarding ethical challenges, difficulties in randomization procedures, and funding obstacles have been doc-

umented as reasons for so few trials with this population. We will share the strategies used and lessons learned in an implementation of a federally funded ongoing multi-site, 4 year randomized controlled trial of a behavioral intervention in hospice. Licensing and certification agencies require hospices to convene an interdisciplinary team (IDT) at least every 14 days to bring together at least nurses, social workers, physicians, and chaplains to collaborate and develop a care plan. Despite the hospice philosophy of patients and family empowerment with decision making regarding their care, they are routinely absent from these meetings. This research team has designed an intervention using Internet based video technology to involve informal caregivers (and patients when they are able) in the hospice interdisciplinary team care plan meetings. The intervention is being tested with 544 randomized hospice caregivers. This poster will demonstrate that large randomized controlled trials are feasible in the hospice setting but require significant planning. A strategic recruitment plan, a standard script for enrollment, a daily presence of research staff in the hospice, hospice participation in planning, and strong pilot testing of interventions have been important steps to assure success of this trial.

#### DIAGNOSTIC AND PROGNOSTIC LABELS: DO THEY IMPACT FAMILY MEMBERS' WILLINGNESS TO HELP AN OLDER RELATIVE?

E.J. Bergman, *Gerontology Institute, Ithaca College, Ithaca, New York*

Objective: Family members are central to care of older adults. This study examined the effects of prognostic and diagnostic labels and gender on family members' perceptions and willingness to help an older relative. Methods: 324 young adults were randomly assigned to 1 of 3 vignettes describing an older mother experiencing physical symptoms and functional disability. One included prognostic label ("terminal"), another included prognostic and diagnostic labels ("terminal lung cancer"), and the third included no labels. Effects for diagnostic and prognostic labels and gender were examined. Results: Participants who read no label were more likely to believe the mother's problems were due to old age than other groups; attributed less blame than those told the mother's condition was due to terminal lung cancer; attributed more blame and control than those only given the prognostic label; and were more likely to feel the mother's problems could improve if she received better medical care than those told the mother had terminal lung cancer. Diagnostic and prognostic labels did not affect feelings of anger, sympathy, willingness to help, have the mother move in, discuss EOL care, serve as a health care proxy, or support aggressive treatment. Female participants were more likely than males to have their mother move in and support aggressive treatment. Conclusions: While gender was a factor in health care and caregiving decisions, diagnostic and prognostic labels did not play a major role in these domains. However, they may subtly shape perception of and communication with older family members.

#### THE PERSPECTIVES TOWARD "GOOD DEATH" AMONG LOW-INCOME OLDER ADULTS

E. Ko<sup>1</sup>, M. Esperanza<sup>2</sup>, T. Pham<sup>1</sup>, S. Hall<sup>2</sup>, J. Kwak<sup>3</sup>, M.U. Mazzyck<sup>2</sup>, M. Piwowarski<sup>2</sup>, 1. *San Diego State University, San Diego, California*, 2. *Senior Community Centers, San Diego, California*, 3. *University of Wisconsin-milwaukee, Milwaukee, Wisconsin*

This study explores the low-income older adults' perspectives toward a "good death". A qualitative study, in-depth of individual interviews was conducted with 21 residents at the Transitional Housing Program (THP) in a large city in Southern California. Individual interviews were audio-taped and transcribed. The participants' mean was 65 years old. More than half of the participants were socially isolated; 57.1% (n=12) reported having no one to provide a care if they were severely ill. The main themes regarding a good death revealed by analysis of the interviews includes: 1) painless death-dying in one's sleep; 2) dying with the Lord; 3) dying surrounded by loved ones; 4) death is death. Many

participants emphasized that dying with comforts without physical pain is a good death. God holds a high power in controlling one's destiny that being with God during the final days was seen important. Some participants were fear of dying alone. Facing the last moment surrounded by loved ones was seen blessing. While others defined a good death, some viewed death as final passage which cannot be determined whether good or bad.

### **SIMILARITY BETWEEN ROMANTIC PARTNERS' END-OF-LIFE TREATMENT PREFERENCES**

M. Inoue, S.M. Moorman, *Boston College, Chestnut Hill, Massachusetts*

When terminally-ill people are unable to communicate their wishes for medical treatment, surrogates often make such decisions. It is critical for researchers to identify whether couples know each other's end-of-life preferences because if a dying person is married, his or her spouse is the first priority in most states to be selected as a surrogate. However, previous research using hypothetical scenarios finds that the surrogate's decision does not match the dying person's preference much of the time. Past research and theory suggests that people assume that others hold preferences similar to their own, and that people project these inaccurate appraisals onto others. Projection, however, is an acceptable strategy as long as couples truly share similar values. The purpose of the study is to examine couple characteristics that are associated with their similarity in end-of-life care preferences. The study conducts dyadic analyses using a nationally representative sample of 1,075 heterosexual American couples aged 18 to 64. We find that couples with an age gap of more than three years ( $\beta=0.59$ ,  $p<0.01$ ) and couples with differences in perceived health status ( $\beta=0.66$ ,  $p<0.05$ ) have more dissimilar treatment preferences. In contrast, cohabiting couples' preferences are more similar than those of married couples ( $\beta=-0.83$ ,  $p<0.01$ ). These findings offer important implications for legal and medical policies regarding romantic partners' end-of-life decision making for their loved ones.

## **SESSION 305 (POSTER)**

### **FAMILY RELATIONS**

#### **THE IMPORTANCE OF PERCEIVED FAMILY COHESION AND CONTACT ON PSYCHOLOGICAL WELL-BEING OF ASSISTED LIVING RESIDENTS**

K. O'Malley<sup>1</sup>, S. Qualls<sup>1</sup>, M.A. Doffing<sup>1</sup>, M. Williams<sup>2</sup>, *1. University of Colorado Colorado Springs, Colorado Springs, Colorado, 2. Caring Family, LLC, Colorado Springs, Colorado*

Family involvement with assisted living residents is believed to be valuable in ways that are comparable to the positive impact of regular visits on the well-being of nursing home residents, but empirical data are sparse (Gaugler, Anderson, & Leach 2003; Port et al., 2005). This study examined the impact of familial contact initiated by either the family member or AL resident on the residents' psychological well-being (depression and loneliness). 112 AL residents in multiple facilities were assessed on measures of depression, loneliness, perceived family contact and cohesion. Perceived rates of family contact related to AL residents' perceptions of family cohesion and predicted resident loneliness and depression. Specifically, AL residents who initiated contact with their families experienced lower levels of depression,  $r = -.28$ ,  $p = .004$ , and lower levels of loneliness  $r = -.23$ ,  $p = .02$ . Family member initiated contact with the AL resident also impacted residents' loneliness ratings,  $r = -.22$ ,  $p = .02$ . Furthermore, higher ratings of family cohesion correlated negatively with loneliness,  $r = -.23$ ,  $p = .02$ . Family cohesion was positively correlated with AL resident initiated contact,  $r = .23$ ,  $p = .02$ . Family contact and cohesion accounted for 15% of the variance in loneliness,  $p < .001$ , and 12% of the variance in depression,  $p = .002$ . These findings show the importance of interventions

designed to foster stronger family-resident contact following a move into assisted living.

### **THE EFFECTS OF POSITIVE FEEDBACK ON 'GENERATIVITY' IN OLD AGE**

M. Tabuchi<sup>1</sup>, T. Nakagawa<sup>2</sup>, Y. Gondo<sup>2</sup>, *1. Kwansei Gakuin University, Nishinomiya, Japan, 2. Osaka University, Suita, Japan*

In Japan, the role of elderly people in guiding and supporting next generations has been emphasized. The supportive actions for next generations are motivated by 'generativity', suggested by E.H. Erikson. These actions have an important effect on psychological well-being for not only young people but also elderly people. However, the conflicts between younger and older generations within the activities become a problem in some cases. In this study, we hypothesized that 'generativity' in old age would not develop unless they are received to be valued and get respect by the next generations. 400 Japanese elderly people responder to measures of 'generativity', generative actions, perceived respect, and emotional psychological well-being. Structural equation modeling showed that perceived respect had a direct impact on 'generativity'. These results suggested that the importance of positive feedback from young generations for the 'generativity' development in old age.

### **DISCREPANCIES IN REPORTS OF MARITAL QUALITY BETWEEN HUSBANDS AND WIVES WHO ARE KOREAN BABY BOOMERS**

J. Lee<sup>1</sup>, K. Kim<sup>2</sup>, G. Han<sup>3</sup>, *1. Chonnam National University, Dept. of Family Environment & Welfare, Gwangju, Republic of Korea, 2. Pennsylvania State University, Dept. of HDFS, University Park, Pennsylvania, 3. Seoul National University, Dept. of Child & Family Studies, Seoul, Republic of Korea*

The majority of Korean Baby Boomers (born between 1955 and 1963) are currently married or have a partner (first marriage: 88%, remarriage: 2%, domestic partnership: 1%). Using dyadic reports of married couples, this study examined discrepancies in reports of various aspects of marital quality between husbands and wives (e.g., marital satisfaction, sexual satisfaction, positive relationships and negative relationships) and investigated predictors of discrepancies in reports of marital quality of Korean Baby Boomer couples. Data used in this study are from the first wave of "Korean Baby Boomers Panel Study". A total of 4,668 respondents were surveyed in face-to-face interviews using structured questionnaires in this panel study. The surveys were conducted from May 2010 till August 2010. In this study, data from 1,218 couples (individual N = 2,436) was analyzed. About 44% of Baby Boomer couples were satisfied with their marriage while 6% were not satisfied. In addition, Baby Boomers reported to have positive relationships with their spouses. However, not surprisingly, Baby Boomers' marital relationships also showed certain levels of conflict and discord. Regarding dyadic discrepancies in reports of marital quality, husbands showed higher levels of marital satisfactions than wives. Especially the level of discrepancy in sexual satisfaction between husbands and wives is higher than other indicators of marital quality. These results suggest that there are different levels of discrepancies in reports of various aspects of marital quality between husbands and wives. Discrepancies in marital quality were associated with couple interactions.

### **ACTOR AND PARTNER EFFECTS OF DAILY RESTEDNESS ON MARITAL SATISFACTION**

A. Bond, K. Gustafson, W. Godfrey, J. Yorgason, *Brigham Young University, Provo, Utah*

Sleep is a crucial component of life therefore our aim was to examine the effects of daily sleep on marital satisfaction. We hypothesized that this relationship would be mediated by cognitive functioning. Our sample consisted of 161 aging couples from the Life and Family Legacies study. Each participant completed daily diaries for 14 consecutive

days. The participants rated the quality of sleep that was received (0=not well at all to 4=extremely well) and how rested and energetic he or she felt during the day. Marital satisfaction was assessed through questions regarding satisfaction (0=very unsatisfied to 6=very satisfied) with daily chores, support, time spent together, conflict resolution, conversations, affection, and dependability. The results indicate that a female's feeling of rest positively affects her marital satisfaction ( $\beta=.02$ ,  $p=.001$ ). For males, results were similar in that a male's feeling of restedness positively impacted his marital satisfaction ( $\beta=.04$ ,  $p=.000$ ). We also found it interesting that male's cognition positively affects female marital satisfaction ( $\beta=.06$ ,  $p=.032$ ), despite the evidence that males cognition negatively impacts their own marital satisfaction ( $\beta=-.54$ ,  $p=.006$ ). These findings may suggest a difference between male's and female's ability to compartmentalize daily challenges from daily marital satisfaction. Our findings indicate the importance of restedness and cognition on both individual and spousal marital satisfaction.

#### **FAMILY INVOLVEMENT AND WELL-BEING IN AN ASSISTED LIVING POPULATION**

E. Plys, N.G. Bliwise, *Emory University, Atlanta, Georgia*

Family visitations provide residents of long term care facilities a link to the outside world, continuity of relationships, and social support (Tseng & Wang, 2001; Thomas, 2001). Previous research suggests that the quality of family relationships may have greater mental health impacts for older adults than the quantity of family interactions (Conner, Powers, & Bultena, 1979). This study investigated the relationship between the quantity of family interactions and the quality of family relationships, and their impact on long term care residents' life satisfaction and depression. Factors influencing the quality of relationships between residents and their primary family caregiver were also of interest. Forty-four assisted living residents were sampled. Participants completed four measures assessing emotional bondedness to family, perceived social support, life satisfaction and depression. In addition, open-ended interviews assessed residents' perceptions of family interactions. Regression analysis revealed that the quality of family relationships better predicted life satisfaction and depression than the quantity of family interactions. In addition, the amount of socio-emotional support activities families engaged in correlated to higher emotional bondedness. Families who reminisced also showed higher scores of emotional bondedness, suggesting reminiscing might be a tool for families to improve the quality of interactions with institutionalized elders. Predictors of life satisfaction and depression for assisted living residents included self-rated health, friendships within the facility, and family involvement. These results have implications for residents of long term care facilities and their family members, as well as, staff and social workers.

#### **ROLES IN THE FAMILY, FAMILY STRUCTURE AND TIME PERSPECTIVE OF OLDER ADULTS IN JAPAN**

A. Ohashi<sup>1</sup>, K. Abe<sup>2</sup>, C. Ohi<sup>1</sup>, K. Mizuno<sup>1</sup>, Y. Arai<sup>1</sup>, *1. Chubu Gakuin University, Seki, Japan, 2. Kansai University of International Studies, Miki, Japan*

**Objectives:** This study was conducted on older adults residing in a local community in Japan for the purpose of examining the roles in their families. An examination was also made as to whether the roles in the family and family structure have an influence on time perspective. **Methods:** Data obtained from 2256 older adults residing in Shirotori-cho, Gujo city, Gifu prefecture, Japan. The participants provided information regarding the types of roles they have in their family, family structure, marital status and their time perspectives of the past, present and future. **Results:** 82.5% of the participants replied that they fulfilled some form of role in their family. The roles of more than 40% of the participants consisted of field or garden work, cleaning, washing clothes, meal preparation and home maintenance. Results of regression analysis revealed that having a role in the family is a predictor of each of past,

present and future time perspectives. In addition, marital status was a predictor of past time perspective, while living with or near to children or grandchildren was a predictor of present and future time perspectives. **Discussion:** The results suggested that having a role in the family would have the potential to bring about a positive time perspective. In addition, the presence of a spouse, children or grandchildren each would have a positive effect on different time perspectives.

### **SESSION 310 (POSTER)**

#### **HEALTH RISK BEHAVIOR**

##### **TEMPORAL PATTERNING OF ALCOHOL CONSUMPTION AMONG OLDER ADULTS**

M. Horn Mallers, L. Zettel-Watson, C. Elmi, *Human Services, CSU Fullerton, Fullerton, California*

A strong predictor of alcohol consumption is day of week. Few current studies have examined temporal drinking patterns, especially as it relates to older adults, though such information is critical for a greater understanding of daily health and coping behaviors. The present study thus examined the temporal pattern of daily drinking among a nationally representative sample of adults aged 33-84 and its concordance with daily stressors, affect and health symptoms. Data were a nationally representative sample of nearly 1000 adults from the second wave of the National Study of Daily Experiences (NSDE), carried out under the Midlife in United States (MIDUS) study. Results indicate that older adults are more likely to drink on weekends as compared to weekdays and that weekend drinking is associated with both positive and negative levels of affect. Additionally, compared to younger adults, older adults show more consistency in drinking amount across the week. Implications for both maladaptive and proactive coping processes among older adults who drink will be discussed.

##### **HAZARDOUS ALCOHOL USE IN STOCKHOLM COUNTY BETWEEN 1998 AND 2010**

K. Ahacic<sup>1</sup>, S. Kelfve<sup>2</sup>, R. Kennison<sup>3</sup>, *1. Department of public health, Social medicine, Karolinska Institutet, Stockholm, Sweden, 2. Karolinska Institutet & Stockholm University, ARC, Stockholm, Sweden, 3. California State University, Department of Psychology, Los Angeles, California*

The baby boomers are reaching the oldest ages. In Sweden the prevalence of abstainers has gone down considerably with the coming of these cohorts. This study therefore examines overtime changes the other end of the spectrum, i.e., the proportion of the population with a hazardous use of alcohol. The data set is four waves of Stockholm County Public Health Surveys conducted in 1998 ( $n=3043$ ), 2002 ( $n=30973$ ), 2006 ( $n=34414$ ), and 2010 ( $n=30468$ ). The postal interviews representative of the county's adults (with response rates around 60 percent) used a grid which asked for the beverage specific consumption during a typical week. A hazardous alcohol use exceeds 9/14 standard glasses of alcohol. While the proportion decreased in younger ages, in the ages 65+ there was a pronounced increase between 1998 and 2010. In age group 65-74 the prevalence increased from 17 to 29 percent and in age group 75-84 from 9 to 18 percent. While women have a lower proportion of hazardous users, the overtime trend was similar for men and women. While the prevalence of hazardous alcohol use decreases with age among older people, this trend suggests that there is a need to focus on older people's alcohol habits. Moreover, much of the scientific basis for limits of hazardous use etc. has been based on younger people; these things may have to be examined specifically for older ages. With the coming of the baby boomers, it is also clear that institutions and elderly dwellings may need to adopt to changing behavior patterns.

## ALCOHOL USE AND PRESCRIPTION DRUG SAFETY IN OLDER ADULTS

A. Hoogland, F. Zanjani, *University of Kentucky, Lexington, Kentucky*

**Introduction:** Alcohol and prescription drug use is a dangerous combination at any age. Alcohol can directly impact the availability or toxicity of a drug, which is especially problematic for older adults as a result of the decreased ability to metabolize alcohol due to age-related changes. Further, older adults oftentimes consume prescription drugs to treat late-life health conditions, and combining these drugs with alcohol can produce disastrous effects. Given these concerns, it is imperative that older adults are cognizant of the consequences of consuming alcohol while taking prescription drugs. **Objectives:** To determine the degree to which older adults are aware of and practice safe drinking habits while taking prescription drugs. **Methods:** Older adults (mean age = 71 years) were approached at a public pharmacy in Lexington, KY, and given a survey addressing drinking habits and prescription drug safety (PDS) knowledge to complete and return. **Results:** Sixty-seven percent of participants indicated that they drank alcohol, and 29% of these participants drank heavily. Participants reported mixed knowledge of PDS, with over a third suggesting that heavy alcohol consumption was safe when taking prescription drugs. Interestingly, females tended to report greater awareness of the dangers of combining alcohol with prescription drugs. **Conclusions:** While some older adults are aware of and practice safe drinking habits, others engage in dangerous practices and are unaware of how alcohol can interact with prescription medications. As such, it is necessary that researchers develop effective ways to inform older adults of the hazards of combining alcohol with certain prescription drugs.

## IMPACT OF CANADIAN PROVINCIAL ALCOHOL POLICIES ON YOUNGER AND OLDER DRINKERS: A 14-YEAR POPULATION-BASED STUDY

N. Giesbrecht<sup>2</sup>, N. Huguet<sup>1</sup>, B. McFarland<sup>3</sup>, D.H. Feeny<sup>4</sup>, A. Wettlaufer<sup>2</sup>, R. Caetano<sup>5</sup>, N.A. Ross<sup>6</sup>, M.S. Kaplan<sup>1</sup>, 1. *Portland State University, Portland, Oregon*, 2. *Centre for Addiction and Mental Health, Toronto, Ontario, Canada*, 3. *Oregon Health and Science University, Portland, Oregon*, 4. *University of Alberta, Edmonton, Alberta, Canada*, 5. *University of Texas School of Public Health, Houston, Texas*, 6. *McGill University, Montreal, Quebec, Canada*

Extensive international literature indicates that population-level alcohol policies — price, type of retailing system, density of outlets, and hours and days of sale, influence overall consumption and high-risk drinking. This study, funded by the National Institute on Aging, used data from the longitudinal Canadian National Population Health Survey (1994/6 – 2008/09) to examine relationships between changes in provincial-level alcohol policies and weekly alcohol consumption among current drinkers aged 15-54 and 55 and older. Annual archival alcohol policy data for 1994/95 through 2008/09 were collected for British Columbia, Ontario, and Quebec. Seventeen variables were organized into five categories: pricing and sales; outlet density; type of retail system; availability; and on-premise sales restrictions. The dependent variable was number of drinks per week among current drinkers (provincial n's: 1,478 to 3,671). Individual level covariates included age, gender, and income. Multi-level model results showed that policies affect alcohol consumption among younger drinkers more than among older drinkers. In Quebec, changes in outlet hour regulations were associated with weekly drinking among younger but not older adults. In British Columbia, alcohol policies were not associated with weekly drinking. In Ontario, price of alcohol, minimum price regulation, and changes in restriction of outlet hours and Sunday and holiday shopping were associated with weekly drinking among younger drinkers. Relaxed restrictions on private store sale hours were associated with drinking among older residents of Ontario. The results suggest that alcohol-control policies are more likely to reduce population-level risks among younger than older drinkers.

## ORAL HYGIENE AND THE DYNAMICS OF DENTAL CARIES AMONG OLD ADULTS

J. Liang<sup>1</sup>, B. Wu<sup>2</sup>, B.L. Plassman<sup>2</sup>, J.M. Bennett<sup>1</sup>, J. Beck<sup>3</sup>, 1. *Health Management & Policy, University of Michigan, Ann Arbor, Michigan*, 2. *Duke University, Durham, North Carolina*, 3. *University of North Carolina, Chapel Hill, North Carolina*

There is little research on the dynamic linkages between oral hygiene (i.e., brushing, rinsing, and flossing) and dental caries experience (i.e., decayed teeth, missing teeth, and filled teeth). We examined variations in the trajectories of dental caries among older Americans, particularly with reference to oral hygiene. Data came from 810 older Americans who were dentate at the baseline in 1988 with up to 4 repeated observations through 1994. Hierarchical linear models with ordered logit were employed in evaluating the linkages between oral hygiene and trajectories of dental caries. In general, baseline oral hygiene was correlated with the levels of dental caries but not their rates of change. In addition, rinsing differs from brushing and flossing in its effects on the trajectories of dental caries. For instance, baseline brushing and its time varying measure were associated with less tooth decay, whereas flossing but not rinsing at the baseline was correlated with fewer decayed teeth. The effects of baseline brushing and flossing persisted even with socio-demographic and baseline health attributes controlled. Nonetheless, oral hygiene was not associated with the rate of change in tooth decay. In contrast, baseline brushing and flossing were associated with more filled teeth, but baseline rinsing was correlated with fewer filled teeth. In addition, baseline rinsing was associated with a greater rate of decline in tooth filling. Time-varying measures of brushing and rinsing were not associated with tooth filling. The effects of oral hygiene remained significant even when socio-demographic and health attributes were adjusted. Supported by NIH/NIDCR (1R01DE019110)

## SESSION 315 (POSTER)

### INTERGENERATIONAL RELATIONS

#### HOW JAPANESE DAUGHTERS-IN-LAW CONSTRUCT THE MEANING OF PARENTAL CAREGIVING: A QUALITATIVE ANALYSIS

H. Kodama, *Tokyo Metropolitan Institute of Gerontology, Itabashi-ku, Tokyo, Japan*

My aim in this study is to explore how Japanese daughters-in-law (re)construct the meaning of their caregiving to their parents-in-law. Because daughters-in-law have been expected to care for their parents-in-law under the traditional familial institution in Japan, their caregiving tends to be seen merely as a burden; as a result, little is known about daughters-in-law's personal meaning of their care experiences. Using a qualitative approach, I examined (a) how Japanese daughters-in-law reflect on their care experiences after their care recipients (i.e., parents-in-law) deceased, and (b) how, through such reflection, they (re)construct the meaning of their care experiences for their lives. In doing so, I focused on daughters-in-law in rural Japan, where the traditional familial institution persists. Semistructured interviews were conducted with 13 daughters-in-law in a rural area who had cared for their parents-in-law until their death. I analyzed interview transcripts guided by a grounded theory approach. A dominant theme among participants' narratives is recurrent interpretation of their care experiences; participants reported that they reconstructed the meaning of their caregiving for their lives multiple times in response to changes in their circumstances. Further, how they reinterpreted their care experiences after their parents-in-law's death was linked to their current self-view and life satisfaction. Findings suggest the need for a long-term perspective from which to examine daughters-in-law's personal meaning of their care experiences. It also is necessary to support daughters-in-law who see their care experiences negatively after their parents-in-law deceased; such a negative interpretation can adversely affect their view of self and life.

## MEASURING MEANINGFUL TIME EXPERIENCES IN INTERGENERATIONAL RELATIONSHIPS: A PILOT TEST

H. Tabatabaei-Moghaddam<sup>1</sup>, C. Bolkan<sup>1</sup>, C. Peters<sup>2</sup>, 1. *Washington State University Vancouver, Vancouver, Washington*, 2. *Michigan State University, Lansing, Michigan*

We live in an increasingly fast-paced society with multiple demands and obligations; this limits the amount of time available to spend in meaningful interaction with family. This challenge becomes progressively more prominent as families age. A better understanding of how aging families perceive quality of time spent together and how it influences individual well-being and family relationships in later life would be useful to researchers and practitioners. In this study, we pilot tested the first quantitative measure developed to capture how older adults value shared time experiences with family (Peters & Bolkan, 2009). Participants included 23 older parents (16 mothers; 7 fathers) who reported on experiences with 44 adult children. We recruited participants (M = 82 years) from local Independent and Assisted Living sites to complete face-to-face surveys. In addition to the pilot measure, we collected information on sociodemographics, health, mood, and intergenerational ambivalence. The measure demonstrated good content validity and was created with an intergenerational ambivalence theoretical framework. Four related components of family time were assessed: closeness, genuineness, spontaneity, and emotion. Preliminary descriptive analyses of the ten-item measure indicated wide variability in meaningful time experiences reported by participants and no items were significantly skewed. Items were significantly inter-correlated and associated with related questions regarding intergenerational ambivalence. The internal consistency of the measure appears acceptable (Cronbach's alpha = .798), however, we will re-analyze after the second wave of data collection (estimated N = 40 participants, 85 relationships). This study provides initial promising evidence for a valid measure of meaningful time experiences in intergenerational relationships.

## KOREAN BABY BOOMERS - A TRANSITIONAL COHORT OF INTERGENERATIONAL RELATIONSHIPS?

G. Han<sup>1</sup>, J. Kim<sup>2</sup>, J. Min<sup>3</sup>, 1. *College of Human Ecology, Seoul National University, Seoul, Republic of Korea*, 2. *Institute on Aging, Seoul National University, Seoul, Republic of Korea*, 3. *University of Southern California, Los Angeles, California*

Contrary to western society, providing supports to elderly parents in Korea has been based on strong patriarchal normative expectation. However, it is argued that the nature of kin relationships has been changed to a direction towards bilateralization with recent social changes. While Korean Baby Boomers have been believed to be a transitional cohort of intergenerational relationships, there is little empirical research. This study examined how Baby Boomers provided supports to their elderly parents with special attention to the flow of support structured by family lineage across different types of support: financial support and instrumental support. Data used in this study has drawn from the 1st wave (2010) of Korean Baby Boomers Panel Study. The sample consisted of 1,468 Boomers being married and having at least one living parent on both sides. Results showed that bilateralization of providing support was clearly observed in financial support than in instrumental support. Also, women were in higher probability of bilateralization than men regardless of support types. Survivorships of each side-parents showed a significantly different relationship with degree of bilateralization between financial support and instrumental support. We discussed the role of survivorship of parents, child's gender, and types of support as key factors in the process of bilateralization.

## GRANDPARENTS OF GRANDCHILDREN WITH AUTISM SPECTRUM DISORDER (ASD): STRENGTHENING RELATIONSHIPS THROUGH TECHNOLOGY ACTIVITIES

S.D. Wright, V. D' Astous, C. Wright, M. Diener, *Gerontology Program, University of Utah, Salt Lake City, Utah*

This study of grandparent-grandchild relationships was embedded in the context of technology workshops offered for young children on

the autism spectrum. We examined the relationship dynamics of six grandparents with their grandchildren in the context of shared technological activities (using Google SketchUp software) in structured workshops at a university setting. Content analysis of transcribed focus group sessions with the grandparents indicated two emergent key themes: expectations were reframed and communication bridges were built through shared interests. The grandchildren learned technological skills, increased their social interactions with peers, family members (parents, siblings), and grandparents. The positive experience the grandparents perceived their grandchildren to have in the program gave them hope for future educational and employment opportunities for their grandchildren. The grandparents also indicated that the shared interests in the computer program augmented communication opportunities between themselves and their grandchildren, with other grandparents of grandchildren with ASD, and with their sons and daughters.

## THE EFFECT OF INTERGENERATIONAL PROGRAMS FOR PRIMARY SCHOOL STUDENTS THROUGH AN INTERGENERATIONAL PROGRAM WITH READING PICTURE BOOKS

Y. Murayama<sup>1,2</sup>, M. Yasunaga<sup>1</sup>, R. Takeuchi<sup>1</sup>, K. Nonaka<sup>1</sup>, H. Ohba<sup>1</sup>, M. Kuraoka<sup>1</sup>, S. Shinkai<sup>1</sup>, Y. Fujiwara<sup>1</sup>, 1. *Tokyo Metropolitan Institute of Gerontology, Itabashi Tolyo, Japan*, 2. *Keio university, Tokyo, Japan*

This article focuses on an intervention research project, the REPRINTS Program (Fujiwara et al., 2006), which educates and engages senior volunteers in picture book reading to school-aged children in educational settings. The focus is on the intergenerational effects on the children's prosocial development. This program was held in an elementary school in Kawasaki city during "Koryu Jugyo" for the purpose of the Picture Book Reading for first grade students. In all 28 students were assigned to the intervention group and 56 students were assigned to the waiting list (control group). Both groups answered questions before and after the "Koryu Jugyo" was conducted. The questionnaire consists of 2 scales, 35 items (Sense of voluntary participation, Empathy Scale, Intimacy with senior volunteer, Commitment to the intergenerational program, Social desirability scale.) A two-way (Groups × test session) repeated measures ANOVA showed interaction ( $F(1,77) = 7.20, p < .01$ ). Analyses of simple main effects showed that the intergenerational program "Koryu Jugyo" significantly improved the sense of volunteer work in the intervention group, but showed no change in the control group. Finally, structural equation modeling after the intergenerational program showed that the model is a good fit of the data  $X^2 = 6.544(5), p = .257, CFI = .974, RMSEA = .061$ . In summary, the result showed that an intergenerational program has a positive effect on the sense of volunteer participation. Concretely, not only empathy but intimacy with senior volunteer mediated the effects of volunteer participation. Furthermore, commitment to the intergenerational programs and sex determined intimacy with senior volunteer.

## CORESIDENCE WITH CHILDREN AND DEPRESSIVE SYMPTOMS IN MEXICAN AMERICAN ELDERS: THE MODERATING EFFECTS OF CULTURE AND NEEDS

Z. Cong, S. Park, D. Feng, J. Scott, *Human Development and Family Studies, Texas Tech Univ, Lubbock, Texas*

Purpose: Coresidence with adult children may promote children's support to parents and suggest substantial psychological consequences because of cultural expectations of intergenerational support among Mexican American elders. This investigation examined the conditions when coresidence with children reduces elder parents' depression, and addressed the debate about whether coresidence is a cultural preference or more out of elder parents' needs. Data/Methods: The sample included 89 Mexican American elders aged 60 and above recruited in a city in Southwest Texas in 2010. OLS was used to examine the effect of coresidence with children on elder parents' depressive symptoms, and whether

this effect is conditional to elder parents' needs and their acculturation. Results: We found that the effects of coresidence depended on elder parents' acculturation level. Elder parents who were less acculturated benefited more, i.e., experienced reduced depression to a greater degree, from coresidence with children. In addition, elder parents who had lower level of education also benefited more from coresidence. But the effects of coresidence did not depend on elder parents' income, health, or familism. Conclusion: We found that the cultural orientation, which is operationalized as acculturation, was an important factor to consider when examining the effects of coresidence on Mexican American elders' psychological well-being; whereas needs were not directly relevant. This to some degree offers support to the argument that cultural orientation is more important than needs that motivate coresidence with children among Mexican American elders.

### **INTERGENERATIONAL WII® PHYSICAL ACTIVITY PROGRAM: MIXED METHODS FINDINGS OF SOCIALIZATION BENEFITS**

M.S. Heinz<sup>1</sup>, J.A. Margrett<sup>1</sup>, S.L. Francis<sup>2</sup>, K. Strand<sup>2</sup>, M.J. Peterson<sup>2</sup>, W.D. Franke<sup>2</sup>, 1. *Human Development and Family Studies, Iowa State University, Ames, Iowa*, 2. *Iowa State University, Ames, Iowa*

The LIFE (Living [well through] Intergenerational Fitness and Exercise) study was designed to promote whole-person wellness among older adults participating in an eight-week intergenerational program. The program focused on physical activity using the Wii® as well as interactive games incorporating physical, social, and cognitive stimulation. Pre- and post-tests were collected from 46 participants that completed the program; 87% of participants were female and 80% lived independently. Participants ranged in age from 60-92 years (mean = 75.30). Mixed methods were employed to evaluate older adults' mental health pre- and post-intervention. Analysis of variance tests indicated that choosing to participate in the program for social reasons (n = 18) demonstrated significantly greater positive affect (p < .05) and less negative affect (p < .05) at follow-up (25 weeks). Qualitative comments from older adult participants and younger adult trainers supported the quantitative findings. Participants noted enjoyment socializing with one another as well with as the college-aged trainers. Trainers commented on participants' enthusiasm to participate and that a primary strength of the program was the ability to "get to know people on a deeper level." Together these findings indicate that intergenerational physical activity programs can be particularly advantageous for older adults seeking increased socialization. The program not only benefitted older adults physically, but also mentally by providing increased opportunities for socialization that ultimately resulted in more positive affect post intervention.

## **SESSION 320 (POSTER)**

### **LIFE SATISFACTION**

#### **THE IMPACT OF GEOGRAPHIC PROXIMITY OF CHILDREN ON LIFE SATISFACTION AMONG AGING PARENTS**

N. Xie, E. Dugan, *UMASS at Boston, Billerica, Massachusetts*

Previous theoretic research has identified the impact of geographic proximity between adult children and their aging parents on intergenerational relations. However, research investigating the impact of geographic proximity on life satisfaction differences of foreign-born and native-born parents is still scarce. This study addresses the questions of whether proximity between adult children and aging parents has an impact on life satisfaction, and whether life satisfaction of foreign-born aging parents is more likely to be affected by such proximity. Using data from the 2008 Health and Retirement

Study, the study estimates the effects of geographic distance between adult children and their aging parents on life satisfaction of people who are 65 years old and older. Descriptive, bivariate and logistic regression analyses were conducted. The findings show that older adults who have children living nearby generally have higher life satisfaction (p=0.038) while the impact of distance is not clear. Also, life satisfaction (p=0.014) and distance (p=0.026) between children and parents are significantly different between foreign-born and native-born elderly. However, the impact of proximity on life satisfaction is not significantly different in nativity whereas significant differences of health status, household income and net worth have significant impact on life satisfaction of these two nativity groups. Given the declining intergenerational coresidence, studies on the economic and social vulnerability of foreign-born subpopulation have become more increasingly important. The findings of the paper highlight the need for researchers and policymakers to consider this foreign-born population.

#### **UNDERSTANDING RELATIONSHIPS BETWEEN PERSONALITY, FEELINGS ASSOCIATED WITH ACTIVE ENGAGEMENT, AND LIFE SATISFACTION IN THE ELDERLY**

B. Dadic, *Southern CT State University, New Haven, Connecticut*

This study examined the role of personality in understanding feelings associated with particular activities and overall sense of life satisfaction among the elderly. Participants (n=27), ages ranging from 63-102 years, completed measures of personality (Neo-Five Factor Inventory-3, NEO-FFI-3), life satisfaction (Life Satisfaction Index-Z) and an activity inventory, which evaluated common activities and associated feelings (e.g., card playing, movies, reading and dancing, and feelings such as excitement, happiness, nervousness and stress). Extroversion was related to time spent in active leisure, particularly physical, and the happiness and excitement experienced in these activities, particularly card playing and going to movies. Interestingly, feeling stressed when dancing and reading, and feeling nervous while going to the movies was also related to extroversion. Neuroticism was negatively correlated with life satisfaction. Relationships between personality factors, common activities chosen by elderly individuals, and feelings experienced with these activities suggest the need for individualized programs for activities for this age group. Activities may provide more enjoyment to those who are extroverted than introverted, and interestingly, some activities may be more stressful to extroverts than to introverts. Based on this work, we recommend consideration of personality factors when designing activity programs for this age group, and to avoid a one-size fits all approach.

#### **ADAPTATION IN THE OLDEST OLD: THE ROLE OF MASTERY BELIEFS AND SOCIAL RELATIONS FOR LIFE SATISFACTION**

M. Takayama<sup>1</sup>, R. Fukuda<sup>1</sup>, J. Ando<sup>1</sup>, Y. Gondo<sup>2</sup>, H. Akiyama<sup>3</sup>, 1. *Keio University, Tokyo, Japan*, 2. *Osaka University, Osaka, Japan*, 3. *The University of Tokyo, Tokyo, Japan*

Numerous studies report that life satisfaction peaks in old age but few include participants over age 85. The population of the oldest-old is growing faster than any younger segment of the older population in most countries all over the world. This is also the age when more people require care because of illness and frailty which may constrain their potential for well-being. Moreover this trend may lead to a change of patterns of resources of life satisfaction in very old age, compared to those of the young old who maintain relatively better physical and cognitive fitness. However, little research has focused on life satisfaction

of people over age 85. In this context, it is especially timely that we learn more about life satisfaction and factors associated with life satisfaction in current cohorts of the oldest old. Studies of the young old suggest that mastery beliefs are important buffers against health-related losses in subjective well-being. Moreover, they also suggest that providing support and social integrations enhance mastery beliefs. Is this the case in very old age? We examine these questions using data from locally representative in-depth studies of the oldest old conducted in Tokyo, Japan (N = 663 M age = 89; range 85-102). The results showed that the typical resources explained the variance of life satisfaction, but some resource effects were mediated through mastery beliefs. Our findings suggest that adaptive capacities may be preserved into advanced age and highlight the pivotal role of perceived control for successful aging.

#### **LIFE SATISFACTION AMONG THAI ELDERLY: IMPACTS OF PHYSICAL, EMOTIONAL HEALTH, SOCIAL SUPPORT, AND SOCIO-ECONOMIC STATUS (SES)**

R. Phatchana, 1. Mahidol University, Salaya, Nakhon Pathom, Thailand, 2. Miami University, Oxford, Ohio

Life satisfaction, one component of quality of life, is rarely studied in social sciences in Thailand. The diversity of characteristics of the elderly indicates multiple factors affecting life satisfaction. Predictors of life satisfaction are complicated for various reasons and age as a sole predictor is not representative, so other factors must be further examined. This study takes an analytical approach to investigate the impacts of life, looking at physical, emotional health, social support, and socio-economic status on satisfaction among Thai elderly, using data from National Research University project. Life satisfaction among Thai elderly is analyzed across three different age groups, including young old, old-old and oldest old groups; urban-rural differences; and gender differences. Other research shows that life satisfaction was likely to decrease when age increased. Between rural and urban elderly, life satisfaction is not significantly different. The oldest old persons were found to have lower life satisfaction affected by health, and social support. Life satisfaction among other two age groups is significantly affected by income. Life satisfaction between older males and females are not really different. Readers will gain insight into the significance of predictors of Thai older adults' life satisfaction along with an understanding of implications for the future.

#### **PAYING IT FORWARD: THE ROLE OF GENERATIVITY IN THE RELATIONS BETWEEN WORKING OR VOLUNTEERING FULL-TIME AND LIFE SATISFACTION**

M. Montpetit, M. Dinkle, E.M. Ledvort, S. Schmelter, Illinois Wesleyan University, Bloomington, Illinois

The benefits of working and/or volunteering full-time on life satisfaction have been well-established. The current study investigates generativity, the sense that one is meaningfully contributing to the well-being of others, as one mechanism underlying this relationship. Data from 90 aging adults (M Age = 67 years; SDAge = 5.1 years) were used to test the hypothesis that generativity mediates the relationship between working or volunteering full time and life satisfaction. Sobel's test, applied to the results of regression analyses, suggests that partial, rather than full, mediation is more tenable. That is, generativity explains a significant portion, but not all, of the variance shared by full time pursuits and life satisfaction. Thus, the benefits of full time occupation on life-satisfaction are conferred, in part, through a sense of meaningful social contribution. Interestingly, satisfaction with one's own life may be maintained or enhanced by engaging in activities that enrich the lives of others.

## **SESSION 325 (POSTER)**

### **MENTAL HEALTH ASSESSMENT**

#### **FARSI VERSION OF THE GERIATRIC ANXIETY SCALE: TRANSLATION AND PSYCHOMETRIC PROPERTIES AMONG IRANIAN OLDER ADULTS**

D.L. Segal<sup>1</sup>, M. Bolghan-Abadi<sup>2</sup>, 1. University of Colorado at Colorado Springs, Colorado Springs, Colorado, 2. Ferdowsi University of Mashhad, Mashhad, Islamic Republic of Iran

The Geriatric Anxiety Scale (GAS) is a promising new self-report anxiety screening measure designed for older adults. Due to the need for validated, culturally-appropriate screening measures for anxiety among older adults in Iran, the purposes of this study were to translate the GAS into Farsi and to explore the preliminary psychometric properties of the Farsi version. The GAS was translated from English into Farsi through an initial translation and back translation process (double blind method). This draft version was then completed by 30 older Iranians. This pilot study revealed that each item of the Farsi GAS was understandable and culturally appropriate except for one item which was revised to fit with Iranian cultural expressions of anxiety. For the validation study, a large sample of Iranian older adults (N=295; M age = 67.0 years; range = 60 to 92 years) completed the GAS and the Iranian version of the Geriatric Depression Scale (GDS-15). Cronbach's alpha for the GAS total score and the GAS sub-scales were acceptable (Total score  $\alpha = .91$ ; Cognitive  $\alpha = .81$ ; Somatic  $\alpha = .81$ ; Affective  $\alpha = .80$ ). Test-retest reliability after two weeks was moderate ( $r = .51$ ,  $p < .001$ ). As expected, there were strong positive relationships (all  $p$ 's  $< .01$ ) between the GAS total score and each of the three GAS sub-scales (Cognitive  $r = .89$ ; Somatic  $r = .90$ ; Affective  $r = .88$ ). Additionally each sub-scale was significantly positively correlated (all  $p$ 's  $< .01$ ) with the other sub-scales, which shared common variance ranging from 42% to 56%. Next, the GAS total score and each of the sub-scales were significantly positively correlated with the GDS-15, with medium effect sizes (GAS total  $r = .55$ ; Cognitive  $r = .49$ ; Somatic  $r = .49$ ; Affective  $r = .48$ ). Finally, confirmatory factor analysis supported the three factor structure of the GAS. This study provides preliminary psychometric support for the Farsi version of the GAS.

#### **VALIDATION OF THE GENERALIZED ANXIETY DISORDER SCALE (GAD-7) IN THE ELDERLY POPULATION**

B. Wild<sup>1</sup>, A. Eckl<sup>1</sup>, W. Herzog<sup>1</sup>, S. Lechner<sup>1</sup>, D. Niehoff<sup>1</sup>, H. Müller<sup>2</sup>, H. Brenner<sup>2</sup>, B. Löwe<sup>3</sup>, 1. Department of General Internal Medicine and Psychosomatics, University Hospital Heidelberg, Heidelberg, Germany, 2. Division of Clinical Epidemiology and Ageing Research, German Cancer Research Center, Heidelberg, Germany, 3. Department of Psychosomatics and Psychotherapy, University Hospital Hamburg, Hamburg, Germany

Background: Generalized anxiety disorder (GAD) is one of the most prevalent mental disorders in the elderly population. Unfortunately, GAD in elderly people often goes undetected. The aim of the present study was to examine the operating characteristics of the seven-item Generalized Anxiety Disorder Scale (GAD-7) in participants ages 60 to 85. Methods: A subsample of 438 persons of the ESTHER study - a large German epidemiological cohort study - was included. Participants completed the GAD-7 questionnaire as part of a home visit. Subsequently, the Structured Clinical Interview (SCID) was conducted via telephone to diagnose anxiety and depressive disorders. The SCID diagnosis of GAD constituted the criterion standard to determine sensitivity and specificity of the GAD-7 scale. Results: 27 participants met the DSM-IV criteria for current GAD according to the SCID interview (6.2%; 95%-CI: 3.9%-8.2%). Patients with GAD had a markedly higher mean GAD-7 score than persons without anxiety disorder. A cut point of 5 or greater appeared to be optimal for detecting GAD - at this cut

point the sensitivity of the GAD-7 was 0.63 and the specificity was 0.9. At a cut point of 6 or greater, sensitivity decreased to 0.52 (specificity=0.94). The Area under the Curve (AUC) of the GAD-7 was 0.88 (95% CI: 0.83-0.93). Discussion: Results of this study show that the recommended cut point of the GAD-7 for detecting GAD should be lowered for elderly people (from 10 to 5). The AUC indicates that the questionnaire could discriminate well between elderly people with and without GAD.

### **OLDER ADULTS' SLEEP DIARIES OVER TWO WEEKS: A HAWTHORNE EFFECT?**

R. Zamora<sup>1</sup>, K.L. Lichstein<sup>1</sup>, D.J. Taylor<sup>2</sup>, B.W. Riedel<sup>3</sup>, A.J. Bush<sup>4</sup>, 1. University of Alabama, Tuscaloosa, Alabama, 2. University of North Texas, Denton, Texas, 3. University of Memphis, Memphis, Tennessee, 4. University of Tennessee, Memphis, Memphis, Tennessee

Sleep diaries are a self-reported behavioral log that asks individuals to record their sleeping behavior over consecutive days. The process of completing the sleep diaries may unintentionally make the individuals aware of their previous behavior and result in an alteration in future behavior. The present study attempts to examine week differences in 2 weeks of sleep diaries in older adults with and without chronic insomnia to determine if a Hawthorne effect occurs in sleep efficiency (SE). 246 older adults, collected in a normative epidemiological study, were enrolled using random-digit dialing. Participant's SE was collected for 14 days via 2 weeks of sleep diaries. A mixed ANOVA was performed to analyze mean SE week differences between individuals with insomnia and normal sleepers. The SE for week 2 was significantly higher than week 1. The SE of those with insomnia was significantly lower than those without insomnia. A significant interaction between week difference and insomnia condition found that individuals with insomnia had an increase in SE from week 1 to week 2, whereas those who did not have insomnia had a decrease from week 1 to week 2. A subsequent analysis tested for the regression to the mean, replacing consecutive days with odd and even days, and was not found to be significant. Therefore, the presence of sleep difference between the 2 weeks suggests that the process of completing sleep diaries can alter SE in older adults, especially those with insomnia; however the effect is small and may not be clinically relevant.

### **THE UCSD SORT (U-SORT): ASSESSMENT OF ORGANIZATIONAL SKILLS IN PATIENTS WITH SCHIZOPHRENIA**

D. Tiznado<sup>1</sup>, S. Abel<sup>2</sup>, T. Davine<sup>3</sup>, B. Mausbach<sup>2</sup>, V. Cardenas<sup>2</sup>, T.L. Patterson<sup>2</sup>, D. Jeste<sup>2</sup>, 1. Psychology, University of Missouri-Kansas City, Kansas City, Missouri, 2. University of California- San Diego, San Diego, California, 3. San Diego State University, San Diego, California

Patients with schizophrenia have cognitive and functional deficits that affect their quality of life. The present study evaluated the validity of a new cognitive test intended to assess organizational skills. Participants were 183 middle-aged and older adults (Mean age = 52.36, SD=8.05) with a DSM-IV chart diagnosis of schizophrenia or schizoaffective disorder. The Repeatable Battery for the Assessment of Neuropsychological Status (RBANS) assessed cognitive functioning. The UCSD Performance-based Skills Assessment (UPSA) measured functional capacity. The UCSD SORT (U-SORT) test measured organizational skills. For the U-SORT, participants were given items that might be found in a drawer in their home. They were instructed to sort items into two different piles, Keep: items that might be useful to keep (e.g. coins, paper clips), and Trash: items that should be thrown away (e.g. bent paper clips, empty ketchup packet). A significant correlation was found between U-SORT scores and UPSA total scores,  $r(115) = .331$ ,  $p < .001$ . Significant correlations were also found between the U-SORT and UPSA subscales, with the exception of household chores. No sig-

nificant correlations were found between the U-SORT and symptoms. There was also a significant correlation between the U-SORT scores and the RBANS total score,  $r(117) = .254$ ,  $p = .005$ . As expected, no correlation was found between U-SORT scores and income. Preliminary results suggest that the U-SORT test is correlated with measures of functional capacity. However, more research is needed to examine the relationship between the U-SORT scores, indices of real-world functioning, and other cognitive domains.

### **RELATIONSHIP BETWEEN PRE-SLEEP AROUSAL AND SLEEP OUTCOMES IN YOUNGER AND OLDER ADULTS: VARIABILITY AS A PREDICTOR OF SLEEP**

K. Douglas<sup>1</sup>, C.S. McCrae<sup>2</sup>, N.D. Dautovich<sup>1</sup>, 1. University of Alabama, Tuscaloosa, Alabama, 2. University of Florida, Gainesville, Florida

Introduction: This study examined whether variability in pre-sleep arousal predicts sleep outcomes above and beyond overall pre-sleep arousal. To our knowledge, no study has examined whether overall arousal or variability in arousal better predict sleep outcomes. Examining fluctuations in nightly arousal predicting sleep outcomes across ages has implications for understanding the sleep-arousal relationship. Methods: 50 younger (M=19.88, SD=2.76) and 50 older (M=67.81, SD=6.73) adults completed 14-consecutive-day sleep and arousal diaries. Hierarchical multiple regressions were computed for sleep variables, entering the following: 1) age and gender 2) mean cognitive and somatic arousal, and 3) intraindividual standard deviations for cognitive and somatic arousal. Results: Variability accounted for negligible additional variance in sleep outcomes. Mean cognitive arousal predicted SOL ( $\beta=.48$ ,  $p<.01$ ), WASO ( $\beta=.37$ ,  $p<.01$ ), TST ( $\beta=-.29$ ,  $p<.05$ ), SE ( $\beta=-.43$ ,  $p<.01$ ), and SQR ( $\beta=-.51$ ,  $p<.01$ ). Mean somatic arousal predicted WASO ( $\beta=-.28$ ,  $p<.01$ ). Variability in arousal predicted SQR above and beyond mean levels, with variability in somatic arousal predicting SQR ( $\beta=-.31$ ,  $p<.01$ ). Conclusions: Overall arousal better predicts sleep outcomes than arousal variability with the exception of sleep quality ratings, suggesting variability, at least in pre-sleep arousal, is not negatively associated with sleep processes. Only global sleep quality ratings were influenced by variability. Variability in arousal may be impacting components of sleep that contribute to overall perception of sleep (i.e., the amount of time spent in deep sleep or the number of alpha intrusions) that are not assessed with sleep diaries. Implications for assessment and treatment of sleep disorders in younger and older adults are presented.

### **ASSOCIATIONS BETWEEN PERSONALITY DISORDER FEATURES, BELONGINGNESS, AND BURDENSOMENESS IN OLDER ADULTS**

M. Marty<sup>1,2</sup>, D.L. Segal<sup>1</sup>, 1. Psychology, University of Colorado at Colorado Springs, Colorado Springs, Colorado, 2. VA Palo Alto Health Care System, Palo Alto, California

Recent research has suggested that personality disorder (PD) features are strongly positively correlated with suicidal ideation and explain a significant proportion of the variance in suicidal ideation (Segal et al., 2011). Likewise, perceived burdensomeness (PB) and thwarted belongingness (TB) have been shown to be important indicators of suicide ideation (Van Orden et al., 2010). This study explored the relationships between PD features, TB, and PB among a community sample of older adults. Participants (N = 284, M age = 73.3 years, SD = 7.1, age range: 64 – 96 years) anonymously completed the Interpersonal Needs Questionnaire (Joiner et al., 2009), a self-report measure of TB and PB, and the Short Coolidge Axis II Inventory (Coolidge et al., 2010), a self-report inventory designed to assess the 10 standard personality disorders listed in the DSM-IV-TR. Results showed TB had significant positive and moderate correlations with Borderline ( $r = .30$ ), Schizoid ( $r = .32$ ), Paranoid ( $r = .35$ ), and Avoidant ( $r = .36$ ) PD features. Similarly, PB had significant positive and moderate correlations with Antisocial ( $r = .35$ ), Paranoid ( $r = .41$ ), Borderline ( $r = .45$ ), Schizoid ( $r =$

.49), and Avoidant ( $r = .50$ ) PD features. TB and PB were somewhat less related to Histrionic and Narcissistic PD features ( $r = .06 - .12$ ). Findings suggest that specific PD types are associated with increased TB and PB, perhaps due to the social disruption associated with PD pathology. Although the direction of this relationship is unknown, PD features should be considered during a thorough assessment of late-life suicidal risk.

#### INVESTIGATING SHORT TERM TEMPORAL ASPECTS OF LONELINESS IN OLDER PEOPLE: A PILOT STUDY

M. Sullivan, C. Victor, M.L. Gilhooly, *Brunel University, Uxbridge, Middlesex, United Kingdom*

The dynamic nature of loneliness in later life has been largely overlooked by the numerous cross-sectional studies which have sought to establish the prevalence of, and risk factors for, loneliness within the United Kingdom and other developed countries. A limited number of longitudinal studies have characterized three loneliness trajectories: (1) regenerative; (2) degenerative; and (3) enduring. However, less is understood about how feelings of loneliness may vary in the short term between different times of day or days of the week or how loneliness may vary across the course of a year. This poster presents the findings of an exploratory mixed methods study that sought to explore the links between the temporal variations in loneliness and an individual's intrapersonal and interpersonal characteristics and social environment. We undertook a quantitative survey of reported levels of loneliness using a self report and the de Jong Gierveld scale, at 3 month intervals across a 12 month period, and a series of in-depth interviews. We present a framework of five elements that contributed to participants' vulnerability (and capacity to combat) loneliness namely intrapersonal and interpersonal characteristics, the micro and macro social environment, and life events. We also introduce the complex relationship between temporal variations in loneliness and an individual's psychosocial context. We conclude by outlining some of the methodological challenges for longitudinal investigations of loneliness, and the possible implications of the findings for loneliness intervention strategies for a diverse group of older people.

#### WHAT ACCOUNTS FOR POSITIVE PERCEPTIONS OF SELF-RATED HEALTH AMONG OLDEST-OLD ADULTS? FINDINGS FROM THE GEORGIA CENTENARIAN STUDY

J. Cho<sup>1,2</sup>, P. Martin<sup>3</sup>, M. Cress<sup>4</sup>, M.G. Ory<sup>2</sup>, L. Poon<sup>4</sup>, 1. *Scott & White Healthcare, Temple, Texas*, 2. *School of Rural Public Health, Texas A&M Health Science Center, College Station, Texas*, 3. *Iowa State University, Ames, Iowa*, 4. *University of Georgia, Athens, Georgia*

**Background.** Older adults commonly experience a decline in physical activities and an increase in the number of medical comorbidities. Nevertheless, many old adults, especially oldest-old adults, have positive perceptions of their overall health. This study investigated which determinants (physical health impairment vs. physical performance) make oldest-old adults rate their health positively. **Methods.** 324 participants from the Georgia Centenarian Study were included. Multiple regression analyses were conducted to identify correlates of self-rated health items with three indicators of physical health impairment (number of health problems, number of diseases, number of usages of devices), five indicators of physical performance (physical performance scale, average grip strength, average leg strength, physical activity of daily living, instrumental activity of daily living) after controlling for age, sex, residence and ethnicity. **Results.** Data showed that number of health problems ( $\beta = -.15, p < .05$ ), number of devices usage ( $\beta = -.19, p < .05$ ), instrumental activity of daily living ( $\beta = -.15, p < .05$ ), and the physical performance scale ( $\beta = -.24, p < .05$ ) were significant factors for perceptions of overall health among oldest-old adults. Those who had less health problems, used less devices, and needed less help to do instrumental activities rated their health better. Additionally, after controlling for demographics, health problems and activities of daily living,

oldest-old adults who showed poor performance on the GCS scale rated their health better, pointing to a suppressor effect. **Conclusion.** The findings suggest disabilities or health problems were not obstacles for the very old age group to perceive their health as long as they experience less difficulty in everyday life.

### SESSION 330 (POSTER)

#### NURSING HOME CARE

##### NURSING HOME EMPLOYEE PERCEPTION OF ORGANIZATIONAL CULTURE AND ITS RELATION TO JOB SATISFACTION

B. Getz, I. Kostiwa, S. Shah, B. Ludwin, S. Meeks, *Department of Psychological and Brain Sciences, University of Louisville, Louisville, Kentucky*

Organizational culture in nursing homes has been found to be related to job satisfaction (Kostiwa & Meeks, 2009). However, the nature of the relationship between specific behavioral expectations and job satisfaction has not been fully explored. We hypothesized that (1) employees would be more satisfied with their jobs if they perceived a culture that discouraged avoidance, opposition, and competitiveness; and (2) Certified Nursing Assistants (CNAs) would perceive their work culture differently than other staff: as encouraging less avoidance, opposition, and competitiveness. One-hundred and sixteen nursing home employees were asked about job satisfaction and organizational culture, including sixty CNAs and 56 nursing home employees from management and other areas of the organization. Job satisfaction was measured by the Benjamin Rose Nurse Assistant Job Satisfaction Survey (Ejaz, Noelker, Menne, & Bagakas, 2008). Nursing home employees' perceptions of behavioral expectations in the workplace were measured by the Organizational Culture Inventory (OCI; Cooke & Rousseau, 1988). We found that employees were more satisfied with their jobs if they perceived a culture that encouraged less avoidance and more competitiveness. No effect was found for opposition. CNAs perceived the culture as more discouraging of avoidance and opposition as compared to other nursing home employees. No effect was found for competitiveness. The results support the idea that CNAs have a unique perspective of the nursing home environment; understanding employee perceptions of the environment may be key to reducing job dissatisfaction and changing nursing home culture.

##### LONGITUDINAL CHANGES IN EXPECTATIONS FOR NURSING HOME USE IN THE HEALTH AND RETIREMENT STUDY

P.P. Haley<sup>1,2</sup>, R.S. Allen<sup>2</sup>, 1. *South Texas Veterans Health Care System, San Antonio, Texas*, 2. *Department of Psychology/Center for Mental Health and Aging, The University of Alabama, Tuscaloosa, Alabama*

The Behavioral Model of Health Services Use (Andersen, 1968; Andersen & Newman, 1973) is a framework frequently used to examine factors that bear upon the decision to utilize health services (Andersen & Newman, 1973; Mui, Choi, & Monk, 1998). According to this model, an individual's predisposing characteristics, enabling resources, and degree of need determine whether they will pursue health services, including nursing home care. As expectations for nursing home use appear to approximate actual risks of utilizing nursing home services (Lindrooth, Hoerger, and Norton, 2000), the current study investigated relations between variables predicted by the Behavioral Model of Health Services Use to influence longitudinal expectations for nursing home use among Health and Retirement Study (HRS) respondents ( $N = 1,487$ ) 50 years of age and older. Variables of interest were drawn from the 2002-2008 waves of the HRS and included demographics, previous health services use, insurance possession, social support, cognitive status, emotional health, and functional status. Latent growth curve mod-

els were developed to test whether these variables predicted expectations for future nursing home placement. Results indicate that models that included respondents' age [X<sup>2</sup>(8)=12.891, p=.116, CFI=.991, TLI=.995, RMSEA=.020], previous health services use [X<sup>2</sup>(25)=26.796, p=.366, CFI=.999, TLI=.999, RMSEA=.007], insurance coverage [X<sup>2</sup>(8)=6.598, p=.581, CFI=1.002, TLI=1.000, RMSEA=.000], enjoyment of life and feeling full of energy [X<sup>2</sup>(24)=25.754, p=.366, CFI=.998, TLI=1.000, RMSEA=.007], and difficulty shopping [X<sup>2</sup>(28)=30.909, p=.321, CFI=.996, TLI=.999, RMSEA=.008] significantly predicted longitudinal expectations for future nursing home placement.

#### **DECREASING THE USE OF PHYSICAL RESTRAINTS IN NURSING HOME CARE**

A. Pot<sup>1,2</sup>, B.M. Willems<sup>1</sup>, D. Smit<sup>1</sup>, J.D. Lange<sup>1</sup>, 1. *Netherlands Institute of Mental Health and Addiction, Utrecht, Netherlands*, 2. *VU University, Amsterdam, Netherlands*

In the last years, there is increasing attention for the use of physical restraints in living arrangements for people with dementia. The Health Care Inspectorate and several field parties agreed to ban the belts in nursing home care in the Netherlands. From 2011, belts may only be applied under strict conditions. In this presentation, the changes in the use of belts and other types of physical restraints from 2009 to 2011 will be presented. Data will be used from the Living Arrangements for people with Dementia (LAD-) study. This study is an ongoing nation-wide study including around 140 living arrangements for people with dementia in the Netherlands. Every two years a measurement is carried out on the quality of care, care staff's well-being and residents' quality of life. Results of 2009 show that the mean number of physical restraints per resident was .52, ranging from 0 to 1.26. In the presentation, attention will be paid to the definition of restraints, different types of restraints, changes over time, the link with policy and ways to reduce the use of physical restraints.

#### **A COMPARATIVE ANALYSIS OF SNF DEFICIENCY PATTERNS: ARIZONA MASSACHUSETTS AND WASHINGTON**

K.A. Bailey, M. Velez, J. Tan, *Social Work, Bridgewater State University, Bridgewater, Massachusetts*

According to the most recent National Nursing Home Survey, there are 1.6 million individuals nationwide who reside in skilled nursing facilities (SNFs). It is critical to understand what factors impact the provision of quality care in these settings. Using the nursing home compare public use data set, this study examines the patterns of deficiencies in three states, Arizona, Washington and Massachusetts. Federal regulations dictate educational requirements for qualified social service directors. However, state regulations can add additional requirements. Massachusetts is a state that has additional educational requirements. Overall it was found that Massachusetts had the lowest average number of deficiencies while Washington had the highest average number of deficiencies. Predicting factors included facility ownership, multi-facility chain affiliation, and facility size. Analysis was conducted to test whether the relationship between these factors and deficiency level vary by state. It was found that these three factors are significant predictors for level of deficiency among the combined data sets. Specific results indicated ownership type as a statically significant predictor of deficiency level only in Washington, multi-facility chain affiliation as a statically significant predictor of deficiency level for Massachusetts and Washington and facility size to be a statically significant predictor of deficiency level only in Massachusetts. Results from this exploratory study demonstrate clear differences in deficiency patterns and indicate

a need for examination of deficiency scope and severity and deficiency categories to better interpret potential differences.

#### **THOSE WHO MATTER SPEAK OUT ABOUT OPTIMAL CARE ON A RESIDENTIAL DEMENTIA CARE UNIT**

R.H. Robnett<sup>1</sup>, B. Moore<sup>2</sup>, J. Sawyer<sup>2</sup>, 1. *Occupational Therapy, University of New England, Portland, Maine*, 2. *Genesis Health Care, Falmouth, Maine*

This qualitative research project explores optimal dementia care from the perspective of the involved stakeholders on a dementia-based residential care unit. We ran several focus groups comprised of staff and formal caregivers (n=24), family and friends of residents (n=8), and the residents themselves (n=16). This poster gives an overview of the distinct process employed to carry through each of the types of focus groups and shares the general results from the three different perspectives. Comprehensive theme analysis of the transcribed group meetings was conducted. The results offer not only crucial input regarding what is deemed best care for the residents, but also demonstrate that each type of focus group had varying and distinct views on optimal care. The majority of staff reported that the favorite aspect of their jobs was working directly with the residents, while the lack of time was the most challenging aspect. All participant groups agreed that more activities and more attention to the residents would be optimal. However, while the families and the staff focused more on environmental and physical issues, the residents rarely mentioned anything related to physical care. Rather, most residents focused on the positive aspect of social activities, such as music and singing, and food. While the results can be generalized only extremely cautiously beyond the facility in which they took place, the method of using focus groups and interviews to explore the opinions of those who matter in realm of dementia care easily could be replicated.

#### **TEST-RETEST RELIABILITY OF PERSONAL PREFERENCES IN COMMUNITY AND VETERAN NURSING HOME RESIDENTS**

K. VanHaitma<sup>1,3</sup>, K. Curyto<sup>2</sup>, K. Eshraghi<sup>1</sup>, M.H. Kleban<sup>1</sup>, C. Duntzee<sup>1</sup>, 1. *Polisher Research Institute, North Wales, Pennsylvania*, 2. *Western NY VAMC, Batavia, New York*, 3. *University of Pennsylvania, Philadelphia, Pennsylvania*

Use of personal preferences in planning individualized care requires reliable information. This study sought to assess the test-retest reliability of residents' self reported preferences for everyday living in two nursing home (NH) samples. Forty-six VA residents aged 55 to 94 (M=74.98, SD=11.13) and 37 non-VA NH residents aged 55 to 101 (X=81.62, SD=11.83) participated. The Preferences for Everyday Living Inventory (PELI), an 81 item questionnaire, was administered at 2 time points, 5-7 days apart. The PELI assesses a range of preference dominions including social contact, growth activities, leisure activities, self-dominion, and caregivers and care. Measures of agreement were derived for each subject. Perfect agreement was defined as exact scores across the T1 & T2 PELI measures. Acceptable agreement based on +/- 1 deviation across T1 & T2 for each subject was also calculated. Non-VA subjects demonstrated perfect agreements on average 66 percent of the time (AD = 9, range = 48 - 88) while VA subjects averaged 56 percent agreement (SD = 9.91, range = 32 - 76). For percent agreements based on +/- 1 deviations, non-VA subjects had a mean percentage = 95 (SD = 3, range = 88 - 100) and the VA subjects had a mean percentage = 88 (SD = 8.48, range = 70 - 99). Multiple regression analyses were conducted to examine significant predictors of reliability in both samples using demographics, cognitive, functional variables, and interviewer ratings. Results will be presented and implications for future research and clinical practice will be highlighted.

## BEHAVIOR PROBLEMS IN OLDER NURSING HOME RESIDENTS

K.A. Kitchen<sup>1</sup>, C.L. McKibbin<sup>1,2</sup>, D. Fleming<sup>1,2</sup>, T.L. Wykes<sup>1</sup>, A.A. Lee<sup>1</sup>, C.P. Carrico<sup>1,2</sup>, 1. *Psychology, University of Wyoming, Laramie, Wyoming*, 2. *Wyoming Geriatric Education Center, Laramie, Wyoming*

Certified nursing assistants (CNAs) have the most direct contact with residents among nursing home staff, yet receive little training in behavior management, particularly in rural communities. Thus, it is vital to understand rural CNAs' confidence in managing behavior problems. CNAs employed in Wyoming nursing homes (n=100) completed a survey assessing the type and frequency of observed behavior problems, their confidence in responding to behavior problems, and the extent to which they identify patient risk factors. Respondents ranged in age 16 to 67 (M=36.0, SD=14.1). The majority had at least a high school education (94%). CNAs (52%) reported that their patients display behaviors that interfere with care on at least a daily basis. They felt significantly more confident in their ability to effectively respond to the most frequently observed behaviors (M=3.09, SD=.81) than the least frequently observed behaviors (M=2.90, SD=.95;  $t(97) = 5.30, p < .001$ ), the nonaggressive behaviors (M=3.05, SD=.83) as opposed to the aggressive behaviors (M=2.98, SD=.94;  $t(97) = -2.01, p < .05$ ), and the verbal behaviors (M=3.06, SD=.86) as opposed to physical behaviors (M=3.00, SD=.87;  $t(98) = -2.35, p < .05$ ). The physically aggressive behaviors were often the most difficult to manage. "Physical and psychological disease" was identified as the most common risk factor for displaying behavior problems. Less than half of CNAs seek information about patient risk factors from a nurse or chart (40%), and few seek information when they begin working with a resident (27%). This information will be used to design future CNA trainings.

## SESSION 335 (POSTER)

### RELIGION AND SPIRITUALITY

#### COMPARING MEDIATORS OF THE FORGIVENESS - PHYSICAL HEALTH ASSOCIATION IN A PRISON SAMPLE WITH OLDER NON-VIOLENT AND VIOLENT OFFENDERS

G. Randall<sup>1</sup>, A.J. Bishop<sup>2</sup>, 1. *Family & Consumer Sciences, Bradley University, Peoria, Illinois*, 2. *Oklahoma State University, Stillwater, Oklahoma*

Using a sample of 262 older incarcerated males, we tested a path model linking forgiveness of self, situation, and others, both to an objective assessment of physical health (an index of health conditions) and to an assessment of perceived health, through religiosity, depressive symptoms, perceived stress, and social support. We conducted a two-group analysis comparing the hypothesized model between non-violent (n= 90) and violent offenders (n= 171). We employed Mplus 6.11 and indirect effects (IE) were calculated using the bias-corrected bootstrap resampling method to produce point estimates and 95% Confidence Intervals. The best fitting model allowed all paths free to estimate for both groups (i.e., the model fit differently for each group): Satorra-Bentler  $\chi^2(df=12)=17.43; p=.14; CFI=.99; RMSEA=.06; SRMR=.02$ . For the non-violent group, one specific IE was found for Forgiveness of Self through Social Support on Perceived Health, 95% CI [.02, .34]. For the violent group, one specific IE of Forgiveness of Situation through Depression on Health Conditions was found, 95% CI [-.26, -.03] and one specific IE of Forgiveness of Situation through Depression on Perceived health was found, 95% CI [.07, .29]. Implications for therapeutic interventions, particularly the relationship between type of crime and type of forgiveness, are discussed.

## DIFFERENCES IN DIMENSIONS OF FORGIVENESS BY TYPE OF CRIME COMMITTED BY OLDER INCARCERATED MALES

A.J. Bishop<sup>1</sup>, G. Randall<sup>2</sup>, 1. *Human Development and Family Science, Oklahoma State University, Stillwater, Oklahoma*, 2. *Bradley University, Peoria, Illinois*

The purpose of this study was to examine differences in self-reported forgiveness among older male prison inmates incarcerated for violent and non-violent criminal offenses. Participants included a sample of N = 261 incarcerated men, aged 45 and older, residing in state managed prisons in Oklahoma. IBM/SPSS 19.0 was used to examine mean differences across forgiveness of self, situation, and others by type of criminal offense (violent, n = 171; non-violent, n = 90). Controlling for age, race, religiosity, depression, social support, and perceived health, no significant differences by crime type emerged relative to forgiveness of situation,  $F(1,199) = .26, p = .61$ , or forgiveness of others,  $F(1, 197) = .15, p = .70$ . However, a significant difference by crime type was found for forgiveness of self,  $F(1, 197) = 4.17, p = .04$ , partial  $\eta^2 = .02$ . Planned contrasts revealed that older inmates who had committed a non-violent crime had higher levels of forgiveness of self than older prisoners who committed a violent offense,  $p = .04$ , 95% CI [-.372, -.065]. Implications relative to use of forgiveness as a therapeutic intervention with older male prison inmates are discussed.

## SECULAR REVERENCE AND SHORTER HOSPITAL LENGTH OF STAY AMONG CARDIAC SURGERY PATIENTS

A.L. Ai<sup>1</sup>, L. Noel<sup>1</sup>, F.P. Hopp<sup>2</sup>, P.M. Wink<sup>3</sup>, 1. *Florida State University, Tallahassee, Florida*, 2. *Social Work, Wayne State University, Detroit, Michigan*, 3. *Wellesley College, Wellesley, Massachusetts*

**BACKGROUND:** Despite the surging interest in the faith-health connection in aging, understanding this link is complicated by the growing diversification of the American religious landscape coinciding with the coming of age of the Baby Boomers. The Pew Forum (2008) reports an increasing number of Americans (approximately 16%) who express no religious affiliation. This study explored the role of traditional religiousness and of experiencing reverence in religious and secular (e.g., naturalistic, moralistic) contexts predicting postoperative hospital length of stay among patients undergoing open-heart surgery. Reverence was broadly defined as "feeling or attitude of deep respect, love, and awe, as for something sacred." **METHODS:** Information on demographics, faith factors, sense of reverence, mental health, and medical comorbidities was collected from 400+ patients (age 62+-12) around two weeks before surgery via personal interview. Standardized medical indices were retrieved from the Society of Thoracic Surgeons' national database. **RESULTS:** Hierarchical multiple regression showed that reverence in secular contexts predicted shorter hospitalization, after controlling for demographics, medical indices, depression, and psychosocial protectors. Other hospital length of stay predictors included female gender, age, medical comorbidities, low left ventricular ejection fraction, perfusion time, and coronary bypass graft surgery. **CONCLUSIONS:** Secular reverence exerts a protective impact on an objective measure of cardiac health. If these findings can be replicated, health providers may integrate a naturalistic perspective of spirituality in cardiac aging care.

## GOD GRANT ME THE STRENGTH: EXPLORING THE SPIRITUAL CAPITAL OF MOTHERS OF BREAST CANCER SURVIVORS

L. Manning<sup>1</sup>, M. Radina<sup>2</sup>, 1. *Center for Aging/Dept of Sociology, Duke University, Durham, North Carolina*, 2. *Miami University, Oxford, Ohio*

The National Cancer Institute estimated that 230,480 women will be diagnosed with and 39,520 women will die of breast cancer in 2012. Because breast cancer is an event that impacts the entire family, not

just the patient/survivor (Baider, Cooper, & Kaplan De-Nour, 2000; White & Klein, 2002), an equal or greater number of families may be affected by breast cancer as well. A growing number of women under 50 are being diagnosed with breast cancer (American Cancer Society, 2011). The mothers of these young breast cancer patients, who are likely impacted in a variety of ways by their daughters' diagnoses, deserve empirical research attention. To date, no research exists addressing the perspectives of this population. This study explores the perspectives of mothers of breast cancer survivors. We investigate the role spirituality plays for these mothers in the management of the stress and struggles of having a loved one with a diagnosis of cancer. This study uses secondary analysis of data generated during an earlier study on the families of the women with breast cancer. In a sample of 31 women, ranging in age from 40 to 81, we find that these mothers of daughters with breast cancer have well-developed spiritual capital, and as a result intentionally rely on their spirituality for managing the stress associated with having a loved one with breast cancer. In addition, we find that a cancer diagnosis is a source of spiritual strengthening for these mothers. Implications for health and well-being are considered.

### **RELIGIOUS/SPIRITUAL STRUGGLE: PREVALENCE AND CORRELATES AMONG OLDER ADULTS WITH DEPRESSION IN THE BRIGHTEN PROGRAM**

P. Murphy, G. Fitchett, J. Brunner, E.E. Emery, *Rush University Medical Center, Chicago, Illinois*

A growing body of evidence points to the harmful spiritual, emotional, and physical effects of religious/spiritual (R/S) struggles (e.g., feeling abandoned by God or punished by God). The aim of this study was to advance our understanding of R/S struggle among older adults with depression. The sample included 200 adults, aged 60+, with depression who were participants in the BRIGHTEN program. Half (51%) screened positive for R/S struggle. Hispanics were less likely than non-Hispanic Whites to screen positive for R/S struggle (OR .40, 95% CI .16, .99). Age was inversely associated R/S struggle (OR .95, 95% CI .92, .99). Gender, marital status, education, African-American race, and number of chronic illnesses were not associated with R/S struggle. R/S struggle was associated with higher levels of depressive symptoms ( $t = -2.841$ ,  $df = 195$ ,  $p = 0.005$ ), a difference that remained significant after adjustment for demographic and medical factors. Positive screening for R/S struggle in this sample of older adults with depression was consistent with that of individuals with cancer, congestive heart failure, or diabetes. The finding of higher levels of depressive symptoms among those screening positive for R/S struggle is consistent with other research. The high prevalence of positive screens for R/S struggle in this sample suggests that professionals who work with older adults, both mental health professionals and clergy and chaplains, should be alert to the potential co-occurrence of R/S struggle and depression and consider collaborative treatment or a referral to address conditions beyond one's expertise.

### **A CALLING TO COMPASSIONATE CARE: THE NEED FOR GERONTOLOGY EDUCATION IN THE SEMINARY**

D. Walsh, *Gerontology, CSU, Sacramento, Shingle Springs, California*

An understanding of all aspects of aging is crucial for those who work with elders. Parish priests minister to elder parishioners on a regular basis. The intent of this research is to determine to what extent Catholic seminaries offer adequate gerontology instruction and training for those who are preparing for the priesthood. It looks at whether seminarians and recently ordained priests believe they are adequately trained and prepared to serve elder parishioners. It examines what experiences they have in ministering to elders. It also looks at what seminarians and priests express they want and need to have taught in the seminary on age-related topics. Most information is gathered through a survey created by the researcher. The survey is made up of 13 open-

ended questions. Secondary research methods are observations, shadowing, and the examination of seminary curricula and library content. The data from these secondary methods are used to supplement the information gathered through the survey. The research of the seminary curricula studied shows gerontology courses are not being offered and participants report not having courses related to aging. The majority report not feeling fully prepared to work with elders. The survey responses indicate participants have a wide range experience with elders, yet when experiences prove challenging, many are not confident and comfortable. Many participants request a wide range of age-related topics to be taught. Responses clearly demonstrate a consensus from both seminarians and priests for gerontology instruction to better prepared them for ministering to elders.

### **RELIGIOSITY, SPIRITUALITY, AND SUBJECTIVE WELL-BEING: THE ROLES OF HOPE AND CONTROL**

M. Montpetit, S. Schmelter, E.M. Ledvort, M. Dinkle, K.M. Roessler, J.M. Abbasi, *Illinois Wesleyan University, Bloomington, Illinois*

The current project explores the process by which religiosity and spirituality impact subjective well-being. In particular, existing literature suggests that these constructs have practical (e.g., self-efficacy) and existential (e.g., hope) benefits for elderly individuals, but many of these relationships are not well understood. Data from 90 aging adults (MAge= 67 years; SDAge= 5.1 years) were used to investigate whether control or hope mediated the relationships of interest. Results of regression analyses indicate the both hope and control mediate the relationship between spirituality and well-being. The relationship between religiosity and well-being did not meet the criterion for significance ( $p = .06$ ). Interestingly, although a mediating model could not be tested, there was a strong positive relationship between religiosity and hope, but not control. Overall, results suggest that spirituality is more strongly to subjective well-being than religiosity, and that the benefits of spirituality are conferred through the sense of control and hope fostered thereby.

### **THE INTERACTION EFFECTS OF RELIGIOUS SUPPORT AND SOCIAL SUPPORT ON DEPRESSION AMONG KOREAN-AMERICAN OLDER ADULTS (KAOAS)**

S. Park<sup>1</sup>, S. Roh<sup>2</sup>, M.J. Lawler<sup>2</sup>, *1. New York University, New York, New York, 2. University of South Dakota, Vermillion, South Dakota*

Method: The study utilized a cross-sectional survey design. Through face-to-face interviews, two hundred participants, 115 male and 85 female, were recruited from Korean senior centers in New York City. In an attempt to measure a broad range of social support, Lubben Social Network Scale-Revised (LSNS-R) was used. Religious support subscale from the Brief Multidimensional Measures of Religiousness and Spirituality (BMMRS) were employed to measure a broad range of religious support. Depression was measured with the Geriatric Depression Scale-30 Korean version (GDS-K). Results: Multiple regression analysis indicated that social support ( $B = -.122$ ,  $p < .05$ ), religious support ( $B = -.511$ ,  $p < .05$ ), and physical health status ( $B = -1.451$ ,  $p < .01$ ) were significant factors for males, while religious support ( $B = -.846$ ,  $p < .05$ ), physical health status ( $B = -2.447$ ,  $p < .01$ ), and income ( $B = -1.19$ ,  $p < .01$ ) were significant predictors of depression for females. A significant 2-way interaction between religious support and social support for predicting depression was found ( $B = -0.074$ ,  $p < .05$ ), but the model including this interaction term was statistically significant only for females ( $F(7,77) = 4.174$ ,  $p < .05$ ,  $R^2 = .359$ ). The results indicate that social support moderates the relationship between religious support and depression among female Korean elderly. Conclusion: These findings emphasize that religious and social support could be contributive factors to decrease depressive symptoms. More attention should be paid to developing a variety of social services as a way of improving mental health among KAOAs. Future research is needed to replicate this study for diverse ethnic elderly groups. \* This study was supported by John A. Hartford Foundation.

## THE BLACK CHURCH AND “FULL-BODY” RELIGIOUS INVOLVEMENT: RACE AND RELIGION AMONG WORCESTER’S ELDERLY

M. Oviedo, *College of the Holy Cross, Worcester, Massachusetts*

Religiosity is a multidimensional construct that consists of cognitive, attitudinal, behavioral, experiential, and emotional aspects. Historically, the “Black Church” has shaped the expression of religiosity in ways thought to be different from that of the mainstream and evangelical “White Church”, such that several theorists see a more integrative influence of affiliation on religious expression. African Americans belonging to historically Black churches are thought to demonstrate a more “full bodied” religious experience with heightened involvement across all aspects of religiosity. We examined this “full body” hypothesis using data from interviews of 357 elders over the age of 60 in Worcester, MA. Multivariate analyses comparing African American and White older adults demonstrated heightened religious involvement on all aspects of religious involvement in keeping with the “full bodied” hypothesis. Of the 90 African Americans older adults in this sample, a sizable number were in mainline, historically integrated churches. Few differences in religiousness were noted between those African Americans in historically Black versus integrated White churches. This finding of full-bodied religiousness among those African American older adults affiliated with both Black and integrated churches is discussed in terms of developmental and stress/coping theories of religious expression in later life.

## SESSION 340 (POSTER)

### SOCIAL AND CIVIC ENGAGEMENT

#### SOCIOECONOMIC POSITION, MOBILITY, AND POLITICAL PARTICIPATION AMONG MEN AND WOMEN 77+ IN SWEDEN

I. Kåreholt, H. Long, *Aging Research Center, Stockholm, Sweden*

Introduction: Political participation, e.g. voting, is important as it allows people to influence national/regional politics. From an egalitarian perspective it is desirable that everyone, irrespective of age, sex, socioeconomic position, and health, has the possibility to vote. We study the relationship between voting and a combination of mobility and three measures of socioeconomic position (social class based on occupation, years of education, and income). Methods: Two nationally representative Swedish samples aged 53-75 were interviewed in 1968 and 1981 respectively. Survivors from 1968 were re-interviewed in 1992 (n=461), survivors from 1981 in 2002 (n=614). Both 1992 and 2002 were election years in Sweden. The question posed was: did you vote in the election? Logistic regressions were controlled for sex, age, and cognition. Mobility, measured as walking aids outdoors was coded: 1)no aids; 2)some aids (cane(s), quadraped(s), crutch(es), walker); 3)wheelchair/never go out. Results: Significant differences in voting were found for both sexes, for all measures of socioeconomic position – people with a high socioeconomic position being more likely to have voted. The association between voting and socioeconomic position varied over mobility, but not systematically: social class had the strongest association among men without walking aids; education among men using some aids; and income for men using a wheelchair/not going out. Social class and income had the strongest associations among women with some aids, education among women without aids. Conclusions: There are systematic socioeconomic differences in political participation measured by voting, but no systematic pattern in how the associations vary over mobility.

## THE LINK BETWEEN PRIVATE AND PUBLIC HELPING BEHAVIOR: CAREGIVING AND CITIZENSHIP ACTIVITIES AMONG AFRICAN AMERICAN URBAN ELDERS

L.J. Ficker<sup>1</sup>, P.A. Lichtenberg<sup>1</sup>, M. Herring<sup>2</sup>, M. Kruman<sup>2</sup>, C. Lysack<sup>1</sup>, J. Hannigan<sup>3</sup>, *1. Institute of Gerontology, Detroit, Michigan, 2. Center for the Study of Citizenship, Detroit, Michigan, 3. Merrill Palmer Skillman Institute, Wayne State University, Detroit, Michigan*

Older persons who provide care to others have been found to be more active in their communities in White, middle-class samples. The objective of this study was to determine if this is also true for African American elders living in an urban context. We interviewed 501 African American elders in order to assess caregiving activities, mobility status of elders, citizenship, and volunteering activities. The majority of the sample was female (86.0%) and retired (89.6%) with an average age of 70.7 years (SD = 8.6). Almost 80% of the sample had grandchildren (n = 391), one-third of whom (n = 131) were currently involved in caregiving for their grandchildren, and 85 were involved in caregiving for other adults, such as disabled family members or friends. Caregiving grandparents reported significantly higher citizenship activities compared to grandparents not involved in grandchild care. Caregivers of other adults reported higher volunteering compared to non-caregivers. Although caregivers were significantly younger than non-caregivers, mobility status was the same in both groups. Curvilinear relationships in citizenship and volunteering were found according to the amount of caregiving activities for both groups. Elders who provided the least and the most amount of care for others/grandchildren reported less citizenship and volunteering than those who provided a moderate amount. Implications are that elders who provide care for friends and family members may be more likely to volunteer and participate in citizenship activities, but that elders who provide the most intensive caregiving may have lower levels of involvement in community activities.

#### TRAJECTORIES OF QUALITATIVE SOCIAL SUPPORT: FINDINGS FROM THE VA NORMATIVE AGING STUDY

N. Toyokawa<sup>1</sup>, C.M. Aldwin<sup>1</sup>, A. Spiro<sup>2</sup>, *1. Human Development & Family Sciences, Oregon State University, Corvallis, Oregon, 2. Boston University & Veterans Affairs, Boston, Massachusetts*

Socioemotional selectivity theory (SST: Carstensen, 2006) predicts that old age is normatively associated with better quality of social relationships with emotionally meaningful social partners. In contrast, dynamic integration theory (DIT: Labouvie-Vief, 2003) predicts that the significant individual differences in qualitative social relationships are explained in part by varying cognitive resources. To compare these predictions, we examined longitudinal data on 1,066 men from the VA Normative Aging Study. Mean age at baseline was 60.83 (SD = 8.08, range: 40 - 88). Data on qualitative social support (reliance on family and friends) from three triennial surveys 1985-1991 were analyzed using conditional growth models with random intercept and slopes. In support of SST, the fixed effect of the qualitative social support indicated a slightly positive slope,  $B = .01$ , 95% CI =  $-.004 - .015$ , however, there was a slight but significant random effect in both the intercept,  $B = 1.32$ , 95% CI =  $1.19 - 1.45$ , and the slope,  $B = .01$ , 95% CI =  $.001 - .09$ , suggesting individual differences. Better self-reported health was positively associated with the slope,  $B = .258$ , 95% CI =  $.127 - .389$ , while having memory problems was associated with lower levels,  $B = -.233$ , 95% CI =  $-.42 - -.05$ . These findings suggest that physical and cognitive health may be protective factors for older adults' efforts to maintain their ability to rely on family & friends.

#### “CALL UP SOMEBODY AND TELL THEM YOU MISSED THEM”: SOCIAL NETWORKING AMONG ADULTS AGE 80 AND OVER

P. Sawyer<sup>1</sup>, B.R. Williams<sup>1</sup>, R.M. Allman<sup>2,1</sup>, *1. University of Alabama at Birmingham, Birmingham, Alabama, 2. Birmingham/Atlanta VA GRECC, Birmingham, Alabama*

PURPOSE: Among the oldest old adaptation of emerging communication modalities has been slow. This analysis explores older adults'

(age 80+) descriptions of the ways they stay up-to-date and connected to others. **METHODS:** We conducted a secondary analysis of semi-structured interviews conducted to examine mobility among community-dwelling older adults. Interviews included race, sex, age, residence, and life-space mobility (0-120; higher scores representing greater mobility). Content analysis of interview texts was used to explore social networking in this population. **RESULTS:** Participants (n=26) had a mean age of age 85.5 years (SD = 4.1) and were predominately white 69.2% (n=18), female 73.1% (N=19), and resided in single family dwellings 61.5% (n=16). Mean life-space scores were 40.6 (range 23-70). Emerging themes included the salience of staying connected to others, especially among adults with limited life-space mobility. Respondents showed an overwhelming preference for staying in touch with others by telephone, handwritten notes/letters, and face-to-face visits. Social gatherings and mealtimes provided opportunities for conversing with others and staying current. References to communicating by e-mail or using the internet did not appear in any interview text. **CONCLUSIONS:** These findings point to the importance of social connectedness in the lives of adults age 80 and older. However, non-internet modalities of social networking typified this sample. This suggests a cohort effect limiting the scope and range of communication patterns, potentially isolating the oldest adults from the mainstream of society, with important implications for communication between older and younger generations.

### **SOCIAL NETWORK COMPOSITION IN SENIOR HOUSING COMPARED TO A NORMATIVE SAMPLE**

J. Carroll, S. Qualls, *University of Colorado at Colorado Springs, Colorado Springs, Colorado*

A move into senior housing can both interrupt social networks and add new opportunities for social contact, yet shifts in the composition of social networks after move-in have not yet been documented in detail. Literature suggests that a move should not impact the inner circle, but the middle and outer circles could benefit from added friendship opportunities. In this study, Antonucci's concentric circle task assessed social network membership in a pilot sample of 22 residents two to three months after moving into an independent living senior residence. Compared to a national sample (Antonucci & Akiyama, 1987), the present analysis found network composition following move-in to be significantly larger in the inner circle (M = 9.68 versus 3.5 in national norms) and middle circle (M = 7.05 versus 3.2 nationally); whereas the outer circle was similar (M = 2.82 versus 2.0). Larger inner and middle circles in the present sample may indicate heightened family closeness during the transition into senior housing. However, the small size of the outer circle points to the rarity of including other senior housing residents as acquaintances a few months following move-in. A qualitative analysis of the identity of members of the circles points to ambivalence about integrating new acquaintances into the network. Further, more specific analysis quantifying the proportion of fellow senior housing residents compared to total network membership after move-in provides content to support this qualitative observation. **Keywords:** senior housing, social network composition, acquaintances

### **SOCIAL CAPITAL AND THE LIFE WORLD OF OLDER PEOPLE IN KOREAN RURAL COMMUNITIES**

S. Yoon<sup>1</sup>, G. Han<sup>2</sup>, *1. Samsung Life Retirement Research Center, Seoul, Republic of Korea, 2. Department of Child Development and Family Studies, Seoul National University, Seoul, Republic of Korea*

This study aims to explore how social capital is created and sustained in the life-world of older people in Korean rural communities and to understand the meaning of aging-in-place in rural communities within a framework of social capital. Two rural villages in Sunchang County in North Jeolla Province, South Korea were selected for this study and ethnographic fieldwork was conducted for about 2 months to gather the data. Research findings show the usefulness of the concept of social

capital in analyzing and understanding characteristics of social environments and the lives of older people in rural communities. Communities are places where they have not only established and sustained life-long social networks with friends and neighbors but also gained social status and roles. Older people made frequent contact and exchanged various resources with community members. In addition, they created and actively participated in organizations or associations they formed, and through this they gained a strong sense of ownership. Also, they collectively set and accomplished the goals for the community, and further developed their own unique culture. Despite the fact that rural communities face restructuring and economic decline, such experiences allowed them to have a sense of pride and a positive perspective about their community. This research shows older people in rural communities are producers of social capital and active agents of their life-world, dismantling stereotypical notions of older people as dependent and marginalized. Implications of the study are discussed in detail.

### **HUMOROUS SOCIAL INTERACTIONS AND MENTAL HEALTH IN ASSISTED LIVING RESIDENTS**

A.E. McQueen, *Portland Community College, Tualatin, Oregon*

Research has established that social interactions are related to older adults' mental and physical health. Social interactions involving humor may be particularly salient in the lives of older adults living in long-term care settings, who often face multiple age-related losses. Studies indicate that humor can enhance or promote social relationships and a sense of belonging, aid in the coping process, and help to buffer the effects of psychological stress. However, humor also has an ominous side. Negative forms of humor, which include both failed attempts at humor and humor with negative intent, may be characterized by aggression, criticism, manipulation of others, sarcasm, and ridicule that are interpreted as hurtful, offensive, demeaning, or overbearing. A new measure of humorous social interactions was developed and tested on a sample of 130 residents from assisted living communities in the Portland, Oregon metropolitan area. Confirmatory factor analysis showed the scale to have a two-factor structure, consisting of both positive and negative humorous interactions, and excellent internal consistency. Results from regression analyses indicated that positive humorous interactions were significantly related to depression (B=-.197, p=.018), negative affect (B=-.246, p=.001), and loneliness (B=-.231, p=.001). Negative humorous interactions were significantly related to depression (B=.189, p=.040), loneliness (B=.329, p=.001), and self-rated health (B=-.265, p=.022). Understanding the role of humorous interactions in relation to mental health is an important addition to the literature on social interactions and may also lead to practical interventions in long-term care facilities.

### **AWARENESS OF RISK FACTORS FOR LONELINESS AMONG THIRD AGERS**

E. Schoenmakers<sup>1</sup>, T.G. van Tilburg<sup>1</sup>, T. Fokkema<sup>2</sup>, *1. VU University, Amsterdam, Netherlands, 2. NIDI, The Hague, Netherlands*

Awareness of risk factors for loneliness is a prerequisite for preventive action. We focus on two risk factors: poor health and widowhood. Preventive action by developing a sufficient social network requires time and effort and thus seems most feasible for people unexposed to the risk factors, i.e. third agers and non-lonely people. Three questions are addressed. Are older adults aware of poor health and widowhood as risk factors for loneliness? Are there differences in awareness between third and fourth agers? Are there differences in awareness between lonely and non-lonely older adults? After being introduced to four vignette persons, 920 respondents aged 61-99 from the Longitudinal Aging Study Amsterdam were asked whether they expected these persons to be lonely. Older adults, especially third agers, expected peers in poor health, widowhood, or both to be lonely more often than peers in good health and marriage. This suggests that third agers are aware of the risk factors even

though they do not live under loneliness-evoking conditions. Compared to lonely older adults, non-lonely ones expected peers to be lonely less often, suggesting that non-lonely older adults are less aware of the risk factors than lonely ones. We conclude that third agers are aware of poor health and widowhood as risk factors for loneliness. This may contribute to initiating preventive action to avoid becoming lonely.

### **THE EFFECT OF THE BABY-BOOMER GENERATION'S INTIMACY FACTORS WITH AGED PARENTS ON FILIAL RESPONSIBILITY AFTER THE INTRODUCTION OF THE LONG-TERM CARE INSURANCE IN SOUTH KOREA**

Y. Sohn, *Humanities, Catholic University of Pusan, Busan, Republic of Korea*

The purpose of this paper is to examine Korean baby-boomers' locus of filial responsibility (over two year period between 2008 and 2010) after the introduction of the long-term care insurance, and determine whether intimacy factors with their aged parents are related to the locus of filial responsibility. The public long-term care insurance program initiated by the government, started in July 2008, its intention of alleviating the social and economic burden of the frail elderly, marked a watershed in formalizing 'socialized elder care'. From the life course perspective, the Korean baby-boomer generation is 'sandwiched' and feels double burdened for caring for both their aged parents and children. The concept of intimacy is indexed by the frequency of making a phone call, seeing each other, and the satisfaction toward their aged parents. It was hypothesized that those making frequent phone calls, seeing each other often, and having a higher parental satisfaction tended to say both individual and society should care for aged elders. Data are used from the Social Survey conducted by Statistics Korea in the years 2008(n=5,004) and 2010(n=3,698). Over the two period, those answered both individual and society responsibility is shifted from 48.3%(in the year of 2008) to 52%(in the year of 2010). The continuous shift toward both individual and society responsibility for the older population fortells that the generational stake will be increasingly higher as the baby-boomers started retiring in 2010. This result may be related to a series of 'socialized elder care' policies that are mainly spurred by the aftermath of both low fertility and mortality. The most consistently significant findings across three logit multivariate models were gender, education, and place of residence. Being men, having higher education, living in a city were more likely to prefer dual(individual and society) responsibility. Hypotheses were partially supported; that is, those feeling close to their aged parents tended to place filial responsibility on an individual/family one. Considering the fact that increases in both medical costs for the elderly and the national retirement pension will intensify the generational claims in the near future, well-balanced policies and programs for empathizing personal responsibilities along with government-initiated ones were suggested.

### **RELATIONSHIP BETWEEN SOCIAL NETWORK AND SOCIAL SUPPORT OVER TIME AMONG COMMUNITY DWELLING KOREAN-AMERICAN OLDER ADULTS**

H. Jeon, *Social Work, Boston College, Newton, Massachusetts*

This study extends existing research on social support and network integration among older adults in two ways. First, it focuses on marginalized older adults, especially in the population of Korean-American, who receive relatively little attention in gerontology. Second, it employed panel data, which permit stronger causal inferences than the most past cross-sectional studies. Based on the lagged dependent variable approach among 658 community dwelling older adults from 1994 and 1995, our findings indicate that one's social network integration had a positive impact on the amount of social support one receives in the ensuing year. Moreover, those older Korean-Americans who received positive social support also reported that, in the

previous year, they felt more respected. Being married also demonstrated a positive relationship with social support. However, education correlated negatively with relationship with one's level of perceived social support.

### **IT'S ALL ABOUT THE RELATIONSHIP: SENIORS MENTORING STUDENTS**

B. Heasley<sup>1</sup>, J. Feuerstein<sup>2</sup>, L. O'Neill<sup>1</sup>, J. Mohler<sup>1</sup>, *1. University of Arizona, Arizona Center on Aging, Tucson, Arizona, 2. University of Arizona, College of Medicine, Tucson, Arizona*

Background/Rationale: Senior Mentor Programs (SMP) provide health science students an opportunity to increase their comfort and appreciation of elders while better understanding geriatrics, psychosocial aspects, and communication skills. Senior mentors can facilitate their mentee's personal and professional growth through sharing their knowledge, insights and wisdom. Objectives: Our objective was to describe an ideal senior mentoring relationship, and to illustrate benefits to both mentee and mentor. Methods: The University of Arizona's SMP program objectives include interpersonal and communication skills; understanding of disciplinary roles and responsibilities; and Interprofessional (IP) team functioning. In guided sessions, students practiced patient-centered interviewing through life review, and assessment for function, resilience and quality of life. Later, case-based instruction and discussion seek to strengthen team consciousness and communication as IP members discussed profession-specific treatment strategies. A 1st year medical student and her senior mentor (a retired nursing home administrator) were assigned in 2010 and followed for two years. Conclusions: The mentor benefitted from sharing life reflections, experiencing a deeper sense of life's meaning and her contributions; she felt energized from exposure to new ideas. The student benefitted from dispelling stereotypes, and observing the resilience, deep social connections and active life her mentor embraced. Embrace of quality-of-life and function as important aging outcomes become increasingly relevant as our population ages, and providers increasingly care for elders. An engaging SMP experience contributes to these goals, as well as provides personal strength through the care of others and a sense of contribution to the mutual betterment of society.

### **SECRETS OF SUCCESSFUL AGING: PRODUCTIVE OCCUPATIONS IN RETIREMENT**

M.B. Cole<sup>1</sup>, K.C. Macdonald<sup>2</sup>, *1. Occupational Therapy, Quinnipiac University, Stratford, Connecticut, 2. Sacred Heart University, Fairfield, Connecticut*

People adapt to life after retirement in vastly different ways. Some find many ways to fill their days with enjoyable and productive activities, while others have little enthusiasm for doing anything at all. What accounts for the difference? How do differences impact function, well-being, and independence? And what can we learn from the former to help the latter? These two occupational therapist authors interviewed over thirty productive retirees ages 62-91, asking them to share their secrets for successful aging. They identified themselves as having at least three of six productive occupational roles: self manager, home manager, care giver, volunteer, part time paid worker, and lifelong learner. High on their list of secrets were staying fit and healthy, staying connected to friends and family, engaging in creative and meaningful activities, continuing positive routines and attitudes, choosing environments that support participation, and advocating for self and others. Findings are supported by interdisciplinary research, and resonate with current social and developmental theories such as Laslett's Third Age, Atchley's continuity theory, and newer theories of social identity and health.

**ASSESSMENT 1****TWO-STEP APPROACH USING COGNITION AND DAILY ACTIVITIES FOR SHORT-TERM PREDICTION OF CONTINUED OR DISCONTINUED COMMUNITY-LIVING IN OLDER ADULTS AT RISK**

M.R. Tomita, S.M. Nochajski, P. Suryakumar, T. Mashtare, B.J. Naughton, *University at Buffalo, Buffalo, New York*

**Background:** Predictors of discontinued living have been consistent: lower cognition and lower overall functional levels. However, all daily and instrumental daily living activities do not necessarily predict the end-of-life events. Also information regarding predictors lacks especially if a discontinued community-living status is at risk within a year. The purpose of the study was to identify daily activity predictors of continued community-living (CCL) or discontinued community-living (DCL) within a year timeframe in frail older adults. **Methods:** Data from 374 community-dwelling older adults who were discharged from health care services were divided into three levels based on the Mini Mental State Exam (MMSE), according to a ratio of DCL to CCL. Activities of daily living (ADL) and Instrumental ADL were analyzed using hierarchical logistic regression adjusting for other variables. **Results:** If the MMSE score was 13 or less (high risk group), all died. For the moderate risk group (MMSE 14-27), lower scores on the shopping for groceries/clothes, and taking medication items, and for the lower risk group (MMSE 28-30), lower levels of doing house work were predictors. Using cognition and daily activities, overall prediction accuracy ranged 81%-100%. **Conclusion:** Information about specific daily activities rather than an overall functional status within a certain MMSE range provides caregivers with useful information to prepare for older adults' imminent end-of-life event.

**PHYSICAL FUNCTIONAL CAPACITY AND ITS DETERMINANTS AMONG ELDERLY PEOPLE**

P. Pohjolainen, *Age Institute, Helsinki, Finland*

The Helsinki Birth Cohort Study started with aims to assess how growth and environmental factors acting during the fetal period and childhood are related to health in adult life. Since the beginning of the study during 1990s, the follow-up group of adult participants, born during 1934-1944 (n=1000), is now turning to the third age of life, with the current age ranging from 68 to 72 years. The number of participants was 250 (in March 2012) (44 % men, 56 % women). The coming presentation will use data available in November 2012 when the expected number of participants will be approximately 900. The purpose of this study is to describe the connections of birth weight with physical functional capacity in the third age. It was measured by muscle strength tests, a 6-minute walking test, a balance test and measurements of reaction time. In addition we studied how socio-economic status correlated with functional capacity. So far, the results showed that muscle strength and endurance were better among men than among women, while flexibility was better among women. There were no differences between genders in measurements of reaction time and balance. The birth weight was in connection with muscle strength, flexibility and endurance. Education correlated with measurements of muscle strength. In conclusion, the study advances our understanding of the connection of birth conditions and physical functional capacity in the third age.

**PREDICTORS OF TWO-YEAR SURVIVAL AMONG THOSE 85 AND OLDER USING THE MEDICARE HEALTH OUTCOMES SURVEY**

D. Ritenour<sup>1</sup>, M. Elliott<sup>2</sup>, S.C. Grace<sup>1</sup>, L. Giordano<sup>1</sup>, R. Malinoff<sup>1</sup>, *1. Surveys, Research and Analysis, Health Services Advisory Group, Phoenix, Arizona, 2. Rand Corporation, Santa Monica, California*

The oldest old are the fastest growing segment of the elderly, particularly vulnerable with substantial care needs. Little is known about

the extent to which predictors of mortality in younger populations apply, and the extent to which receiving care measured by standard quality measures may reduce mortality in this group. The Medicare Health Outcomes Survey is a national patient-based longitudinal outcomes measure assessing functional health and HRQOL of Medicare managed care beneficiaries. We examine these measures and other predictors of two-year survival among those  $\geq 85$ . This study uses 2008-2010 HOS data for beneficiaries aged  $\geq 85$  (n=50,449). Multivariate logistic regression predicted the probability of death before two-year follow up from demographic characteristics, BMI, health status, HRQOL, and HEDIS® measures. One-in-five beneficiaries  $\geq 85$  died prior to two-year follow up. Lower HRQOL, BMI < 30, male gender, White non-Hispanic, and worse self-perceived health were associated with higher odds of death within two years. Beneficiaries with difficulty eating, bathing, or using the toilet, and those with congestive heart failure, cancer, or respiratory diseases were more likely to die within two years. Receiving advice to increase or maintain physical activity was associated with significantly lower odds of mortality. Significant demographic and health associations with mortality among the  $> 85$  population largely mirrored previous findings in younger populations. Advice to increase/maintain physical activity was associated with a 10% lower odds of two-year mortality beyond health and demographics, both validating it as a quality measure and establishing its importance even for the oldest old.

**AN AUTOMATED MEASUREMENT OF THE "TIMED UP&GO" AS AN ASSESSMENT OF MOBILITY AND GAIT**

J. Kiselev, M. Gövercin, E. Steinhagen-Thiessen, S. Wegel, *Geriatric Research Group, Charité Berlin, Germany, Berlin, Berlin, Germany*

The prevalence of falls is an important issue in aging. About 30% of people aged 65+ falls once a year, 15% of the more often. 7% to 18% of all fallers suffer a hip fracture. 10% of all falls of those aging 70+ result in a traumatic brain injury (TBI), 5% result in the death of the faller. To initiate sufficient interventions to reduce the risk of falling, an early and comprehensive assessment of the individual risk factors is mandatory. However, existing instruments for the evaluation of fall risks are either very time consuming or not able to give detailed information. The "Timed Up&Go" (TUG) test is of the latter category. For this reason, the automated Timed Up&Go (aTUG) was developed. It consists of a chair with an implemented sensor array able to measure gait and weight distribution during sitting and standing up. Additional sensors detect the start and the end of the measurements. We recently started a validation study with 110 older people at risk of falling. Results from the aTUG are compared against a hand-stopped TUG and the results from the Berg Balance Scale and the GAITRite electronic walkway system. Preliminary results showing correlations of the aTUG with the conventional TUG and gait parameters from the GAITRite system are presented.

**THE EFFECT OF GENDER AND AGE ON SENSORY FUNCTIONS OF OLDER PERSONS: PILOT STUDY**

N. Deshpande, L. Delima, B. Brouwer, E. Culham, *Queen's University, Kingston, Ontario, Canada*

Normal aging causes gradual loss in sensory functions which directly impacts postural control. Although vibrotactile sensitivity is lower in men compared to women, the presence of sex-related differences in other sensory functions in an older cohort is unclear. This study examined differences in sensory functions between sexes in young-old (Y-O, aged 65 to 75) and old-old (O-O, age  $\geq 76$ ) groups. Thirty older adults were tested (18 Y-O, 10 females; 12 O-O, 6 females) and three sensory systems: vision (contrast sensitivity), somatosensory (ankle proprioception, vibrotactile sensitivity on the foot's plantar surface, and monofilament testing on the foot's plantar surface and medial malleolus), and vestibular (subjective visual vertical test and vestibular quotient obtained from the Clinical Test of Sensory Integration on Balance). Significant group differences were found in the somatosensory system in which the

Y-O adults had lower thresholds than O-O adults for ankle proprioception and vibration sensitivity ( $p < .05$ ) but not for other sensory functions. Overall, men had higher vibration thresholds and greater vestibular quotients in the anterior-posterior plane, ( $p < .05$ ). When height was included as a covariate, these differences disappeared. Further research with a larger sample size is needed to understand sex differences in these sensory functions. Despite using method of limits for both vibration sensitivity and ankle proprioception, tests that have common sensory pathways, it is important to understand why height affects only the thresholds of vibration sensitivity. O-O adults had greater thresholds for the somatosensory tests, which may have direct implications for balance and mobility tasks.

#### **INFLUENCE OF POSTURAL CONTROL AND LEG STRENGTH ON DOWNWARD REACHING PERFORMANCE IN OLDER ADULTS**

M. Hernandez<sup>1</sup>, J. Ashton-Miller<sup>1</sup>, N.B. Alexander<sup>1,2</sup>, 1. *University of Michigan, Ann Arbor, Michigan*, 2. *VA GRECC, Ann Arbor, Michigan*

Difficulty in reaching to the floor is associated with increased fall risk among community-dwelling older adults. Few studies have explored the relationship between postural control, strength and downward reaching performance. In addition to decrements in reaching distance, we hypothesized that older adults, compared to young adults, would require a greater base of support (BOS). We also hypothesized that leg strength would predict maximal reach performance. Healthy young ( $n=13$ , mean $\pm$ SD age 23 $\pm$ 3, BMI 23 $\pm$ 4) and older women ( $n=12$ , age 76 $\pm$ 6, BMI 25 $\pm$ 5) were recruited from the local community to perform a series of functional downward reaching tasks. Downward reaching performance was evaluated through the maximal forward reaching distance along the floor, as well as their minimal BOS when stooping down to touch their toes. Isometric ankle dorsi- and plantar-flexor strength and knee extensor strength were measured using an isokinetic dynamometer. Older women required a 50% larger BOS when stooping down to touch their toes and had a 25% decrease in their maximal forward reaching distance along the floor. Forefoot BOS was correlated to ankle strength (Pearson's  $r = 0.50-0.62$ ,  $P < 0.05$ ). Furthermore, the maximal forward reaching distance along the floor was strongly correlated to knee and ankle strength ( $r = 0.65-0.71$ ,  $P < 0.001$ ). In conclusion, these data provide the basis for how balance and strength requirements for reaching to the floor place older adults at risk for falls.

#### **TESTING BECK'S PAINCQ-33 SURVEY AND A CAUSAL MODEL OF DISCONFIRMATION IN MEASURING PERCEIVED QUALITY OF PAIN MANAGEMENT CARE IN NURSING HOMES**

T.D. O'Connor, Y. Scherer, *Nursing, SUNY @ Buffalo, Buffalo, New York*

**ABSTRACT** Background: Despite pain management guidelines from national organizations (e.g. American Pain Society) pain management practices in nursing homes continues to be problematic. Unmanaged persistent pain can lead to deterioration in function, and diminished quality of life. Purpose: To test the validity and reliability of the Pain Care Quality (PainCQ-33) in measuring a residents' perceived quality of pain management care in a nursing home setting. Sample: A non-probability, convenient sample of sub-acute and long-term residents with medical and/or surgical pain from a nursing home. Method: The PainCQ-33, the BPI-SF and the VAS - Pain will be administered within two hours after the end of the night shift (2300 – 0700 hours) (Time 1). A repeat measure by all three surveys will occur in three days and within two hours after the end of the night shift (2300 – 0700 hours) (Time 2). Results and Conclusions: Data sets (e.g. gender, age, sources of pain, comorbidities) will be summarized with descriptive statistics. Exploratory Factor Analysis will test the validity of the PainCQ-33. The reliability of the PainCQ-33 in measuring perceived quality of pain man-

agement care in a nursing home will be tested. From disconfirmation theory, the effect of the exogenous variables (resident expectations and caregiver performance) on the endogenous variables (disconfirmation and resident satisfaction) will be explored through regression analysis. Causal relationships among exogenous and endogenous variables will be explored using Structural equation modeling. Implications: The PainCQ-33 can help identify deficiencies in interdisciplinary pain management care that can be corrected through quality improvement processes.

### **SESSION 350 (POSTER)**

#### **ATTITUDES ABOUT AGING**

##### **THE GEOGRAPHY OF PERSONALITY**

K.E. King, *Center for the Study of Aging and Human Development, Duke University, Durham, North Carolina*

Both negative and positive affect have well-documented likely causal links with several downstream health outcomes. A large body of research also documents residential contextual associations with health. Links between a variety of measures of personality and numerous downstream health outcomes have been well-documented. Yet the contribution of residential sorting on the basis of personality has not been explored, despite the facts that (1) similar people choose to live in similar places and are sorted into similar places by socioeconomic processes, and that (2) aspects of residential context may have causal links with affect and other features of personality. Geographic clustering in health-relevant personality may confound estimates of neighborhood effects on health. Using the Health and Retirement Study and the Chicago Community Adult Health Survey, this project first establishes the extent and nature of geographic clustering of personality across personality domains. Negative emotions appear to be particularly geographically-dependent. Analysis then documents geographic variation in personality by region, and according to both built and social environments. Future work should investigate the nature of these associations (causal vs. selective) and the implications for research on neighborhoods and health.

##### **AFTER ALL, IT IS ABOUT KNOWLEDGE: NURSES' ATTITUDES TOWARD OLDER PATIENTS IN ACUTE CARE IN ISRAEL**

M. Topaz<sup>1</sup>, I. Doron<sup>2</sup>, 1. *Nursing, UPenn, Philadelphia, Pennsylvania*, 2. *University of Haifa, Haifa, Israel*

**Aim:** Negative biases and ageist attitudes toward older people among caregivers in acute care settings, especially nurses, are one of the main expressions of ageism in the healthcare system. The presented study was designed to (1) explore the level of knowledge of aging and the attitudes of nurses toward older people in acute care and (2) to examine the effect of selected socio-demographics and nursing work characteristics on attitudes toward older people. **Methods:** A descriptive correlational design was used. Participants were nurses working in med-surgical and surgical units of the largest public hospital located in the northern part of Israel. Out of 210 questionnaires, 170 were completed and returned (response rate of 81%). The research tools used Kogan's Attitudes towards Older People Scale and Palmore's Facts on Aging Quiz. Statistical analysis included univariate correlations and multivariate regression modeling. **Findings** The level of Israeli nurses' knowledge of facts on aging was relatively poor (12.8/25) and their average score on attitudes towards older persons placed them in an intermediate place (3.3/5), compared to finding from other countries. Knowledge of aging and ethnicity were the only significant predictors of the level of ageist attitudes toward older people. **Conclusions:** Placing more emphasis on gerontological education for nurses is an important avenue to reduce ageism, while more research is needed to fully understand the relationships between ethnic background and ageist attitudes.

## WHAT MAKES PEOPLE AGE ACTIVELY AT DIFFERENT AGES?

C. Paúl, L. Teixeira, O. Ribeiro, *UnIFai/ICBAS-UP, Porto, Portugal*

The Active Ageing Plan of Action (WHO, 2002) aims adequate health and social policies for old people, leading to a positive process of ageing. This study aims to verify which factors best predict the Active Ageing construct in two groups of community dwelling seniors (younger old <75 and aged 75+). A multi-group analysis of structural invariance was performed to test the invariance across age groups. Results suggest different structures for each age group ( $p < 0.001$ ). Six distinct factors were revealed in the 75+ old group explaining 55.5% of total variance: psychological factors (12.9%); health factors (12.0%); cognition (9.6%); bio-behavioral factors (7.4%); social relationship (6.9%); personality (6.6%). The confirmatory factor analyses structure describes adequately the 6 factors. The main difference between the structures in both groups is the relative importance of health. Contrarily to the young old group, in those aged 75+ psychological aspects discriminate the most ageing outcomes.

## STUDENTS ATTITUDES AND AGE BIAS TOWARD OLDER PEOPLE

Y. Lee, *San Diego State University, San Diego, California*

**BACKGROUND:** Widespread negative attitudes in society toward aging are prevalent and serve as obstacles for recruitment and training of care providers for the elderly. Young adults and men show greater ageism than others. Further characteristics of attitudes of students toward aging have rarely been studied. **PURPOSE:** To identify students' attitudes and bias toward aging by language use, living experience with older persons, frequency of and comfort with communication with older adults. **METHODS:** A cross sectional sample of 308 students in a nursing program completed measures of Attitudes toward Older People and Aging Quiz by online survey. Positive and negative attitudes and pro- and anti-aged biases were analyzed by using ANOVA and multiple regression. **FINDINGS:** Two variables, frequency of and comfort with communication with older adults were significantly differentiated in positive attitudes and pro-aged bias, while all variables significantly explained negative attitudes and anti-aged bias. Multiple regression analysis showed young, male, Asian students and those who had irregular contact with and uneasy feelings about talking with older adults had significantly more negative attitudes toward older people. **CONCLUSIONS:** The findings indicate that Asian students who speak languages other than English at home and had lived with older adults have more negative attitudes toward older people. Among Asian students, some communication barriers due to use of different languages between young and older generations seem to exist. Frequent communication is a key to understanding older people and reducing negative attitudes and anti-age bias.

## THE IMPACT OF A ONE-MONTH GERIATRIC CLERKSHIP ON MEDICAL STUDENT PERCEPTIONS OF THE AGED

B.A. Bensadon<sup>1</sup>, T. Teasdale<sup>1,2</sup>, G. Odenheimer<sup>2,1</sup>, *1. University of Oklahoma Health Sciences Center, Oklahoma City, Oklahoma, 2. Veterans Affairs, Oklahoma City, Oklahoma*

Given the current dearth of geriatricians and increases in human longevity, a better understanding of medical student attitudes toward the aged, including both biological and psychosocial components, could not be timelier. **Methods:** Palmore's (1976) Facts on Aging Quiz was administered to fourth-year students during a required 4-week geriatric clerkship at a Midwestern college of medicine. 67 students anonymously completed the 25-item quiz on the first and last days of the clerkship. Unpaired, two-tailed t-tests were used to measure statistical differences in pre-post scores and by item domains. **Results:** Improvement in summed posttest scores was revealed ( $p < 0.001$ ), with better accuracy for medical compared to psychosocial questions. This was true when examining pre- and post-test items combined ( $p < 0.001$ ); and those at

posttest only ( $p < 0.001$ ). Though comparatively lower, scores on psychosocial items also showed improvement at posttest ( $p = 0.04$ ). **Conclusions:** Taken together, these findings suggest that without intervention, the accuracy of students' aging knowledge, particularly within the psychosocial realm, may be less than optimal during the pre-clinical years of medical school (i.e., years 1-3), and that geriatric-specific training may enhance the accuracy of these views. As the medical patient population continues to age across most specialties, these data underscore the importance of geriatric curricula, particularly those sensitizing trainees to the need for a biopsychosocial (i.e., interdisciplinary) model of care; and suggest such training should be a required component of medical education. Future research should focus on determining which curricular materials most effectively achieve this end.

## REMAPPING SUCCESSFUL AGING: THE EVOLVING THEORETICAL FRAMEWORK

M. Topaz<sup>1</sup>, M. Troutman<sup>2</sup>, M. MacKenzie<sup>1</sup>, *1. Nursing, UPenn, Philadelphia, Pennsylvania, 2. University of North Carolina, Charlotte, North Carolina*

**Introduction:** The United States life expectancy has increased by 28 years over the last century and the older adult population is rapidly growing, giving rise to intense interest in aging and old age. As we seek to chart new frontiers in aging research, we require new theoretical frameworks to guide us. **Objective:** Our objective is to first present a broad overview of the social theories of aging that have evolved and guided aging research in the last century and then to present an emerging theory: Flood's theory of successful aging. **Methods:** The history of the positivist construction and postmodern deconstruction of aging as a social phenomenon in the 20th century is presented first, illustrated by selected theories. We also demonstrate the impact of each view on nursing science. We then present Flood's Theory of Successful Aging as an emerging theoretical framework for aging, with discussion of the research implications. **Results and conclusion:** In the early to mid 20th century, positivism led to views of aging that were focused on the physical functioning of older adults, as illustrated by the Disengagement and Activity theories. The post-modernism of the late 20th century led to a different representation of aging focusing on personal self-definitions. A more holistic model, combining both the physical and the psychological, the objective and the subjective is now called for. Flood's theory of successful aging, encompassing the domains of spirituality, intrapsychic factors and functional performance mechanisms, provides a more comprehensive theoretical model for the aging scientist of today.

## SESSION 355 (POSTER)

### ATTITUDES AND ISSUES

#### SYSTEMATIC REVIEW OF FINANCIAL EXPLOITATION OF OLDER ADULTS: IMPLICATIONS FOR PRACTICE

L.K. DeSpain, J.S. Wilson, *University of Oklahoma Health Sciences Center, Oklahoma City, Oklahoma*

Financial Exploitation (FE) is a major public health problem for older adults that has been associated with poor health, dementia, behavioral problems, depression, dislocation from homes, and mortality. FE is a type of elder abuse and despite mandatory reporting laws it is under-recognized and under-reported by healthcare professionals. **Purpose:** to do a systematic review of the research about FE, including but not limited to, 1) FE definitions, incidence and prevalence 2) characteristics of FE victims and perpetrators 4) healthcare barriers to FE detection and reporting 5) FE screening tools. **Methods:** A literature search was performed of MEDLINE, CINAHL Plus, OVID, ERIC, Health Source Nursing, PsycARTICLES, Cochrane, and Health Technology Assessments within the disciplines of nursing, gerontology, psychiatry, and sociology. Findings from the search were analyzed for relevance to an interdisciplinary approach for FE prevention and intervention.

Findings: FE rates are highest among females, people over 70 with cognitive impairments, and African Americans over 60. This suggests that cognitive, gender, and racial differences warrant further attention. The most frequent perpetrators were corporations, adult children, females, substance abusers, and those prone to violence. New FE conceptual models and assessment tools have been developed, evaluated providing the groundwork for development of new interventions.

#### **ELDER ABUSE: INTERDISCIPLINARY APPROACH TO RECOGNITION AND REPORTING**

L. Vognar, M. Heflin, *Geriatrics, Duke University, DURHAM, North Carolina*

Elder abuse, first noted in medical literature in the 1970's as "granny battering", is becoming an increasingly recognized national problem. The Senate Special Committee on Aging estimates that as many as five million older Americans may be victims of abuse, neglect, and/or exploitation every year which is estimated to cost tens of billions of dollars annually in health care, social services, investigative and legal costs, as well as lost income and assets. The National Elder Abuse Incidence Study estimated for every one case of elder abuse, neglect, exploitation, or self neglect reported to authorities, about five more go unreported. Physicians and other healthcare providers often have first contact with victimized older adults and can provide early diagnosis and intervention. However, only 20% of referrals to Adult Protective Services come from physicians. Recognizing risk factors, understanding the definitions of, and knowing how to report elder abuse through the education of physicians, nurses, social workers, and home healthcare staff has become an accepted form of intervention and warrants the attention of healthcare professionals both nationally and locally. Objectives: 1) Assess knowledge on types, risk factors, and reporting of elder abuse 2) Determine the impact of an educational intervention with the overall goal of increasing knowledge, raising awareness, and preventing elder abuse Design/Methods -Develop and administer pre and post workshop survey to home healthcare workers, social workers, and geriatric fellows at the Veterans Administration Medical Center, Durham, NC -60 minute workshop featuring lecture by a panel of experts on elder abuse, forensic picture examples, and group discussion focused on risk factors, types, and reporting process of elder abuse -Post intervention survey 4 to 6 weeks after workshop completion evaluating obtained knowledge, identification of risk factors, and reporting of elder abuse Conclusions/Discussion: -Prevention of elder abuse is the responsibility of all healthcare providers and warrants an interdisciplinary approach. Education and further training of healthcare professionals regarding definitions, signs and symptoms, risk factors, and reporting of elder abuse has been given a central role in the recognition, identification and therefore prevention of elder abuse and neglect.

#### **ATTITUDES TOWARD ELDERLY BETWEEN NURSING STUDENTS AND NURSES IN KOREA**

G. Hong<sup>1</sup>, Y. Lee<sup>1</sup>, H. Kang<sup>1</sup>, S. Han<sup>2</sup>, 1. *Hanyang University, Seoul, Republic of Korea*, 2. *Asan Medical Center, Seoul, Republic of Korea*

It is generally known that attitudes toward elders tend to hold negative. It is necessary to investigate differences in attitudes toward elders according to general characteristics in order to improve the attitudes toward elders among nursing students and nurses. The purpose of this study was to examine attitudes toward general elders among nursing students and nurses. Descriptive study design was used through self-report response. Data collection was done from September, 2010 to September, 2011. One hundred seventy-three nursing students (n=76) and nurses (n=97) were recruited from Seoul, Korea. The instrument developed by Takeda and her colleagues (1991) was used to measure the attitudes toward elders. The instrument has three sub-domains such as vitality (18 items), generosity (14 items), and flexibility (5 items). Data were analyzed using t-test and ANOVA. The mean age of respondents was 26.8 (SD=5.56), and the majority of respondents was female

(97.1%), 79 (45.7%) respondents had an experience in living with elders together; 53 of them reported that they had familiarity with elders who they lived together. The vitality was statistically significant by familiarity with elders ( $t=2.51$ ,  $p<.05$ ) and the generosity was significant by working period as an RN ( $t=-3.09$ ,  $p<.001$ ), familiarity with elders ( $t=2.83$ ,  $p<.01$ ), and interest in elders ( $t=3.92$ ,  $p<.001$ ). In conclusion, further nursing intervention should be developed to improve the attitudes on elders in a positive way in both nursing students and nurses.

#### **THE EFFECTS OF ANTICIPATORY DEMENTIA ON SUBJECTIVE MEMORY COMPLAINTS AND OBJECTIVE MEMORY PERFORMANCE**

A.L. Norman<sup>1</sup>, J.L. Woodard<sup>1</sup>, J.E. Calamari<sup>2</sup>, N. Pontarelli<sup>2</sup>, J. Socha<sup>2</sup>, B. DeJong<sup>2</sup>, K.M. Armstrong<sup>2</sup>, 1. *Psychology, Wayne State University, Detroit, Michigan*, 2. *Rosalind Franklin University, North Chicago, Illinois*

Anxiety and worry, are associated with subjective and objective memory concerns and family history of Alzheimer's disease (AD). The specific fear of developing AD is common among older adults and is second only to the fear of developing cancer. Previous research has not investigated whether the fear of AD impacts subjective and objective memory performance, beyond the effects of general anxiety and worry. As part of a longitudinal study, 193 healthy older adults (aged 65-93) rated their concern with developing AD and completed the Penn State Worry Questionnaire, Trait Anxiety Inventory, Memory Functioning Questionnaire (subjective frequency of forgetting), and the Rey Auditory Verbal Learning Test (RAVLT; objective memory performance). Self-reported fear of AD was not associated with age, sex, ethnicity, education, or the RAVLT sum of Trials 1-5 or Delay ( $p>.05$ ). While not associated with objective memory performance, AD fear ( $r=.22$ ,  $p=.003$ ), Trait Anxiety ( $r=.28$ ,  $p<.001$ ), and Worry ( $r=.16$ ,  $p=.03$ ) were independently associated with frequency of forgetting. AD Fear significantly predicted frequency of forgetting when including Worry ( $p=.024$ ), but not when including Trait Anxiety ( $p=.232$ ). Greater frequency of forgetting was associated with older age, less education, greater Trait Anxiety ( $R^2=.267$ ,  $p<.001$ ), and greater Worry ( $R^2=.336$ ,  $p<.001$ ). Fear of developing AD was associated with subjective frequency of forgetting but not with objective memory functioning, suggesting AD concerns were not reflective of memory pathology. Further, AD fear predicted frequency of forgetting only when accounting for worry, suggesting that the fear of developing AD overlaps more with Trait Anxiety than with Worry.

#### **BEHAVIOR CHANGES IN OLDER ADULTS WITH ALZHEIMERS: INFORMAL CAREGIVERS ACCOUNTS AND IMPLICATIONS TO NURSING CARE**

A.M. Marins, J. Da Silva, *Universidade Federal do Rio de Janeiro, Rio de Janeiro, Rio de Janeiro, Brazil*

Multi methods study using descriptive statistics for exploratory quantitative data and Grounded Theory for qualitative data in-depth analysis. Data collection took place in 2011 after approval in two Institutional Review Boards. The key study aim was: to know what behavior changes in older adults with Alzheimers interfere the most in the caregivers daily life. Preliminary qualitative data analysis of resulted in 13 actions (behavior manifestations) of the older adult with Alzheimers. These actions may take place in public or private scenarios and each one of them can trigger repercussions or reactions in the caregiver: emotional (suffering); rational (recognition of behavioral manifestations of Alzheimers); and mixed (both emotional and rational). Furthermore, the data pointed out a gradient of possible reactions that may range from elementary intensity (bothers) or profound (interferes) in the caregivers life. Results indicate that a single action may cause significant changes in the caregivers life: (a) in the relational pattern and (b) in his daily life habits or routine. Over time, such changes may be incorporated as normal - or

not and these results become important resources in the health care management of both the older adult with Alzheimers and the caregiver.

## SESSION 360 (POSTER)

### CARDIOVASCULAR DISEASE

#### DEFECATION SYNCOPE: A HARBINGER OF DISEASE

A. Hsu, M.A. Drickamer, *Yale New Haven Hospital, New Haven, Connecticut*

**Introduction:** Defecation syncope is defined as syncope occurring during or immediately after defecation. Patients with this condition have been found to have high mortality rates secondary to underlying chronic diseases. **Case:** An 86 year old lady with atrial fibrillation, hypertension, diabetes and dementia presented with presyncope as she was having a bowel movement early in the morning. She revealed a long-standing history of constipation as well as significant anxiety regarding having daily bowel movements. Her family noted 6 months of worsening memory loss as well as the inability to take medications properly. EKG showed new lateral ST depressions and echocardiogram a newly decreased ejection fraction. Cardiac catheterization revealed a left anterior descending artery with diffuse disease. Throughout her hospital stay, she was continued on a bowel regimen and was able to have bowel movements without syncope. This case illustrates how defecation syncope can be a harbinger to serious underlying conditions. Defecation syncope is relatively rare, more common in the elderly, females, those with functional constipation and occurs more often after rising from bed. Causes vary from vasovagal reaction, orthostasis, and hypoxia to pulmonary embolus. It should not be considered a benign condition and further work up for underlying causes should be undergone in patients with an initial presentation.

#### ASSOCIATION BETWEEN ALCOHOL CONSUMPTION AND CORONARY ATHEROSCLEROTIC BURDEN

P. Chagas<sup>1</sup>, P. Caramori<sup>2</sup>, I. Filho<sup>3</sup>, C.H. Schwanke<sup>3</sup>, *1. Federal University of Santa Maria, Palmeira das Missoes, Brazil, 2. The Centre for Cardiovascular Research - Pontifical Catholic University of Rio Grande do Sul, Porto Alegre, Brazil, 3. Institute of Geriatrics and Gerontology - Pontifical Catholic University of Rio Grande do Sul, Porto Alegre, Brazil*

**OBJECTIVE:**To verify the association between alcohol consumption and coronary atherosclerotic burden.**DESIGN:**Cross-sectional Study.**METHODS:**Adult patients referred for coronary angiography were invited to participate of the study.The socio demographic data(age, education and occupation),cardiovascular risk factors(smoking, systemic arterial hypertension, dyslipidemia, diabetes, and family history of CAD) and the alcohol drinking habit were collected during the interview.The alcohol drinking consumption was divided in three categories: not drink; less than 15g ethanol/day(for women) or less than 30g ethanol/day(for man); and more than 15g ethanol/day(for women) or more than 30g ethanol/day(for man).The coronary atherosclerotic burden was assessed by a interventional cardiologists blinded to the alcohol drinking consumption, through the Friesinger Score(FS) in the coronary angiography. **RESULTS:**The study populatin was composed of 356 adult patients; 229 were male (63.1%). The average age was 60.5±11 years.Any level of alcohol consumption was reported by, 26 woman(19.4%) and 108 man(47.2%).There was lower alcohol consumption among patients with hypertension when compared to the ones without hypertension(p=0.031) and a more alcohol consumption among smoking patients when compared to the no smoking(p=0,003).There was no significant association between alcohol consumption and the remaining cardiovascular risk factors evaluated.Moderate alcohol consumption was inversely correlated to atherosclerotic burden as assessed by the FS in men(p=0.05) but not in women(P=NS).By multivariate analysis atherosclerotic burden was independently associated with sex, age, hypertension, and dys-

lipidemia,but not with alcohol consumption.**CONCLUSION:**An association between moderate alcohol consumption and lower coronary atherosclerotic burden was observed only in men by univariate analysis.This association was not significant after controlling for traditional risk factors.

#### THE IMPACT OF RESTING HEART RATE ON LONGEVITY IN THE VERY OLD

J. Stessman, J.M. Jacobs, *Geriatrics and Rehabilitation, The Jerusalem Institute of Aging Research, and Hadassah Hebrew-University Medical Center, Jerusalem, Israel*

**Purpose:** The relationship of resting pulse rate (RPR) to longevity among older people is unclear. We examined this relationship from age 70-90. **Methods:** The Jerusalem Longitudinal Study (1990-2010) prospectively follows a representative community-dwelling cohort, born 1920-21. Comprehensive assessment at age 70 (n=453), 78 (n=856) and 85 (n=1044) included resting pulse rate (RPR) (average of 3 measurements), and beta-blocker usage. Mortality data were collected from the Ministry of Interior. Cox proportional hazards ratios (HR's) were determined for RPR (continuous variable), adjusting for gender, education, diabetes, ischemic heart disease, hypertension, kidney disease, physical activity, body mass index, self-rated health, dementia, beta-blocker use, and an interaction term for RPR×beta-blocker use. **Results:** Mean RPR at age 70, 78 and 85 among females was 75±9.9, 74.5±10.9, 68.5±10.5, and males: 74.3±10.7, 73.1±11.2, 65.2±10.5. Among subjects not taking beta-blockers, followed-up from 70-78, 78-85 and 85-90, mean RPR was lower among survivors vs. non-survivors for females: 75.8±9.2 vs. 83.5±10.9 (p<0.001), 75.5±9.8 vs. 79.9±12.6 (p<0.01), and 71.5±9.9 vs. 74.6±10.7 (p<0.05), and males: 75.2±10.3 vs. 75.2±10.9 (p=0.98), 73.5±10.1 vs.77.2±12.1(p<0.005), 67.1±9.5 vs. 70.4±11.7 (p<0.05) respectively. The adjusted hazards ratios for mortality according to increasing RPR, during the period of follow up from age 70-78, 78-85, and 85-90, was 1.008 (95%CI 0.98-1.03), 1.03 (95%CI 1.01-1.05), and 1.016 (95%CI 1.001-1.03) respectively. The hazards ratios for beta-blocker usage and the RPR× beta-blocker interaction-term remained insignificant. **Conclusions:** Longevity among older people is associated with lower resting pulse rate. This effect is independent of beta-blocker usage.

#### HOURLY AMBULATORY BLOOD PRESSURE MONITORING IMPROVES BLOOD PRESSURE CONTROL IN OLDER ADULTS

M.M. Matthews<sup>1,2</sup>, R. Boland<sup>1</sup>, M.D. Neese<sup>1</sup>, V. Hirth<sup>1,2</sup>, *1. Palmetto Health, Columbia, South Carolina, 2. Univ of SC, Columbia, South Carolina*

**Purpose:** Elevated blood pressure (BP) and poor nocturnal BP dipping as measured by 24-hour ambulatory blood pressure monitoring (ABPM) are associated with increased cardiovascular risk in older adults. A pilot study was conducted to determine how availability of detailed BP information from ABPM influences clinical decision making and BP management in older adults. **Methods:** Subjects with no clinical hypertension (HTN) diagnosis, clinically controlled HTN, and uncontrolled HTN (BP>140/85) were recruited from a geriatric outpatient practice. Outcomes include: accuracy of clinical HTN diagnosis compared to ABPM; medication changes adopted after reviewing ABPM results and BP change at 6-month follow-up. Statistical analyses were performed using descriptive statistics and paired t-tests. **Results:** Fifty-two subjects (age 63-89) completed baseline and follow-up ABPM assessments. Agreement between clinical diagnosis and ABPM by group showed: uncontrolled HTN-70% (N=20), controlled HTN-81% (N=16), no HTN-81% (N=16). Medication changes adopted for each group showed: uncontrolled HTN-95%; controlled HTN-25%, no HTN-19%. Six month follow-up ABPM demonstrated significant improvement for those

with uncontrolled HTN (overall SPB decrease 9.6 mmHg,  $p < 0.01$ ; daytime SBP decrease 10.0 mmHg  $p = 0.0031$ ; nighttime SBP decrease 8.1 mmHg,  $p = 0.0056$ ). There were no significant improvements in BP at 6 months in controlled HTN or no HTN groups. Conclusion: ABPM may assist clinicians in improving blood pressure in uncontrolled older adults while it is less clear that it makes a difference for those clinically assumed to be controlled. Future study would involve comparing use of ABPM to a strict protocol of subjects utilizing home ambulatory BP readings.

### QUALITY OF LIFE IN OLDER INDIVIDUALS WITH HEART FAILURE AND SLEEP DISTURBANCES

C. Moon, B. Fahlberg, D.R. Lauver, *University of Wisconsin-Madison, Madison, Wisconsin*

**Background:** Sleep disturbances are common in older individuals with HF and may explain some of the negative impact of HF on their quality of life (QOL). Individuals with HF often report that their sleep is disrupted by nighttime awakenings. Disrupted sleep interferes with functional performance and mental health, negatively impacting QOL. Individualized quality of life (IQOL) incorporates personal perspectives of QOL by eliciting and measuring determinants of QOL that are most important to the individual. Although measures of IQOL could assist in assessment of factors that impact QOL, these measures have not been used in people who have HF and sleep disturbances. **Methods:** Using a cross-sectional design, a secondary analysis was conducted on data collected from 52 older adults with stable chronic HF. Sleep disturbances were assessed with an item from Minnesota Living with Heart Failure questionnaire. General and disease-related versions of the Schedule for the Evaluation of Individual Quality of Life scales were used to measure IQOL. Functional status was measured using the Specific Activities Scale. Data analysis was conducted in SPSS 19.0 using descriptive statistics and multivariate regression. **Results:** Comparing people with minimal and with moderate to severe sleep disturbances, there were no significant differences in demographic factors. Controlling for functional status and comorbidities, sleep disturbance negatively contributed to disease-related IQOL ( $\beta = -.345$ ,  $p = .015$ ). **Conclusions:** Sleep disturbances negatively contribute to IQOL in older individuals with stable chronic HF. These findings suggest the need for future studies to more closely examine sleep disturbances experienced by individuals with HF.

### RELATIONSHIPS BETWEEN ADIPONECTIN, POLYMORPHISM AND CORONARY HEART DISEASE IN NINGXIA HUI NATIONALITY

S. Jia, F. Chen, Z. Liu, R. Yang, *Chinese Medical Association, Yinchuan, China*

The aim of this paper is to study the relationship between Adiponectin (APN) plasma level, single nucleotide gene polymorphism (SNP45T/G and SNP276G/T) and coronary heart disease (CHD) in Ningxia Hui nationality of China. 193 Hui patients were divided into two groups according to the Coronary angiography: 95 cases of coronary heart disease (CHD) and 98 cases of control group. Enzyme Linked Immunosorbent Assay (ELISA) and Polymerase Chain Reaction-Restriction Fragment Length Polymorphism (PCR-RFLP) were used to detect the plasma APN level and gene polymorphism of its two sites. The results show that the plasma APN level of Hui CHD group was reduced ( $P < 0.05$ ), and Distribution Frequency of SNP+45 TG+GG genotype an G allele of Hui CHD group was significantly higher than control group. Distribution Frequency of SNP+276 TG+TT genotype and T allele of CHD group was higher than control group. A conclusion could be drawn that SNP+45, SNP+276 in APN was associated with CHD in Ningxia Hui nationality.

### IMPAIRED VASCULAR FUNCTION FROM UPPER AND LOWER EXTREMITIES IN ELDERLY WITH PERIPHERAL ARTERIAL DISEASE

X. Li, J. Cao, *First Department of Geriatric Cardiology, Chinese PLA General Hospital, Beijing, China*

**Background** Dysfunction of vascular endothelium is an initial event of atherosclerosis. The aim of this study is to evaluate the brachial and superficial femoral endothelium-dependent dilation, i.e. flow-mediated dilation (FMD) and endothelium-independent dilation, i.e. nitroglycerin-mediated dilation (NMD), of elderly patients with peripheral arterial disease (PAD). **Methods** In this non-randomized concurrent controlled trial, thirty-three PAD patients (age > 70 years) and 40 healthy elderly with matched age and gender were recruited. Using non-invasive approach, high resolution color doppler ultrasound diagnosis system was applied to detect FMD of upper and lower extremity arteries in all participants. NMD from arteries in upper and lower extremities were also tested with intake of 0.6 mg nitroglycerin in all the participants. **Results** Both FMD and NMD of the brachial artery and the superficial femoral artery in PAD patients were significantly lower than those of healthy controls (brachial FMD%  $3.56 \pm 1.92$  vs  $10.55 \pm 4.7$ , brachial NMD%  $8.54 \pm 4.72$  vs  $13.40 \pm 3.75$ , superficial femoral FMD%  $2.16 \pm 1.22$  vs  $7.46 \pm 2.52$ , superficial femoral NMD%  $5.27 \pm 3.69$  vs  $8.48 \pm 3.51$ , all  $P < 0.05$ ). In old PAD patients, the superficial femoral FMD and NMD were significantly lower than brachial FMD ( $P < 0.01$ ); There was close relationship between the brachial and superficial femoral FMD ( $r = 0.9314$ ,  $P < 0.01$ ), so was the NMD ( $r = 0.9191$ ,  $P < 0.01$ ). **Conclusion** The superficial femoral FMD and NMD may reflect the vasoreactivity of PAD patients more directly and sensitively than those of brachial artery. There is close relationship between brachial and superficial femoral arteries.

### HEALTH CARE UTILIZATION AND HYPERTENSION MANAGEMENT IN ELDERLY KOREAN IMMIGRANTS

M. Sin, A.M. Hirsch, *College of Nursing, Seattle University, Seattle, Washington*

Despite the efforts of national, state and private organizations to improve the health status of minority immigrants, studies documenting the effectiveness of these efforts are lacking. The purpose of this study is to examine the utilization of health care services and hypertension management in elderly Korean immigrants to the United States. In this descriptive study, 70 elderly Korean immigrants were recruited from a Korean senior center and church. Health care utilization was assessed with a self-report questionnaire and hypertension management was ascertained through the objective measurement of blood pressure and a self-report questionnaire. Descriptive statistics were used to analyze the data. Results indicated that 96% of elderly Korean immigrants had health care insurance and 86% received regular health check-ups. Although their hypertension was not managed effectively, all participants with a diagnosis of hypertension were aware of it and were taking blood pressure medications. This study provides an overview of health care utilization and hypertension management in elderly Korean immigrants and provides recommendations for further studies.

### FEARFULLY VIGILANT: THE EXPERIENCE OF BEING CAREGIVER TO YOUR AGING SPOUSE WITH ADVANCED HEART FAILURE

H.C. Bursch, *Adult and Gerontological Nursing, College of Nursing, The University of Iowa, Iowa City, Iowa*

The purpose of this first phenomenological study of advanced heart failure (AHF) caregivers (CGs) in the US was to give insight into spouses' understanding and intention for caregiving and provide ethical underpinnings for recommendations guiding care preferences at the end of life with AHF. **Method:** Seven older spouse CGs of care recipients (CRs) with NYHA II-IV heart failure each participated in 3 reflective interviews over a period of 2 months, followed by a phone call at

the conclusion of the study 2-10 months later. Data were analyzed using a method based on Interpretive Theory by Paul Ricoeur and grounded in his Philosophy of Ethics. Findings: Caregivers identified 3 themes and 11 subthemes, and metaphorically described the essence of the experience as “being fearfully vigilant, at the mercy of the disease and its treatment, while worrying about that which remains unspoken”. They emphasized careful negotiation of dignity and respect due to care recipients’ fluctuating physical and cognitive capacities, named specific burdens and described the complexities of managing coexisting diseases. Implications: Healthcare providers need to address symptom interpretation and adherence within the dynamics of the CG-CR dyad. CG health and wellbeing should be routinely assessed during CR outpatient visits. CG burdens can be discussed in the context of a support group including managing multiple dietary restrictions, prioritizing symptom management within a holistic illness presentation, CG self care and relationship counseling. More research is needed to foster adaptive coping in AHF CGs.

### **EXPERIENCING “AGAPE” AND SPIRITUAL CONNECTIONS: A LONGITUDINAL FOLLOW-UP OF MIDDLE AGED AND OLDER SURVIVORS OF CARDIAC SURGERY**

L. Noel, A.L. Ai, *College of Social Work, Florida State University, Tallahassee, Florida*

**BACKGROUND:** Severe cardiovascular disease (CVD) is one of the greatest causes of mortality in the United States. Thus, cardiac surgery often is a life-saving operation for those with advanced heart conditions. However, most studies have focused on pathology related cardiac outcomes. The life and death high stakes of such conditions and associated operations have the potential to lead its victims to question, connect, or reconnect to their spirituality (Ai, Park, & Shearer, 2008). We argue for a need to add to this literature by exploring religious coping, spiritual connectedness, and experiences of divine love in this population. **METHODS:** two wave longitudinal study (N = 200) investigating the experience of divine love (Agape) as an indicator of spiritual growth in middle aged and older adult patients after surviving cardiac surgery for 30 months. **RESULTS:** Hierarchical linear regression indicated the direct effect of preoperative positive religious coping on experiences of divine love, controlling for other key variables. Postoperatively perceived spiritual support was entered at the final step as an explanatory factor, which appeared to mediate the coping effect. None of the other faith factors predicted divine love. **CONCLUSIONS:** Further research regarding divine love and spiritual support may eventually guide clinical attempts to support patients’ spiritual growth as an independently relevant outcome of cardiac surgery.

## **SESSION 365 (POSTER)**

### **CHRONIC DISEASE MANAGEMENT**

#### **UTILIZATION OF CHRONIC PAIN MANAGEMENT AMONG RACIALLY AND ETHNICALLY DIVERSE OLDER ADULTS: THEME-BASED QUALITATIVE DATA ANALYSIS**

J. Park, K. Manotas, C. Hirz, *School of Social Work, Florida Atlantic University, Boca Raton, Florida*

This study explored ethnic (African Americans, Afro-Caribbeans, European Americans, and Hispanics) group differences in perception and management of chronic pain in community-dwelling older adults, including barriers (challenges) and facilitators for utilizing nonpharmacological pain management. Forty participants (10 from each ethnic group), age 60+, were interviewed using a semi-structured protocol relating to their experiences with chronic pain and pain management. Interviews were audio tape-recorded, transcribed, and subjected to theme-based content analysis. For pain therapy, participants used (a) only nonpharmacological management (e.g., acupuncture, yoga, exer-

cise, praying, water aerobics, chiropractic, hot showers), (b) only pain medication (e.g., vicodin, ibuprofen), or (c) both types of therapies. Seven themes related to barriers to using nonpharmacological pain therapies were identified: (a) lack of Medicare coverage for treatment, (b) high cost of treatment, (c) lack of knowledge about the treatment, (d) failure of health care providers to recommend the treatment, (e) concerns regarding possible effects of treatments (f) lack of support for the treatment from friends and family, and (g) limited resources (e.g., transportation, financial instability). Five themes related to facilitators were identified: (a) education, (b) affordable health care plan covering treatments, (c) health care provider recommendations, (d) materials and resources such as brochures from health care providers, and (e) available transportation. More study results will be presented during the GSA poster session. The study results may guide health care providers in understanding pain management in diverse older adults and developing effective pain management to decrease health care utilization costs through reduction in admissions to nursing homes.

### **CONTRIBUTORS TO DEPRESSIVE SYMPTOMS AMONG OLDER KOREAN IMMIGRANTS WITH TYPE 2 DIABETES**

S. Choi<sup>1</sup>, P. Reed<sup>2</sup>, *1. UC Irvine, Program in Nursing Science, Irvine, California, 2. UC Irvine, Department of Psychology and Social Behavior, Irvine, California*

**OBJECTIVES:** To examine 1) prevalence of depressive symptoms among older Korean immigrants with type 2 diabetes; 2) factors associated with depressive symptoms; and 3) whether these relationships with depressive symptoms vary as a function of age or gender. **RESEARCH DESIGN AND METHODS:** A total of 115 Korean immigrant older adults (age 65 and over), recruited from the community, were assessed for three groups of potential factors that could influence depressive symptoms: demographic factors (age, gender, education, English proficiency), clinical factors (duration of diabetes, co-morbidities, insulin use), and psychosocial factors (general health, diabetes quality of life, family support). Depressive symptoms were measured by the Center for Epidemiological Studies – Depression scale [CES-D]. **RESULTS:** 57% of participants had CES-D scores of 16 or higher. Controlling for other factors, multiple regression showed higher levels of depressive symptoms to be associated with greater impact of diabetes on quality of life (b=5.15, p=.02) and less family support (b= -4.27, p=.05). The relationship between depression and diabetes impact on quality of life was stronger for men than women (b= -11.36, p<.01). **CONCLUSION:** The findings suggest that older Korean immigrants with type 2 diabetes have a high prevalence of depressive symptoms, and diabetes related quality of life and family support are important factors to consider in addressing depressive symptoms among this population. Particular attention needs to be paid to men within this population as the relationship between diabetes related quality of life and depressive symptoms is stronger than among women.

### **INVESTIGATION AND HEALTH COUNTER MEASURES ON 9583 PHYSICAL EXAMINATION PEOPLE IN WUHAN**

H. Gui, *Department of Geriatrics, Union Hospital, Tongji Medical College, Huazhong University of Science and Technology, Wuhan, China*

Objective To Analyze the Physical Examination Data In Wuhan And Provide Information For Epidemic Disease Prevention And Health Intervention. Methods Datas of 9583 Physical Examination People In Our Hospital Were Collected, 15 Categories of Diseases And Symptoms Were Analyzed By Sequence Rule And Constituent ratio. Results The Relevance Ratio of the Top 10 Diseases And Symptoms Were Trachoma, Osteopenia, Hypertensive Disease, Hyperlipidemia, Prostatic Hyperplasia, Thyroid Nodule, Helicobacter Pylori Infection, Obesity, Hepatic Cyst and Osteoporosis (31.12%, 14.34%, 10.98%, 9.94%, 8.23%, 7.63%,

5.73%, 3.21%, 2.99%, 2.13%). Spearman Analysis Showed That Trachoma Was Negative Correlated With Age, While Osteopenia, Hypertensive Disease And Hyperlipidemia Were Positively Correlated With Age. The Average Category of Disease Was 2.79. The Rate of Males Was Obviously Higher Than That of Females In 13 Kinds of Diseases And Symptoms Excepted For Thyroid Nodule And Osteoporosis. Conclusions The Present Study Demonstrates That Cardiovascular Diseases And Metabolic Diseases Have A Higher Sickness Rate Level, And the Disease Situation Is Quite Serious. Therefore, Health Education Should Be Carried Out In Time To Physical Examination People In Order To Prevent And Reduce The Occurrence Of Commonly Encountered Disease And Correlated Diseases.

### **SELF-MANAGEMENT OF AGE-RELATED MACULAR DEGENERATION: A TELEMEDICINE APPROACH**

E.P. Griffiths, L.C. Field, S. Edland, H. Ferreyra, S. Brown, C. Depp, B.L. Brody, *UC San Diego, La Jolla, California*

**Background** Patients with age-related macular degeneration (AMD) have twice the rate of depression as community-dwelling older adults. In a randomized controlled trial, in person group self-management intervention has been shown to reduce psychological distress, improve self-efficacy, and improve use of visual assistive devices. To broaden the reach of this intervention, we conducted a pilot study of the feasibility of transporting this program to video-conferencing. **Methods** We conducted an open trial of a 6-week self-management program via video conferencing in a group format. A total of 8 participants participated from their homes through weekly 1.5-hour sessions led remotely by clinicians. The impact of the program was evaluated based on participants' change pre-post in depression diagnosis status (SCID) and depression severity (HAM-D). **Results** Participants were eight patients with AMD aged 82-94 (mean=89 years). Median visual acuity of participants was 20/32 in the better eye and 20/80 in the worse eye. At baseline, 62.5% met criteria for major, minor, or subsyndromal depression. Seven of 8 participants completed the program. Based on the SCID, the rate of major, minor, or subsyndromal depression at baseline was 62.5% and was 25% at post-assessment. The average score on the Hamilton Depression Scale was, at baseline, 4.5, and 3.5 post-treatment. The effect sizes were similar to the ones seen in the in-person self-management program. **Conclusion** This small pilot study indicated that teleconference may be a feasible method of broadening the reach of self-management education to people with AMD and reducing rates of depression in this vulnerable and growing population.

### **TRAINING IN ACCEPTANCE AND COMMITMENT THERAPY AND SELECTIVE, OPTIMIZATION AND COMPENSATION STRATEGIES IN NURSING HOME RESIDENTS WITH CHRONIC PAIN**

M.A. Alonso Fernández, A. López-López, A. Losada, J. Wetherell, J. González, *Psychology, Universidad Rey Juan Carlos, Alcorcón, Madrid, Spain*

In recent years there is growing interest in the study of the efficacy of Acceptance and Commitment Therapy (ACT) with people with chronic pain. In addition to ACT, Selective Optimization with Compensation (SOC) can help the elderly with chronic pain to accept and behave according to their main values and areas of interest. The aim of this study is to analyze the efficacy of an ACT combined with training in SOC strategies for elderly people with chronic pain living in nursing homes. Participants were 111 people (mean age = 82.7; SD = 9.74; 81.1% female), who were randomized to the intervention condition (ACT-SOC) or to a minimal support control group (MSC). Complete data are available of 53 participants (IC: n = 27; MSC: n = 26). Pre, post-intervention, and follow-up assessments were done. Time intervention changes has been found in activities of daily living pain interference ( $p < .06$ ), compensation strategies ( $p < .07$ ), acceptance of pain ( $p < .05$ ), and pain related anxiety ( $p < .05$ ) both at post-intervention and follow-up. No sig-

nificant changes were found for participants in the MSC. Simple effects changes was also found in qualitative dimensions of pain ( $p < .01$ ), in selection ( $p < .01$ ) and compensation strategies ( $p < .05$ ), and catastrophizing beliefs ( $p < .05$ ) both at post-intervention and follow-up. The results suggest that an ACT intervention combined with training in SOC strategies may improve the quality of life of nursing home residents with chronic pain. **Keywords:** aging, elderly, chronic pain, acceptance and commitment therapy, selective optimization with compensation.

### **SPANISH VALIDATION OF THE CHRONIC PAIN ACCEPTANCE QUESTIONNAIRE IN NURSING HOME RESIDENTS WITH CHRONIC PAIN**

M.A. Alonso Fernández<sup>1</sup>, A. Losada<sup>1</sup>, A. López-López<sup>1</sup>, J. González<sup>1</sup>, J. Wetherell<sup>2</sup>, *1. Universidad Rey Juan Carlos, Alcorcón, Madrid, Spain, 2. University of California, San Diego, California*

Chronic pain acceptance is a process that involves the willingness to experience pain and engaging in life activities. Acceptance of pain appears as an important factor in the explanation of functional capacity of older people with chronic pain. The Chronic Pain Acceptance Questionnaire (CPAQ) is the most often used measure of pain acceptance in chronic pain, and is composed of 20 items grouped in two factors (pain willingness and activities engagement). The aim of this study is to examine the psychometric properties of the Spanish validation of the CPAQ in nursing home residents with chronic pain. A total of 129 Spanish older people with chronic musculoskeletal pain (mean age = 82.7; SD = 9.26; 79.1% female) participated in the study. Confirmatory factor analysis (CFA) of both the initial two factors and one-factor solutions showed a poor fit to the data. Drawing upon the two factor structure, those items with factor loadings lower than .40 were deleted, resulting in an 11 item version of the CPAQ (RCPAQ; with 5 and 6 items for the pain willingness and activities engagement subscales, respectively). This model showed an acceptable fit to the data ( $\chi^2 = 76.92$ ;  $df = 42$ ;  $p < .001$ ; CFI = 0.91; TLI = 0.88; RMSEA = 0.08). Acceptable reliability indexes (Cronbach's alpha) were also found for the RCPAQ global scale (.76) and the factors pain willingness (.77) and activities engagement (.75). Significant associations were found between the RCPAQ and the CPAQ-20 ( $r = .94$ ), AAQ ( $r = -.33$ ), pain intensity ( $r = -.38$ ), catastrophism beliefs ( $r = -.54$ ), depression ( $r = -.48$ ) and anxiety ( $r = -.65$ ), all of them significant ( $p < .01$ ). The Spanish RCPAQ is an acceptable tool for measuring pain acceptance in older people with chronic pain living in nursing homes. **Keywords:** acceptance, chronic pain, assessment, depression, pain anxiety related.

### **POORER EXECUTIVE FUNCTION PREDICTS EARLY DROP-OUT FROM PULMONARY REHABILITATION IN OLDER ADULTS WITH CHRONIC OBSTRUCTIVE PULMONARY DISEASE**

S.S. Chang<sup>1</sup>, T.M. Gill<sup>1</sup>, V. Towle<sup>1</sup>, A.L. Ries<sup>2</sup>, *1. Medicine/Geriatrics, Yale School of Medicine, New Haven, Connecticut, 2. UCSD, San Diego, California*

**Background:** Impaired executive function increases in prevalence with advancing chronic obstructive pulmonary disease (COPD) and reduces treatment adherence, leading to ineffective COPD management. While pulmonary rehabilitation (PR) has demonstrated important clinical benefits for managing moderate-to-severe COPD, early drop-out is common. Whether poorer executive function predicts early PR drop-out remains unclear. **Methods:** Data were drawn from the National Emphysema Treatment Trial, a cohort of adults aged  $\geq 60$  with COPD who participated in comprehensive PR prior to randomization to lung-volume reduction surgery (N=1559). Early drop-out was defined by non-completion of PR. Executive function was assessed by Part B of the Trail Making Test (TMT) and the difference in completion time between Parts B and A (Delta TMT), with higher scores indicating poorer cognitive performance. Delta TMT reflects the level of cognitive flexibility after accounting for manual dexterity. TMT scores were log-trans-

formed because of their skewed distribution. Relative risks of the relationships between TMT scores and early PR drop-out were estimated using modified Poisson regression with robust error variance. Models were adjusted for socio-demographic characteristics, anxiety, and depressive symptoms. Results: The prevalence of early PR drop-out was 19.9% (N=310). Poorer performance on TMT-B by 4.1 seconds and on Delta TMT by 3.6 seconds increased the risk of early PR drop-out; adjusted RRs were 1.41 (95%CI=1.05-1.88, P=0.02) and 1.28 (1.05-1.55, P=0.01), respectively. Conclusions: In older PR participants with COPD, poorer executive function is strongly associated with drop-out from PR. Developing interventions to improve PR completion rates should include an early evaluation of executive function.

### **THE EXPERIENCE OF THE OLDER ADULT WITH PULMONARY ARTERIAL HYPERTENSION**

A. Monson<sup>1,2</sup>, S. Pennell<sup>3</sup>, 1. *New York Methodist Hospital, Brooklyn, New York*, 2. *Saint Xavier University, Chicago, Illinois*, 3. *University of Massachusetts, Amherst, Massachusetts*

Pulmonary arterial hypertension (PAH) is a chronic and devastating disease that has been under-diagnosed for many years. As research, awareness, and medical interventions in PAH have blossomed over the past 10 years, more PAH patients are being diagnosed in all age groups and living longer lives as a result. Patients diagnosed with PAH now live into their sixties, seventies, and eighties and more are being diagnosed in their later years. It is documented that PAH patients suffer from decreased quality of life and experience psychosocial problems such as depression, anxiety and increased family/interpersonal stress, however little work has been done with an older adult (age 65+) population. This poster will present findings from an exploratory grounded theory inquiry focused on the daily activity, illness experience, and quality of life of older adults with PAH.

### **ANTIPARKINSON DRUG ADHERENCE AND IMPACT ON MEDICARE PART D ENROLLEES WITH PARKINSON'S DISEASE**

Y. Wei, F. Palumbo, L. Simoni-Wastila, *University of Maryland School of Pharmacy, Baltimore, Maryland*

Antiparkinson drugs (APDs) are the mainstream treatment for Parkinson's disease (PD). Limited population-based data exist on the prevalence and factors of adherence to APDs, and the association of APD non-adherence with healthcare utilization and expenditures. A 5% random sample of Medicare beneficiaries from 2006–2007 Chronic Condition Warehouse data was used to select patients who had (1)  $\geq 1$  medical claim with an ICD-9 code 332.0 (paralysis agitans) in two consecutive years; (2) continuous enrollment in Parts A, B, and D from 6/1/2006 through 12/31/2007 or date of death; and (3)  $\geq 2$  APD prescription fills. APD adherence measures included duration of therapy (DOT) and Medication Possession Ratio (MPR) assessed over 19 months (579 days). Factors associated with APD adherence were analyzed using multinomial regressions. The association of adherence with all-cause utilization for five services (hospital, ER, skilled nursing facility, home health agency, and office-base physician care) and expenditures was estimated using negative binomial and gamma generalized linear models, respectively. One-fourth of APD users (n=7,583) had short DOT (<400 days) and low MPR (<0.80). Factors associated with low adherence included older age ( $\geq 65$ ), non-white ethnicity, cognitive impairment, having  $\geq 11$  comorbidities, and having changes in APD therapy. Longer DOT and higher MPR were associated with reduced rates of all-cause utilization and total, Part A, and Part B expenditures, but associated with increased Part D expenditures. Findings suggest improving duration of treatment and adherence to APDs may lead to significant reductions in all-cause healthcare utilization and expenditures in Medicare beneficiaries with PD.

### **EVALUATION OF A PILOT HIGH RISK CONGESTIVE HEART FAILURE DISEASE MANAGEMENT PROGRAM FOR MEDICARE BENEFICIARIES WITH MEDIGAP COVERAGE**

K. Hawkins<sup>1</sup>, R.J. Ozminkowski<sup>1,3</sup>, G.R. Bhattarai<sup>1</sup>, J.J. Li<sup>2</sup>, J. Huang<sup>1</sup>, T.S. Wells<sup>1</sup>, R.J. Migliori<sup>3</sup>, C.S. Yeh<sup>4</sup>, 1. *Analytics and Data Management, OptumInsight, Ann Arbor, Michigan*, 2. *OptumHealth, Golden Valley, Minnesota*, 3. *UnitedHealth Group Alliances, Minnetonka, Minnesota*, 4. *AARP Services, Inc., Washington, District of Columbia*

Research Objective: To evaluate quality of care received by Congestive Heart Failure (CHF) Disease Management program participants. Methods: Adults at least 65 years of age with CHF and an AARP® Medicare Supplement (i.e., Medigap) Insurance Plan provided by UnitedHealthcare Insurance Company were included in the analysis. Eligible members had a high health risk severity score and/or were referred to the program by their health care provider or another care management program. Participants were provided a scale that reported their weight, pulse, and blood pressure daily to nurses. Considering these, nurses provided telephone and mailed services to improve CHF-related care. 1,235 members actively participated in the program. 8,662 members were qualified but did not participate and were used for comparison. Logistic regression analyses estimated differences in quality of care between program participants and non-participants. Quality measures pertained to hospital readmissions and evidence based medicine (EBM) metrics that addressed the appropriate use of office visits and pharmaceuticals. Results: Compared to similar non-participants, participants were significantly (P<0.05) more likely to have an annual office visit with a doctor to manager their CHF and to have an office visit soon after hospital discharge. Participants were more likely to be compliant with recommended pharmacotherapy and less likely to be readmitted to the hospital within 30 days of hospital discharge, but these last two measures were not statistically significant. Conclusions: This may be the first CHF Disease Management program designed for Medigap insureds. All the analyses showed that program participants may have received higher quality of care.

### **PRELIMINARY RESULTS FROM AN RCT TO EVALUATE A SELF-CARE TRAINING PROGRAM FOR CHRONIC DISEASE MANAGEMENT AMONG LOW-INCOME COMMUNITY DWELLING OLDER ADULTS IN SINGAPORE**

A. Chan<sup>2,1</sup>, M. Fink<sup>1</sup>, A.J. Hu<sup>2</sup>, R. Singh<sup>2</sup>, C. Chei<sup>1</sup>, D.B. Matchar<sup>1</sup>, 1. *Health Services and Systems Research, Duke-NUS Graduate Medical School Singapore, Singapore, Singapore*, 2. *National University of Singapore, Singapore, Singapore*

Aim: This paper assesses knowledge, attitudes, and beliefs about chronic disease and health related quality of life. This topic has yet to be examined among low-income community dwelling older adults in Singapore. We hypothesize that baseline data will show a correlation between lower rates of knowledge about chronic disease and a higher prevalence of undiagnosed hypertension. Methods: The sample size for this cluster randomized control trial is 400 older persons (above 55 years) without severe illness or impairment. Using cluster randomization, six of the 12 randomly selected Senior Activity Centers were assigned as intervention sites. At baseline, all screened and consented participants completed a health exam and interviewer administered questionnaire. Results: Preliminary results show a high prevalence of hypertension (62%) and pre-hypertensive measurements (25%). Study participants showed above average levels of self efficacy (mean score 7.7) as scored using Stanford's Self-Efficacy for Managing Chronic Disease 6-item Scale. This is despite a substantial lack of knowledge regarding the symptoms of chronic diseases. Of the participants who have hypertension, 20% were unaware of their condition. Eighty-three percent of study participants did not know that one usually feels fine despite having high

blood pressure, and 63% did not know that decreasing blood pressure can reduce the risk of kidney problems. Conclusion: Baseline results suggest that the knowledge, behavior and attitudes of community dwelling lower income older adults requires substantial improvement to better their health.

### **CHRONIC DISEASE SELF-MANAGEMENT: DO PATIENT DEMOGRAPHICS AND LEADER CHARACTERISTICS AFFECT OUTCOMES?**

J. Woo, E. Hui, W. Chan, *Medicine&Therapeutics, The Chinese University of Hong Kong, Shatin, Hong Kong*

Objective To examine whether the Chronic Disease Self-Management Program (CDSMP) developed for adults with chronic diseases benefits frail older patients with low education levels, and to compare the efficacy of classes taught by older lay leaders compared with professionals. Methods 567 community-dwelling persons aged  $\geq 55$  years with at least one chronic disease were recruited from various community settings. Participants were assigned to either an intervention or a control group. The intervention group was further allocated to standardized CDSMP courses led by professional or older lay leaders. Outcome measures included self-management behaviors, self-efficacy, health status and health care utilization. Two-way ANCOVA was used to compare outcomes of participants from different subgroups of age, education and frailty levels. The Mann-Whitney U test was used to compare the outcomes of lay and professional-taught groups. Results The post-hoc subgroup analysis showed that in various domains, subjects who were older, less educated and frailer experienced better outcomes than other subgroups. Overall, the outcomes of lay-taught and professional-taught classes were not significantly different. Conclusions Frail older patients can benefit from CDSMP. Moreover, older persons can be trained to lead the program as effectively as professionals.

### **CHRONIC DISEASE REFERRALS FOR OLDER ADULTS: HOW CHRONIC PAIN COMPARES TO OTHER COMMON CONDITIONS**

C.R. Shillam, S.M. Fishman, F. Patmon, C. Li, H. Han, *University of California, Davis, Sacramento, California*

Chronic pain affects more Americans than diabetes, heart disease and cancer combined. Despite significant improvements in functional outcomes and pain management when referred to pain centers, a disparity exists in primary care providers referring to specialists for pain compared to other chronic diseases. This study explored referral patterns for older patients with different chronic diseases within a university healthcare system. A random sample of 1504 patients over 65 years old with chronic pain, cardiovascular disease, liver disease, pulmonary disease, and diabetes were identified by extracting data from the electronic health record (EHR) system. Patients with chronic pain were identified by diagnosis and  $>1$  year of opioid use. Patient referral records and emergency department (ED) visits for the previous 2 years were extracted. On average, patients were  $74.3 \pm 7.3$  (mean  $\pm$  SD) years old, (range 65 to 100 years), and 55.5% were female. Patients with chronic pain received significantly fewer referrals (mean  $\pm$  SD =  $0.49 \pm 0.99$ ;  $p < .01$ ) compared to those with cardiovascular ( $2.05 \pm 2.72$ ), liver ( $0.76 \pm 1.79$ ), and pulmonary ( $1.13 \pm 1.65$ ) disease. Significant differences were also noted in the number of ED visits. Exactly how these findings relate to adequacy of referral for patients with chronic pain to pain management centers by primary care providers remains to be clarified. Implications for future research include identifying predictors for referral to pain management centers and determining outcomes available through EHR data to evaluate the effectiveness of chronic pain treatment in the primary care setting.

### **THE PATIENT-DOCTOR RELATIONSHIP IN THE TREATMENT OF CARDIAC DISEASE AMONG OLDER LATINOS WITH SERIOUS MENTAL ILLNESS**

A.P. Gomes<sup>1,2</sup>, L.J. Cabassa<sup>2</sup>, *1. School of Social Work, Columbia University, New York, New York, 2. New York State Psychiatric Institute, New York, New York*

Older patients with serious mental illness (SMI) face substantial challenges in trying to manage comorbid medical conditions because of the nature of psychiatric illness. Minority status adds additional complexity when considering illness management. The quality of patient-provider interactions can impact medical treatment. Findings on older Hispanics with SMI and at risk for cardiovascular disease, and their understanding of the impact of the doctor-patient relationship on their care will be presented. Participants were recruited from a public mental health clinic in New York City. Five focus groups were conducted and analyzed using grounded theory. Positive interactions with providers included respectful communication. Negative interactions included feeling stigmatized due to psychiatric illness. Preferred interactions included patient-centered behaviors by providers, such as a personal warm style. What we learned from this analysis is that the quality of the relationships with their doctors has a clear impact on the healthcare experience of the patients studied.

## **SESSION 370 (POSTER)**

### **COGNITIVE FUNCTION AND THE THREE D'S**

#### **TRAJECTORIES OF COMBINED LABORATORY- AND EVERYDAY-BASED SPEED OF PROCESSING IN COMMUNITY-DWELLING OLDER ADULTS**

F. Lin<sup>1</sup>, D. Chen<sup>1</sup>, D. Vance<sup>2</sup>, M. Mapstone<sup>1</sup>, *1. University of Rochester Medical Center, Rochester, New York, 2. University of Alabama at Birmingham, Birmingham, Alabama*

Speed of processing (SOP) is among the first cognitive abilities to decline in normal aging. Purpose of this study was to: (1) characterize the trajectories of laboratory- and daily-based SOP over 5 years using latent class modeling; (2) explore the baseline individual-level profile that can predict the membership of trajectories; and (3) compare the changes of functional outcomes over time by the trajectories. A cohort study with secondary data analysis was conducted using data from the Advanced Cognitive Training for Independent and Vital Elderly randomized intervention trial. Participants included 2802 community-dwelling older adults without dementia at baseline. Participants' laboratory- and daily-based SOP and functional outcomes were assessed over 5 years, while variables in individual-level profile were collected at baseline. After controlling for covariates, the latent class model yielded 4 distinct trajectories: 4.6% of older adults had poor laboratory-based SOP and very poor daily-based SOP that both declined substantially over time; 17.9% had relatively poor laboratory- and daily-based SOP that declined moderately over time; 38.7% had relatively neutral laboratory- and daily-based SOP that maintained relatively stable over time; and 37.9% had relatively good laboratory- and daily-based SOP that declined slightly over time. Non-White, depression, subjective memory complaints, and several vascular factors predicted the membership in the trajectories. The trajectories significantly differed in the decline rate of activities of daily living, instrumental activities of daily living, and grip strength over time. Distinctly different longitudinal trajectories of laboratory- and daily-based SOP exist in old age, and are related to different trajectories of functional outcomes. Future interventions addressing SOP abilities should particularly target the vulnerable group with poor levels of SOP over time.

## PRE-DIABETES INCREASES THE RISK OF MILD COGNITIVE IMPAIRMENT (MCI): THE MAYO CLINIC STUDY OF AGING

R.O. Roberts, Y.E. Geda, D.S. Knopman, M.M. Mielke, R.H. Cha, V.S. Pankratz, W.A. Rocca, R.C. Petersen, *Mayo Clinic, Rochester, Minnesota*

**Objective:** To investigate the association of pre-diabetes with mild cognitive impairment (MCI), a putative predictor of dementia. **Background:** Type 2 diabetes (DM) has been associated with an increased risk of MCI. However, the association of pre-diabetes with MCI is uncertain. **Methods:** We evaluated a population-based cohort (n = 1,450, ages 70 years and older) using the Clinical Dementia Rating scale, a neurological evaluation, and neuropsychological testing at baseline and at 15-month follow-up visits. A panel of physicians, neuropsychologists, and nurses reviewed all the information to reach diagnoses of normal cognition, MCI, and dementia by consensus. At baseline, DM was assessed using the Rochester Epidemiology Project medical records-linkage system; fasting and random blood sugar (FBS, RBS), and hemoglobin A1c (HbA1c) levels were measured. In subjects without DM, pre-diabetes was defined as: 1) abnormal blood sugar (FBS  $\geq$  100 mg/dl or RBS  $\geq$  140 mg/dl) or HbA1c  $\geq$  5.7%, and 2) abnormal blood sugar and HbA1c  $\geq$  5.7%. **Results:** Over a median 4.0 years, 366 subjects developed MCI. Pre-diabetes (abnormal blood sugar and HbA1c  $\geq$  5.7%) was associated with MCI (hazard ratio [95%confidence interval]; 1.56 [1.05-2.31]) after adjustment for age, sex, education, apolipoprotein epsilon 4 allele, and stroke. After exclusion of subjects with a history of stroke the association persisted: 1.74 (1.02-2.97). By contrast, pre-diabetes defined as abnormal blood sugar or HbA1c  $\geq$  5.7% was not associated with incident MCI. **Conclusions/Relevance:** Pre-diabetes defined by both elevated blood sugar and HbA1c levels may be a risk factor for MCI in elderly persons.

## COGNITION RESULTS FROM THE RESVERATROL FOR IMPROVED PERFORMANCE IN ELDERLY (RIPE) TRIAL

T. Manini, M. Marsiske, W. Perlstein, C. Sozda, V. Dotson, S. Anton, *University of Florida, Gainesville, FL*

Resveratrol, a natural polyphenol found mainly in red wine and dark-skinned grape cultivars, has been shown to attenuate hippocampal cell death and protect against excitotoxic brain damage. We conducted a double-blind Phase IIa randomized, placebo controlled trial to determine the efficacy of resveratrol supplementation on cognition and brain activation in older adults (ClinicalTrials.gov identifier: NCT01126229). Cognitively intact older men and women (N=32; 73.0 $\pm$ 7.0 yrs) were randomized to three treatment groups (placebo, 300 mg/d or 1000 mg/d). Resveratrol was orally ingested resveratrol for 90 days (supplement extracted from *Polygonum Cuspidatum*). Cognition was tested using a comprehensive battery of assessments. A subset of individuals (N=11) underwent functional magnetic resonance imaging to examine hippocampal activation during memory encoding. Participants had 93% compliance rate throughout the trial. Treatment groups had similar effects in visual attention working memory, and short-term and semantic memory. Participants randomized to the 300 mg/d recalled 30% more words compared to other treatment groups (Eta<sup>2</sup>=0.05, p=0.20). Psychomotor speed was improved 10-25% in participants taking 1000 mg/d of resveratrol compared to other treatment groups (Eta<sup>2</sup>: 0.12, p=0.02). Hippocampal activation demonstrated a significant increase in participants taking 1000 mg/d compared to those taking placebo (Eta<sup>2</sup>=0.58, p=0.04), but no effect was seen in participants taking 300 mg/d. The data are supportive of a short-term course of resveratrol supplementation for memory, psychomotor speed and enhanced hippocampal activation. Future work with larger sample sizes and longer duration of supplementation are needed to confirm the findings.

## DISASTER PREPAREDNESS FOR VETERANS WITH DEMENTIA AND THEIR CAREGIVERS: EVOLUTION OF AN EDUCATIONAL INTERVENTION

N.L. Oliva, B. Wexler, G. Gullickson, M. Manco, A. Layton, S. McLean, S.R. Brunskill, *GRECC, Veterans Administration, Palo Alto, California*

**Background:** Sensory, cognitive and physiologic changes in older adults can result in barriers to awareness, communication and help-seeking and help-finding during a disaster. Individuals with dementia are at risk of isolation and injury due to cognitive impairment. This Pilot was designed to address these complex needs among community-dwelling Veterans. **Methods:** A multidisciplinary Disaster Kit Pilot planning committee from several VA Palo Alto Healthcare System (VAPAHCS) geriatrics programs was created, utilizing a Plan-Do-Check-Act (PDCA) Quality Improvement process model to identify and evaluate Pilot tasks. Tasks included design of a disaster kit model with supplies, tools and information customized for cognitively-impaired Veterans/their caregivers, and pre and post-intervention self-report surveys on disaster preparedness. One-hundred and sixty eight (168) Veterans with dementia and 132 caregivers were identified within VAPAHCS geriatric case-loads. **Results:** The pre-intervention survey was mailed to a total 278 caregivers/Veterans in mid-2011; 26% returned completed surveys (71/278). Two-thirds of respondents (68%, n=48) reported not having a disaster kit and 26% (n=17) Not at All Prepared for a disaster. The post-intervention survey (36% response, 44/123) revealed a substantial, positive shift in respondents' knowledge of key disaster preparation elements. Seventy-nine percent (79%, n=19) of respondents reported that they were prepared, with none reporting Not at All Prepared. **Conclusions:** Pre-intervention, few Veterans with dementia or caregivers reported that they were fully prepared for a disaster. Post-intervention, respondents reported much improved disaster preparation. Disaster preparedness in a vulnerable Veteran and caregiver population calls for anticipatory guidance and structured support such as that offered in this Pilot.

## POOR SELF-RATED PHYSICAL FITNESS IN MIDLIFE PREDICTS DEMENTIA IN OLD AGE

J. Kulmala<sup>1</sup>, A. Solomon<sup>2,3</sup>, T. Rantanen<sup>1</sup>, H. Soininen<sup>3,4</sup>, J. Tuomilehto<sup>5</sup>, M. Kivipelto<sup>2,3</sup>, *1. Department of Health Sciences, Gerontology Research Center, University of Jyväskylä, FI-40014 University of Jyväskylä, Finland, 2. Aging Research Center, Karolinska Institutet, Stockholm, Sweden, 3. Department of Neurology, University of Eastern Finland, Kuopio, Finland, 4. Department of Neurology, Kuopio University Hospital, Kuopio, Finland, 5. Department of Public Health, University of Helsinki, Helsinki, Finland*

Physical inactivity and chronic conditions, which are known risk factors for cognitive decline, correlate with poor self-rated fitness. This study aims to investigate, whether perceived physical fitness in midlife is associated with subsequent dementia. Participants of the Cardiovascular Risk Factors, Aging and Dementia (CAIDE) study were derived from random, population-based samples previously studied in a survey in 1972, 1977, 1982 or 1987. After an average follow-up of 21 years, 2000 survivors aged 65 to 79 were invited for a re-examination in 1998, and 1449 individuals (72 %) participated. Dementia was diagnosed in 61 participants, and 56 of the non-participants had a dementia diagnosis in their medical records. Age and gender adjusted logistic regression models were used to assess the association between midlife self-rated fitness and late-life dementia. Among participants, perceived poor physical fitness in midlife increased the risk of subsequent dementia more than four-fold when compared to persons with good perceived physical fitness (OR 4.1, 95% CI 1.8-9.7). Participants who rated their fitness as satisfactory did not have an increased risk for dementia (OR 1.9, 95% CI 0.9-4.0). The results were similar when also the non-participants were included. The preliminary results suggest that people who rate their physical fitness in midlife as poor may be at increased risk of

developing subsequent dementia. Therefore a self-report of poor physical functioning could be considered an early warning sign of cognitive decline in old age and preventive measures should be considered in this group.

#### DEMENTIA AND DELIRIUM AS PREDICTORS OF RECOVERY IN WALKING AFTER HIP FRACTURE

A.L. Gruber-Baldini<sup>1</sup>, E. Marcantonio<sup>2</sup>, E. Barr<sup>1</sup>, J.P. Brown<sup>1</sup>, D. Orwig<sup>1</sup>, M. Terrin<sup>1</sup>, J. Magaziner<sup>1</sup>, J.L. Carson<sup>3</sup>, 1. *University of Maryland School of Medicine, Baltimore, Maryland*, 2. *Beth Israel Deaconess Medical Center, Brookline, Massachusetts*, 3. *UMDNJ-Robert Wood Johnson Medical School, New Brunswick, New Jersey*

Delirium is common after hip fracture and associated with poorer functional outcomes. However, the independent associations of delirium, dementia, and persistence of delirium on recovery in walking ability have not been fully explored. The Transfusion Trigger Trial for Functional Outcomes in Cardiovascular Patients Undergoing Surgical Hip Fracture Repair (FOCUS) Cognitive Ancillary Study examined delirium and outcomes in 139 patients randomized to liberal versus restrictive blood transfusion. Delirium was assessed by direct interviews using the Confusion Assessment Method up to 4 times during hospitalization and at 45-day follow-up. Dementia was assessed using hospital medical records and IQCODE (>3.44) obtained during family informant interviews. Ability to walk independently (without human assistance) was obtained through telephone interviews with patient or a proxy at 30-day and 60-day follow-ups. Logistic regression models predicting walking ability included: delirium, dementia, delirium\*dementia interaction terms as well as treatment effect (not significant). Of 138 subjects with in-hospital delirium assessments, 61 (44.2%) had neither dementia nor delirium during hospitalization; 33 (23.9%) had delirium only; 16 (11.6%) had dementia only; and 28 (20.3%) had both. At 45-day follow-up n=15 (13.5% of 111 w/data) had delirium. Significant predictors of inability to walk were: 1) At 30-day: Dementia (OR=2.2, 95%CI:1.0-4.9) and in-hospital delirium (OR=2.5, 95%CI:1.2-5.3); 2) At 60-day: Delirium presence at 45-day follow-up (OR=5.9, 95%CI:1.3-16.0) and Dementia (OR=3.8, 96%CI:1.4-10.7), but not in-hospital delirium (OR=1.1, 95%CI:0.4-3.2). Accounting for pre-fracture dementia, delirium in hospital and at 45-Day follow-up were associated with failure to recover walking ability. Monitoring for delirium after hospital discharge may be beneficial.

#### HYDROCEPHALUS AS A CAUSE OF DELIRIUM AND COGNITIVE DECLINE IN AN ELDERLY MALE AFTER AORTIC VALVE REPLACEMENT: CASE REPORT

J. Diniz<sup>1</sup>, A. Frisoli<sup>1,2</sup>, A. Diniz<sup>1</sup>, M. Erlichman<sup>1</sup>, M. Maneschy<sup>1</sup>, D. Rangel<sup>1</sup>, S. Ingham<sup>1</sup>, A. Carvalho<sup>1</sup>, 1. *Cardiology Division, Federal University of Sao Paulo., São Paulo, Brazil*, 2. *Center of Aging and Health-Johns Hopkins University, Baltimore, Maryland*

The incidence of cognitive disorders and delirium in the elderly after exposure to extra corporeal circulation is high. Thromboembolism has been identified as a frequent cause, but in the majority of cases, the etiology has not been identified. We report the case of an elderly man who presented with delirium caused by hydrocephalus after an aortic valve replacement. Case report: PF, 85 years old, male, was admitted with episodes of syncope. He had hypertension, a coronary artery bypass grafting (CABG) 20 years ago and an aortic stenosis for 6 years. Five years ago, he was diagnosed with mild cognitive impairment and cranial computer tomography (CT) at the time showed brain volume reduction without signs of hydrocephalus. A week before admission, he developed dizziness, near syncope and sleepiness. In the ER, echocardiography showed critical aortic stenosis, with a valve orifice area of 0.6 cm<sup>2</sup>, mean gradient of 42 mmHg and the coronary angiography revealed an 85% obstruction of the bypass. The EuroSCORE was 29%. He underwent valve replacement and a new CABG. Before, during and after surgery, transcranial doppler sonography (TCD) was per-

formed, demonstrating an increase of about 50% of the flow of right and left middle cerebral artery after the procedure. In the immediate postoperative period, the patient developed delirium. Three weeks later, he was hospitalized due to infection and gait worsening. He developed progressive aphasia. CT showed enlargement of the ventricles without acute ischemia. Cerebrospinal fluid TAP test was performed showing clinical improvement. The radionuclide cisternography was positive for liquor reflux and he was submitted to a ventricular peritoneal shunt. In three days, the delirium had disappeared. In three months, his cognitive performance was better than in the preoperative period. Discussion: In the literature we identified two case reports of hydrocephalus after aortic valve replacement. One of them associated to posterior fossa ischemia, and the another case of hydrocephalus described was in a fetus after aortic valve replacement in a pregnant woman and this was attributed to changes in the blood-brain barrier caused by low flow. The importance of our case lies in two factors: 1- normal pressure hydrocephalus may be more frequent and an underestimated etiology of delirium and cognitive decline in elderly patients after aortic valve replacement; 2- the etiology of these syndromes can be associated not only to ischemic phenomena but also the neurometabolic effects consequent to the increase in cerebral blood flow, as evidenced in this case by TCD and probably present in other cases.

#### ELDERLY PEOPLE ARE ABLE TO IMPROVE THEIR COGNITIVE TEST PERFORMANCE IMMEDIATELY

N. Trushkova<sup>1</sup>, G. Zelano<sup>2</sup>, N. Ermolina<sup>3</sup>, 1. *Center of Motor Education, Aprilia, Italy*, 2. *Catholic University, Rome, Italy*, 3. *Astrakhan State University, Astrakhan, Russian Federation*

BACKGROUND: Several studies suggest that individuals have ability to rebound from mistakes and experience. The aim of our research is to examine how people of different ages change their performance during the second possibility (retest, executed immediately) of execution of motor and cognitive tests. METHODS: We have selected a total of 120 healthy people and created three groups. Group A (n = 40, mean aged 72 years) Group B (n = 40, mean age 40 years), Group C (n = 40, mean age 11 years). All participants have proposed to perform twice the following tests: TMT parts A and B, Digit Span Forward and backward Tests, Rey Auditory Verbal Learning Test, The Time-Get Up and Go Test, Dual Task Tests, Motor control test. RESULTS: Here we show percentage of the number of participants who improved the test. The tests greater improvement are : TMT-A: Group A-80%, Group B-88%, Group C-91% TMT-B: Group A-71%, Group B-68%, Group C-94%, TUG: Group A-60% Group B-80% Group C-54%; Rey Auditory Verbal Learning Test: Group A-80%,% Group B-82, Group C-80%; worst: Digit Span Forward: Group A-17%, Group B-20%, Group C-11%; Digit span Backward: Group A-40%, Group B-14%, Group C-17%; Dual Task Group A-17%, Group B-26%, Group C-31%; CONCLUSION: 80% of elderly people have the ability to improve performance of TMT test part A, 71%-TMT test part B,60%- The Time-Get Up and Go Test immediately.

#### VALIDATION OF THE MOCA-J TO EVALUATE THE TIME COURSE CHANGES OF COGNITIVE FUNCTION IN EARLY-STAGE AD

H. Suzuki, M. Yasunaga, T. Naganuma, S. Shinkai, Y. Fujiwara, *Research Teams for Social Participation and Community Health, Tokyo Metropolitan Institute of Gerontology, Itabashi-ku, Tokyo, Japan*

Objective: We carried out a longitudinal study to examine the validity of the Japanese version of the Montreal Cognitive Assessment (MoCA-J) to evaluate the time course changes of cognitive function in older people with early-stage Alzheimer's disease (AD). Methods: Participants were recruited from the outpatient Memory Clinic of Tokyo Metropolitan Geriatric Hospital. The MoCA-J, the Mini-Mental State Examination (MMSE), and the revised version of Hasegawa's Dementia Scale (HDS-R), were applied to twenty three patients with early-

stage AD (NINCDS-ADRDA criteria, CDR 0.5 or 1, Male = 8, Female = 15, mean age = 76.0 ± 17.3, mean education = ). These neuropsychological tests were executed four times every year for three years. Serial changes of the scores were computed using a one-way repeated measures analysis of covariance. Results: In the first year, there were no changes in the scores for the three neuropsychological tests. In the MoCA-J, the scores significantly decreased every year from the second year onward (p<.01). An annual decrease in score was not seen in the MMSE or the HDS-R. Conclusions: The results of the longitudinal study over three years demonstrate that the MoCA-J is a useful assessment tool for evaluating the time course changes of cognitive function in patients with early-stage AD.

### MENTAL STATUS EVALUATION IN OLDER PATIENTS IN AN EMERGENCY DEPARTMENT IN ITALY: PRELIMINARY RESULTS

N. Zaffarana<sup>1</sup>, M. Cavallini<sup>1</sup>, S. Vanni<sup>2</sup>, E. Mossello<sup>1</sup>, N. Marchionni<sup>1</sup>, S. Grifoni<sup>2</sup>, R. Pini<sup>3</sup>, M. Di Bari<sup>1</sup>, 1. *Unit of Geriatrics, University of Firenze, Careggi Hospital, Firenze, Italy*, 2. *Emergency Department – Osservazione Breve, Careggi Hospital, Firenze, Italy*, 3. *Osservazione Breve Intensiva, University of Firenze, Careggi Hospital, Firenze, Italy*

**Purpose and Methods:** Older patients presenting to an Emergency Department (ED) often show mental status (MS) alterations that remain undetected. To estimate prevalence and accuracy of delirium (DEL) and dementia (DEM) diagnosis and their correlations with clinical and socio-demographic data, we analyzed retrospectively 1000 randomly selected subjects of the 13,837 presented to the ED of an academic hospital between 1/1 to 31/12/2010. Preliminary data based on first 200 are reported. Subjects with “white” triage code or communication disorders were excluded. Reports of a formal diagnosis of DEL and/or of >1 DSM-IV diagnostic criteria for DEL were noted on medical charts (MC), that were considered “suitable”, “partially suitable” or “unsuitable” for DEL diagnosis according with the accuracy of DSM-IV criteria reporting. A diagnosis of DEM was considered when reported by a patient’s kin or when specific report and/or therapy were recorded in MC. Results: 169 subjects mean age 83±5.3 y were analyzed, 52.7% were admitted to the hospital. Prevalence of DEL and/or DEM diagnosis in MC was 5.9% and 18.9% respectively. Even when DEL diagnosis was detected, accuracy of DSM-IV criteria recording was “unsuitable” to support such a diagnosis in 60% of cases, whereas under-reporting of DSM-IV criteria was as high as 94% in subjects with no DEL diagnosis report. Conclusions: This preliminary report shows a DEL prevalence in elderly subjects admitted to an ED lower than international literature, probably because of under-utilization of validated diagnostic tools. Conversely, the prevalence of a DEM diagnosis was comparable to previous studies in ED.

### MOTOR LEARNING TRAINING IS THE EFFECTIVE TOOL AGAINST COGNITIVE DECLINE

N. Trushkova<sup>1</sup>, G. Zelano<sup>2</sup>, N. Ermolina<sup>3</sup>, 1. *Center of Motor Education, Aprilia, Italy*, 2. *Catholic University, Rome, Italy*, 3. *Astrakhan State University, Astrakhan, Russian Federation*

**BACKGROUND:** People with mild cognitive decline having difficulties to perform the second concurrent cognitive activity during walking (dual task), which affects their independence. In our work we achieved effective action of cognitive-motor training that helps to increase the dual task capacity is equally effective against cognitive decline in elderly. **METHODS:** We established special gymnastics, based on complex motor learning training. We preferred exercises with a cognitive effort in the first phase of motor learning during the initial stages of practice. 62 subjects were recruited (28men and 34women) aged 65-85 years who showed initial problems with concentration and memory and found that in addition to this difficulty in performing the dual task. It was proposed to them to perform an hour of activity twice a week for

4 months. **RESULTS:** All participants showed improvement in all tests. The mean values obtained before and after surgery in the following tests: MMSE: 23.8 - 25.9; TMT-A: 78.9 - 60.8; GDS(30): 11.7 - 9.9; Digit Span Forward: 4.2 - 5.1; Rey Auditory Verbal Learning Test(first attempt): 3.8 - 5.6; Rey Auditory Verbal Learning Test(15’): 8.1- 9.9; Token test: 9.1 - 10.5; Tinetti tests: 26.0- 27.5; Time “Get -Up and Go”10.96- 9.56; Dual task 1:19.39-15.63; Dual task2:21.3-18.4 **CONCLUSION:** The practical method of complex motor learning training developed by us proved to be an important tool that helps increase the walking speed during dual task and improve cognitive function in people with mild cognitive decline.

### NEUROPSYCHOLOGICAL CORRELATES OF MOTOR PERFORMANCE IN OLDER ADULTS WITH COGNITIVE IMPAIRMENT

A. Mello, E. Mossello, D. Simoni, G. Rubbieri, C. Baroncini, M. Cavallini, N. Marchionni, M. Di Bari, *Unit of Gerontology and Geriatric Medicine, University of Florence, Florence, Italy*

**OBJECTIVE:** To evaluate neuropsychological and neuro-radiological features related to lower extremity performance in older adults with mild-to-moderate cognitive impairment, referred to an Italian geriatric outpatient memory clinic. **METHODS:** Each subject underwent a comprehensive geriatric assessment, including a physical performance test (Short Physical Performance Battery, SPPB) and a neuroimaging exam. Neuropsychological evaluation included Mini Mental State Examination (MMSE), immediate and delayed recall of Auditory Verbal Learning Test and of Story Recall Test, Digit Span Forward (DSF) and Backward, Trail Making Test A (TMTA) and B, Controlled Oral Word Association Task (COWAT), Semantic Verbal Fluency Test, Digit Cancellation Test (DCT), Colored Progressive Matrices, Freehand Copying of Drawings. **RESULTS:** 62 patients were enrolled (mean age 78, MMSE 25.7), 39% of them with mild dementia (92% Alzheimer’s Disease with or without white matter lesions - WML), 53% with Mild Cognitive Impairment and 8% with subjective memory impairment. 25% of sample had moderate-to-severe WML. Lower SPPB score was significantly associated with worse COWAT, TMTA, DSF and DCT score, as well as with female gender, WML and comorbidity. In several linear regression models, each including a single cognitive test, independent predictors of worse physical performance were female gender, WML, COWAT (p=0.02) and DCT (p=0.011). Lower physical performance and lower MMSE score were independently associated to disability in basic (p=0.012) and instrumental (p=0.011) activities of daily living, respectively. **CONCLUSIONS:** In this sample of cognitively impaired older adults, an independent association between frontal cognitive dysfunction and lower physical performance was observed, partly explained by coexistent WML.

### DIFFERENCE IN RATINGS ON THE PROFESSIONAL CAREGIVER BURDEN INDEX (PCBI) BY CHARACTERISTICS OF NURSING HOME RESIDENTS WITH DEMENTIA AND THEIR NURSING CAREGIVERS

J. Song, *College of Nursing, Korea University, Seoul, Republic of Korea*

Differently from the past, when extended family used to participate in caring for older generations, many Korean families today would like to seek professional care provided by skilled nursing facilities especially when the older adults suffer from dementia. Despite many studies have reported difficulties of professional caregivers who provide care for residents with dementia (RWD), little data is available among Korean nursing home (NH) caregivers. In this study, caregivers (N=145, mean age=50.69±5.70; men 3%) from six NHs (≥ 80 beds) were asked to complete the PCBI. RWDs cared for by the caregivers were evaluated by the Mini-Mental Status Exam (MMSE), Activities of Daily Living (ADL), and Cohen-Mansfield Agitation Inventory (CMAI); and their

demographic information was obtained by chart review. Pearson's correlation coefficients, t-tests, and ANOVAs were used for data analysis. Among the characteristics of RWDs, only CMAI score were correlated with the PCBI score ( $r=.275, p<.05$ ); and higher PCBI scores ( $p<.05$ ) were obtained in six of the 29 CMAI items including hitting, kicking, grabbing, inappropriate sexual behavior, and screaming. Caregivers who perceived themselves as "novice" or "experienced" in dementia care had higher PCBI scores than those indicated as "expert" ( $F=3.63, p=.029$ ). Findings of this study have important implications for study, care, and policy making related to those affected. Replication with a larger random sample is necessary to confirm this outcome. This work was supported by the Korea Research Foundation Grant funded by the Korean Government (KRF-2008-331-E00411) and by a Korea University Grant. Correspondence to Jun-Ah Song, RN, PhD (E-mail: [jasong@korea.ac.kr](mailto:jasong@korea.ac.kr)).

### **A PILOT STUDY TO EXAM THE PSYCHOMETRIC PROPERTIES OF A NEWLY DEVELOPED EVERYDAY MEMORY QUESTIONNAIRE**

Y. Chiu<sup>1,2</sup>, C.N. Huang<sup>1</sup>, H. Huang<sup>1,2</sup>, W. Hsu<sup>1,2</sup>, 1. *Chang-Gung University, Taoyuan, Taiwan*, 2. *Healthy Aging Research Center, Taoyuan, Taiwan*

Recent estimates suggest 15-24% of patients with dementia (PWDs) have impaired awareness. However, most of them focused on memory problems. Few have taken a multi-domain perspective to explore which domains of awareness may impact PWDs in different ways. Therefore, the purpose of this study was to test the psychometric properties of an innovative questionnaire, Everyday Memory Questionnaire (EMQ). It is a self-reported instrument, covering cognitive, behavioral and affective domains of awareness used by PWDs with early to mild stages. This study was a cross-sectional study design to recruit 153 elderly people living in community and PWDs from a memory clinic at a teaching hospital in northern Taiwan. The mean age was  $66.92\pm 19.05$  years old with the mean educational level of  $7.17\pm 5.87$  years. Among them, 31.1% was cognitively intact, 35.1% MCI, 24.5% AD. The Chronbach's alpha values for the cognitive, behavioral and affective domains of the EMQ were 0.93, 0.87, 0.88, respectively. The ICC values of inter-rater reliability for the three domains were 0.99, -0.62, 0.83, respectively (all  $p < 0.01$  except for the behavioral domain). The principal component factor analysis with varimax rotation resulted in an eight-factor solution for the cognitive domain of the EMQ, explaining 67.38% of variance, a six-factor solution for the behavioral domain, explaining 64.17% of variance, and a five-factor solution for the affective domain, explaining 67.00% of variance. The results showed the EMQ had good psychometric properties. Future studies should delineate the inter-correlations among these three domains and their relationships with other cognitive functions in PWDs.

### **EXECUTIVE DIFFICULTY AND APATHY IN BEHAVIORAL VARIANT FRONTOTEMPORAL DEGENERATION**

L.M. Massimo, L.K. Evans, B. Morgan, J. Powers, M. Grossman, *University of Pennsylvania, Philadelphia, Pennsylvania*

**Objective:** To investigate executive difficulty in apathetic subjects with behavioral variant Frontotemporal Degeneration (bvFTD) **Background:** The syndrome of apathy, defined as a reduction in self-generated or voluntary behavior is caused in part by disruption of the frontostriatal system. Impaired executive function, a common finding in bvFTD, has been associated with apathy. Previous approaches to measuring apathy have depended upon caregiver ratings, but are confounded by stress. Here we describe an objective, quantitative assessment of apathy. **Design:** We assessed apathetic bvFTD subjects (MMSE=26.92;  $n=17$ ) and demographically-matched controls (NC; MMSE=29;  $n=12$ ). To quantify apathy we assessed reaction time on two levels of task difficulty on a computerized experiment. We measured the total reaction time to lift the finger from the start key in response to a visual stimu-

lus and to press a target key to complete a trial (total latency). "Executive scores" were created to measure the difference in total latencies on the two levels of task difficulty. Executive scores were related to grey matter atrophy using voxel-based morphometry. **Results:** bvFTD subjects were slower on the simple task (bvFTD=991.67ms; NC=708.90ms;  $p=.017$ ) and the complex task (bvFTD=1874.29ms; NC=1021.63ms;  $p=.000$ ). They had larger difference scores than NC (bvFTD=859.77; NC=312.71;  $p=.000$ ). Executive scores in bvFTD were related to atrophy in several frontal regions including the right dorsolateral area. **Conclusion:** Patients with bvFTD have executive difficulty that contributes to apathy. These impairments cause an inability to carry out plans of action. This is related to atrophy in frontal regions important for goal-directed behavior.

### **THE FEELING TONE QUESTIONNAIRE (FTQ) AND ITS PSYCHOMETRIC PROPERTIES: ASSESSING DEPRESSIVE SYMPTOMS IN DEMENTED, COMMUNICATION-IMPAIRED OLDER PERSONS IN LONG TERM CARE FACILITIES**

J.A. Toner<sup>1,2</sup>, J.A. Teresi<sup>1,2</sup>, B. Gurland<sup>1</sup>, F. Tirumalasetti<sup>1</sup>, 1. *Columbia University Stroud Center, New York, New York*, 2. *New York State Psychiatric Institute, New York, New York*

This research aimed at developing a means of uncovering the subjective inner life of persons who are seriously limited in their ability to communicate feelings of distress associated with depression and other affective disorders. These analyses further developed a reliable and valid measure of affective disorder in communication-impaired elderly demented patients. The FTQ builds upon the existing knowledge in the field of assessment of depression in dementia by combining a direct assessment focus and clinical observation method and adding behaviorally anchored ratings of affect, or feeling-tone. It consists of 16 questions and 16 corresponding observation ratings of affect and was specifically designed for use with the communication-impaired demented patient. The FTQ uses standardized questions with simple wording. The total sample size was 764 respondents from four samples of respondents in New York City and upstate New York nursing homes and a psychiatric hospital. The mean age of the combined sample was 84. Internal consistency reliability and interrater reliability were good across all four samples, as was test-retest reliability. Concurrent convergent construct validity and discriminant validity coefficients were generally high. Criterion-related validity was provided in two samples utilizing DSM ratings by geriatric psychiatrists. These findings provide support for the view that the FTQ works well as a method of facilitating the recognition of depressive signs in the more severely communication-impaired group of demented older persons. Preliminary findings regarding the application of the FTQ in an evaluation study of staff training being conducted by the Consortium of New York Education Centers (CNYGEC), will be discussed.

### **TREATMENT DECISION-MAKING PREFERENCES OF ELDERLY DEPRESSED PRIMARY CARE PATIENTS**

P. Raue<sup>1</sup>, M.L. Bruce<sup>1</sup>, H.C. Schulberg<sup>1</sup>, D. D'Angelo<sup>1</sup>, M. Das<sup>2</sup>, B. Ladds<sup>2</sup>, M. Rodriguez<sup>2</sup>, J. Bell<sup>2</sup>, 1. *Psychiatry, Weill Cornell Medical College, White Plains, New York*, 2. *Lincoln Hospital, Bronx, New York*

**Purpose:** We examined factors associated with preferences for involvement in treatment decision-making among elderly depressed, inner-city primary care patients not currently receiving treatment. **Methods:** 53 primary care subjects aged 65+ who scored positive on the PHQ-9 ( $>10$ ) via standard physician screening were interviewed. Subjects were assessed for their preference for involvement in decision-making regarding depression, on a spectrum ranging from making decisions solely by themselves to shared decision-making to physician taking full responsibility. Subjects were also assessed for their preference for a variety of treatment approaches, depression severity, and other medical and psychosocial factors. **Results:** Subjects were predominantly Hispanic (47; 88%). Subjects were categorized as pre-

ferring sole (6; 11%), shared (30; 57%), or physician (17; 32%) responsibility for depression treatment decisions. Lower depression severity ( $r=-.33$ ,  $p=.02$ ) and higher MMSE ( $r=.30$ ,  $p=.04$ ) were associated with greater patient preference for taking sole responsibility for treatment decision-making. Most subjects (37; 70%) ranked some form of active treatment (psychotherapy or medication) as their first choice, while 16 (30%) ranked complementary approaches (exercise, religious activities, herbal remedies) as their first choice. Younger age ( $t=-3.8$ ,  $p=.001$ ) and prior treatment ( $\chi^2=4.9$ ,  $p=.03$ ) were associated with preference for active treatment. Conclusions: Among untreated elderly depressed patients from an inner city hospital, a number of sociodemographic and clinical variables were associated with preference for level of involvement in depression treatment decision-making, and for type of treatment preferred. Findings suggest that one way primary care physicians may provide patient-centered care is by understanding patients' preferred level of involvement in decision-making.

### **BRAIN-DERIVED NEUROTROPHIC FACTOR AND DEPRESSIVE SYMPTOMS IN THE HEALTH ABC STUDY**

W. Santos-Modesitt<sup>1,2</sup>, K. Yaffe<sup>1,2</sup>, A.L. Byers<sup>1,2</sup>, E.M. Simonsick<sup>3</sup>, S. Satterfield<sup>4</sup>, J.A. Cauley<sup>5</sup>, T.B. Harris<sup>3</sup>, D.E. Barnes<sup>1,2</sup>, 1. *University of California, San Francisco, San Francisco, California*, 2. *San Francisco Veteran's Affairs Medical Center, San Francisco, California*, 3. *National Institute on Aging-National Institutes of Health, Bethesda, Maryland*, 4. *University of Tennessee Health Science Center, Memphis, Tennessee*, 5. *University of Pittsburgh, Pittsburgh, Pennsylvania*

Background: Serum brain-derived neurotrophic factor (BDNF) levels have been found to be lower in clinically based studies of patients with major depressive disorder (MDD) and to increase with antidepressant treatment. However, little is known about the association between BDNF and depressive symptoms in community-dwelling, healthy older adults, and few prior studies have included older adults or non-white subjects. We examined the cross-sectional associations between serum BDNF, depressive symptoms and antidepressant usage in HABC, a community-based cohort study of white and black older adults. Methods: Cross-sectional analyses of 923 subjects (mean age=75±3; 52% women; 42% Black), in year two of study, were performed. Depressive symptoms were assessed with the 15-item Geriatric Depression Scale (GDS-15) with scores ≥6 suggesting depression. BDNF was assayed using ELISA. ANOVA was used to compare mean GDS scores across BDNF-quartiles (quartiles 1-4=low-high) and mean BDNF levels as a function of depressive symptoms and antidepressant use. Results: Mean (standard deviation [SD]) GDS-15 scores did not differ across BDNF-quartiles: 1.4 (1.8), 1.4 (1.9), 1.3 (1.7), and 1.3 (1.5) respectively, ( $F=0.40$ ,  $df=3$ ,  $p=0.7253$ ). Likewise, mean BDNF levels did not differ by depressive symptoms or antidepressant usage (mean [SD] ng/mL): low symptoms/no antidepressant, 24.0 (8.7); low symptoms+antidepressant, 21.5 (8.2); high symptoms/no antidepressant, 22.6 (8.3); high symptoms+antidepressant, 26.7 (11.3) ( $F=1.92$ ;  $df=3$ ;  $p=0.12$ ). Conclusions: We found no concurrent associations between depressive symptoms, antidepressant medications and serum BDNF in this older adult cohort. BDNF may not be associated with lower-level depressive symptoms, or longitudinal studies may be needed to observe associations in healthy elders.

### **IMPACT OF STRESS IN ADULT CHILDREN CARING FOR PARENTS WITH DEMENTIA**

L.M. Solberg<sup>1</sup>, L.B. Solberg<sup>2</sup>, E.N. Peterson<sup>1</sup>, 1. *Internal Medicine and Public Health, Vanderbilt University School of Medicine, Nashville, Tennessee*, 2. *Meharry Medical College, Nashville, Tennessee*

Background: Adults caring for parents and their own children are the "sandwich generation". Their stress is noted in the behavioral sciences, but largely absent in medical literature. Clinically adult children accompanying parents with dementia verbalized distress. This IRB-

approved survey determined, among a convenience sample, the impact of emotional and social changes and financial burden in the caregiver role. Methods: Study setting was a geriatric private practice. Respondents completed a 51-item survey (Cronbach's alpha .80) on impact of caregiving on emotion, stress, finances, and coping mechanisms. Descriptive statistics were conducted using SPSS. Results: Of those surveyed 85/95(89%) were returned and 45/85(53%) were included. On average caregivers were 54 years old, 36/45(80%) women, 28/45(62%) were married, 38/45(84%) had children, 18/45(40%) were "sandwich generation." There was no significant difference in mean caregiver burden between sandwich and non-sandwich generations. Caregivers reported little impact on professional lives. Over a third reported stress providing daily care, felt more irritable, and more feelings of anxiety. 24/45(53%) reported taking their parent to doctors' appointments emotionally difficult. Participating in activities of interest/hobbies decreased, but not time spent with friends. Helpful services were seminars on care of demented parents (58%) and on coping mechanisms (53%), and meetings with social workers for resource availability (63%). Conclusions: Adult children caring for demented parents were negatively emotionally impacted with stress, anxiety, and sadness. Attention should be directed to the caregivers' emotional well-being during routine care of the elderly. Further program development supporting adult children caregivers with coping mechanisms identified may be beneficial.

### **RELATIONSHIP AMONG FAMILIARITY, DEPRESSION, COGNITION, AND ACTIVITY OF DAILY LIVING IN ELDERLY RESIDING IN LONG TERM CARE FACILITIES**

Y. Lee, G. Hong, *Hanyang University, Seoul, Republic of Korea*

The concept of familiarity is pretty well applied in environments in long-term care facilities; however, little information exists about the relationship between familiarity and other health outcomes. Therefore, the purpose of the study was to understand the relationships among familiarity, depression, cognition, and activities of daily living (ADLs). Descriptive study design was used through face-to-face interviews. Data collection was done from October to December, 2011. Subjects were taken from 6 long-term care facilities of more than 80 beds in Korea, and a convenient sample of 162 elderly who were over 65 years of age, had lived in the facility for more than a month, had agreed to participate, and scored more than 13 out of 30 on the Korean version of Mini-Mental Status Examination for screening dementia (MMSE-DS). Instruments were included familiarity scale, Korean version of the Modified Barthel Index, the Cornell Scale for Depression and Dementia (CSDD), and MMSE-DS. Mean age was 79.7(SD=7.27), and the majority of the subjects was female (77.2%). Familiarity was significant by the duration of education ( $F=3.237$ ,  $p=.042$ ). Mean score of MMSE-DS was 18.03, and showed a significance in education ( $F=8.713$ ,  $p=.000$ ), current diagnosis ( $F=3.782$ ,  $p=.025$ ), and existence of life-long occupation ( $F=-2.190$ ,  $p=.030$ ). There was a significant negative correlation between familiarity and depression ( $r=-.192$ ,  $p=.016$ ), while depression and ADLs showed a significant positive correlation ( $r=.281$ ,  $p=.000$ ). It is important to understand the individualized familiarity of elderly living in long-term care facilities, and it is necessary to develop intervention programs that allow for patient centered nursing.

### **CROSS-LAGGED ANALYSES OF COGNITIVE FUNCTION AND DEPRESSIVE SYMPTOMS IN THE KOREA LONGITUDINAL STUDY OF AGING**

J. Yoon, R.L. Brown, *School of Nursing, Univ of Wisconsin-Madison, Madison, Wisconsin*

Studies have shown an association between depressive symptoms and cognitive decline in older adults; however, the nature of this relationship remains ambiguous. This study provides evidence

for prospective associations between cognitive function and depression using a cross-lagged panel model, a specific application of structural equation modeling to draw inferences about or causal relationship between multiple constructs over time based on a longitudinal research design. The data from a longitudinal panel study, the Korean Longitudinal Study of Aging, surveyed a nationally representative sample in the community every two years. Completed surveys for 2006 (T1) and 2008 (T2) were analyzed for 3,469 adults. An auto-regressive, cross-lagged path analysis was performed to examine the reciprocal relationship between depressive symptoms and cognitive function over time, controlling for age, gender, satisfaction with income, marital status, number of children, comorbidity, and IADL. Results indicate that the two-year cross lagged effect of depressive symptoms (T1) on cognitive function (T2) was significant ( $\gamma = -0.032$ ); however, the two-year cross lagged effect of cognitive function (T1) on depressive symptoms (T2) did not achieve significance. Results of this study show that depressive symptoms predicted subsequent changes in cognitive function but not vice versa. To help understand these relationships, additional models were run to examine whether the association between depressive symptoms and cognitive function might be attributed to the social activity level or having close relationships with friends or relatives; however, the lagged effects of the two social network variables were not significant for depressive symptoms nor cognitive function.

#### **IMPROVED MMSE AND 3MS SCORES POST REAL COGNITIVE TRAINING INTERVENTION**

R.E. Herman, E.K. Smith, K. Mees, K.N. Williams, *School of Nursing, Univ of Kansas, Kansas City, Kansas*

The Reasoning Exercises in Assisted Living (REAL) study tested an intervention designed to improve reasoning and problem solving skills for AL residents. As part of this study The Mini-Mental Status Exam (MMSE) and the Modified Mini-Mental State Examination (3MS), were administered to assess the cognitive status of participants. The MMSE has been widely used as a brief cognitive screening tool since its introduction (MMSE; Folstein, Folstein, & McHugh, 1975). Teng & Chui (1987) developed the 3MS, to address shortcoming of the MMSE. In the 3MS four subtests were added and a modified scoring system allowed for partial credit on some items increasing the maximum score from 30 to 100 points. Since both the MMSE and the 3MS can be administered at the same time, we used both screening tools to measure cognitive status. Test-retest scores generally remain stable over short intervals (<3 months) for non-impaired older adults (Tombaugh, 2005). Three groups of resident volunteers were tested, the intervention group, an attention control (placebo) group, and a no treatment (control) group. The intervention and placebo groups completed six training sessions over a three week period. Pre-intervention and immediate post-intervention MMSE and 3MS assessment scores were compared. Residents' MMSE and 3MS scores in the REAL group increased significantly from pre- to post-intervention ( $t_{mmse} = -4.88$ ,  $p_{mmse} = .000$ ,  $t_{3ms} = -3.73$ ,  $p_{3ms} = .001$ ). Scores in the placebo and control group remained statistically unchanged from pre- to post-intervention. REAL training improved cognitive performance as assessed by the MMSE and the 3MS.

#### **INAPPROPRIATE DRUG USE IN ELDERLY PATIENT WITH ADVANCED COGNITIVE IMPAIRMENT: RESULTS FROM THE SHELTER STUDY**

F. Landi, R. Liperoti, G. Colloca, R. Bernabei, G. Onder, *Geriatric (CEMI), Catholic University of Rome, Rome, Italy, Italy*

**Aim:** The aim of this study was to explore appropriateness of drug use in elderly patients with advanced cognitive impairment living in Nursing Home (NH) in Europe. **Methods:** Analyses are based on a sample of 1449 NH residents with advanced cognitive impairment, admit-

ted to 57 NH in 7 European Countries and 1 non EU country, participating to the Services and Health for Elderly in Long TERM care (SHELTER) study, a project funded by the Seventh Framework Programme of the EU. Drug appropriateness was defined based on Holmes criteria (J Am Geriatr Soc. 2008). Results: inappropriate drug use was observed in 643 residents (44.9%) and it was directly associated with specific disease including diabetes (OR 1.64; 95% CI 1.21-2.24), heart failure (OR 1.48; 95% CI 1.04-2.09), stroke (OR 1.43; 95% CI 1.06-1.93), and recent hospitalization (OR 1.69; 95% CI 1.20-2.39). An inverse relation with inappropriate drug use was shown for a presence of geriatrician in the staff (OR 0.55; 95% CI 0.39-0.7) and assistance required in ADL (OR 0.82; 95% CI 0.71-0.94). **Conclusions:** Inappropriate drugs use is common among NH residents. Its determinants include comorbidities, recent hospitalization and functional status. Geriatric care is associated with reduced rate of inappropriate drug use.

#### **AD PATHOLOGY AND CEREBRAL INFARCTIONS ARE ASSOCIATED WITH MEMORY AND EXECUTIVE FUNCTIONING ONE AND FIVE-YEARS BEFORE DEATH**

F.M. Yang<sup>1</sup>, A. Grigorenko<sup>2</sup>, D. Tommet<sup>2</sup>, S. Farias<sup>3</sup>, D.M. Mungas<sup>3</sup>, D. Bennett<sup>4</sup>, R. Jones<sup>1</sup>, P.K. Crane<sup>5</sup>, *1. Institute for Aging Research, Hebrew SeniorLife, Beth Israel Deaconess Medical Center, Harvard Medical School, Boston, Massachusetts, 2. Institute for Aging Research, Hebrew SeniorLife, Boston, Massachusetts, 3. University of California, Davis, Department of Neurology, UC Davis Alzheimer's Center, Davis, California, 4. Rush University, Rush Alzheimer's Disease Center, Chicago, Illinois, 5. University of Washington, Department of Medicine, Seattle, Washington*

**Objective:** To understand the differential effects of cerebral infarctions and AD pathology on memory and executive functioning performance. **Methods:** Participants from the Religious Orders Study (n=440) followed from enrollment to death with annual neuropsychological evaluations. Standard procedures for brain removal and neuropathology evaluation were conducted at autopsy. We used structural equation modeling to determine the independent effects of AD pathology and cerebral infarctions at autopsy on overall cognition and on specific cognitive tests. **Results:** AD pathology and cerebral infarctions at autopsy were independently associated with poorer overall cognition one year and five years prior to death (all p values <0.05 except as indicated). AD pathology at autopsy was associated with additional deficits in episodic memory (word list recognition, word list delayed recall, Story A delayed recall, East Boston delayed recall { $p=0.09$ }) but relative preservation of working memory (digit ordering) at five years prior to death. There were no additional effects of cerebral infarctions at autopsy on specific cognitive tests five years prior to death. AD pathology at autopsy was associated with additional deficits in episodic memory (word list recognition, East Boston immediate recall { $p=0.09$ }) and semantic memory (Boston naming) at one year prior to death. Cerebral infarctions at autopsy were associated with additional deficits in perceptual speed (number comparisons and symbol digit) at one year prior to death. **Conclusion:** Understanding the differential effects of AD pathology and cerebral infarctions will help improve clinical detection of AD and potentially vascular dementia using easily-administrable, inexpensive, and well-established neuropsychological tests.

#### **SUBJECTIVE AND OBJECTIVE COGNITIVE DYSFUNCTION IN OLDER ADULTS WITH RHEUMATOID ARTHRITIS**

S. Shin<sup>1</sup>, P. Katz<sup>2</sup>, M.I. Wallhagen<sup>1</sup>, L. Julian<sup>2</sup>, *1. Department of Physiological Nursing, University of California, San Francisco, San Francisco, California, 2. Department of Medicine, University of California, San Francisco, San Francisco, California*

**Purpose:** Research shows a gap between perceived cognitive dysfunction and objective neuropsychological performance in persons with chronic diseases. This study explored this relationship in older adults

with RA. Methods: Individuals (age $\geq$ 55) from a longitudinal cohort study of RA participated in a study visit that included physical, psychosocial, and biological metrics. Subjective cognitive dysfunction was assessed using the Perceived Deficits Questionnaire (PDQ). Objective cognitive impairment was assessed using a battery of 12 standardized neuropsychological measures yielding 16 indices. On each test, subjects were classified as 'impaired' if they performed 1 SD below age-based population norms. A total cognitive impairment score was calculated by summing the transformed scores. Multiple regression analyses controlling for gender, race, marital status, income, education, disease duration, disease severity, depression, and fatigue were conducted to identify the relationship between objective and subjective cognitive measures. Results: 84 subjects with mean ( $\pm$ SD) age of 64 ( $\pm$ 6.9) years were included. Mean total cognitive impairment score was 2.5 ( $\pm$ 2.1). Mean PDQ score was 5.6 ( $\pm$ 3.8). In the multivariate analysis, there was no significant relationship between PDQ score and total cognitive impairment score. However, depression and fatigue ( $\beta$ =0.27,  $p$ =0.024;  $\beta$ =0.25,  $p$ =0.026) were significantly associated with the PDQ score. Conclusion: There was no significant relationship between perceived cognitive dysfunction and objective neuropsychological performance in this cohort. Depression and fatigue were significantly associated with perceived cognitive dysfunction. Findings emphasize the gap between subjective and objective measures of cognitive impairment and the importance of considering psychological factors in the context of cognitive complaints in clinical settings.

#### **CREATIVE ART ENHANCING COGNITIVELY LIMITED SENIORS' LIVES: AN EVALUATION OF THE ARTMAIL PROJECT**

S. Shreeniwas<sup>1</sup>, L. Miller<sup>2</sup>, E. Thomas<sup>1</sup>, E. Chia<sup>1</sup>, 1. *Human Devpt and Family Studies, UNC Greensboro, Greensboro, North Carolina*, 2. *Creative Aging Network-NC, Greensboro, North Carolina*

Participating in structured art programs is said to improve physical and mental health and social functioning of older adults including those with dementia. However, research on this subject is new, and awareness of these programs is limited. Feedback for improved program design and delivery is also needed. In a partnership between UNC Greensboro and the Center for Creative Aging, NC, we conducted a pilot project in North Carolina (USA) in 2011 to evaluate whether participating in a 10 week art exchange project called ARTmail improved mood and social connectedness among seniors. Although 60 seniors took part in the ARTmail program, most of them with a cognitive limitation, only 31 seniors took part in the evaluation, mostly because the legal representative of many cognitively limited seniors did not give permission for them to participate in the evaluation. We collected baseline and endline information on socio-demographic background; physical health, functional status; and depression, loneliness, and mood / connectedness scales appropriate for dementia and non-dementia groups. We also conducted qualitative interviews with selected site staff, volunteers, and participants. Our findings indicated that among seniors with cognitive limitations, the mean of mood scores at endline was lower than at baseline, suggesting improved mood (approaching significance at the .10 level). A larger sample would likely have shown significant results. We conclude with a discussion of observations and suggestions from staff, volunteers, and participants, on experiences with the program and suggestions for improved implementation in future.

#### **ANTIPSYCHOTIC AND OTHER PSYCHOPHARMACOLOGICAL MEDICATION USE IN NURSING HOME RESIDENTS WITH DELIRIUM**

L. Simoni-Wastila<sup>1</sup>, Y. Wei<sup>1</sup>, C.S. Franey<sup>1</sup>, M. Luong<sup>1</sup>, G.B. Rattinger<sup>1</sup>, T. Huang<sup>1</sup>, I.H. Zuckerman<sup>1</sup>, J.A. Lucas<sup>2</sup>, 1. *School of Pharmacy, University of Maryland, Baltimore, Maryland*, 2. *Rutgers University, New Brunswick, New Jersey*

Delirium in nursing home residents is prevalent, problematic, and potentially preventable. Individuals with dementia are at increased risk for developing delirium, especially when exposed to medications with anticholinergic properties. Thus, minimizing psychopharmacological medication (PPM) use can reduce delirium occurrence. Although antipsychotics effectively treat delirium, they are reserved for individuals with severe agitation, for short duration, at lowest possible dose. In this study, we examine antipsychotic and PPM treatment patterns in NH older adults with delirium. Using 2006-2007 Medicare data (Parts A, B, and D) linked to Minimum Data Set files, we developed a national cohort of continuously-enrolled Medicare beneficiaries in NHs for  $\geq$ 100 days ( $n$ =69,832). Dependent measures included: 1) prevalence of antipsychotic and PPM use; and 2) appropriateness of antipsychotic and PPM use by indication, duration, and dose. In 2007, 35.2% of residents exhibited delirium; of these, 43.2% received at least one antipsychotic. Other PPM use ranged from 38.4% (antidepressants) to 39.4% (anxiolytics). Among residents with delirium who received an antipsychotic, 23.5% had no other clinically appropriate diagnosis warranting antipsychotic use. The mean duration of use among delirium-only antipsychotic users was 195 ( $\pm$ 121) days, with 20.1% receiving  $\geq$ 1 antipsychotics daily and 5.8% exceeding the mean recommended maximum geriatric dose. Findings suggest antipsychotic and other PPM use and exposure is prevalent and persistent among NH residents with delirium, contrary to recommended treatment guidelines. Further longitudinal findings investigating the temporality of symptoms relative to antipsychotic and PPM use, as well as delineating precipitating factors and outcomes, will be presented.

#### **PROCESS FOR RECRUITING PERSONS WITH LATE-STAGE DEMENTIA FOR NURSING HOME RESEARCH**

M.B. Aselage<sup>1,2</sup>, E.J. Amella<sup>3</sup>, J. Zapka<sup>3</sup>, M. Mueller<sup>3</sup>, C. Beck<sup>4</sup>, 1. *Duke University School of Nursing, Durham, North Carolina*, 2. *John A. Hartford BAGNC Scholar, New York, New York*, 3. *Medical University of South Carolina School of Nursing, Charleston, South Carolina*, 4. *University of Arkansas for Medical Sciences College of Nursing, Durham, North Carolina*

Background: In 2010, the Department of Health and Human Services announced a proposal to enhance the Common Rule. "Additional safeguards" are recommended when recruiting persons with dementia (PWD) into research studies, but no clear or consistent guidelines exist for researchers working with this vulnerable population. Purpose: To discuss a process of recruiting, screening, and enrolling persons with late-stage dementia into nursing home research studies. Methods: The sampling procedure used in this study was based on an algorithm developed from a 2009 literature review, titled the "Partnership of Consent". This study, conducted in 2 for-profit southeastern United States nursing homes enrolling 5 PWDs per facility, was the first to implement the algorithm. From onset through conclusion of the study, researchers partnered with the legally authorized representatives and nursing home staff to minimize research burden on the PWD and used a continued assent process. Findings: After implementation, the algorithm was enhanced by grouping components into phases of the research process: recruitment, obtaining informed consent, and assent of the PWD during screening and as an ongoing process. New techniques for improving recruitment efficiency by were discovered, including maximizing use of the Minimum Data Set for initial screening of subjects. Conclusions: Information related to specific approaches and process information about the consent process being used with PWD in the nursing home is much

needed. This study provides a potential best practice standard regarding informed consent and assent for PWD; guidelines much needed by regulatory agencies and researchers to protect human subjects.

#### **“GETTING TO KNOW ME”: ENHANCING SKILLS IN THE CARE OF PEOPLE WITH DEMENTIA IN GENERAL HOSPITALS: THE DEVELOPMENT AND EVALUATION OF A TRAINING PROGRAMME**

R. Elvish<sup>1,3</sup>, S. Burrow<sup>1</sup>, J. Keady<sup>1,2</sup>, K. Harney<sup>2</sup>, P. Graham<sup>4</sup>, J. Gregory<sup>1,4</sup>, R. Cawley<sup>1</sup>, 1. *School of Nursing, Midwifery and Social Work, University of Manchester, Manchester, United Kingdom*, 2. *Greater Manchester West Mental Health NHS Foundation Trust, Greater Manchester, United Kingdom*, 3. *Pennine Care NHS Foundation Trust, Greater Manchester, United Kingdom*, 4. *Royal Bolton Hospital NHS Foundation Trust, Greater Manchester, United Kingdom*

**Background:** Recent findings suggest that the care of people with dementia in general hospital settings in the UK should be improved. The aims of the current study were: i) to design and develop a dementia care training programme to be used within general hospitals; ii) to evaluate the impact of the training programme; and iii) to design scales with good psychometric properties to measure knowledge in dementia and confidence in working with people with dementia. **Methods:** The “Getting to know me” training programme was designed as a flexible training package comprising: i) a range of materials to be used by staff and patients; and ii) a DVD made in collaboration with people with dementia and carers. The training programme was delivered to staff at a hospital in Greater Manchester, UK (n=59). The evaluation of the programme consisted of a pre-post design using questionnaire and focus group methodology. **Results:** Following attendance at the training programme, knowledge in dementia increased (n=59), and confidence in working with people with dementia improved (n=51). The presentation will also report on additional findings, and on the psychometric properties of newly developed scales that have been designed as part of the study: Knowledge in Dementia Scale (n=111) and Confidence in Dementia Scale (n=105). **Discussion:** Significant changes in knowledge in dementia and confidence in working with people with dementia occurred in general hospital staff following attendance at the “Getting to know me” training programme. The interpretation and wider impact of the findings will be discussed.

D.L. Woods, M. Yefimova, *Center for the Advancement of Gerontological Nursing Science, School of Nursing, University of California, Los Angeles, Los Angeles, California*

**Background:** Circadian rhythm disruption, alterations in sleep wake activity and daytime napping is consistently reported in NH residents with dementia. Normally, within individual sleep-wake and daytime napping activity are relatively stable, while day-to-day instability is an indication of a circadian rhythm disruption. The concept of allostatic load, a measure of cumulative biological burden over a lifetime, may be a helpful model for cortisol diurnal rhythm and daytime napping activity. The purpose of this study was to examine the association between intra-individual daytime napping episodes, and basal cortisol diurnal rhythm in NH residents with dementia. **Method:** In this within-individual longitudinal design (N = 51), we observed and recorded daytime napping every 20 min for 10 hr per day for 4 days. We obtained saliva samples 4 times daily for 4 days (upon participants’ waking within 30–45 min, 6 hr, and 12 hr after participants’ wake time). **Results:** Participants were categorized as high changers (HCs), day-to-day instability, or low changers (LCs), day-to-day stability. There was a significant difference between HC and LC in napping episodes ( $F = 4.86$ ,  $p = 0.03$ ) with an interaction effect of evening cortisol on napping episodes in the HC group ( $F = 10.161$ ,  $p = .001$ ). There were no significant differences in resident characteristics between groups. **Conclusions:** NH

residents with unstable daytime day-to-day napping episodes are more responsive to alterations in evening cortisol, an index of a dysregulated HPA axis. They may also be more amenable to environmental intervention, an avenue for further research.

#### **WHAT CHANGES AND WHAT REMAINS: PERCEPTIONS OF QUALITY OF LIFE BY PEOPLE WITH DEMENTIA**

K. Samsi, *Social Care Workforce Research Unit, King’s College London, London, United Kingdom*

Change is inherent in narratives of the lived experience of dementia. The concept of continuity, however, is less well understood. Using Interpretative Phenomenological Analysis, this paper explores the significance of continuity, as a means for people with dementia to cope on a daily basis. Nine people with dementia and their 9 carers were interviewed about change in quality of life in dementia; all had previously participated in a longitudinal study measuring change in their quality of life. Interviews revealed that, alongside discussions of change and deterioration, people with dementia were keen to emphasize continuity and retained factors, abilities that could be managed and components of their lives that had remained intact, such as lifelong personality characteristics, habits and an innate internal sense of self. Change was discussed in the context of techniques used to manage and accommodate change. Coping strategies used often related to past habits and personality characteristics, which in turn further reinforced continuity of individual’s sense of self. Reports of positive life quality appeared related to the level of continuity people with dementia expressed. The role of carers in supporting these feelings is also explored. This is the first study to look in detail at how elements of continuity can enhance the lives of people with dementia and carers and enable them to cope more effectively and experience greater well-being. This study has methodological relevance for the field of quality of life, and in the development of long-term support strategies for people with dementia.

#### **EVIDENCE BASED INTERVENTIONS IN DEMENTIA: THE EVIDEM EARLY DIAGNOSIS TRIAL**

S. Iliffe, J. Wilcock, M. Griffin, P. Jain, I. Thune-Boyle, F. Lefford, D. Rapp, *Primary care and population science, UCL, London, England, United Kingdom*

**Background:** Previous research has shown that the ability of primary care physicians to recognise dementia can be improved by education, but that the subsequent management of the patient does not change. Incentivisation of dementia diagnosis and management in the UK since 2006 has not altered recorded incidence or prevalence. **Aim:** To improve clinical management of people with dementia in primary care **Methods:** Cluster randomised controlled trial of an educational intervention to enhance diagnostic and management skills in dementia among primary care staff. The educational intervention was developed by expert users, including carers, based on state-of-the-art educational principles for adult learning, and was used within the primary care workplace. **Participants & settings:** 22 group practices in SE England **Measures:** Case ascertainment, clinical reviews of patients with dementia, and concordance with management guidelines. **Results:** Twenty two practices participated and identified 800 people with dementia, of whom 167 gave permission for detailed analysis of their medical records. The trial’s findings will be reported, including case ascertainment, frequency of dementia clinical reviews and concordance with dementia management guidelines on counselling and provision of information, support for carers and management of BPSD (including use of anti-psychotic medication) **Conclusions:** The implications of the trial for clinical practice in will be discussed, in terms of professional learning and system design.

## RESEARCHING THE CARE-BASED HAIR SALON EXPERIENCE: DEVELOPING A FULL-BODIED APPROACH TO DEMENTIA CARE

S. Campbell, R. Ward, *School of Nursing, Midwifery and Social Work, University of Manchester, Manchester, United Kingdom*

Until recently, research in dementia care has been characterised by a fairly limited methodological repertoire. In particular, a reliance on observational approaches has meant that the evidence-base emphasises that which can be seen or heard and the 'readable' aspects of care. Much that is unobservable and non-discursive has been neglected and its significance underplayed. In this paper we advocate a more 'full-bodied' approach to dementia research as we discuss the challenges and insights associated with a two-year ethnographic study of care-based hair salons. The Hair and Care project used a qualitatively-driven mixed method approach to investigate the experience of attending the hair salon for people with dementia residing in care. Our aim was not only to explore the representational and symbolic importance of appearance and image in care but also the intrapersonal, embodied and sensory aspects of appearance-related encounters. In order to do this we have employed methods less familiar to dementia studies drawing particularly upon visual and sensory ethnography. Using our own bodies as research tools has been integral to this process. Our experiences underline the importance of the sensory and embodied realm in the maintenance of a social presence for people whose capacity to communicate and interact in more conventional ways may have deteriorated. The research signals the importance for practice and policy of attending to the unobservable and non-discursive domains and for research to extend beyond conventional approaches and thinking in order to gain a fuller appreciation of the everyday lives of people living with dementia.

## THE WATERMEMORIES SWIMMING CLUB

C. Neville<sup>1</sup>, T. Henwood<sup>1</sup>, K. Clifton<sup>1</sup>, E. Beattie<sup>2</sup>, *1. School of Nursing and Midwifery, The University of Queensland, Ipswich, Queensland, Australia, 2. Queensland University of Technology, Brisbane, Queensland, Australia*

This pilot project aimed to try something different - rekindle positive memories of swimming in people with dementia who enjoyed swimming throughout their lives, and involve them in active swimming again using a swimming club intervention. Club members were recruited from two residential aged care facilities in Queensland, Australia (n=25 recruited, n=18 commenced, n=11 (median age=88.4, IQR=12.3; 1 male) completed the intervention). The 12 week program consisted of two, 45 minute sessions per week held at a municipal pool, using a trained instructor and assistants. Measures, taken at baseline, Week 6, Week 9 and post intervention included psychosocial and physical assessments such as the Revised Memory and Behavior Problems Checklist, Psychological Well-Being in Cognitively Impaired Persons, Seniors Physical Performance Battery and bioelectric impedance analysis. Stakeholder focus groups determined the barriers and facilitators for the club. Three outcomes have been achieved: 1) the development of a dementia specific, evidence-based, aquatic exercise program. This valuable resource will ensure that the benefits will be maximized with tailored exercises for strength, agility, flexibility, balance, relaxation and stress reduction, 2) improved quality of life for members, with statistically significant improvements in psychological wellbeing ( $\chi^2=8.66$ ,  $p<0.05$ ), BPSD expression ( $\chi^2=16.91$ ,  $p=0.001$ ) and staff distress ( $\chi^2=16.86$ ,  $p=0.001$ ) and 3) an informative website with instructional video clips and a manual to assist others in implementing and maintaining a Watermemories Swimming Club. This pilot project has provided strong evidence that aquatic exercise can produce positive physical, psychosocial and behavioral outcomes for people with dementia.

## THE MENTAL ACTIVITY AND EXERCISE (MAX) TRIAL

D.E. Barnes<sup>1,2</sup>, W. Santos-Modesit<sup>1,2</sup>, A.L. Byers<sup>1,2</sup>, G. Poelke<sup>2</sup>, W. Goodson<sup>1</sup>, L.E. Middleton<sup>3</sup>, K. Yaffe<sup>1,2</sup>, *1. Psychiatry and Epidemiology & Biostatistics, University of California, San Francisco, San Francisco, California, 2. San Francisco Veterans Affairs Medical Center, San Francisco, California, 3. University of Waterloo, Waterloo, Ontario, Canada*

Background: Physical and mental activity have a variety of beneficial effects in older adults, but few randomized, controlled trials (RCTs) have compared the effects of different physical and mental activity interventions, particularly in individuals with cognitive complaints, who may be at a critical point for intervention. Methods: We performed an RCT with a factorial design in which 126 sedentary elders with cognitive complaints were randomized to 12 weeks of physical activity (aerobic exercise or stretching, 60 minutes, 3 days/week) plus mental activity (computer training or educational DVDs, 60 minutes, 3 days/week). Outcomes included cognitive function (summary score from an extensive neuropsychological battery), physical performance (Senior Fitness Test), health-related quality of life (SF-12), depressive symptoms (Geriatric Depression Scale) and sleep (abbreviated Sleep Disorders Questionnaire). Results: Study participants had a mean age of 73 and were 63% women and 35% Hispanic or non-white. Overall, participants experienced significant improvements in physical performance (chair stands:  $p<.001$ ; arm curls:  $p<.001$ ; steps in 2 minutes:  $p=0.007$ ; inches from touching toes:  $p=.002$ ), physical health-related quality of life ( $p=0.05$ ) and depressive symptoms ( $p=.008$ ), with no differences between groups. In subjects with poor memory, cognitive function improved significantly more with computer training than educational DVDs ( $p=.03$ ). In subjects with poor sleep, sleep quality improved significantly more with stretching than aerobic exercise ( $p=0.02$ ). Conclusions: A 12-week physical and mental activity intervention had wide-ranging beneficial effects, with some interventions better for some outcomes. Lifestyle changes should be recommended to preserve function and quality of life in older adults with cognitive complaints.

## DEVELOPMENT OF SCREENING WEB SITES FOR ALZHEIMER'S AND AGE-RELATED MEMORY DECLINE: PROGRESS UPDATE

C.B. Ashford<sup>1</sup>, K. Hamrick<sup>2</sup>, T.L. Rose<sup>3</sup>, S. Kaib<sup>4</sup>, J. Vogelmann<sup>5</sup>, A. Wetherell<sup>6</sup>, R.J. Martin<sup>3</sup>, J. Ashford<sup>7</sup>, *1. MemTrax LLC, Redwood City, California, 2. Veteran's Health Administration Palo Alto Health Care System/War Related Illness and Injury Study Center, Palo Alto, California, 3. Research, MMT Corporation, Sherman, Connecticut, 4. Kronos Science Laboratory, Phoenix, Arizona, 5. Orentreich Foundation for the Adv of Sci, Cold-Spring-on-Hudson, New York, 6. Retired, London, United Kingdom, 7. Stanford/VA Aging Clinical Rsch Center, VA Palo Alto Health Care System, Palo Alto, California*

BACKGROUND: To determine which measurements provide highest reliability per minute of measurement, the MemTrax, Kronos (H-Scan) and Blueberry Study (BBS) groups compared results obtained by the same participant cohort over a 10 day measurement period. METHODS: Methods and measurement sites are available at MemTrax.com and Blueberrystudy.com. These sites link to hand-held tablet, Android, iPhone and Kindle book reader versions under development to provide inexpensive screening alternatives. RESULTS: For offline (H-Scan) highest audible pitch (HAP) and online HAP, MemTrax photo recognition, BBS word recall and face recognition (FR), test-retest and split half reliability (correlation, r) ranged from poor ( $r < 0.7$ ) to high (MemTrax  $\leq 0.87$ ; BBS word recall 0.96; offline H-Scan HAP 0.98) depending on number of repeated measurements averaged before reliability calculation. Correlations with age were HAP offline, -0.610; HAP online, -0.787; MemTrax (beta), 0.610. MemTrax and FR correlated more closely with HAP than chronological age (e.g., MemTrax(beta)-age  $r=0.610$ ; MemTrax(beta)-HAP  $r=0.767$ ) suggesting that HAP may reflect biological rather than chronological age. Correlations between online

MemTrax and FR response times were 0.752; between offline and online HAP, 0.927. Within-person standard deviations for vertical finger movement times were approximately half as large as horizontal, resulting in large power increases. MemTrax discriminability ( $d'$ ) values from this investigation matched those obtained previously (Ashford et al. *J. Alzheimers Dis.* 2011;27(4):885-95). **CONCLUSIONS:** MemTrax photo recognition, BBS word recall and H-Scan highest audible pitch had high test-retest reliability values (0.87-0.98) indicating that relatively precise measurements can be obtained via online measurements for either screening or long-term performance monitoring.

### HELP SEEKING PATHWAYS AND ASSOCIATED FACTORS IN ELDERLY WITH DEPRESSIVE SYMPTOMS

M.U. Pérez-Zepeda, V.E. Arango-Lopera, C. Garcá a-Peñ a, *Research, Instituto de Geriatria, México, D.F., Mexico*

It is widely recognized that depression in the elderly is associated with multiple adverse outcomes such as high health services utilization rates, low pharmacological compliance, and synergistic interactions with other comorbidities. Moreover, help seeking process, which usually starts with the “feeling that something is wrong” and ends with an appropriate medical care is influenced by several factors. Explore the associated factors of the pathway of help seeking of older subjects with depressive symptoms. Data reported here come from the “Integrated Study of Depression Among Elderly Insured by Instituto Mexicano del Seguro Social (IMSS) in Mexico City”. A questionnaire applied by trained nurses explored the process of health care seeking in four stages: depressive symptoms, help seeking, help acquisition and specialized mental health. Associated factors with the health care seeking process were assessed, grouped in sociodemographic, comorbidity, functionality, depression, anxiety, executive function and cognitive status. To explore the associated factors of this path, three outcomes were assessed: help seeking, not getting help and getting specialized mental health. These three main outcomes (help seeking, acquisition of help and specialized mental health) were tested in a bivariate fashion and then a logistic regression was done. A total 2,322, 57.92% had depression symptoms. A total of 337 (25.05%) subjects seek for help, and 271 (80.41%) got help. Finally 103 (38%) subjects got specialized mental health care. Previous use of health care, scholarship, executive function and anxiety were significantly associated in the logistic regression with help seeking (Odds ratio=1.06, 2.71, 1.02 and 1.08 respectively). Hypertension was inversely associated with help acquisition OR 0.32 (CI 0.16-0.65,  $p$  0.002). Finally, the variables associated to receiving specialized mental-health care, were scholarship and limitation in vigorous physical activity. Appropriate mental health care is rather complex and is influenced by several factors.

### IMPACTS OF AEROBIC EXERCISE: A QUALITATIVE STUDY OF INDIVIDUALS WITH ALZHEIMER'S DISEASE AND THEIR CAREGIVERS

F. Yu<sup>1</sup>, R. Swartwood<sup>2</sup>, 1. *University of Minnesota School of Nursing, Minneapolis, Minnesota*, 2. *University of Minnesota, Minneapolis, Minnesota*

**Background:** Aerobic exercise has shown potential to be an effective behavioral therapy for reducing cognitive decline in Alzheimer's disease (AD). However, emerging aerobic exercise studies in AD have reported inconsistent findings and poor exercise compliance. **Methods:** The purpose of this qualitative study is to examine the feasibility and perceptions of the impact of a 6-month moderate intensity cycling program from the perspectives of community-dwelling older adults with AD (participants) and their family caregivers. Participants ( $n=10$ ) and their caregivers ( $n=10$ ) participated in a total of four focus groups after the participants completed the 6-month cycling program. **Results:** An inductive analysis was used for analyzing data and revealed four converging themes from both participant and caregivers interviews, respectively: 1) There was no perceived positive change in cognitive symp-

oms; 2) The 6-month exercise program was socially rewarding; 3) The 6-month exercise program increased physical strength; and 4) The assessment of the exercise program was unanimously positive. Two additional themes were identified from focus groups with family caregivers: “The exercise program led to improved attitude in participants” and “The exercise program reduced caregiver stress.” **Discussion:** Findings from this study suggest that aerobic exercise is a feasible and well-perceived intervention and may be able to stabilize cognitive decline and reduce caregiving burden, thus, improving quality of life for both older adults with AD and their family caregivers. Subsequent research should compare these qualitative results with quantitative measures to determine the effect of aerobic exercise on cognition, caregiver burden, and quality of life.

### EFFECTS OF A WEB-BASED EDUCATION PROGRAM FOR PRIMARY CAREGIVERS TO MANAGE BPSD OF NURSING HOME RESIDENTS WITH DEMENTIA

J. Song, Y. Kim, H. Kim, *College of Nursing, Korea University, Seoul, Republic of Korea*

The purpose of this study was to develop and evaluate a web-based educational program for primary caregivers to help their practice in management of BPSD (WebED-BPSD) exhibited by nursing home residents with dementia (NHRDs). Based on the Network-Based Instructional System Design (NBISD), four sessions of WebED-BPSD were developed and operated through a web server for 4 weeks. Participants, who have been working for more than one month in the study nursing homes ( $N=6$ ) located in the city of Seoul or Kyounggi province, South Korea, were randomly assigned into the experimental ( $N=37$ , mean age=53.54±4.49) or control group ( $N=30$ , mean age=52.57±4.60). Pre- and post-tests were performed to assess participants' knowledge about BPSD management, self-efficacy, and perceived problem solving ability for both groups; and program satisfaction for the experimental group only. The data was analyzed using descriptive statistics,  $\chi^2$ -test, t-test, paired-t-test. The WebEd-BPSD was effective on participants' knowledge about BPSD management ( $t=2.87$ ,  $p=.006$ ) and self-confidence about problem solving ( $t=-2.08$ ,  $p=.045$ ), while being not effective for self-efficacy and overall perceived problem solving ability about BPSD management. Participants' overall satisfaction about system and contents of the WebEd-BPSD was pretty high. The WebEd\_BPSD may be useful to improve nursing caregivers' knowledge, skills, attitude about BPSD management in dementia care. However, it is necessary to conduct further research in advance to evaluate longitudinal effects about the program on self-efficacy and overall perceived problem solving ability. This work was supported by the Korea Research Foundation Grant funded by the Korean Government (2010-0023525). Correspondence to Jun-Ah Song (E-mail: jasong@korea.ac.kr).

### PREVENTING LOSS OF INDEPENDENCE THROUGH EXERCISE (PLIÉ) FOR OLDER ADULTS WITH DEMENTIA

D.E. Barnes<sup>1,2</sup>, M.A. Chesney<sup>3</sup>, K. Yaffe<sup>4,2</sup>, C. Flores<sup>5,6</sup>, E. Wu<sup>3</sup>, W.E. Mehling<sup>3</sup>, 1. *Psychiatry and Epidemiology & Biostatistics, University of California, San Francisco, San Francisco, California*, 2. *San Francisco Veterans Affairs Medical Center, San Francisco, California*, 3. *Osher Center for Integrative Medicine, University of California, San Francisco, San Francisco, California*, 4. *Psychiatry, Neurology and Epidemiology & Biostatistics, University of California, San Francisco, San Francisco, California*, 5. *School of Nursing, University of California, San Francisco, San Francisco, California*, 6. *Institute on Aging, San Francisco, California*

This study examines the effects of a new, integrative, group exercise program for older adults with dementia called Preventing Loss of Independence through Exercise (PLIÉ). PLIÉ incorporates elements of Tai Chi, yoga and Feldenkrais with traditional exercises and focuses on improving body awareness of the functional movements necessary to perform basic activities of daily living as well as relaxation and group

enjoyment. Prior studies have found that traditional exercise programs that include aerobic, strength and flexibility training improve physical function in older adults with dementia, but little is known about the effects of other types of exercise. We hypothesized that enhancing traditional exercises with those that emphasize body awareness, ease and 'mindfulness' in movement would improve cognitive as well as physical function. PLIÉ is being pilot-tested in subjects who are attending an adult day program in San Francisco, CA. Subjects have been placed in an intervention group (n=7) or a usual care group (n=5) based on their attendance schedules. Intervention subjects participate in PLIÉ 2-3 days/week for 45 minutes for 18 weeks while usual care subjects participate in 15 minutes of standard chair-based exercises. The groups cross over after 18 weeks. Outcomes are assessed at baseline, 18 weeks and 36 weeks and include physical function, cognitive function, quality of life, dementia-related behaviors, fall self-efficacy, incontinence and caregiver burden. To date, exercise instructors and caregivers report that PLIÉ participants have experienced improvements in physical function and general awareness. Full results will be available at the time of the conference.

### **EVALUATION OF DEMQOL IN ASSESSING THE QUALITY OF LIFE (QOL) IN RESIDENTIAL CARE. ROGER WARNE, SHARON NG, IRENE TAN, CENXUE WANG, DOUG MCKITRICK, JOHN METAXAS**

R.W. Warne, *Geriatric Medicine, Royal Perth Hospital, Perth, Western Australia, Australia*

Outcome measures: comprised Information Orientation Scale (IOS), Behavior Rating Scale (BRS) Dependency, Dementia Quality of Life (DEMQOL) and DEMQOL proxy scores. Results: 85 residents (29 men and 54 women) mean age 85.5 years was reviewed. 40 residents completed DEMQOL and 80 DEMQOL Proxy Scores. 29 residents were not able to complete DEMQOL owing to the severity of dementia. The correlation between DEMQOL and Proxy scores were greatest in independent and frail elderly, and least in dependent persons. Health and well being, social relationships sub categories, DEMQOL and Proxy scores were highly correlated in independent and frail persons, while in the most cognitively impaired the correlation between DEMQOL and Proxy was highest. Conclusions: DEMQOL was established as a community QOL which has a role in residential care. The utility of DEMQOL is limited in the most severe demented elderly in residential care. Reference: Smith SC, Lamping DL, Banerjee S, Harwood RH, Foley B, Smith P, et al. Development of a new measure of health-related quality of life for people with dementia: DEMQOL. *Psychological medicine*. 2007;37(5):737-746.

## **SESSION 375 (POSTER)**

### **DEATH AND END OF LIFE**

#### **POLYPHARMACY AND LIMITED LIFE EXPECTANCY IN NURSING HOME RESIDENTS WITH ADVANCED DEMENTIA**

G. Onder<sup>1</sup>, R. Liperoti<sup>1</sup>, G. Gambassi<sup>1</sup>, E. Topinkova<sup>2</sup>, D. Fialova<sup>2</sup>, F. Landi<sup>1</sup>, R. Bernabei<sup>1</sup>, *1. Università Cattolica del Sacro Cuore, Rome, Italy, 2. Charles University, Prague, Czech Republic*

Background: advanced dementia is associated with limited life expectancy (LLE) and benefits of drugs may be reduced in this population. However, polypharmacy is common among patients with this condition. The aim of the present study is to assess prevalence of polypharmacy and the effect of polypharmacy on 1-year mortality according to life expectancy among nursing home (NH) residents with advanced dementia. Methods: 822 NH residents with advanced demen-

tia participating to the SHELTER project, a study collecting information on NH residents in Europe. Polypharmacy was defined as use of  $\geq 10$  drugs. LLE was defined by an ADEPT score  $\geq 13.5$  (Mitchell S. *JAMA* 2010). Results: mean age was 84.9 (SD 8.6) years and 104 residents (12.7%) had a LLE. Polypharmacy was observed in 16/104 (15.4%) residents with LLE and in 98/718 (13.6%) residents without LLE ( $p=0.64$ ). Among residents with LLE, 11/16 (68.8%) on polypharmacy (crude incident rate (CIR) per person-year (p-y)=1.50) and 37/88 (42.0%) not on polypharmacy (CIR per p-y=0.63) died during the follow-up; among residents without LLE 28/98 (28.6%) on polypharmacy (CIR per p-y=0.36) and 136/620 (21.9%) not on polypharmacy (CIR per p-y=0.27) died during follow-up. After adjusting for potential confounders, polypharmacy was associated with significantly increased mortality (HR=2.25, 95% CI 1.09-4.62) in the LLE group, but not in the group without LLE (HR=1.05, 95% CI 0.69-1.60). Conclusion: in NH residents with advanced dementia prevalence of polypharmacy is not influenced by LLE. Polypharmacy is associated with increased mortality in residents with LLE. Estimating life expectancy is necessary to improve the quality of prescribing in advanced dementia.

#### **RISK OF IN-HOSPITAL DEATH IN ELDERLY INPATIENTS RECEIVING PALLIATIVE CARE BY SITE OF CONSULTATION**

K. Sekiguchi<sup>1</sup>, C.L. Bell<sup>2</sup>, K. Masaki<sup>2</sup>, D. Fischberg<sup>3,2</sup>, *1. University of Hawaii John A. Burns School of Medicine - Internal Medicine Residency Program, Honolulu, Hawaii, 2. The John A. Hartford Center of Excellence in Geriatrics, Department of Geriatric Medicine, John A. Burns School of Medicine, University of Hawaii, Honolulu, Hawaii, 3. The Queen's Medical Center, Honolulu, Hawaii*

Background: Data are limited on predictors of in-hospital mortality for elderly inpatients receiving palliative care consultations. Methods: This prospective observational study included inpatients  $\geq 65$  years old receiving palliative care consultations in a 542-bed tertiary-care hospital in Honolulu, Hawaii from 1/2005 through 12/2009. In-hospital death included deaths with or without hospice care. Consultation site was categorized as ICU, non-ICU medical, non-ICU surgical and rehabilitation settings. Diagnoses were categorized as cardiac, pulmonary, cancer, surgical and other. Consultation intensity was categorized as intense plan-of-care (addressing goals of care) and non-plan-of-care (pain or symptom management). Results: Of 1,835 elderly inpatients receiving palliative care, 299 (18%) died in-hospital. In-hospital death was significantly associated on multiple logistic regression with age  $\geq 75$  (OR=1.39, 95%CI=1.01-1.90), intense consultation (OR=1.98, 95%CI=1.39-2.83), and longer preconsult length-of-stay (OR=1.02/each day, 95%CI=1.01-1.03); reduced odds for non-ICU (vs. ICU) sites (ORs=0.32-0.49, 95%CI=0.12-0.89) and Karnofsky scores (OR=0.66/10% increase, 95%CI=0.59-0.73). In-hospital death among non-ICU medical patients was associated with older age (OR=1.42, 95%CI=1.00-2.02), intense consultation (OR=1.97, 95%CI=1.34-2.90) and preconsult LOS (OR=1.02, 95%CI=1.00-1.03); reduced odds for higher Karnofsky scores (OR=0.73, 95%CI=0.65-0.81); primary diagnoses were non-significant. In-hospital death among ICU patients was associated with cardiac diagnoses (OR=41.19, 95%CI=1.91-889.42) and cancer (OR=9.24, 95%CI=1.31-65.11); reduced for higher Karnofsky scores (OR=0.37, 95%CI=0.21-0.64); intense consultation was non-significant. Conclusions: In-hospital death was associated with longer preconsult length-of-stay in all patients; intense consultation in non-ICU patients and cardiac and cancer diagnoses in ICU patients. Recognizing risk of in-hospital death might allow palliative care patients to avoid in-hospital death if they prefer to die at home.

## PRE-DEATH ENCOUNTERS: EMERGENCY DEPARTMENT VISITS AMONG OLDER ADULTS IN THEIR LAST TWO YEARS OF LIFE

M. Cadogan<sup>1</sup>, L.R. Phillips<sup>1</sup>, H. Aronow<sup>2</sup>, S. Takayanagi<sup>1</sup>, 1. *UCLA School of Nursing, Los Angeles, California*, 2. *Cedars-Sinai Medical Center, Los Angeles, California*

Older adults are frequent users of the emergency department (ED) and recent studies document rapidly increasing rates of ED use for this group. Little is known about patterns of ED visits in the context of pre-death trajectories. This presentation will focus on patterns of visits (range 1-13) to an urban ED among 1167 adults age 65 – 106 (mean = 82) over a two year period prior to their deaths. The sample was 82% Caucasian and evenly divided by gender (50% male and female). Of the final ED encounters, 90% resulted in a hospital admission prior to death. The average number of hospital days in the final encounter was 12.6 with a range of 1-323 days. Symptoms and diagnoses associated with all ED encounters along with ED dispositions, intervals between visits for those with multiple encounters, and implications of findings will be discussed.

## EFFECT OF SOCIAL SUPPORT AND DECISIONAL CONFLICT ON ADVANCE DIRECTIVES ATTITUDES AMONG OLDER ADULTS IN KOREA

J. Lee<sup>1</sup>, D. Jung<sup>2</sup>, 1. *Yonsei University College of Nursing, Seoul, Republic of Korea*, 2. *Ewha womans university, Seoul, Republic of Korea*

Purpose: The purpose of this study was to examine the relationship of social support and decisional conflict on older adults' advance directive attitudes in South Korea. Methods: This study used a descriptive and cross-sectional survey design. Subjects were Korean community-dwelling older adults over 65-years-of-age living in S city, South Korea (n=209). Data collection was conducted from September 2011 to January 2012. Standardized questionnaires were applied to measure perceived social support, decisional conflict, and advance directive attitudes. Descriptive statistics, Pearson's correlation, and multiple regression analyses were conducted using SPSS 18.0 program. Results: Subjects' advance directives attitudes were more likely to have negative attitude toward advance directives. Among decisional conflict scale, uncertainty domain revealed difficulty in decision making. Overall, social support and decisional conflict had a statistically significant relationship with advance directives attitudes ( $p < .001$ ). Decisional conflict had a statistically significant negative relationship with perceived social support system ( $p < .01$ ). Advance directives attitudes had positive association with perceived social support ( $\beta = .238, p < .01$ ) and negative association with decisional conflict level ( $\beta = -.519, p < .01$ ). Social support was found to mediate the relationship between decisional conflict and advance directive attitudes. Conclusion: The study results contributed to the understanding of advance directives attitudes among older adults in South Korea. The knowledge gained from this study will be used to develop culture-specific and timely nursing interventions for older adults and social policies.

## DYING WITH DIGNITY DURING END OF LIFE CARE

Q. Guo, C. Jacelon, *School of Nursing, University of Massachusetts Amherst, Amherst, Massachusetts*

Purpose: To clarify the meaning of dying with dignity and to identify universal aspects of dignity at the end of life. Background: Dying with dignity is considered to be very important by patients approaching life's end, their families and health care providers. As the population ages, more individuals are dying from disease and often experience a prolonged period of decline prior to death. During this period these individuals are often receiving care from both formal and informal caregivers. Methods: This research was an integrative review, using the matrix method to analyze all identified articles. The author performed keyword searches of the following electronic databases: PubMed,

CINAHL, PsycINFO, Academic Search Premier, and Social Sciences Abstracts. The final sample includes 30 empirical articles and 2 theoretical articles. Results: Patients and health professionals have similar definitions on "dying with dignity". Factors that influence dignity include: demographic factors, illness-related factors, treatment and care, communication, functional status, negative feelings, relationship with others, and so on. Three models of dignity were identified: Dignity-Conserving Care Model, Model of Preservation of Dignity, and Dignity Conceptual Model. The Dignity-Conserving Care Model is the most widely used. While several instruments have been developed to measure dignity at the end of life, interventions to maintain or support dying patients' dignity are increasing but still limited. Conclusions: This review provides comprehensive information on dignity at the end of life. Dignity is at the heart of end of life care, more efforts need to be done on how best to support it.

## EXPLORING PATIENT PERSPECTIVE AT END OF LIFE: QUALITATIVE INTERVIEWS WITH TERMINALLY ILL PATIENTS

K.T. Nguyen, M.A. Drickamer, *Yale University, Fremont, California*

Background: Patient perspective should guide end of life of care. Prior studies offer valuable information on patients' thoughts regarding specific issues but the issues were predetermined by the researchers, and did not allow patients to shape the discussion. There is a need for a qualitative study enabling terminally ill patients to be the primary drivers of end of life discussion. Objective: This study aims to attain a more comprehensive, in-depth understanding of issues important to terminally ill patients in order to provide better care at end of life. Methodology: Semi-structured interviews were conducted with fifteen terminally ill patients. The interviews were recorded and transcribed, and common topics were identified. The transcripts were coded using NVIVO software. The content of each topic was reviewed, and themes were identified. Results: Fifteen commonly discussed topics were identified: quality of life, course of illness, approaches to treatment, personal goals, hopes, fears and worries, decisions of daily living, place of living, family, prior experiences with death and dying, religion, timeframes, memories, attitude and emotion toward dying, and adjustment. An overarching theme centered on the issue of self-identity, and how illness changed this concept for patients. Conclusion: Many patients related their experiences to how illness affected their self-identities, and how they strive to subsequently preserve their identities. Understanding patient experience in the context of their thoughts and feelings, particularly those framed by their self-identities, can help shape discussions of goals of care and treatment, and improve end of life care.

## SESSION 380 (POSTER)

### DISABILITY, FALLS, AND MOBILITY

#### COMORBIDITY AND MOBILITY LIMITATION IN OBESE AND NON-OBESE OLDER WOMEN

S. Jung, S. Seino, N. Yabushita, M. Nemono, Y. Osuka, Y. Okubo, K. Tanaka, *University of Tsukuba, Tsukuba, Japan*

Objective: The objective of this study was to examine the combined association of obesity and comorbidity with mobility limitation. Methods: This cross-sectional study included pooled data of 762 older women, aged 65-91 years, in local communities in Japan between 2007-2011. They were divided into obese (BMI:  $\geq 25$  kg/m<sup>2</sup>) and non-obese ( $< 25$  kg/m<sup>2</sup>) and also classified into three categories (0, 1 and 2 or more) according to the self-reported number of chronic diseases. Main outcome was mobility limitation assessed by self-reported (ability to walk 400m or climb one flight of stairs). Multivariate logistic regression analysis was performed to determine the combined associations using age, exercise habit, smoking status and alcohol intake as covariates. Results: A total of 312 participants (43.3%) had mobility limitation.

Compared with non-obese without morbidity, the adjusted odds ratios (95% confidence interval) for mobility limitation were 1.29 (0.81-2.04) in non-obese with a disease, 2.73 (1.58-4.69) in non-obese with two or more diseases, 2.01 (1.80-3.76) in obese without morbidity, 1.91 (1.08-3.39) in obese with a disease and 5.27 (2.85-9.74) in obese with two or more diseases. The odds ratio in obese with two or more diseases was significantly greater than that in non-obese with two or more diseases. Conclusion: The non-obese with comorbidity showed higher risk of mobility limitation than obese without morbidity and obese with a disease. Specifically, the results suggest that obesity with comorbidity is associated with mobility limitation to a greater extent than non-obese with comorbidity.

#### **RACE, GENDER AND DISABILITY: CALIFORNIA HEALTH INTERVIEW SURVEY IN 2005**

L. Quach<sup>1,2</sup>, H. Lee<sup>2</sup>, S.G. Leveille<sup>2</sup>, M.T. Hannan<sup>1,3</sup>, M. Nguyen<sup>2</sup>, E. Dugan<sup>2</sup>, 1. *Hebrew SeniorLife, Roslindale, Massachusetts*, 2. *University of Massachusetts Boston, Boston, Massachusetts*, 3. *Harvard Medical School, Boston, Massachusetts*

In later life, women have higher rates of disability than men. This disparity could be caused partly by the higher rate of chronic conditions among women compared to men. Little is known about the association of race with disability. We conducted a cross-sectional analysis using data from the 2005 California Health Interview Survey with a diverse population of adults aged  $\geq 65$  ( $n=9695$ ). Disability was measured based on physical, mental, and emotional conditions with self-reported questions and coded as present or absent. Race was classified into five categories: Latino, Asian, Black, White and Other. Logistic regression models were performed to determine whether race is associated with disability stratified by gender. The mean age was 74.5 years (range 65 to 85) and 62.7% of respondents were female. Respondents' race/ethnicity was as follows: 82.1% White, 4.9% Latino, 6.2% Asian, 3.7% Black, and 3.1% others. About half of Asian or White respondents had disability (50.7%, 51.0% respectively); and more than half of Latino or Black respondents had disability (58.9%, 57.8% respectively). Among women, compared to Whites, being Latino or Asian increased the odds of disability by 30% adjusting for age, education, marital status, cigarette smoking, arthritis, hypertension, and diabetes (OR= 1.33, 95% CI= 1.02-1.74; OR=1.29, 95% CI=1.02-1.64 respectively). No associations were observed in men or in other races. In summary, we observed the likelihood of disability was higher in Latino and Asian women compared to Whites. Further research is needed to understand racial differences in disability among older women.

#### **COEXISTENCE OF SENSORY DIFFICULTIES PREDICTS FEAR OF FALLING IN OLDER WOMEN**

A. Viljanen<sup>1</sup>, M. Rantakokko<sup>1</sup>, J. Kulmala<sup>1</sup>, M. Koskenvuo<sup>2</sup>, J. Kaprio<sup>2,3,4</sup>, T. Rantanen<sup>1</sup>, 1. *Department of health sciences, University of Jyväskylä, Gerontology Research Center, Jyväskylä, Finland*, 2. *University of Helsinki, Hjelt Institute, Helsinki, Finland*, 3. *National Institute for Health and Welfare, Helsinki, Finland*, 4. *University of Helsinki, Institute of Molecular Medicine, Helsinki, Finland*

Aim of the study was to explore whether coexistence of sensory difficulties predicts fear of falling (FOF). Self-reported hearing, vision and balance difficulties, as well as FOF were assessed using structured questionnaires at the baseline and after a three-year follow-up in 63-76 year-old community-dwelling women ( $n=416$ ). Logistic regressions were used for analyses. Forty percent ( $n=173$ ) of women feared falling at baseline. In cross-sectional baseline analyses the odds ratio (OR) for FOF was higher among persons who reported several sensory difficulties compared to persons who had no sensory difficulties. Among women without FOF at baseline, new FOF developed for 42% ( $n=101$ ) of participants during follow-up. Women with one sensory difficulty at baseline had a modestly increased risk (OR 1.4, 95% CI 0.7-2.8) for development of FOF during follow-up compared to those who had no sensory

difficulties at baseline. The OR was 2.3 (95% CI 1.1-4.9) in participants with two and 8.3 (95% CI 1.9-35.1) in participants with three sensory difficulties. All regression models were adjusted for age, number of chronic diseases and occurrence of a previous serious fall. According to our results coexistence of sensory difficulties predicted FOF. The coexistence of sensory difficulties may hinder older people from receiving compensatory information about body position and the environment, thus jeopardizing a person's confidence in maintaining a balanced position. Regular screening of sensory functions followed by appropriate actions may prevent the development of FOF, and thus contribute to prevention of falls and promotion of healthy aging.

#### **COGNITIVE SCREENING AND FUNCTION AMONG OLDER AFRICAN AMERICAN AND WHITE MEN AND WOMEN**

S.L. Garrett<sup>1,4</sup>, P. Sawyer<sup>2,4</sup>, R.M. Allman<sup>3,4</sup>, 1. *Morehouse School of Medicine, Atlanta, Georgia*, 2. *University of Alabama at Birmingham (UAB), Center for Aging, Birmingham, Alabama*, 3. *Birmingham/Atlanta GRECC and University of Alabama at Birmingham (UAB), Center for Aging, Birmingham, Alabama*, 4. *Deep South RCMAR, Birmingham, Alabama*

BACKGROUND: Little is known regarding racial-gender specific differences in Mini-Mental State Exam (MMSE) scores and how these correlate with disparities in functional measures. OBJECTIVES: (1) To determine if there are differences in the associations between MMSE scores and difficulties in BADL and IADL by racial-gender groups. (2) To assess whether these differences remain after adjusting for education, age, income, and comorbidities. METHODS: We used data from the baseline in-home assessment from the UAB Study of Aging. Baseline data included socio-demographics, co-morbidity, BADL, IADL difficulty, and MMSE. We excluded participants with a diagnosis of dementia or with missing data. We performed analyses to determine differences in the prevalence of MMSE, BADL, and IADL by race-gender specific groups, to assess correlations between BADL and IADL with MMSE, and used multivariable logistic regression to test the significance and independence of observed associations. RESULTS: The sample ( $N=974$ ) (Mean Age (SD) = 75.2 (6.71 years) included 238 (24.4%) African American (AA) women; 243 (24.9%) AA men; 246 (25.3%) White (W) women; and 247 (25.4%) W men. After adjusting for age, education, and income, multivariable logistic regression showed that MMSE scores were independently and significantly associated with BADL and IADL difficulty among AA men and only BADL among W men. CONCLUSION: These data suggest MMSE scores are associated with BADL difficulty among both African American and White men, but associated with IADL difficulty only among AA men. Difficulties in BADL and IADL among women were not associated with MMSE among African American or White women.

#### **PREDICTING DECREASED COMMUNITY MOBILITY IN OLDER MEN AND WOMEN. A 13-YEAR PROSPECTIVE STUDY**

S. Fristedt<sup>1</sup>, A.K. Dahl<sup>2,1</sup>, A. Wretstrand<sup>3</sup>, A. Björklund<sup>1</sup>, T. Falkmer<sup>4,1,5</sup>, 1. *School of Health Sciences, Jönköping University, Jönköping, Sweden*, 2. *Department of Medical Epidemiology and Biostatistics, Karolinska Institutet, Stockholm, Sweden*, 3. *Faculty of Engineering, Lund University, Lund, Sweden*, 4. *School of Occupational Therapy and Social Work, Curtin University, Curtin, Western Australia, Australia*, 5. *Department of Medical and Health Sciences, Division of Community Medicine, Faculty of Health Sciences, Linköping University, Linköping, Sweden*

Community mobility defined as "moving self in the community and using public or private transportation" seems to have a unique ability to promote older peoples' wellbeing by enabling independence. Early predictors of decreased community mobility among older men and

women are valuable to develop health promoting strategies, but long-term prediction is rare. The present study describes factors associated with community mobility, as well as decreased community mobility over time. In total, 119 men and 147 women aged 82-96 years at follow-up responded to a questionnaire in 1994 and 2007. After 13 years, 40% of the men and 43% of the women had decreased their community mobility. Cross-sectionally independent community mobility was associated with higher rating of subjective health ( $p < 0.01$ ), having no depression and sport activities ( $p < 0.05$ ) among men and for women with subjective health ( $p < 0.05$ ) and more I-ADL outside home ( $p < .001$ ). Further, lower subjective health predicted decreased community mobility ( $p < 0.05$ ) for men and women ( $p < 0.01$ ) over time, while self-reported physical health conditions did not. For women higher age ( $p < 0.05$ ) was also associated with decreased community mobility. Societal measures and individual interventions aiming to improve community mobility should acknowledge older persons' subjective health.

#### **INPATIENT FALL PREVENTION: USE OF IN-ROOM WEBCAMS**

S.R. Hardin<sup>1</sup>, P. Rudisill<sup>2</sup>, J. Dienemann<sup>1</sup>, K. Mills<sup>2</sup>, 1. *University of NC at Charlotte, Charlotte, North Carolina*, 2. *Health Management Associates, Mooresville, North Carolina*

**Objectives:** Patient falls are a challenging safety and quality issue in acute care settings. This study compared inpatient falls on medical-surgical units with and without webcams and assessed the Morse Risk Assessment (MRA) for effectiveness in identifying fall risk. **Methods:** Ten hospitals in one health system that exceeded the benchmark for falls were chosen for a 6 month study. One medical-surgical unit in each of the ten hospitals was randomly assigned to an intervention or control group. The intervention group utilized webcams that viewed the bed with a central monitoring system. A "virtual bed rail" function was used for those patients with a Morse Risk Assessment (MRA) of greater than 25. **Results:** There were 185 falls for all 10 hospitals. The majority of falls were with older adults that had a Morse Risk Assessment score of 50+. A significant difference ( $p < 0.05$ ) between groups was found in fall rate per 1000 admissions. The Morse Risk Assessment was a significant predictor of risk. **Conclusion:** Webcams are one option to increase surveillance for high risk patients. The use of the MRA with a 50+ score for high risk is recommended. More research is needed on patient acceptance of this form of intervention and effectiveness in preventing falls on various inpatient units or with specific age groups.

#### **FACTORS CONTRIBUTING TO FEAR OF FALLING IN PEOPLE WITH PARKINSON'S DISEASE**

M.H. Nilsson<sup>1,2</sup>, S. Iwarsson<sup>1,2</sup>, 1. *Department of Health Sciences, Lund University, Lund, Sweden*, 2. *Centre for Ageing and Supportive Environments (CASE), Lund University, Lund, Sweden*

Fear of falling (FOF) results in activity limitations, restrictions in participation and may cause social isolation, and is thus an important issue to address in order to promote activity and participation. In order to design robust intervention studies, it is however imperative to have a thorough understanding of influential factors on the main outcome. That is, if actively targeting contributing factors to FOF, this may reduce FOF. In comparison to age-matched controls, a FOF is both more common and pronounced among people with Parkinson's disease (PD). Furthermore, balance impairment constitutes one of the hallmarks of PD, and approximately 70% of people with PD experience falls. A FOF can however be present also among those who do not experience any falls. The latter further underlines the importance of addressing FOF specifically. This presentation will provide an overview of studies targeting FOF in people with PD, followed by examples from our ongoing studies. The content will cover aspects such as prevalence and consequences, but the strongest focus will be on studies investigating influential factors. Although the majority of such studies have used bivariate analysis, there are presently three studies that used multivariate analysis when

investigating contributing factors to FOF in people with PD. To briefly summarize, these prior studies indicate that gait and balance problems are the strongest contributing factors to FOF in people with PD.

#### **ASSOCIATION OF CARDIOVASCULAR RISK FACTORS WITH WALKING SPEED DIFFERS BY AGE, GENDER AND APOLIPOPROTEIN E GENOTYPE: A POPULATION-BASED STUDY**

A. Welmer<sup>1,2</sup>, S. Angleman<sup>1</sup>, E. Rydwick<sup>1,3</sup>, L. Fratiglioni<sup>1,4</sup>, C. Qiu<sup>1</sup>, 1. *Karolinska Institutet, Stockholm, Sweden*, 2. *Karolinska University Hospital, Stockholm, Sweden*, 3. *Research and Development Unit, Jakobsbergs Hospital, Järfälla, Sweden*, 4. *Stockholm Gerontology Research Center, Stockholm, Sweden*

**OBJECTIVES:** To examine to which extent different vascular risk factors (VRFs) are associated with impaired walking speed, and whether the possible associations vary by age (<80 vs. ≥80 years), gender or Apolipoprotein E (APOE) genotype. **DESIGN:** Cross-sectional study. **SETTING:** Community-based. **PARTICIPANTS:** A random sample of 2883 people, aged 60 years and older, who were free from clinical stroke and dementia. The sample included people living either at home or in institutions from the Swedish National Study on Aging and Care in Kungsholmen. **MEASUREMENTS:** Walking speed was assessed by trained nurses, and functional impairment was defined as walking speed <0.8 m/s. VRFs or disorders (e.g., hypertension, diabetes, high total cholesterol, heart disease, obesity, heavy alcohol consumption and smoking) was ascertained based on clinical examination by a physician, self-reported history, inpatient register, and use of medications. **RESULTS:** Diabetes, ischemic heart disease, heart failure, underweight, obesity, and current smoking were associated with an increased odds ratio of functional impairment, whereas high cholesterol and alcohol consumption were associated with lower odds of functional impairment. These associations were particularly strong among people under 80 years and in women. APOE epsilon 4 allele amplified the association of functional impairment with diabetes, but diluted the association with heart failure. **CONCLUSION:** VRFs and related morbidities are associated with impaired functional ability; however the associations vary by age, gender, and genetic susceptibility.

#### **PATIENT SAFETY IN HOSPITALS: INFLUENCE OF SAFETY CULTURE ON A FALLS PREVENTION**

A.A. Zecevic, A. Li, C. Davy, M. Halligan, A. Kothari, *Western University, London, Ontario, Canada*

Safety of elderly patients is a growing concern in hospitals as the cost of adverse events, such as serious injurious falls, poses a significant economical burden. Organizational safety culture can mediate the success of falls prevention interventions. The purpose of this study was to explore the influence of safety culture on implementation of the Systemic Falls Investigative Method (SFIM) in two high risk hospital units. A mixed methods design and the Ottawa Model of Research Use (OMRU) framework guided data collection and analysis. A Modified Stanford Patient Safety Culture Survey Instrument, interviews and focus groups were used to explore the barriers and facilitators of SFIM implementation. Axial coding analysis identified emerging themes that were fitted into the OMRU elements. Survey results revealed that the staff perceived unit safety culture as poor. Facilitators of SFIM implementation were: hospital accreditation, patient safety as priority, good teamwork, history of falls prevention programs implementation, champions, and SFIM's capacity to uncover systemic contributors to falls. The barriers were: heavy workloads, high patient-staff ratios, chronic lack of time, limited resources, absence of incentives for safety improvements, patient demographic, communication breakdowns, and competing demands. The SFIM implementation was achieved by the efforts of the research team, good staff training and improved safety awareness. Findings demonstrate that unit safety culture greatly influenced implementation of a falls prevention intervention. With adequate resources, staff

time and staff training, the SFIM has the potential to contribute to safety culture improvements in high risk hospital units.

### **OPERATIONALIZATION AND SELECTION OF FUNCTIONAL FITNESS OUTCOME VARIABLES**

C.E. Rogers<sup>1</sup>, C.K. Craven<sup>1</sup>, C. Keller<sup>2</sup>, 1. *Nursing, University of Oklahoma Health Sciences Center, Oklahoma City, Oklahoma*, 2. *Arizona State University, Phoenix, Arizona*

**Introduction:** Conceptualization and operationalization of mediating and outcome variables is critical to testing intervention efficacy in theory-driven research. In our research, Adaptation-level theory and the Specific Adaptations to Imposed Demands Principle are used in concert to identify the factors needed to promote adaptation to healthy aging that reduces the risk of progression to functional decline. Our research is used as an exemplar to guide geriatric investigators and clinicians in the selection of appropriate measures to evaluate outcomes in research designed to maintain and improve physical function among sedentary older adults living in the community. The aims of this presentation are to 1) outline the theoretical framework used to conceptualize the measurement of functional fitness outcomes. 2) Compare and contrast the laboratory versus field measures selected for our research in the community. **Methods:** A review of the best laboratory and field measures of functional fitness was conducted. Considerations in the selection of responsiveness include construct and content validity, sensitivity and specificity to change in response to the intervention, floor and ceiling effect, reliability, participant burden, field versus laboratory, and cost. **Results:** The functional fitness outcomes and best field measures for the conceptualization and operationalization of mediating and outcome variables in our research include: balance (Timed Up & Go), endurance (6-minute walk), strength (arm curls and chair stands), and flexibility (back scratch and chair sit-and-reach). We report on the selection of valid and reliable field measures that provided strong conceptualization and operationalization of outcome variables of functional fitness outcomes for our research.

### **THE MANY FACETS OF MULTIMORBIDITY IN OLD AGE: INTERRELATIONS AND INTERDEPENDENCIES IN THE CONTEXT OF QUALITY OF LIFE**

M. Holzhausen<sup>1,2</sup>, B. Rhode<sup>1</sup>, B. Gaertner<sup>2,1</sup>, C. Scheidt-Nave<sup>2</sup>, 1. *Charité - Universitaetsmedizin Berlin, Berlin, Germany*, 2. *Robert Koch Institut, Berlin, Germany*

Multimorbidity in old age is more than just medical conditions. Complex health states can be conceptualized as comprising of physical morbidity, physical limitations, and limitations in everyday activities. These facets (separately and in interaction) are thought to affect patients' autonomy, participation, and quality of life. The identification of interdependent patterns of multimorbidity and correlations with quality of life outcomes can help to identify those older patients with special psychosocial or health care needs. In a representative urban sample of older people (N=299), we describe prevalences of multimorbidity's facets in their various combinations: 'physical multimorbidity' (at least two out of 22 organ-related disease clusters affected), 'limitations in physical functioning' (sub-threshold performance in at least one out of four physical performance tests), and 'limitations in everyday activities' (dependency in at least one activity of IADL). Overall life satisfaction and subjective health were assessed as proxies of subjective quality of life. Linear regression analyses were carried out in order to elucidate multimorbidity's effect on these outcomes. We found differential prevalences and interrelations between the three facets of multimorbidity. Isolated physical multimorbidity was the most prominent one (34.8%), while limitations of IADL or physical functioning were hardly observed in isolation. Also, physical multimorbidity was the most influential predictor of subjective life satisfaction and subjective health.

### **MOBILITY RECOVERY TRAJECTORIES IN HIP FRACTURE PATIENTS**

A. Salpakoski<sup>1</sup>, T. Törmäkangas<sup>1</sup>, J. Edgren<sup>1</sup>, M. Pekkonen<sup>4</sup>, A. Heinonen<sup>2</sup>, M. Kallinen<sup>3</sup>, T. Rantanen<sup>1</sup>, S. Sipilä<sup>1</sup>, 1. *Gerontology Research Center and Department of Health Sciences, University of Jyväskylä, Jyväskylä, Finland*, 2. *Department of Health Sciences, Jyväskylä, Finland*, 3. *Department of Physical Medicine and Rehabilitation, Central Finland Central Hospital, Jyväskylä, Finland*, 4. *Peurunka – Medical Rehabilitation and Physical Exercise Center, Laukaa, Finland*

We studied mobility changes related to hip fracture and investigate the characteristics which correlate with different recovery trajectories. This prospective follow-up study uses pre-trial data of a randomized controlled trial (ProMo, ISRCTN 53680197). The Population-based sample consisted of 81 community-dwelling, 80±7 year-old, hip fracture patients. Self-reported mobility difficulty walking 500 meters was assessed at discharge (3.2±2.2 weeks after the surgery) and 6.0±3.3 weeks after discharge from the hospital. Pre-fracture mobility had been queried during hospital stay. Recovery trajectories were identified using linear latent trajectory model based on mixture distribution methodology. Two recovery trajectories were found. From no to minor difficulty -trajectory includes 27 patients with no pre-fracture difficulty walking 500 meters, followed by at most minor difficulty. In Catastrophic -trajectory (n=54) many had pre-fracture mobility difficulties followed by steep decline at discharge and only minimal improvement at 6 weeks after discharge. Pre-fracture, patients in Catastrophic -trajectory used walking aids indoors (p=.023) and outdoors (p<0.001) and had sustained falls indoors a year before fracture (p=.041) more often than patients in the From no to minor difficulty -trajectory. Patients in Catastrophic -trajectory were older and had longer inpatient period (p<0.001), their functional balance (p=.004) and knee extension force (p=.050) was 6 weeks after discharge poorer while they experienced more lower body pain (p=.002) compared to patients in From no to minor difficulty -trajectory. Trajectories of mobility differ among hip fracture patients. Identifying recovery prognoses at the early stage enables individualized rehabilitation.

### **SESSION 385 (POSTER)**

#### **EDUCATIONAL EVALUATION**

#### **RATING GOALS PRIORITY OF PRESCRIBING DRUG THERAPY FOR ELDERLY PATIENTS AMONG MEDICAL INTERNS: A PILOT STUDY ON TEACHING PATIENT-CENTERED OUTCOMES AND DECISION MAKING**

H. Cheng, *medicine, university of virginia, Charlottesville, Virginia*

**Background:** elderly patients often take multiple drugs due to multiple co-existing chronic conditions. The goals of care can be varied among elderly patients. This could be a challenging for young physicians such as medical interns to prescribe drug therapy for this population. Furthermore, it is unknown how they rate goals priority of drug therapy for elderly patients. Therefore, the author explored medical interns how to rate goals priority of prescribing drug therapy for elderly patients among five goals: 1). Relieve symptoms; 2). Reduce complications; 3). Live longer; 4). Reduce hospitalization; 5). Improve independent function. **Methodology:** It was an observational study. Medical interns were asked to rate goals priority of drug therapy for elderly patients from most important to very important, important, less important, and maybe important before a dialectic lecture on drug use in elderly patients. Descriptive analysis was performed using SPSS. **Results:** 91% medical interns (30/33) has rated goals priority. Overall, relieving symptoms was rated as the most important goal and living longer rated as the least important goal of prescribing drug therapy for elderly patients. 97% medical interns rated relieving symptoms as most important or very

important goal and 83% medical interns rated living longer as less important or maybe important goal of prescribing drug therapy for elderly patients. However, goals priority varied among medical interns. Conclusions: this small pilot study demonstrated that medical interns rated relieving symptoms as top goal priority of prescribing drug therapy for elderly patients.

#### **INTERDISCIPLINARY TEAM TRAINING: DISCIPLINE SPECIFIC PERSPECTIVES OF TRAINEES LEARNING TO WORK IN HEALTHCARE TEAMS**

A.G. Rothrock<sup>1</sup>, P. Sawyer<sup>1</sup>, C. Ford<sup>1</sup>, C.J. Brown<sup>1,2</sup>, C. Ritchie<sup>3</sup>, 1. *University of Alabama at Birmingham, Birmingham, Alabama, 2. Birmingham/Atlanta VA GRECC, Birmingham, Alabama, 3. University of California, San Francisco, San Francisco, California*

Health systems are encouraging providers to participate in interdisciplinary team meetings to gain a full perspective on patient care and to provide their insights and recommendations that allow for the most comprehensive, collaborative care. The University of Alabama at Birmingham Geriatric Education Center has offered the Interdisciplinary Team Training (IDT) experience six times over the past three years, which has included 1089 students from 9 health professions. The 2 ½ hour activity includes observation of an older adult interview by faculty members from each discipline. Trainees then divide into small groups where faculty members lead development of care plans, based on the interview. Evaluation data from the last 4 sessions (Fall 2010-Spring 2012) is presented. Attendees for these sessions included 914 trainees from dentistry (N=51), medicine (N=324), nursing (N=79), nutrition (N=25), occupational therapy (N=72), optometry (N=58), pharmacy (N=135), physical therapy (N=72), and social work (N=98). Overall the IDT experience was rated as a valuable experience, relevant, and a recommended activity (4.2, 4.3, 4.1 respectively on a 5-point scale) with the interview/observation and small group activities rated equally. Participants rated the impact of the interview and small group sessions on their awareness of the multiple perspectives to consider in designing a care plan and what their individual disciplines could contribute. Both the interview and small group sessions received high ratings from all 9 disciplines, ranging by discipline from 3.6 to 4.9 on a 5-point scale. Ratings were consistently and significantly higher ( $p < .001$ ) from nursing, occupational therapy, pharmacy, and social work trainees.

#### **THE DEVELOPMENT OF A COMMUNITY-BASED CURRICULUM IN AGING: THE GEC OF MICHIGAN EXPERIENCE**

L.J. Keilman<sup>1,2</sup>, J.D. Yonker<sup>1,2</sup>, M. Ensberg<sup>1,2,3</sup>, J. Ilardo<sup>1,2</sup>, G.J. Thomas<sup>2</sup>, 1. *Michigan State University, East Lansing, Michigan, 2. Geriatric Education Center of Michigan, East Lansing, Michigan, 3. Sparrow Hospital, Lansing, Michigan*

The Geriatric Education Center of Michigan (GECM) was established in 1987 and since then has been educating interdisciplinary health care professionals in aging knowledge and concepts. As the number of older adults increases, health care professionals will need to be more knowledgeable about the unique multidimensional issues facing this population. One of the overarching goals of the GECM has been enhancing the geriatric/gerontology knowledge of individuals working with older adults in the community. Health care professionals, both those with and without formal education/training in geriatrics/gerontology, have been the focus of the GECM curriculum development. One strategy in accomplishing this goal has been through development and delivery of fundamental aging content in a variety of methodologies and venues. A multitude of strategies and techniques have been utilized in the past 25 years and many lessons have been learned. The basic principles, concepts, and decision-making process of creating aging curriculum materials will be described. Demographic and organizational variables influencing the development of innovative models of curriculum are presented, including determining basic competencies. Pitfalls and point-

ers will be shared. Results of the GECM experience may be helpful to clinicians, educators, and administrators looking to establish successful interdisciplinary teams of aging experts in their communities.

### **SESSION 390 (POSTER)**

#### **END-OF-LIFE**

#### **DOES SELF-REFLECTION ON MORTALITY RELATE TO ANXIETY AND DEPRESSION IN HOSPICE PATIENTS?**

E. Meier, R. Farokhpay, L. Montross, N. Karuvannur, A.E. Zautcke, S. Irwin, *San Diego Hospice and The Institute for Palliative Medicine, San Diego, California*

Depression and anxiety are common among patients with advanced illness. However, little is known about how patients' self-reflection on their mortality may relate to these symptoms. The aim of this study was to measure the prevalence of self-reflection on mortality, as well as the relationship between mortality contemplation, depression, and anxiety among hospice patients. Twenty-one hospice patients completed standardized tests of depression and anxiety. Patients completed qualitative interviews assessing levels of self-reflections on mortality and how these thoughts may have changed since entering hospice. Patients had a mean age of 79 (range = 45-94), were 85% Caucasian, and 57% male. Patients' levels of mortality contemplation significantly increased upon entering hospice ( $t_{20} = -3.681$ ,  $p = 0.001$ ). Prior to hospice care, patients reported contemplating their mortality an average of once per year. After entering hospice, patients contemplated mortality an average of once per month. Patients' level of depression or anxiety was not significantly correlated with levels of self-reflection on mortality. In qualitative interviews, patients most frequently discussed "good care and comfort" received in hospice and acceptance of death. Patients reported a fear of physical pain associated with death more than death itself. The quality of hospice care and the comfort patients received while on service alleviated concerns of mortality. Despite facing imminent death, patients did not endorse depression or anxiety, accepted death, and were more concerned with the physical pain associated with dying. These findings provide useful data for clinicians regarding psychological concerns of hospice patients.

#### **EXPLORING CLINICIAN-FAMILY COMMUNICATION IN ACTIVE HOSPICE INTERDISCIPLINARY TEAM MEETINGS**

K. Washington<sup>1</sup>, D. Parker Oliver<sup>2</sup>, E. Wittenberg-Lyles<sup>3</sup>, G. Demiris<sup>4</sup>, S. Shaunfield<sup>5</sup>, 1. *Kent School of Social Work, University of Louisville, Louisville, Kentucky, 2. Department of Family and Community Medicine, University of Missouri, Columbia, Missouri, 3. Markey Cancer Center, University of Kentucky, Lexington, Kentucky, 4. School of Nursing, University of Washington, Seattle, Washington, 5. Department of Communication, University of Kentucky, Lexington, Kentucky*

Technology enables family caregivers to participate in hospice interdisciplinary team (IDT) meetings from geographically remote locations as part of the ACTIVE (Assessing Caregivers for Team Intervention via Video Encounters) intervention. Research suggests that effective communication is critical to the success of ACTIVE team meetings. The purpose of this study was to obtain a better understanding of the attributes of clinician-family communication during ACTIVE team meetings involving family caregivers of hospice patients. Using a template approach to text analysis, researchers analyzed clinician-family communication during 84 video-recorded IDT meetings conducted as part of a randomized controlled trial of the ACTIVE intervention supported by an R01 grant from the National Institute of Nursing Research. Results indicate that members of the IDT regularly employ communication to more fully involve caregivers in decision-making and executing the hospice plan of care. Less frequently, communication is used to address

emotional aspects of care and to better understand patients and family members in a holistic manner. Discussion of study results includes practical guidance on effective communication with family caregivers in IDT meetings.

### **THE TRAJECTORY OF PALLIATIVE CARE CONSULTATION RECOMMENDATIONS**

E. Kozlov, B.D. Carpenter, *Psychology, Washington Univ, St. Louis, Missouri*

**Introduction:** In 2008, the Veterans Association mandated that all VA hospitals have a palliative care consult team (PCCT) in place to provide specialized services to veterans with severe, life-limiting illness. The goal of these teams is to offer guidance to the originating medical team regarding holistic treatment that maximizes quality of life. The purpose of the current study was to examine systematically what recommendations are made by a PCCT and how they are implemented. **Methods:** This medical records review study examined initial palliative care consultations conducted between January 1st, 2009 and December 31st, 2010. Data extraction focused on PCCT recommendations, timing of implementation, and nature of implementation. **Results:** PCCT recommendations ranged in their focus from symptom management, to placement suggestions, to goals of care adjustments. The mean number of recommendations made by the PCCT was 2.14 (SD=1.88) per consult. Over half (58.8%) of the recommendations were implemented by the originating care team. Of the recommendations that were implemented, the mean time to implementation was 1.03 days (SD=1.35), and most recommendations were implemented as instructed by the PCCT. **Conclusions:** In this setting, the PCCT is active in offering a wide range of recommendations that are implemented frequently and efficiently. Nonetheless, the medical chart review methodology raises questions about what informal care decisions and conversations occur outside of the formal documentation system. Additional research methods may provide further insight into how palliative care consultation teams can function most effectively.

## **SESSION 395 (POSTER)**

### **ADULT PROTECTION AND ELDER ABUSE**

#### **PHYSICAL ABUSE IN THE ELDERLY: AN EPIDEMIOLOGIC STUDY IN ATLANTA, GEORGIA**

T. Price<sup>1</sup>, R.L. Dillard<sup>1</sup>, S. Strasser<sup>2</sup>, P.S. King<sup>3</sup>, K. Johnson<sup>1</sup>, *1. Division of Geriatric Medicine, Emory University, Atlanta, Georgia, 2. Georgia State University, Atlanta, Georgia, 3. Georgia Division of Aging Services, Atlanta, Georgia*

Increased awareness of elder mistreatment (EM) in the United States has led to prevalence and risk factor research, but few studies to date have investigated legal consequences of cases processed within the judicial system. Researchers in DeKalb County, Georgia reviewed EM cases from 2009-2010. These cases were obtained through a unique collaboration of academic centers of Gerontology and local law enforcement officials (solicitor general, district attorney, and local police departments) as part of a greater effort to identify and care for the victims of elder mistreatment in Atlanta, Georgia. Using standardized epidemiological methods, 41 cases of elder physical abuse crimes, risk factors, and outcomes were categorized. These EM cases were all filed as misdemeanors in state court. Findings include: EM recurrence among 77% of cases; familial perpetrator in 61% of cases; and simple battery as the most frequent charge filed. One-third of cases were dismissed before trial due to lack of evidence or testimony (*nolle prosequi*), half involved guilty pleas without subsequent trial, and the remainder dismissed for other reasons. Results may indicate that the victim-abuser relationship may lead to reluctance to testify or prosecute; thus cases are not fully

resolved in the judicial system. Of particular concern is the high rate of recidivism, which may be perpetuated by insufficient consequences of EM crimes.

### **ANALYSIS OF ABUSE AND CARE WORKERS' SATISFACTION WITH THEIR WORKPLACES: A NATIONWIDE STUDY IN JAPAN**

K. Masuda, T. Tatara, *Japan Rec Cross Kyusyu International Nursing College, Munakata, Japan*

This study had the following three aims: 1) to evaluate the extent of elder abuse and abuse of people with disabilities while receiving care, 2) to assess the extent to which environmental factors affect care workers using a scale to measure their satisfaction in their workplaces, and 3) to analyze the relationships between the extent of abuse and the care workers' satisfaction. Between February 10 and March 12, 2011, a mail survey was conducted on 1,713 individuals working as care workers at 564 institutions. A total of 1,135 (66.3%) valid responses were received. The following major findings were observed: 1) slightly more than 25% of all respondents indicated that they had committed physical or psychological abuse in their workplaces, 2) 48.1% of respondents were not satisfied with their salary because they considered it to be very low compared to other jobs, 3) 35% of all respondents were very dissatisfied with their work hours, 4) abuse and neglect were strongly related to the care workers' level of satisfaction with their workplaces, and 5) the level of abuse and neglect differed depending on the education level of the respondents. Currently, Japan has child protective services and adult protective services for the elderly and a similar program will be started for people with disabilities on October in 2012. However, the results of this study indicate the urgent need to improve the work environment of care workers in Japan. These and several other findings will be discussed in this session.

### **A LATENT GROWTH MODEL OF SPOUSAL VIOLENCE AND ELDERLY DEPRESSION TRAJECTORY IN KOREA**

M. Park<sup>1</sup>, H. Jun<sup>1</sup>, J.I. Wassel<sup>2</sup>, *1. Department of Child & Family Studies, Yonsei University, Seoul, Republic of Korea, 2. The University of North Carolina Greensboro, Greensboro, North Carolina*

Little is known about the long-term effects of spousal violence on the mental health of the perpetrators and the victims. Using the longitudinal data of South Korea Welfare Panel Study (2006-2009), we explored the association between spousal violence and elderly depression among South Koreans aged 55 and over. For analyses, a Latent Growth model was used. The results indicated that experiencing spousal violence both as a victim or a perpetrator was associated with elderly depression. Older Koreans, who had perpetrated verbal or physical violence towards spouses, demonstrated higher levels of depression at the first wave compared to those with no reported spousal violence. The higher effect was found for perpetrators across all four waves. Older Koreans who were victims of spousal abuse marked high initial levels of depression (2006) compared to those who reported no spousal violence; however the cross-sectional differences between the two groups tended to decrease across all four waves. The results indicate that the perpetrators of spousal violence are more likely to experience negative long-term effects on mental health compared to victims. These findings strongly suggest that the policy makers, practitioners, and researchers need policies and resources not only for the victims, but also for the perpetrators. Addressing the needs of both groups may both to reduce domestic violence and to improve the mental health of the victims and the perpetrators of domestic violence.

## CONTEXT EXAMINED: ORGANIZATIONAL DYNAMICS AND ELDER MISTREATMENT IN LONG-TERM CARE SETTINGS

A. Kille<sup>1</sup>, D. Burns<sup>1</sup>, P. Hyde<sup>2</sup>, F. Poland<sup>1</sup>, A. Kenkmann<sup>1</sup>, R. Gray<sup>1</sup>, *1. Faculty of Medicine and Health Sciences, University of East Anglia, Norwich, United Kingdom, 2. The University of Manchester, Manchester, United Kingdom*

**Objective:** To examine the organizational factors and interactions associated with mistreatment of older people being cared for in long-term care settings. **Background:** Research into elder abuse in long term care settings has examined risk factors associated with the older person, and with the staff group, with calls for more contextual approaches. **Design:** Comparative case study design incorporating participatory research. **Setting:** Eight long-term care settings in England. **Participants:** 167 residents, relatives and staff. **Methods:** In eight case studies in a purposive sample of long-term care settings organizational factors were used to direct ethnographic observation and interviews. Peer researchers (people aged over 60 with interest in/experience of care homes) contributed to data collection and analysis. **Results:** Organizational factors were identified by literature review and expert panel discussion with service users, family carers and care providers. The case study research revealed organizational factors to be in interaction. Such 'organizational dynamics' at times led to good care becoming unstable. Some systems could adapt, limiting fluctuations in care quality. However, organizational dynamics led in places to mistreatment, preventing 'good' people from providing good care. **Conclusions:** Quality assurance processes should examine how organizational factors are interacting (organizational dynamics) to affect care quality. Poor practice can become embedded in workplace cultural norms, and no longer recognised as concerning. Further development of processes to facilitate contribution of residents and staff to quality assurance processes would tap an as yet unrealised source of knowledge about how a long-term care setting is functioning at an organizational level. This paper is based on a research study funded by the Department of Health and Comic Relief. The views expressed in this paper are not necessarily the views of the Department of Health and Comic Relief.

## EXPERIENCING ABUSE AND FEELING ABUSED: EXPERIENCES FROM THE CANADIAN PILOT STUDY ON ABUSE & NEGLECT

C. Thomas<sup>1</sup>, L. McDonald<sup>2</sup>, S. Hirst<sup>3</sup>, P. Silva<sup>1</sup>, M. Beaulieu<sup>4</sup>, *1. Westat, Rockville, Maryland, 2. National Initiative for the Care of the Elderly (NICE), University of Toronto, Toronto, Ontario, Canada, 3. University of Calgary, Calgary, Alberta, Canada, 4. Sherbrooke University, Quebec, Quebec, Canada*

The Canadian pilot study on abuse and neglect was conducted in the summer of 2011. Some respondents noted that although they said "yes" to one or several items of abuse, they did not feel they experienced abuse during cognitive testing of the survey instrument. Because of this finding, we included a summary question that addressed this issue in the telephone interviews with older adults living in the community and institutionalized older adults. Respondents were given a definition for each type of abuse (neglect, psychological abuse, physical abuse, sexual abuse and financial abuse). If respondents said "yes" to any abuse item, they were asked if they felt they had experienced that particular type of abuse (e.g. physical abuse). To further understand how they felt, we asked them to describe their experiences. While 122 (46%) of respondents said "yes" to one or several abuse items, only two-thirds of them (78) felt they had been "abused." In classifying a series of events as abuse, we found that it is important and relevant to take account of respondents' own perceptions and descriptions of the situation. By including objective items and respondents' interpretations of events, there can be more sensitive and accurate estimates of prevalence. It may be necessary to make qualitative judgments about whether a specific case constitutes abuse. This is an important and unique contribution to

the measurement of elder abuse prevalence. This poster will show how respondents viewed their experiences and the kinds of situations they experienced.

## MIND THE GAP: IMPROVING CRIMINAL JUSTICE AGENCIES AND SOCIAL SUPPORT AGENCIES RESPONSES TO INTIMATE PARTNER VIOLENCE AGAINST OLDER WOMEN

B. Penhale<sup>1</sup>, B. Nagele<sup>2</sup>, O. Toth<sup>3</sup>, W. Goreham<sup>1</sup>, B. Haller<sup>4</sup>, H. Perista<sup>5</sup>, T. Goergen<sup>6</sup>, *1. School of Nursing Sciences, University of East Anglia, Norwich, Norfolk, United Kingdom, 2. Zoom-prospektive NGO, Göttingen, Germany, 3. Institute of Sociology, Budapest, Hungary, 4. Institute for Conflict Research, Vienna, Austria, 5. CESIS NGO, Lisbon, Portugal, 6. German Police University, Munster, Germany*

**Context:** This EU-funded (Daphne III programme) study on Intimate Partner Violence (IPV) and Older women includes partners from Austria, Germany, Great Britain, Hungary, Poland, and Portugal. The project is running between March 2011 and March 2013 and addresses the issue of how to improve responses by criminal justice and social support agencies to intimate partner violence against older women. Until now, comparatively little has been known about this issue and this project helps to address that knowledge deficit. This work builds on previous work in this area, specifically a study undertaken between 2009-2011. **Method:** The first phase of the study consisted of analysis of case files held by the police and other criminal justice agencies in each country. Phase two consists of the development of guidance and training material for criminal justice agencies. The final phase consists of the development of guidance and PR and awareness raising material in conjunction with social support agencies. **Results:** The case file analysis was undertaken in 7 different police forces across England and Wales and 150 cases were analysed across a number of different fields. Likewise the expert workshops with criminal justice and social support agency representatives consisted of representatives from both countries, who contributed to the development of guidance, training and PR materials concerning intimate partner violence and older women. The results of the case file analysis will be presented and work in progress in the subsequent phases of the project will be described and discussed.

## PROTECTING VICTIMS OF FINANCIAL EXPLOITATION: THE EFFECT OF AN ELDER ABUSE FORENSIC CENTER

A.E. Navarro<sup>1,2</sup>, Z.D. Gassoumis<sup>2</sup>, K. Wilber<sup>2</sup>, *1. Azusa Pacific University, Azusa, California, 2. University of Southern California, Los Angeles, California*

Elder financial exploitation is defined as the taking or misappropriation of an older person's property, possessions, or financial assets. For cases reported to Adult Protective Services (APS) arriving at a remedy can be time-consuming and complex, requiring cooperation from a diverse array of institutions. This National Institute of Justice study focused on outcomes from a specialized multidisciplinary team—the elder abuse forensic center (the Center)—comprised of a diverse collaborative of professionals, meeting weekly with an overarching goal of protecting vulnerable adults. The sample consisted of community-dwelling adults, aged 65 and older, residing in Los Angeles County, California (n=482). Propensity score matching compared the "value added" from the Center to usual APS care. Each victim reviewed at the Center (n=241)—January 2007 through December 2009—was matched with unduplicated APS clients (n=33,650) served during the same period. Covariates included socio-demographics, additional abuse types, and referral sources. Referrals were tracked by Office of the Public Guardian (PG) revealing those with a PG investigation (17.8%, n=86). Outcomes included PG conservatorship, third party conservatorship, determination of self-sufficiency, and other. Preliminary evidence suggests the combined expertise of health, social service, and justice professionals enhanced conservatorship outcomes aimed at protecting financial

exploitation victims, as Center cases were over seven times more likely to be investigated (OR 8.5, CI:4.6-15.9,  $p < .001$ ) and over six times more likely to be conserved by PG (OR 7.3, CI:2.1-25.6,  $p < .05$ ). These results have implications for policy and practice related to the national replication of elder abuse forensic centers.

### **NURSING STAFF PERCEPTIONS OF ELDER ABUSE IN KENTUCKY**

T. Wangmo<sup>2</sup>, P.B. Teaster<sup>1</sup>, 1. *Health Behavior, Univ of Kentucky, Lexington, Kentucky*, 2. *University of Basel, Basel, Switzerland*

It is estimated that one in ten older persons living in the U.S. in community settings have experienced abuse or neglect during the previous year. Abuse and neglect of older persons also occurs in facilities such as nursing homes, where elders are dependent on professional staff due to health care conditions and limitations in performing activities of daily living. Some providers may be under stress to complete their responsibilities, resulting in neglectful acts. The aim of this study was to examine nursing staff members' perceptions of elder abuse in Kentucky. Using questions from a number of validated instruments (e.g., the revised Conflict Tactic Scale, Social Support Instrument, Elder Neglect Assessment, and Elder Abuse Screening Test) a survey was constructed and sent to registered nurses (RN) and licensed practical nurses (LPN) in Kentucky. The study population included 8,528 RNs and LPNs registered with the Kentucky Board of Nursing. A sample of 4,000 RNs and LPNs were randomly selected and stratified into rural, urban, and metro regions. In our effort to oversample rural area, 80% of the rural population received the survey, while 39% of urban and metro populations were selected. Preliminary results suggest that only 5% of the surveys were returned. These responses (approx. 25% each) were from RNs and LPNs living in rural and urban regions. Almost 40% of respondents had been working at a nursing facility for more than one year and another 36% had worked in their current workplace for more than 6 years. Almost all respondents (95%) were white, female (90.3%), and most (90%) had either a college diploma or degree. The results of this study highlight perceptions of the prevalence of elder abuse in Kentucky's nursing homes and provide information about measures that can be taken to prevent and intervene in elder abuse in nursing homes.

### **ELDER FINANCIAL ABUSE: CRIMES OF OCCASION, DESPERATION AND PREDATION**

P.B. Teaster<sup>1</sup>, K.A. Roberto<sup>2</sup>, R. Blancato<sup>3</sup>, J. Migliaccio<sup>4</sup>, 1. *Health Behavior, Univ of Kentucky, Lexington, Kentucky*, 2. *Virginia Tech, Blacksburg, Virginia*, 3. *Matz Blancato and Associates, Washington, District of Columbia*, 4. *MetLife Mature Market Institute, Westport, Connecticut*

Elder financial abuse, the unauthorized use or illegal taking of funds or property of people aged 60 and older, is regarded by some as the "Crime of the 21st Century." Our study compared three months of national news articles from 2008 and 2010 to examine trends in financial elder abuse. The annual financial loss by victims in 2010 was estimated at 2.9 billion, which was a 12% increase in the amount estimated in the 2008 study. Fraud perpetrated by strangers was present in 51% of articles; 34% concerned financial abuse perpetrated by family, friends, and neighbors. Women were nearly twice as likely to be victims of financial abuse as were men. The majority of victims was 80-89 years of age, lived alone, and needed assistance with either health care or home maintenance. Nearly 60% of perpetrators were males between 30-59 years of age. In most instances, perpetrators practiced deceit, threats, and emotional manipulation to exploit the elders. Empowering elders and families to prevent and reduce elder financial abuse is an important policy initiative. Study findings have been cited in congressional hearings on elder justice and have implications for educating older adults and the public at large about the widespread occurrence of this problem.

### **SOCIAL WORKER ABILITY TO IDENTIFY ELDERLY WITH HIGH ADULT PROTECTIVE SERVICE (APS) RECIDIVISM RISK**

D.H. Sommerfeld<sup>1</sup>, G.A. Aarons<sup>1</sup>, L.B. Henderson<sup>2</sup>, 1. *University of California, San Diego, La Jolla, California*, 2. *Human Services Agency, County of Ventura, Ventura, California*

**Introduction:** Research on Adult Protective Service (APS) recidivism for elders is limited. This study assesses the ability of APS social workers to accurately (and prospectively) evaluate the likelihood of requiring future APS intervention following case closure. **Methods/Data:** Data came from Ventura County, California, elder adult APS episodes with a confirmed self-neglect and/or abuse-by-other allegation between 11-1-2009 and 3-31-2011 (n=648). Recidivism was measured dichotomously (yes/no) based on whether a subsequent APS episode with a confirmed allegation occurred within 180-days of initial episode closure. APS social workers indicated the prognosis for "non-recurrence" at case closure on a 6-point ordinal scale. We utilized chi-square tests and multilevel, multivariate logistic regression analyses to assess the relationship between 180-day recidivism and social worker prognosis overall and by allegation type. **Findings:** Overall, 12.7% experienced 180-day recidivism. This rate varied by allegation type from 6.5% (abuse-by-other), to 14.8% (self-neglect), and 38.0% (both abuse-by-other/self-neglect). Social worker determined prognosis was associated with recidivism overall and for each allegation type. Overall, a low, medium, or high prognosis for non-recurrence corresponded to a 22.0%, 12.2%, and 1.0% actual 180-day recidivism rate. In the multivariate logistic analyses, prognosis continued to be a significant and substantial predictor of actual 180-day recidivism. **Conclusions:** The capacity of APS social workers to successfully identify clients most likely to experience future maltreatment combined with variations in recidivism evident by allegation type indicates that APS can accurately target longer term monitoring and support services to clients with high recidivism risk. This prospective shift can help prevent future maltreatment.

### **INSIDE THE BLACK BOX OF MULTIDISCIPLINARY TEAM PROCESS: MANAGING CONFLICT AND AGREEMENT**

J. Wysong, M. Riparetti-Brown, K. Wilber, *Davis School of Gerontology, University of Southern California, Los Angeles, California*

A multidisciplinary team (MDT) approach is an important tool to address complex elder abuse cases; building trust between disciplines is necessary for successful teamwork. Knowledge of team member roles, decision-making processes, and group dynamics will aid promotion of group cohesion without compromising interdisciplinary creativity. This study used case discussion transcripts and written observations of non-verbal communication to qualitatively examine an elder abuse MDT's discussion processes (n=38). The Team Observation Protocol was used to classify each interaction by function. Of all interactions, 72.3% were either questions or information; the majority of questions were asked by the team Geriatrician (22.7%), the Neuropsychologist (20.0%), Adult Protective Services (18.7%), and the District Attorney (12.0%). The case presenter was the primary source of information (73.6%). The most frequent decision-makers were the Geriatrician (38.5%) and the Public Guardian (30.8%). Narrative analysis found that themes within information-gathering are "victim characteristics," "suspected abuser profile," and "case facts." Themes in decision-making were "support services," "protective interventions," and "further evaluation." Sub-categories within each theme are detailed in a discussion process model. Verbal conflicts consisted of the expression of opposing views, and were often followed by humor or affirmation for the work of the team or case presenter. Findings from this study and the case discussion process model contribute to improving the efficiency and effectiveness of MDT case review processes. Findings suggest team members sometimes express opposing views that are necessary for advancing case objectives and for innovative case plans. Simultaneously supportive

interactions diffuse the corrosiveness of disagreement and perceived conflict.

### **SLOWING THE REVOLVING DOOR: THE EFFECT OF AN ELDER ABUSE MULTIDISCIPLINARY TEAM ON RECIDIVISM WITHIN ADULT PROTECTIVE SERVICES**

J. Wysong, Z.D. Gassoumis, J.M. Yonashiro Cho, K. Wilber, *Davis School of Gerontology, University of Southern California, Los Angeles, California*

Empirical research on recidivism of suspected elder abuse victims within Adult Protective Services (APS) is lacking. Of the two previous studies, complexity of suspected abuse type, advanced age, and living alone were predictors for re-referral to APS after case closure. More evidence is needed to better understand why recidivism occurs and how to enhance case resolution. Building on previous findings that analyzed predictors of recidivism among elder abuse cases referred to Los Angeles County APS between 2007 and 2009, this presentation includes APS investigation findings in a predictive model of recidivism and analyzes recidivism outcomes among cases referred to the Los Angeles County Elder Abuse Forensic Center (the Center). The sample consists of 592 APS clients, selected by propensity score matching of APS usual care cases to those seen by the Center. A majority (40%) of the Center clients were recidivists prior to intervention compared to 17% of the control group ( $p < 0.001$ ), indicating that recidivism is a basis for referral to the Center. This finding was confirmed in a logistic regression model controlling for demographics and suspected abuse types ( $OR = 3.17, p < .001$ ); however, the odds of Center cases exhibiting recidivism after presentation at the center was markedly lower ( $OR = 2.18, p < .05$ ). The Center reduced recidivism by 50% compared to 37% for clients in usual care. APS is an over-burdened public service. Evidence-based information on recidivism will aid policy decisions on staff training, investigation procedure, and the role of forensic multidisciplinary intervention as means to reduce elder abuse recidivism.

## **SESSION 400 (POSTER)**

### **AGING AMONG MINORITY AND DIVERSE POPULATIONS**

#### **ETHNIC IDENTITY AND THE ISSUE OF AUTHENTICITY: THE MIDLIFE PERSPECTIVES OF SECOND-GENERATION KOREAN AMERICAN BABY BOOMERS**

L.S. Park, C.E. Barber, *Human Development and Family Studies, University of Wisconsin-Madison, Madison, Wisconsin*

Much of the research on ethnic identity has centered on the experiences of adolescents and young adults. By contrast, this study focuses on ethnic identity from the perspective of middle adulthood. Of particular interest is the issue of authenticity, wherein individuals grapple with being viewed both as a “racial foreigner” in one cultural context, and as a “cultural foreigner” in another. The 16 middle-aged participants in this qualitative study are second-generation Korean Americans born between 1953 and 1965. In semi-structured interviews, participants shared retrospective thoughts and experiences about being seen as “neither a real American nor a real Asian” (Tuan, 1999). Identity issues related to being a “racial foreigner” were revealed in attempts to blend in with white peers, particularly during their youth into college and young adult years. However, as participants tried to assimilate into the predominant American/white culture, they began to understand how different they were and subsequently sought out co-ethnic peers as the Korean immigrant communities grew around them. Importantly, in the latter cultural context, participants experienced “othering” and exclusion from their co-ethnic community and peers; that is, they were viewed as “cultural foreigners”. From their midlife perspective, the experience of being viewed as cultural foreigners within the immigrant Korean communities was more distressing than being viewed as “racial foreig-

ners” earlier in life. While the combination of these experiences resulted in participants often questioning their authenticity as a Korean, the midlife period of their adulthood brought a new appreciation and sense of their identity.

### **MENTAL HEALTH SERVICE NEEDS & USE AMONG DEPRESSED OLDER ADULTS: THE ROLE OF ACCULTURATION**

H. Lee, M.S. Yang, E. Dugan, *University of Massachusetts Boston, Boston, Massachusetts*

Mental health service use is related to one’s help needs. Discrepancy between help needs and actual use might be related to one’s attitudes toward mental health and mental health service use. Immigrants may have different ideas about these, depending on the level of acculturation. This study aims to examine the role of acculturation in mental health service needs and use among older adults with depression. This study analyzes foreign and native born older adults (age 50 and over) who have depressive symptoms ( $N = 1,547$ ) from the 2001 California Health Interview Survey (CHIS). Acculturation is measured with immigration status and English proficiency. Descriptive, bivariate, and multinomial logistic regression are conducted. 47.3% of respondents do not report any perceived help needs for mental concern. Less than half of respondents who have help needs actually used mental health services. Immigrants are less likely to perceive help needs than US born ( $OR = .66, p < .05$ ). Lower English proficiency is a risk factor of not using mental health services ( $OR = .20, p < .05$ ). Older adults who are relatively younger, female, White, and have higher education, good health, and mental health insurance are more likely to have perceived help needs and to use mental health services. This study helps to identify risk groups who need help but do not have help needs and who need help but do not have access to services among older adults with depression with respect to the acculturation.

### **UNINSURED OLDER ADULTS: PREDICTORS OF ELEVATED RATES IN 50 STATES AND DC**

P. Huffman-Oh, C. Lee, L. Quach, N. Xie, E. Dugan, *University of Massachusetts, Boston, Boston, Massachusetts*

Uninsured older adults are disproportionately located in a few States. Although small in number, those aged 65+ without medical insurance represent a potentially significant cost to state healthcare systems. This study explores variations in rates by examining state population characteristics and state healthcare policy. State level data was derived from the 2010 Current Population Survey, Annual Social and Economic Supplement. Descriptive, bivariate, and multivariate analyses were conducted. The proportion of uninsured older adults was computed for each of the 50 States and DC. Based on the observed distribution, states were grouped into those with low ( $\leq 1\%$ ), moderate ( $> 1\% - \leq 3\%$ ), and high ( $\geq 3\%$ ) rates. Un-insurance rates varied dramatically across states and groups. 3.6% of older adults in high-rate states were uninsured compared to 1.4% in the remaining states ( $t\text{-test} = -9.0243, p < .001$ ). Bivariate analysis comparing low-rate with high-rate States showed significant differences in the percentage of older adults who were Hispanic (5% vs 8.9%,  $p = .009$ ), Black (1.6% vs 3.1%,  $p = .038$ ), Asian (5.2% vs 12.3%,  $p = .019$ ), immigrants (4% vs 13%,  $p = .002$ ), and living at or below 150% of poverty (19.4% vs 24%,  $p = .01$ ). Multivariate regression showed that population characteristics (e.g., % non-citizen immigrant, % minority, % 65-69 years) contributed to state older adult un-insurance rates but that per capita Medicaid expenditure and un-insurance among those 18-64 did not ( $F = 48.40, p < .001$ ). These findings suggest State rates of older adult un-insurance are influenced by different factors than rates among younger ages. Implications for state healthcare policy are discussed.

## **SOCIAL COHESION AND TRUST AMONG OLDER MEXICAN AMERICANS LIVING IN HIGH DENSITY ETHNIC NEIGHBORHOODS**

K.G. Emerson<sup>1</sup>, K. Eschbach<sup>2</sup>, 1. *Institute of Gerontology, University of Georgia, Athens, Georgia*, 2. *University of Texas Medical Branch, Galveston, Texas*

**Background:** Extant research shows that neighborhoods with a high proportion Mexican Americans can have a positive effect on mortality as well as both good physical and mental health outcomes for older Mexican Americans. Researchers speculate that this is due to social processes at work in these neighborhoods. **Purpose:** We test the hypothesis that social networks for older Mexican Americans living in high density ethnic neighborhoods differ from those that do not live in such neighborhoods. **Methods:** Using data from Wave 5 of the Hispanic Established Population for the Epidemiological Study of the Elderly (Hispanic EPESE; N=1,716) we test this hypothesis by examining the impact of individual level social ties and neighborhood-level characteristics on social cohesion and trust (SC&T). We employ multi-level regression modeling, which considers individual factors nested within county-level data. **Results:** Hierarchical models suggest that persons living in neighborhoods with a higher density of Mexican Americans report higher rates of SC&T ( $p$ -value<.05). Additionally, models showed that while having family in the neighborhood was not significantly associated with SC&T, having a few friends ( $B=1.38$ ) or many friends ( $B=3.49$ ) compared to having no friends in the neighborhood was highly and significantly correlated with the outcome. **Conclusions:** The original hypothesis is supported, suggesting that the protective effect of high density Mexican American neighborhoods could be due to higher rates of social cohesion in these neighborhoods. Results also showed that friends in the neighborhood are more important to forming SC&T rather than family. Implications of the results will be discussed.

## **ETHNICITY, CAPITAL, ACCULTURATION, AND FUNCTIONAL STATUS AMONG OLDER ASIAN IMMIGRANTS IN THE U.S**

Y. Jeong, H. Igarashi, R. Nath, N. Toyokawa, *School of Social and Behavioral Science, Oregon State University, Corvallis, Oregon*

Despite the rapid growth and large presence of Asian immigrants in the U.S (U.S. Census Bureau, 2012), their health status and its heterogeneity among subgroups is poorly understood. Based on empirical studies with the general population and non-Asian groups (Gong, et al., 2011; Frisbi, et al., 2001), this study examined the links between older Asian immigrants' functional status and underlying mechanisms such as ethnicity, capital, and acculturation. Using the 2010 American Community Survey, we sampled older immigrants (65 years or older) from Philippines, China, India, Vietnam, and South Korea (N = 8566). Functional status questions asked whether respondents had self-care and ambulatory difficulty. Capital included education, household income, and enrollment in health insurance. Acculturation was measured by duration of residence in the U.S and English proficiency. Logistic regressions were used for the analysis. Controlling for demographic characteristics, Filipino, Indian, and Vietnamese immigrants were more likely to have self-care difficulty than U.S-born White counterparts. Chinese, Vietnamese, and Korean older adults were less likely to report ambulatory difficulty than US-born White counterparts although Filipino and Asian Indian immigrants showed a higher chance of having this difficulty. Capital was less associated with the functional status among Asian immigrants than U.S-born White counterparts. For Asian immigrants, longer residence in the U.S and decreased a chance to have self-care difficulty, and better English proficiency did ambulatory difficulty. The effects of capital and acculturation on functional status varied by ethnicity. This study highlights the diversity of health among older Asian immigrants.

## **EFFECTS OF PARTICIPATION IN ADULT DAY HEALTH CARE (ADHC) ON QUALITY OF LIFE AMONG LOW-INCOME OLDER KOREAN IMMIGRANTS**

B. Kim<sup>1</sup>, L.B. Maradik Harris<sup>2</sup>, 1. *School of Social Work, University of Hawaii at Manoa, Honolulu, Hawaii*, 2. *UCLA, LA, California*

**BACKGROUND:** Social activity benefits elders by improving their quality of life. Community-based long-term care for older participants is especially beneficial in enhancing their quality of life because it includes engagement in activities such as exercise, teaching, taking classes, and volunteering. Few studies have examined the association between participation in adult day health care (ADHC) and quality of life among low-income older Korean immigrants. The purpose of this study was to explore the correlation between participation in adult day health care and quality of life of low-income older Korean immigrants. **METHODS:** The study uses a cross-sectional survey design with a sample of 215 older Korean immigrants in Los Angeles County. Participation variables (number of years in ADHC and number of days in ADHC) were used to measure participation. To measure quality of life, the Rand SF-36 scale was utilized. The study was conducted through questionnaires administered to 215 older Korean participants at 9 adult day health care centers in Los Angeles County. **RESULTS:** The study found that participants who attended more years in ADHC were more likely to have higher QOL. However, no correlation was found between number of days in ADHC and QOL. In particular, female participants in adult day health care had stronger positive correlations with QOL. **IMPLICATIONS:** Findings suggest that participation in ADHC is significantly associated with QOL among low-income older Korean immigrants, in particular female elders. Practitioners and community leaders can use these findings to encourage older Korean immigrants to participate in community-based long-term care such as ADHC.

## **HEALTHY EATING HURDLES: A QUALITATIVE INVESTIGATION OF OLDER ADULTS' FOODSCAPE MANEUVERABILITY IN URBAN NEIGHBORHOODS**

M.L. Boehm, *Sociology, Case Western Reserve University, Cleveland, Ohio*

It has been consistently documented that healthy eating is one of the core contributors to disease prevention (Shepherd et al. 2006). Moreover, there is a large body of literature demonstrating the relationship between social structures and health (Coveney 2004). To date, there has been little attention paid to barriers within neighborhood Total Food Environments (TFEs), particularly in regards to older adults residing in public housing. Determining what these barriers are is even more critically important in understanding what can be done to positively aid in breaking down these barriers to healthy eating in low-income neighborhoods. This qualitative study is one of the first to determine healthy eating barriers in urban neighborhoods, particularly for aging seniors who reside in public housing. Data consist of 20, one-on-one semi-structured interviews with CMHA (Cuyahoga Metropolitan Housing Authority) Senior (50+) residents in the Cleveland, Ohio area. Through use of a qualitative design, this methodological approach has been used rarely, if at all, in research on urban food environments. Preliminary results indicate that safety and dishonest pricing methods in neighborhood cornerstores limits the already barren food choices available within their neighborhood boundaries. These data will inform efforts to increase access to healthy foods in underserved neighborhoods, including future programming, sustainability of interventions, and neighborhood infrastructure planning.

## **AGING ORGANIZATIONS IN A TIME OF ECONOMIC DOWNTURN: FINDINGS FROM THE 2011 TITLE VI AGING NETWORK SURVEY**

K. McGrew<sup>1</sup>, E. Carpio<sup>1</sup>, J. Straker<sup>1</sup>, M. Kaschack<sup>2</sup>, 1. *Miami University, Oxford, Ohio*, 2. *National Association of Area Agencies on Aging (n4a), Washington, District of Columbia*

Organizations serving older adults have faced unusual challenges in the past three years of economic downturn; increased demand for

services and reduced or threatened funding require organizations to do more with less. One network of organizations, the 249 Older Americans Act Title VI American Indian, Alaska Native and Native Hawaiian programs, is relatively understudied as it works to maintain services, build capacity, and expand programs in these challenging times. With a grant from the Administration on Aging (AoA), the National Association of Area Agencies on Aging (n4a) partnered with the Miami University Scripps Gerontology Center to conduct the 2011 survey of Title VI programs. The survey assessed the role of Title VI programs in providing services and supports to elders in their communities. The survey was completed by 207 Title VI programs (83%). Respondents reported ongoing fiscal pressures; over three-quarters (77.6%) of Title VI programs have been faced with the likelihood of running out of funds for services. They also reported a range of strategies employed to meet the growing needs of their community elders. Among these strategies are engaging in partnerships with organizations within and beyond their communities, including collaborations with Area Agencies on Aging; developing improved access to services; developing business planning and outreach activities; and the use of volunteers. Finally, respondents reported strong interest in training and technical assistance to enhance strategic planning, resource development, grant writing, and the development of outcome measures. Implications for advocacy, policy development, training, and research are suggested.

#### **HEALTH INSURANCE COVERAGE AMONG OLDER ASIAN AND HISPANIC IMMIGRANTS: CITIZENSHIP STATUS AND ETHNIC DIFFERENCES**

S. Lee, *Gerontology, Univ Mass Boston, Boston, Massachusetts*

The purpose of this study is to compare health insurance coverage (Medicare, Medicaid, private health insurance (PHI), and no health insurance (NHI)) across older Asian and Hispanic immigrants. The data are drawn from the American Community Survey 2010. The sample consisted of Asian and Hispanic immigrants, who are noninstitutionalized and older than 65 years. The findings for Asians show that the effect of being a US citizen is significant for all health insurance indicators, where the odds of having PHI and Medicare is 2 and 4 times greater, respectively, than among the Asians who don't have that insurance. In contrast, the likelihood of having Medicaid and having NHI decrease by 20% and 99% for US citizen Asian than among the non-citizen Asian, respectively. Very similar results are found among Hispanics. In terms of Asian ethnicity, the odds of having PHI or Medicare are much lower for Chinese, Filipino, Indian, Korean, and Vietnamese than for Japanese. Moreover, the odds of having Medicaid or NHI are much higher across all Asian groups than for Japanese. In terms of Hispanic ethnicity, the odds of having PHI or Medicare are much lower for Mexican and Cuban than for Puerto Rican (PR). In addition, the odds of having Medicaid or NHI are much higher across all Hispanic groups than for PR. This study shows that Asian and Hispanic ethnic groups experience disparities in health insurance coverage. In order to decrease a late-life gap in health insurance coverage, barriers to obtaining health insurance should be reduced.

#### **HEALTH CARE UTILIZATION AND LANGUAGE PREFERENCES AMONG OLDER ASIANS IN CALIFORNIA**

M. Nguyen, S. Wang, L. Quach, E. Dugan, *University of Massachusetts, Boston, Boston, Massachusetts*

The quality and satisfaction with care is related to the ability to communicate. The aim of this study is to investigate the role of language in health care utilization among older Asian adults in California. This cross-sectional analysis used 2009 California Health Interview Survey (CHIS) to examine the health care utilization among older Asians aged 50 and over (N=2,596) who report speaking English "not well or not at all". The ethnicities looked at are Chinese (n=570), Vietnamese (n=757), and Korean (n=535). Descriptives, bivariate, and SEM analyses were conducted. When asked if language was a barrier to going to see the doc-

tor, subjects responded "no" including those who self-reported poor to no knowledge of English. Of Asians aged 50 and over, 44% speak poor to no English. When broken down by ethnicities, Vietnamese and Koreans self-report speaking poor English at 70% and 67% respectively. The number of doctor visits and patients speaking "poor to no" English are not dependent of each other  $c2(6, N=2,596) = 7.22, p=.30$ ). In addition, older Asians with poor English prefer to go to their doctor and more than 80% visit a doctor that speaks their native language in each ethnic group. Thus, the older Asian adults in this study seem to overcome the language barriers to obtain health care. The value of translation services, family translators, and multilingual healthcare providers was demonstrated.

### **SESSION 405 (POSTER)**

#### **AGING AND TECHNOLOGY; APPLICATIONS AND IMPLICATIONS**

##### **THEORISING THE IMPACT OF SURVEILLANCE TECHNOLOGIES ON OLDER PEOPLE**

A. Sixsmith, W. Mortenson, R. Woolrych, *Simon Fraser University, Vancouver, British Columbia, Canada*

Surveillance technologies are increasingly being used to monitor the activities and health status of older people living at home. While these systems can improve safety and security, little attention has been given to the way they impinge on the lives of users. Ambient Assistive Living (AAL) systems involve "activity monitoring", using data collected from environmental and body-worn sensors to build a profile of the dweller's typical pattern of living. Variations from this pattern may be a source of concern, possibly requiring intervention. Activity monitoring can be used to track changes in the health and functional status of people in the longer-term. Although AAL aims to facilitate autonomy, safety and security, there remain concerns over how activity monitoring may affect user's privacy and everyday behaviour. Using Foucault's concepts of observation and self-discipline, the paper explores the nature and experience of surveillance and the potential impacts on the everyday lives of older people. Activity monitoring blurs the division between intimate and public spaces, creating new mechanisms and forms of coercion (restraints and constraints). Surveillance technologies create a "pseudo-panopticon" that has the potential to change the way social relationships are negotiated and mediated. The way AAL is developed and used must progress from a technological construction of the problem space, to one that sees surveillance technology as part of a wider socio-technical system. Concern over privacy must extend beyond technical matters of data security and confidentiality, to include how monitoring technologies affect social relationships, everyday behaviour and the experience of home.

##### **CAREGIVERS' DEMENTIA RELATED DRESSING ISSUES INFLUENCING DEVICE DESIGN AND DEVELOPMENT**

D.F. Mahoney<sup>1</sup>, E.L. Mahoney<sup>2,1</sup>, W. Burseson<sup>2</sup>, *1. Nursing, MGH Institute of Health Professions, Boston, Massachusetts, 2. Arizona State University, Tempe, Arizona*

Prior research indicates that dressing is the most common daily concern for family caregivers of persons in late early to mid-stage Alzheimer's disease (AD). The purpose of this study was to: 1) identify and explore dementia related dressing problems and 2) obtain caregivers' critique of a mockup automated dressing coach. Methodology: Qualitative focus group study of 20 primary caregivers who helped to dress relatives with AD using a semi-structured probative discussion format. Conversations were audio-taped and transcribed. The PI moderated each session and analyzed data with a second reader, using standard content analysis procedures. Results: Three focus groups were conducted and six individual telephone interviews for those unable to attend a group. Caregivers reported being fatigued

and emotionally drained by the constant prompting and cueing. Strategies involved simplifying choices and pre-organizing clothes. The adult children were most enthusiastic about the prototype, expressing discomfort from crossing their personal intimacy boundaries when dressing their parents. Spouses viewed the opportunity to extend independence in dressing as a means to sustain their loved one's dignity. Everyone desired ways to help maintain "normalcy" at home and saw the proposed technology as an innovative means to do so. Most prototype features were affirmed, others redesigned. Unexpectedly, the infrared privacy camera was desired. Conclusions: Dressing issues were prevalent and a common source of caregiver distress. Current dressing assistive devices are not practical for persons with dementia. Developing a device that addresses the needs of the caregiver-care recipient dyad is not only particularly challenging but also highly desirable.

#### **OLDER PEOPLE'S USE OF ASSISTIVE TECHNOLOGY: FORMULATING A SOCIOLOGICAL RESEARCH AGENDA**

G.W. Pritchard, K. Brittain, *Institute of Health and Society, Newcastle University, Newcastle upon Tyne, United Kingdom*

Assistive Technology (AT) incorporates a wide and increasing range of devices and services. According to the Audit Commission they include 'any item, piece of equipment, product or system that is used to increase, maintain or improve the functional capabilities and independence of people with cognitive, physical or communication difficulties' (2008: 3). Although traditionally discussed in relation to disability, the UK government and others have identified AT as something of a 'magic bullet' that will work as a panacea for the plethora of cost and care-related challenges associated with the ageing populations of Western nations. It has also been celebrated at the level of the individual by being heralded as an enabler that allows an often-maligned social group to live independently in their own homes for longer and forgo the immediacy of institutionalization. However, despite these perceived benefits, evidence suggests that uptake of AT among older people has been low and an emerging area of academic inquiry has speculated on the reasons for this. This paper offers a critical commentary on this literature with particular reference to its tendency to be uncritical, overly schematic and reliant on psychological models. I further argue that overall, this developing canon has failed to fully exploit the meaningful conceptual insights from social theory and the article concludes by suggesting a more sociologically-focused research agenda organized around the three central themes of identity; social inequality and the emerging 'social model of ageing'

#### **A "CALL TO ACTION": EMPOWERING KANSAS SENIOR CITIZENS THROUGH PARTICIPATION IN TECHNOLOGY**

T. Paul, *Senior Services, Inc. of Wichita, Wichita, Kansas*

One of the principal problems encountered when working with senior citizens is their tendency to isolate and withdraw from activities. A research project used technology as to enhance the quality of life for seniors; reducing their isolation, and studying physical and social changes. Participants received instruction on the use of the Internet and either a desk top computer or an Apple iPad. One hundred and eleven seniors from two senior centers participated in the project. Accumulated data included both focused on individuals age 50 and over. The participants were volunteers and individually completed report forms. Demographic data and monthly physical measures and pre/post self-report anxiety, participant comments and user satisfaction were accumulated for analysis. Participating organizations included an African American senior center. Preliminary analyses suggest both physical and social behavior of participants improved over the duration of the project. Data supporting the improvements and implications thereof will be provided.

#### **EXPLORING ONLINE HEALTH MANAGEMENT TOOL ADOPTION AMONG OLDER ADULTS**

L. Zettel-Watson, E. Chang, *California State University, Fullerton, Fullerton, California*

As the population ages and chronic diseases become more abundant, our health care system will be strained beyond anything our society has seen before. The current system is ill-equipped to handle the abundance of patients/needs in the years to come. Consequently, individuals will be called upon to help manage their own health. Already in existence and quickly increasing in popularity are online health management tools. These tools have the potential to diminish or even replace in-person contact with health professionals, but their efficacy has not been tested and current usage trends are unknown. The goal of the current study was to explore perceptions and usage patterns among users of online health management tools, and to identify barriers and barrier-breakers among non-users. In collaboration with our local Osher Lifelong Learning Institute (OLLI), we obtained in-depth information from 169 computer users over the age of 50 who use/do not use online health management tools. Analyses revealed that a sizable proportion (37%) of participants use online health management tools and most users (89%) are satisfied with these tools. However, a limited number of tools are being used and usage occurs in relatively limited domains. For non-users, most seem open to using this technology, but they need more information on existence and capabilities, as well as internet security assurances. Detailed findings will be presented and the implications for individuals, caregivers, health care providers, program planners and policy makers will be discussed.

#### **BRIDGING THE PROFESSIONAL DIGITAL DIVIDE: COMPARATIVE ANALYSIS OF TECHNOLOGY USAGE BEHAVIORS ACROSS THE WORKING LIFESPAN OF PROFESSIONAL SOCIAL WORKERS: A QUANTITATIVE STUDY**

A. Bonner, *1. Howard University, Washington, D.C., District of Columbia, 2. Research and Strategic Analysis, AARP, Washington, District of Columbia*

Technology is a fact for modern day social workers and yet there is a scarcity of research about how social workers adopt or fail to adopt technology. The purpose of this study is to examine the factors that explain the behavioral intent to use computers and computer based technologies by licensed social workers who are age 45 and older. The universe for this study consists of the licensed membership base of the National Association of Social Workers (NASW) which has currently has 133,000 professional social workers enrolled. This study tested the modified theory of the Unified Theory of Acceptance and Use of Technology (UTAUT) that relates the independent variables of computer self-efficacy (CSE), performance expectancy (PE), effort expectancy (EE), social influence (SI), and facilitating conditions (FC) to the dependent variable behavioral intentions (BI) while controlling for the variables of age, gender, experience, ethnicity, and distance to retirement for licensed social workers. The independent variables, FC, PE, EE and SI were found to have a positive linear relationship with the dependent variable BI as seen in previous studies, while FC and PE the strongest predictive power. Contrary to the theory used in the present study, many of the control variables suggested were not found to have any impact on predicting the relationship between the DV and IV's. This leads to two major recommendations: 1) that employers should supply adequate technical and organization support and that employers should seek out CBT that can be directly tied to improving job performance.

#### **NEW TECHNOLOGY TO STORE, RETRIEVE, AND CONVINC FUTURE CLINICIANS TO HONOR PATIENTS' KNOWN WISHES**

S.A. Terman, *Caring Advocates, Carlsbad, California*

Even the clearest, most specific clinical forms can have no effect unless they reach the clinicians providing medical care in time for them

to follow their directions. This poster introduces some technical innovations whose goal is to expedite retrieval of information needed to honor patients' last wishes after they no longer can speak for themselves. The proposed solution is flexible and comprehensive. A clinical example shows how such an innovation might have prevented extreme and prolonged suffering of one patient by facilitating an expedient way to retrieve his most recent and accurate expression of treatment preferences and proxy/agent designation. Poster visitors can appreciate firsthand, an interactive demonstration to see how they can easily upload now, so that others can later view and retrieve critically important forms and videos of interviews. "The MyLastWishes.org Program" offers a unique strategic solution to CONVINCING clinicians to HONOR a person's LAST WISHES by displaying on-demand, videos of short patient-physician or patient-planning professional interviews. After the patient describes WHAT s/he wants and explains WHY, the professional expresses an opinion if the patient possessed mental capacity to give informed consent to two critically important end of life options: A) Palliative Sedation to Unconsciousness that may be the only means to relieve days to weeks of unending, unbearable pain and suffering; and B) Natural Dying that may be the only means to avoid premature dying and still avoid months to years of lingering in Advanced Dementia with its increased risk of unrecognized and under-treated pain and suffering.

## SESSION 410 (POSTER)

### AGING RELATED POLICY STUDIES

#### OLDER ADULTS' FAMILY LEISURE ACTIVITIES AND FAMILY FUNCTIONING: DO ASSETS MATTER?

S. Hong<sup>1</sup>, C. Han<sup>2</sup>, 1. *Social Work, National Univ Singapore, Singapore, Singapore*, 2. *Sungkyunkwan University, Seoul, Republic of Korea*

**Purpose.** Using nationally representative data in Singapore, this study examines how older adults' assets influence family leisure activities and family functioning in Asian contexts. **Methods.** We collected 955 paired data from older adults and their family members about household asset profiles (homeownership and the value of financial assets), the Family Leisure Activity Profile developed by Zabriskie and McCormick (2001), and family functioning measured by Family Adaptability & Cohesion Evaluation (FACE) IV. For family leisure activities, Latent Class Analysis (LCA) was used to identify the patterns of the leisure activities and multinomial logistic regression analysis was adopted to examine the relationship between assets and leisure activities. On the other hand, we used OLS regressions to look into the relationship between assets and family functioning with three standardized ratio scores. **Results.** LCA classified four different groups based on family leisure activities: low, mild, moderate, and high family leisure classes. Controlling for socioeconomic demographics and health status, we found that both homeownership and financial assets were likely to be engaged in higher family leisure activities. In addition, we found that financial assets were positively associated with better family functioning measured by family cohesion, flexibility, and total circumplex ratio. **Implication.** The findings confirmed the positive asset effects on family leisure and functioning among older adults. Assets may be a crucial determinant enhancing older adults' family activities and relationships, which is meaningful information for gerontological practice. Gerontological social

workers and health professionals should pay more attention to asset-based programs and their effects in later life.

#### A SUBGROUP ANALYSIS OF LEGAL NEEDS AMONG OLDER ADULTS IN RURAL COMMUNITIES

D.C. Wihry<sup>1</sup>, J. Crittenden<sup>1</sup>, L.W. Kaye<sup>1</sup>, J.L. Martin<sup>2</sup>, 1. *University of Maine, Orono, Maine*, 2. *Legal Services for the Elderly, Augusta, Maine*

Understanding differences in legal issues among subgroups of older adults is key to effectively tailoring services to low income older adults living in small towns and rural communities. This research examines legal problems of older adults in Maine identified by survey respondents who are: homebound (N=46); 70+ (N=40); or received a denial or reduction of benefits from DHHS (N=22). Low-literacy and limited English proficiency populations were examined through proxy surveys of providers (N=41). More than half (56%) of respondents reported having legal problems in the previous year. Based on the percentage of individuals reporting problems, the most common issues across subgroups include financial scams (38%), home repair problems (19%), obtaining or retaining government benefits (18%), debt collection (18%), and accessing medical services (14%). Homebound older adults were less likely ( $p < .01$ ) to report having difficulties obtaining medical services compared to other groups although 50% of this population stated that they had faced one or more legal issues in the previous year. Among those 70 years of age and older, a majority (67%) reported having legal problems in the previous year, and significant differences ( $p < .01$ ) were discovered when they were compared to other subgroups in terms of the frequency of legal problems related to government benefits, medical services, and relationship violence. Among those elders who had experienced a recent reduction or denial in benefits, almost half (45%) indicated having or being aware of legal problems in the past year. Preferred approaches by older adults for obtaining legal information/assistance will be highlighted.

#### THE EFFECT OF RN AND CNA STAFFING ON RESIDENT OUTCOMES

K. Smith, K. Hyer, A.A. Holup, H. Meng, *School of Aging Studies, University of South Florida, Tampa, Florida*

The primary objective of this study is to examine the effect of registered nurse (RN) and certified nursing assistant (CNA) staffing on resident outcomes. Florida staffing level standards for direct-care workers increased to 3.9 hours per resident day (HPRD) with a daily minimum of 2.7 effective January, 1 2007. Due to reimbursement cuts in July 2008, sanctions for violations of these mandated minimum levels were relaxed for facilities staffing above 3.6 HPRD for a 12-month period. Staffing levels have been found to be associated with quality of care. This study uses the structure, process and outcome model (SPO) to examine the effect of maintaining higher levels of staffing (structural component) on restraint use and indwelling catheterization (process component) and quality measures including pressure sores, four point activities of daily living decline, and bladder incontinence (outcome components). Data from quarterly Florida staffing reports and the Online Survey Certification and Reporting database were used to examine CNA staffing levels of free-standing nursing homes during 2008-2009. Results indicated that relaxed requirements precipitated an immediate drop of CNA staff in 61% of Florida's nursing homes. Nursing homes maintaining higher staffing levels were more likely to be non-profit,  $\chi^2(1) = 14.25, p < .05$  and have lower Medicaid ratios ( $t = 3.48, p = .001$ ). These findings reinforce the importance of adequate state reimbursement for Medicaid residents to insure that all residents receive adequate care and quality of care is not determined by reimbursement. Future research should explore how quality out-

comes vary given different staffing, process of care and reimbursement levels.

### **AGEING PRISONERS HEALTHCARE: ANALYSING THE LEGAL SETTINGS IN EUROPE AND THE UNITED STATES**

W. Bretschneider, T. Wangmo, V. Handtke, B.S. Elger, *Institute for Biomedical Ethics, University of Basel, Basel, Switzerland*

Little is known about the current healthcare situation and the legal rights of ageing prisoners worldwide. To date, only a few studies have investigated their rights to healthcare. Still, elderly prisoners need special attention. Therefore a critical review of healthcare related national and international legal frameworks for ageing prisoners with a particular focus on Switzerland, England/Wales, and the United States was undertaken. This was done to compare and analyse all relevant national and international legal frameworks in order to investigate the obligation of the state in protecting the healthcare of its most vulnerable group, ageing prisoners. The International Plans of Action on Ageing published by the United Nations contribute the most by providing an in-depth analysis to the healthcare needs of ageing persons. Under the principle of equivalence, all mentioned topics should apply to ageing prisoners as well. The decision of the U.S. Supreme Court in *Estelle v. Gamble* in 1976 sets the standard of deliberate indifference applicable and pertinent to medical care and special environmental needs of ageing prisoners. Still, critical analysis of all obtained documents reveals the lack of legislation regarding the healthcare for ageing prisoners. Neither national nor international institutions have specific guidelines or laws that secure the precarious situations of ageing adults in prisons. To initiate a change, this work presents critical issues that must be addressed to protect the rights and well-being of ageing prisoners. Additionally, it is important to design legal structures and guidelines that acknowledges and accommodates the needs of ageing prisoners.

### **RETHINKING AGING: AN INNOVATIVE COMMUNITY-ENGAGED APPROACH TO PLANNING FOR AN AGING SOCIETY**

J. Weinstein, P. Carder, M.B. Neal, A. DeLaTorre, M. Cannon, K. Brown Wilson, M. DeShane, *Institute on Aging, Portland State University, Portland, Oregon*

This poster details a novel approach to engaging a diverse range of community members in discussion on the ways in which our community should respond to an aging society. Through a series of four summits, participants identified the challenges and opportunities that Oregon will face as our population becomes increasingly older and more diverse. Summit participants included academicians committed to education and research on issues in aging, leaders in aging services and policies, and recognized leaders from a broad range of fields and interests outside of gerontology. This engagement model, developed by the Aging Matters, Locally and Globally Initiative of the Institute on Aging at Portland State University in collaboration with Oregon Consensus, utilized a graphic facilitator and a World Café approach to facilitate lively discussion and generate new thinking on topics such as the evolving notion of retirement, the future of long-term care in Oregon, and our value system around aging services. For example, Oregon's noted home and community-based system has for over 30 years embraced the value of independence, but summit participants questioned whether this value is and will continue to be relevant. As a result of this collaborative process and the active participation of over 75 community members, core values emerged, a vision was shaped and an agenda of action items was formulated. This poster illustrates the summit planning and implementation process, as well as a step-by-step framework for replication that can be used by other communities planning for an aging population.

### **HOW TO ASSESS THE LEVEL OF INTEGRATION OF DIFFERENT PROVIDERS? LESSONS LEARNED FROM THE QUEBEC'S PRISMA MODEL ADAPTED FOR THE FRENCH ALZHEIMER PLAN**

D. SOMME<sup>1,5,6</sup>, M. De Stampa<sup>4,6</sup>, H. Trouve<sup>2</sup>, C. Perisset<sup>3</sup>, O. Dupont<sup>3</sup>, N. Armaout<sup>3</sup>, J. Ankri<sup>4,6</sup>, O. Saint-Jean<sup>1,5,6</sup>, 1. *APHP-HEGP, Paris, France*, 2. *Fondation Nationale de Gérontologie, Paris, France*, 3. *Caisse Nationale de Solidarité pour l'Autonomie, Equipe de pilotage nationale, Paris, France*, 4. *APHP-Saint-Périne, Paris, France*, 5. *Université Paris Descartes. Faculté de Médecine, Paris, France*, 6. *Laboratoire Santé Environnement Vieillessement EA 2506 Université de Versailles Saint Quentin, Paris, France*

One problem in implementing integrated services delivery (ISD) is to assess whether experimental projects progressed in level of integration. The 2008-2012 French Alzheimer plan aims to implement an ISD which is based on the PRISMA Québec's model. The level of integration was assessed by crossing 3 data sources from the 17 projects: 1) a 2 years continuing qualitative data collection 2) on-site semi-structured interviews (local pilot, local manager and case managers) 3) a simple tool made-up to measure the integration level according to the Québec's model resulting in a score varying from 0 to 24. The 2 qualitative approaches result in 5 categories of ISD implementation: 1) good implementation (n=3); 2) partial implementation but good diffusion of the concepts comprehension between providers (n=5); 3) difficulties in implementing ISD but good apprehension by the change-management agent of the problem (n=3); 4) difficulties in implementing ISD and ISD not being a high priority (n=4); 5) very high difficulties irreversible in a short term (n=2). The MAIA 24 scoring results in a score of 0-20 at the beginning and 4-21 at the end of the assessment period. It is possible to identify 2 sites with high level of ISD implementation, 3 sites with low level of implementation, and 12 sites in the medium level. Crossing the approaches is very useful because both have some limits. We develop a methodology to measure level of integration in a multi-providers network that was based on a Québec's model of integration adapted in France.

### **LONG-TERM CARE FINANCING REFORM AND THE DEMISE OF THE CLASS ACT: WHERE DO WE GO FROM HERE?**

W. Dawson, *University of Oxford, Oxford, United Kingdom*

This paper explores the determinants of federal long-term care (LTC) policymaking in the United States, specifically the interlinking role of ideology, political institutions and policy actors in the design, legislative success and failure to implement the Community Living Assistance Services and Supports (CLASS) Act. Long-term care financing is a growing policy issue for all advanced industrialized countries of the world, and it is driven by evolving family dynamics, population ageing and rapid advances in medical technology that are prolonging the human lifespan. These challenges are particularly stark in the United States amidst the backdrop of the global economic downturn and a highly charged politically environment. Why, after years of relative stability, did LTC financing reform take place as part of the Patient Protection and Affordable Care (PPACA) Act of 2010? Interviews with LTC policy stakeholders were carried out to explore the impact of ideology, institutions and policy actors on the design and legislative success of the CLASS Act. The subsequent decision not to implement the CLASS program after its legislative success raises several questions about the future of LTC financing and the possibilities for bringing about substantial policy change. Several policy options will be examined that may be able to navigate the varying impediments to policy change and bring about significant LTC financing reform.

## JAPAN'S "LIVING DEAD": AN EXPLORATION INTO THE PHENOMENON OF THE MISSING CENTENARIANS

H. Ueda<sup>1</sup>, S.S. Harasyn<sup>2</sup>, 1. Graduate School of Human Sciences, Osaka University, Suita, Osaka, Japan, 2. University of British Columbia, Vancouver, British Columbia, Canada

Japan has long been known as a country with an aging population and a rapidly increasing number of "centenarians" who are aged 100 and over. The number of this age cohort has reached more than 47,756 in 2011 since the first official report of 153 persons in 1963 when the Act for the Welfare of the Aged was established. Starting with the case in which a family member wrongfully received the pension benefits of a 111 year old man in 2010, many similar cases were later reported by the media. In September 2010, the Japanese Ministry of Justice reported that 234,000 centenarians were missing despite being recorded in the family registration system. To examine the roles in and the correspondence of a municipality dealing with this issue, and to clarify current remaining problems, we interviewed municipality officials in Kobe City where 105 missing centenarians had been reported. We found that there is internal miscommunication between their district office and the central municipality office. The self-report system by a family member of a deceased centenarian is neglected to some extent. The Great Hanshin Earthquake also complicated this issue. Thorough effort by family members and proactive routine correspondence by the municipal office is necessary in order to solve the issue of missing centenarians and also other younger age cohorts.

## WHAT ARE HOSPICES DOING RELATED TO QUALITY? FINDINGS FROM THE CMS VOLUNTARY REPORTING PERIOD

F.S. Rokoske, N. Zheng, B. Lyda-McDonald, A. Kirk, S. Bernard, *RTI International, Research Triangle Park, North Carolina*

Background: Beginning in January 2013, hospices nationwide will be required to report quality data to the CMS Hospice Quality Reporting Program (HQRP) in order to receive their annual payment update. Prior to launching the HQRP, hospices were invited to voluntarily submit quality indicators (QIs) data from their Quality Assessment and Performance Improvement (QAPI) programs. This Voluntary Reporting Period represents the first national look at hospice quality data. Methods: Hospices entered data about their QIs in a web-based data entry system. Two researchers independently coded the entries and established agreement of coding. Indicators were grouped by care domains and topics within those domains, and then content-analyzed. Results: 911 hospices submitted 6,712 QIs addressing patient care domains such as symptom management; psychosocial, spiritual, cultural aspects of care; communication with patients and families; and patient and family/caregiver experiences of care. Many QIs addressed non patient care related topics such as length of stay, employee turnover, and meeting organizational requirements. The data showed a large variation in QIs, even within domains of care for which standardized QIs exist. We found large variation among hospices with regard to the definition and use of QIs; some hospices are quite advanced while others lack basic understanding of what a QI is. Conclusions: Hospices use a wide variety of QIs to monitor their care, including "home-grown" and standardized, endorsed measures. The range of activity suggests that the adoption of standardized QIs by hospices is feasible as a way to improve the quality of end-of-life care.

## THE EFFECTS OF POVERTY AND HEALTH INSURANCE STATUS ON THE TIMING OF HEALTH SERVICE UTILIZATION AMONG OLDER ADULTS

J. Kim, *Northeastern Illinois University, Chicago, Illinois*

The Affordable Care Act of 2010 addresses one of the major concerns of our public health insurance system by expanding Medicaid eligibility to include poor, working-age adults up to 133% of the federal poverty line. Although access to health insurance, whether public

or private, does not necessarily guarantee that one will access health services, the research on health service utilization among the elderly is unambiguous in finding that those who are the most heavily insured use the most health services. Thus, while older adults may eventually find it easier to access the health services that they need due to the recent Medicaid changes, those just exceeding the new eligibility threshold may still find it difficult to access the care that they need. As such, this study extends the current literature by examining the patterns of health service utilization among poor and near-poor older adults as they approach the traditional age of Medicaid eligibility. This investigation uses data from the Rand version of the Health and Retirement Study spanning the years 2002-2008 to estimate a discrete-time hazard model of health service utilization which is used to explain the effect of poverty and health insurance status on the utilization decision. Life table analysis reveals that poor older adults are much more likely to utilize overnight hospital services and much less likely to utilize doctor services relative to non-poor older adults. Moreover, a discrete-time hazard model reveals that poverty status interacts with Medicaid receipt to significantly influence both hospital and doctor service utilization.

## SERVING MULTIPLE AUDIENCES: POPULATION DATA AT THE INTERSECTION OF ACADEMIA AND PUBLIC POLICY

T. Yamashita<sup>1</sup>, S. Mehdizadeh<sup>1</sup>, S. Kunkel<sup>1</sup>, P. Ritchey<sup>2</sup>, 1. Miami University, Oxford, Ohio, 2. University of Cincinnati, Cincinnati, Ohio

With the availability of 2010 census data and related information from the American Community Survey, demographic data about the older populations is especially newsworthy and relevant to planning and decision-making at many levels. Effective communication of high quality population data to a variety of audiences is one of the great opportunities afforded to researchers at the nexus of gerontology, public policy, applied research, and demography. Given their importance and broad accessibility, population projection data need to be effectively communicated. Based on population projections to 2050 using 2010 census data for the state of Ohio, and on state-of-the art information about data visualization, we have created a portfolio of products, and a dissemination strategy, designed to reach a wide range of audiences including policy makers, services providers and planners, Area Agencies on Aging, researchers, and the general public. This presentation will describe target audiences and the strategies and products designed to communicate with them. Products include a wall-chart with static color-coded maps, a dedicated website where individuals may download electronic version of projected data in multiple formats (e.g., Microsoft Excel), and static and interactive visualized data products (such as an interactive online thematic map). This presentation demonstrates the projection data products, and discusses overarching points regarding identification of multiple audiences, development of practically relevant projected data, and multiple means to effectively disseminate final products that can inform planning and decision making.

## SESSION 415 (POSTER)

### ATTITUDES AND PUBLIC OPINION ABOUT AGING

#### LGBT AGING TRAININGS EFFECTUATE POSITIVE CHANGE IN KNOWLEDGE & ATTITUDES OF ELDER SERVICE PROVIDERS

K. Porter, *UMASS Boston, Quincy, Massachusetts*

Background: Lesbian, Gay, Bisexual, and Transgender (LGBT) older adults are a marginalized and stigmatized population needing access to sensitive elder service providers. Elder service providers have a desire to increase their cultural awareness of LGBT older adults in order to serve their full community. Cultural competency trainings for this population have not been evaluated. Data: LGBT cultural sensitivity train-

ings were held at four mainstream aging agencies in Massachusetts and data were collected from pre-and post-surveys of 76 provider participants (N=76). Results: Findings revealed statistically significant improvement in numerous aspects of elder care providers' knowledge, attitudes and behavioral intentions subsequent to the training sessions. For instance, at posttest providers showed 30% or more improvement in knowledge about policy disparities affecting LGBT older adults and 23% more comfortable in knowing how to respond to and LGBT older adult's disclosure of sexual orientation or gender identity. Conclusions: This study concludes that mainstream elder service provider trainings on LGBT aging can effectuate positive change. Based upon the findings, the curriculum was incorporated into statewide trainings by the LGBT Aging Project that added an organizational capacity building component to support agencies committed to culture change.

### **IMAGE OF THE ELDERLY HELD BY UNIVERSITY STUDENTS —A CROSS-CULTURAL STUDY IN JAPAN AND SOUTH KOREA—**

Y. Hosoe<sup>1</sup>, J. Kim<sup>2</sup>, 1. Joetsu University of Education, 1 Yamayashiki - cyo, Joetsu, Nigata-ken, Japan, 2. Seoul National University, Kawanak-or 1, Kawanak-gu, Seoul, Republic of Korea

The purpose of this study was to compare and analyze the image of the elderly held by university students in Japan and South Korea. Despite sharing traditions based in Confucianism, the two countries have quite different social norms and cultural values concerning the elderly. And although both have enjoyed a rapid growth of economy, Japan being a super-aged society and South Korea an aging society also merits comparison. The study was conducted in Japan in 2009 and in South Korea in 2011 employing self-administered questionnaires based on a semantic differential scale using 50 adjective pairs. The sample consisted of 320 students from two universities in Japan (response rate 95.9%) and 384 students from two universities in South Korea (response rate 96.2%). The outcome was as follows: (1) A factor analysis identified four semantic spheres in Japan and five in South Korea. "Capable" and "Cooperative" were common to both countries. "Active" and "Social" were distinctive to Japan; "Noble and intelligent," "Happy," and "Intimate" to South Korea. (2) In the "Active" sphere, students in Japan had a more positive image than those in South Korea. In "Cooperative," students in both countries had a positive image. (3) "Concern for the elderly or the problems of the elderly," "Experience in activity with the elderly," and "Satisfaction for the family" were important factors in shaping the respondents' image. The study suggested that in post-industrial societies, personal factors such as experience with and concern for the elderly became stronger determiners of the resulting image.

### **DON'T WORRY, BE HAPPY: GENDER AND ETHNICITY DIFFERENCES IN PERCEPTIONS OF AGING**

C. Clark, *Psychology, Queens University of Charlotte, Charlotte, North Carolina*

The outlook a person has about aging has been shown to influence both the quality and quantity of older years. Given this relationship, it behooves us to learn as much as we can about the diversity of aging perceptions. The present study (part of a larger survey) asked 1264 participants whether old age was a happy time and what the best/worst things about growing older were. Significantly more females (.70) than males (.65) said old age is a happy time,  $X^2(2) = 6.95, p = .03$ . More African and White Americans (.70 and .69) agreed that aging is happy than did Asian or Hispanic Americans (.64 and .66),  $X^2(3) = 31.38, p = .03$ . For the best things about aging, more women than men (.16 and .10) and more African Americans (.17) than Asian (.11), White (.13) or Hispanic (.13) named wisdom,  $X^2(1) = 7.74, p = .005$  and  $X^2(3) = 17.88, p = .04$ , respectively. More women (.44) than men (.35) named sickness as a worst thing,  $X^2(1) = 11.79, p = .001$ , but there were no ethnic group differences for this naming. The cultural and gender diversity in the many other best and worst things about growing

older named will be presented and discussed with an eye toward determining a typical view of aging. Education and intervention programs can greatly benefit from understanding where diversity in perception exists and recommendations for such programs will be made based on these data.

### **TOWARD A MORE EFFECTIVE USE OF SENIOR VOLUNTEERS: AN EXPLORATORY STUDY**

M. Kuraoka, Y. Murayama, E. Kobayashi, H. Ohba, K. Nonaka, H. Suzuki, H. Jung, Y. Fujiwara, *Tokyo Metropolitan Institute of Gerontology, Itabashi, Tokyo, Japan*

This study explores how school-community coordinators view senior volunteers in Japan and how they utilize the volunteers in their activities. In 2008, the Ministry of Education launched a new policy called School Support Regional Headquarters Project in order to enrich education for children and enhance school functions through the support of local communities, as well as designated coordinators for the headquarters. Although the number of headquarters has increased nationwide (2,540 headquarters in 2010) since the start of the policy, the training for the coordinators to meet the needs for the school and volunteers has not been developed sufficiently or effectively implemented. A semi-structured interview was conducted in four focus groups in three locations, Tokyo, Kisarazu, and Yokohama in Japan. to identify how the current coordinators view the senior volunteers involved in the school support activities and how they utilize such volunteers. Twenty-two coordinators in total have participated in the study. The results indicate that the coordinators did not make any discernible distinction between the more elderly volunteers and the younger volunteers. Although some coordinators have paid special attention to circumstances when they coordinated with senior volunteers, none of the coordinators have been trained to understand the characteristics or special arrangements of the elderly. In order to promote community involvement that includes senior volunteers' participation, it is expected that developing a training program to educate the coordinators about the aged and developing skills to empower the volunteers in school volunteer activities are essential.

### **LOOKING AT THE HEALTH & RETIREMENT SURVEY 2008: FACTORS INFLUENCING OLDER ADULTS' SOCIAL SECURITY EXPECTATIONS**

M. Nguyen, *University of Massachusetts, Boston, Boston, Massachusetts*

The economic recession in late 2007 has affected the lives of many older Americans. The recession changed their outlook on the future of the economy in the United States. Knowing the timing of when the recession took place, the purpose of this study is to look at the characteristics of respondents in regards to expectations of Social Security benefits. This cross-sectional data analysis used the 2008 Health and Retirement study (N=14,339). The dependent variable was expectations of future Social Security benefits. Independent variables included race, socioeconomic status (SES), education, economic expectations, and financial preparedness. The study analyzed the data using logistic regression and structural equation modeling. A significant effect for race,  $t(14,323) = -3.38, p < .001$ , SES  $t(14,323) = 4.77, p < .001$ , and education,  $t(14,323) = 5.676, p < .001$ , were found on low expectations of Social Security benefits. Those who were pessimistic about the economy expected to have lower Social Security benefits ( $t(14,323) = 4.458, p < .001$ ). Financial preparedness did not have a significant effect on Social Security expectations. The old-age generation is extremely active in the policy and advocacy realm. Knowing the future expectations of older Americans will assist policymakers in representing older Americans' beliefs in Social Security and secure supportive programs for future generations.

## ATTITUDES OF UNDERGRADUATE STUDENTS IN GERONTOLOGY TOWARDS THE ELDERLY

M. Vazquez Arias, E. Arlas-Merino, M.J. Arias-Merino, N.M. Mendoza-Ruvalcaba, *Salud Pública, Universidad de Guadalajara, Zapopan, Jalisco, Mexico*

Aging in Mexico is a major challenge now and more in the future, making it necessary to have professionals in the geriatric field to meet the needs and contribute to knowledge in relation to the aging process. The University of Guadalajara, in their role and social commitment of higher education institution, established Degree in Gerontology to prepare professionals in understanding and addressing the psychological, biological and social aspects of a growing population of older adults. However, it is not known, What are the attitudes of new students toward the elderly? Data collection was conducted among students through a structured interview face to face which is divided into two parts. The first part of sociodemographic characteristics. In the second part, we apply an assessment of attitudes toward older adults through cultural assessment of attitudes. Results: participants 37 students, age 18±44 years (Average 23 ±7 years), women 81 %. Positive attitudes: Elderly people are wise 92%, Level of maturity 70%, Guidance to young people 92%, Do things clearly knowing the consequences 78%, Accomplished much in life 75.7%, More mellow 63%, Less frustrations 83.1%, Can laugh at youthful impetuosity 67.6%, Value the relationship with their partner 86%, Can feel some security about life 67.6%, Time to appreciate music 81%, Truly enjoy old friends 70.3%, maintain tradition 100%, truly enjoy children 62.2%. Conclusions. The attitudes shown by undergraduate students of gerontology toward older adults generally show attitudes about aging and old age accorded their own socio-economic and cultural context.

## SESSION 420 (POSTER)

### CIVIL ENGAGEMENT; ADVOCACY AND PARTICIPATION

#### LIFT UP YOUR VOICE! HEALTH CARE ADVOCACY TRAINING PROGRAM: EMPOWERING OLDER ADULTS

A. Gottlieb<sup>1</sup>, K. Barton<sup>2</sup>, N.M. Silverstein<sup>1</sup>, *1. Gerontology Institute, University of Massachusetts Boston, Boston, Massachusetts, 2. Gerontology Department, McCormack Graduate School of Policy and Global Studies, University of Massachusetts Boston, Boston, Massachusetts*

Lift Up Your Voice! is an advocacy training program developed by Community Catalyst and funded through Atlantic Philanthropies aimed at directly engaging older adults with chronic disease in state-based Campaign for Better Care initiatives that seek to achieve changes in the health care delivery system. An evaluation, conducted in 2011-12, included site visits in Pennsylvania, Ohio, and Massachusetts, participant surveys (N=50), and in-depth stakeholder interviews (N=14). We investigated the effectiveness of the training curriculum for engaging older adults in healthcare reform; the level of participant engagement post-training; and pre/post changes in participant empowerment. Over 50% of respondents reported participation in post-training advocacy activities (e.g. contacting elected officials, attending Medicare rallies). Paired sample t-tests revealed a significant increase in multiple dimensions of a consumer-constructed Empowerment Scale, including "You can't fight city hall" ( $t(32) = -1.97, p < .03$ ) and "Experts are in the best position to decide what people should do or get" ( $t(32) = -1.78, p < .04$ ). Compelling outcomes were awareness of problems with the health care system and that participants were not alone. Crafting powerful and concise personal narratives during trainings gave participants a voice regarding broader health care issues. For example, one participant reported, "I put a lot of time into writing the testimony for the health insurance commissioner and was glad that I did it. Sometimes I wonder if one voice really does make a difference, but it doesn't stop me from speak-

ing out..." Findings can inform future health care advocacy programs, especially involving older adults.

#### BRINGING GENERATIONS TOGETHER TO STRENGTHEN RURAL COMMUNITIES AND INDIAN RESERVATIONS

C.M. Mehrotra<sup>1,2</sup>, Z.L. Bail<sup>2</sup>, L.M. Haglin<sup>2</sup>, *1. Psychology, The College of St. Scholastica, Duluth, Minnesota, 2. Northland Foundation, Duluth, Minnesota*

The Northland Foundation launched AGE to age: Bringing Generations Together following a region-wide study to examine civic engagement among older people in northern Minnesota rural communities and Indian Reservations. Research revealed that older adults were highly concerned regarding the well-being of young people. The Foundation worked with 10 communities to develop locally-driven civic engagement projects that meet their needs. These sites range in population from 391 to 12,124 with high poverty rates. Foundation staff initiated a community planning process to identify needs and opportunities, create an intergenerational dialogue, craft a vision, and develop an action plan. Intergenerational activities undertaken to date include: learning to use information technology, sharing cultural traditions, promoting health and wellness, designing and implementing environmental projects, and participating in social and recreational activities. A regional learning community has been created to promote networking relationships, offer continuing education, and share lessons learned. In addition, an annual summit brings together teams of elders and young people from the participating communities. Evaluation indicates that the program has generated sustained enthusiasm and engagement from youth and older adults and has been beneficial in multiple ways: (a) Improved health and well-being of older adults and young people; (b) Increase in their leadership capacity; (c) Development of relationships across generations; (d) Improved understanding of American Indian culture and traditions; and (e) Reduced isolation and age-segregation. A number of state and national funding agencies have provided support to help sustain the momentum the program has generated in northern Minnesota communities.

#### SOCIAL PARTICIPATION OF OLDER PEOPLE: MOTIVATORS AND BARRIERS

L. De Donder<sup>1</sup>, D. Brosens<sup>1</sup>, N. De Witte<sup>1,2</sup>, S. Dury<sup>1</sup>, A. Smetcoren<sup>1</sup>, T. Buffel<sup>1,3</sup>, D. Verté<sup>1</sup>, *1. Vrije Universiteit Brussel, Brussels, Belgium, 2. University College Ghent, Ghent, Belgium, 3. Fund for Scientific Research Flanders, Brussels, Belgium*

Inspired by the World Health Organization the European Commission has declared 2012 to be the European Year of Active Aging and Intergenerational Solidarity. Active Aging refers to the opportunities for health, participation and security as people age. The purpose of this study was to investigate these opportunities for social participation of older people in Belgium. Several dimensions of social participation are examined: voluntary work, participation in associations, informal care; and educational and cultural participation. The following research questions are addressed: What is the activity rate of older people regarding social participation? What is the individual profile of (non) participants? What are the main purposes and thresholds to participate? Data from the Belgian Aging Studies (N = 64 737) indicate that older people realize several active roles in society. However, a considerable amount of older people does not participate. The individual determinants of social participation are discussed in terms of age, gender, marital status, income level, and physical health. Additionally the main reasons (e.g. meeting other people, being personally asked) and thresholds (e.g. timing, price, facilities and services in the local environment) to participate are highlighted. The discussion provides an overview of potential vulnerable groups in terms of social participation. Moreover, it focuses on the implications of these findings for local policymakers and social organizations and provides impetus to organize and increase active aging at the local level.

## **“OF COURSE THEY ARE INVOLVED” RETHINKING POLITICAL ENGAGEMENT AND ADVOCACY AMONG ASIAN AMERICAN AND LATINO OLDER ADULTS**

A. Choi<sup>1</sup>, A. Chin<sup>2</sup>, R. Saborio<sup>2</sup>, 1. *Department of Interdisciplinary Studies, California State University Dominguez Hills, Carson, California*, 2. *St. Barnabas Senior Services, Los Angeles, California*

With the beginning of the retirement of the Baby Boomers, there is a perception that this cohort of older adults will be more politically savvy in drawing political attention to their needs than previous generations of older adults. However, this popular understanding of the well-educated politically engaged older adult fails to recognize how little we know about low income minority immigrant older adults engage politically to advocate for their needs. This presentation examines the obstacles that Latino and Asian American older adults face in their attempts to engage politically and an intervention. “AGENTS of Change” that helped to foster pathways for pathways to political advocacy. Data were collected over a one year-period on 50 Asian American and Latino older adults (age 65 and over). Face-to-face surveys and focus groups were conducted with the older adult. Data were independently coded by at least two researchers. The thematic patterns include obstacles such as language barriers, lack of awareness of how to engage in electoral politics, cultural attitudes about political involvement and social isolation. Strategies to encourage political advocacy included education on social media such as computer training, increasing awareness of local politics, and encouraging intergenerational involvement of the families and friends of these older adults. Enhancing the pathways to political participation of immigrant older adults ultimately contributes to the quality of life and empowerment of these individuals.

## **THE ROLE OF SENIOR UNIVERSITIES IN JAPAN TO PROMOTE CIVIC ENGAGEMENT OF OLDER ADULTS**

L. Chen, *Kwansei Gakuin University, Nishinomiya, Japan*

After the rapid economic growth of the 60s, the Japanese government passed grandeur social welfare laws and programs to enhance the older citizens' quality of life. In the 1970s, health care became free for all older adults, health benefits were improved, pension system was updated with the introduction of the macro-slide measure, and pension benefits were more than doubled in 10 years. Moreover, “Ikigai to sozo no jigyo” or “Program for Meaning in Life and Creativity” was created for the hardworking retirees who helped build the economic wealth of Japan to enjoy their retirement by delving into hobbies and leisure. One of the mandated programs was “Rojin daigaku” or “Senior Universities”, which was established in all 47 prefectures to enhance life-long learning of older adults. After 40 years since its establishment, these universities still maintain their popularity; they continue to become great sources for fostering older adults' interests and maintain civic engagement after their retirement. However, there has been no comprehensive study examining the current state of these universities dedicated to older adults. The aim of this study is to examine the current role of senior universities by conducting a nationwide investigation in Japan. A survey was conducted in Japan on 47 prefectural level senior universities nationwide. Questions include on the features of these institutions as well as the sociodemographic characteristics of the participants. The study found that many of the universities are more alike than different in terms of their management and types of programs offered. Like many other social welfare programs, senior universities are also increasingly facing problems with financing, and attracting seniors to newer classes such as creating leadership in volunteerism. Based on the findings, implications for future pathways of senior universities are discussed, especially for their major potential to expand their role in older adults' civic engagement.

## **WHITHER THE SENIOR CENTER? SERVICE AND ACTIVITIES PREFERENCES OF BABY BOOMERS**

R. McCaslin, J. Chang, *Social Work, Cal. State Univ., San Bernardino, California*

The purpose of the study was to examine baby boomers' intentions to volunteer and types of volunteer and leisure activities they would be interested in after retirement. Also assessed was whether they would attend a senior citizen center for activities and services. Data were collected from 426 baby boomers residing in the southern California. The study employed a survey design with self-administered questionnaires, given to a convenience sample. Participants were recruited from various locations including community agencies, churches, and supermarkets from April through June, 2010. The study found that over 62% reported that they would be interested in volunteering after retirement. There were gender and education differences with women and the college educated showing more interest in volunteering. Participants indicated participating in faith-based activities (57%), mentoring (48%), and civic or political associations (33%) as their preferred type of volunteer activities. Latinos and African Americans were more likely to show interest in faith-based activities than persons of other ethnicities. The study also found that of leisure activities, there was interest in participating in exercise programs (72%), group trips (71%), arts and crafts (64%), guest speaker lectures (52%), games (49%), and dancing (48%). Nearly two thirds (65.6%) indicated they would be interested in activities at a community center, at a community center geared to serve retired people (65.1%), and at a senior citizen center (58%). The findings suggest that human service professionals need to strategize how best to utilize baby boomer volunteers, particularly female boomers. Senior centers need to provide creative programs and leisure activities to reflect the values and needs of active baby boomers. Services and activities should be assessed and refined regularly to match new generations and their changing needs over time.

## **SESSION 425 (POSTER)**

### **CULTURAL AND DEMOGRAPHIC DIVISION OF AGING**

#### **CULTURAL RELEVANCE OF SOCIAL EXCLUSION IN THE GLOBAL CHINESE CONTEXT**

D. Lai<sup>1,2</sup>, H. Tong<sup>1</sup>, X. Bai<sup>2</sup>, 1. *Faculty of Social Work, University of Calgary, Calgary, Alberta, Canada*, 2. *University of Hong Kong, Hong Kong, China*

Social exclusion is a prominent issue in the policy arena in Europe, as well as in many countries in the Western world. The relevancy of social exclusion in addressing poverty and other disadvantages has been widely discussed, but mainly in Western cultural context. Despite of the growth of the aging Chinese population in China and other parts of the world, understanding the cultural relevance of social exclusion in the Chinese context is limited. This presentation will generate discussion on the socio-cultural relevance of social exclusion in understanding older Chinese in the different Chinese contexts (e.g. Chinese in China and Chinese in western societies). The presenters will review the conceptual meanings of social exclusion from a range of social science theories and analyze their relevance to Chinese in different cultural contexts. Multiple empirical data sources were also used to illustrate the indicators of social exclusion in different Chinese communities (China, Canada, & United States) and its relationship with health related outcomes. The results indicate that finance, exclusion related to family and social relationships, institutionalization of age-related discrimination or isolation, and social class associated occupation and rural-urban background, play an important role in social exclusion. While policies and interventions for addressing social exclusion in Western culture often focus on redistribution of tangible resources, addressing social exclusion

among older Chinese in different cultural contexts may require a more holistic perspective that places human and relationship factors as a priority.

### **INTERNATIONAL STUDY OF THE LIFESTYLES AND VALUES OF SENIOR CITIZENS: A JAPAN, KOREA, AND THE U.S. COMPARISON**

N. Tsukada<sup>1</sup>, H. Kim<sup>2</sup>, T. Tatar<sup>3</sup>, 1. *Nihon University Graduate School of Business, Tokyo, Japan*, 2. *Yamaguchi Prefectural University, Yamaguchi, Japan*, 3. *Shukutoku University, Chiba, Japan*

The Cabinet Office of the Government of Japan has conducted the International Study on Lifestyles and Values of Senior Citizens every five years since 1978 to obtain basic information about senior citizens' perceptions of lifestyles and values in different countries. The seventh international study, conducted from October 2010 to January 2011, examined the information from Sweden, Germany, Japan, Korea, and the United States. Using the nationally representative data collected for the seventh international study, this presentation will compare several different aspects of lifestyles and values among Japan (N=1,183), Korea (N=1,005), and the United States (N=1,000). An examination of the data revealed that there are as many similarities as differences in the perceptions of senior citizens about lifestyles and values among Japan, Korea, and the United States. For example, it was found in the three countries that the more senior citizens feel a sense of purposefulness in their lives, the more they are likely to be feeling satisfied with their lives. It was also true in the three countries that the more activities senior citizens are involved with, the more they are likely to be feeling satisfied with their lives. On the whole, the American senior citizens showed the highest degree of life satisfaction among the three, the Japanese came second, and the Koreans were in the third place. Further, the perceptions of senior citizens in the three countries were found to be greatly different in such areas as household chores, care-giving, attitudes towards work, after-retirement preparation, and ideal sources of income.

### **PREDICTORS AND CONSEQUENCES OF CHANGES IN THE STRUCTURE OF RELIGIOUS ORIENTATION IN LATER LIFE**

P. Lam, A. Futterman, *College of the Holy Cross, Worcester, Massachusetts*

Personal religiousness has been thought to develop in predictable ways from childhood to later life. While the development has been sketched both theoretically and empirically in younger adults, few studies have examined changes in personal religiousness in middle age and later life. Using existing standard measures of religious orientation (e.g., Allport and Ross, 1967; Batson and Schoenrade, 1991), we demonstrated relative stability of a three factor – Ends, Means, and Quest – model of religious orientation across late middle-aged (60-74) and older adult (74 and older) random samples of community-dwelling adults living in Worcester, MA. Despite significant differences in stressors, health and functional status, and religious involvement and denominational affiliation between the two samples, only small changes in the structure of the three-factor model were observed (i.e., shifts in the relationships among the Ends, Means, and Quest factors). Also observed were differences in the predictive significance of stress, health and functioning, personality, religious involvement and denominational variables. For example, among late middle age adults health and functioning were unrelated to Quest (questioning and doubt regarding the meaning of life) whereas among older adults, diminished health and functioning were strongly associated with diminished Quest. Such findings are discussed in light of both developmental and stress and coping theories of personal religiousness (e.g., Fowler and Pargament).

### **COMMUNICATION AND CULTURAL COMPETENCE IN HOME HEALTH AND HOSPICE AGENCIES**

D. Liu, J. Ochoa, C. Cochran, *University of Nevada, Las Vegas, Las Vegas, Nevada*

Previous studies have raised concerns in delivering the best quality care to residents in long term-care facilities because providers failed to meet a range of language, cultural, and religious needs of such population (Mold, Fitzpatrick, & Roberts, 2005). Cultural issues are particularly relevant for hospice programs because they deal with the context-specific needs of individuals at the end of their lives, as well as the needs of their families and communities (Doorenbos & Schim, 2004). However, little attention has been paid to the home health and hospice sectors. This study used the 2007 National Home and Hospice Care Survey (NHHCS) to assess the association between the cultural competence strategies and agencies characteristics in home health and hospice agencies. Descriptive statistics and Chi square tests were computed using SAS PROC SURVEYFREQ (version 9.1; SAS Institute, Inc., Cary, NC). Having referrals from ALFs ( $p=0.0779$ ) and physicians' offices ( $p=0.0301$ ), having formal contracts with managed care/private insurance providers ( $p=0.0477$ ) and JCAHO ( $p=0.0381$ ) were significantly associated with availability of interpreter services. Availability of translated materials among Home Health/Hospice agencies was significantly associated with having SNFs ( $p=0.0322$ ) as referral source, and having formal contracts with hospitals ( $p=0.0280$ ). Availability of multilingual staff was associated with having hospitals (0.0052), rehabilitation facilities ( $p=0.0035$ ), having formal contracts with hospitals ( $p=0.0056$ ), and JCHAO ( $p=0.0209$ ). Our findings suggest that a variety of cultural competence initiatives were available, which were associated with the agencies' characteristics. This work highlights the importance and increases the understanding of cultural competence in home health and hospice care.

### **AGING BODIES, AGING SELVES: A SOCIOLOGY OF EXPERIENCES AT MIDLIFE**

U.M. Salim, *University of California, San Francisco, San Francisco, California*

Through the lens of the Midlife in the U.S. Study (MIDUS), this paper explores concepts and constructs of middle age, theorizing how self-perceptions of aging, the experience of disability, and the presence or absence of supportive relationships at midlife might elucidate mechanisms of aging in later life. While the literature suggests that older individuals with positive self-perceptions of aging may live longer than those with less positive self-perceptions, few studies have investigated midlife as a sensitive period for the development of an aging self-consciousness. This paper proposes that middle age is an important period of development, one where adverse life experiences can lead to premature morbidity and mortality in later life. I argue that cumulative advantage or disadvantage begins to manifest in very measurable physiological and psychological ways during middle age. The ubiquitous "mid-life crisis," therefore, represents a turning point in the life course, the point where life experiences accumulate and lay the foundation for future health or illness. Within the broader framework of the MIDUS study and an investigation of midlife as a sensitive period in the development of self-conceptions of aging, this paper also addresses social disparities in health as they affect women, ethnic minorities, and people with a low socioeconomic position during middle age. Finally, this paper concludes with a discussion of why midlife matters to the study of gerontology, recognizing that the unique social, physical and psychological changes during middle age can elucidate mechanisms of healthy aging, conceptions of aging in general, and perhaps longevity.

### **LIFE EXTENSION IN OLDER ADULTS IN JAPAN - LIFE TABLE ANALYSIS 2010**

Y. Ooe<sup>1</sup>, T. Furukawa<sup>2</sup>, 1. *Internal Medicine, Yao Municipal Hospital, Yao, Osaka, Japan*, 2. *Osaka National Hospital, Osaka, Japan*

According to the Japanese abridged life table (2010), the average life expectancy is 79.64 (+1.08) years in men, and 86.39 (+0.87) years

in women. It is clear that the death rate in older adults has decreased over the last 50 years. We categorized the whole death curve of the life table into three components: (1) infantile death, (2) contingent death and (3) aged death by Mixed Weibull Analysis. Based on these categories, we then focus on the change of the aged-death-component. Our former examination of the Japanese life tables (1965-2000) showed that the aged-death-curve of men shifted right by 0.120 years/year, and that of women by 0.222 years/year. However, based on this calculation using the abridged in 2010, the aged-death-curve of men shifts right by 0.110 years/year, and that of women by 0.158 years/year. As a consequence of this analysis, the life extension in older adults in Japan might show signs of a slowdown towards its maximum level. 1965-2000 1965-2010

		Shift amount of the aged-death-curve of men	0.120	0.110 (years/year)	Shift amount of the aged-death-curve of women	0.222	0.158
--	--	---	-------	--------------------	---	-------	-------

## SESSION 430 (SYMPOSIUM)

### FRAILTY FROM THE CELL TO SOCIETY

Chair: *A.B. Mitnitski, Department of Medicine, Dalhousie University, Halifax, Nova Scotia, Canada*

Although the mortality risk increases with age, not everyone of the same age has the same risk of dying. This variable vulnerability to death and other adverse outcomes amongst people of the same age is known as frailty. Frailty can be operationalized using a deficit accumulation approach. Deficits exist at a cellular level, as result of unrepaired damages caused by external and internal factors. Ultimately, they affect various bodily systems, thereby increasing the risk of dying. Complex networks of genes regulate health and define aging phenotypes, but genes alones do not fully explain the considerable variability in health status and life span seen even in genetically identical twins. Amongst many external (environmental) factors, social and economic conditions play an important role in defining the health of individuals and societies. Multidisciplinary cross-national databases of micro data have become available. These allow health related data (including biomarkers) to be linked to polygenic data and social-economic characteristics. Using such data, this symposium will address the following questions: What is the role of genetic networks in maintaining health? What are the relationships between genetic networks and the patterns of morbidities and mortality? To what extent do environmental conditions influence health? How do such conditions interact with genetic networks? The symposium is planned as an interdisciplinary event to bridge Biological, Health and Social Science Sections of the GSA.

### GENES, HEALTH, AGING, AND ENVIRONMENT: HOW ARE THEY RELATED?

*A. Kulminski, I. Culminskaya, K.G. Arbeev, S.V. Ukraintseva, L. Arbeeveva, A.I. Yashin, Center for Population Health and Aging, Duke University, Durham, North Carolina*

Aging of populations raises fear about expansion of morbidity and frailty in developed societies. Revealing genes predisposing to healthspan could be a breakthrough in addressing this problem. Despite progress of genome-wide association studies (GWAS), the optimism in the field is tempered. Candidate-gene and genome-wide genotyping data on two successive generations of humans examined in the Framingham Heart Study during 60+ years are used to characterize the role of lipid-related genes in total cholesterol and cardiovascular disease (CVD) across ages and human generations. We show that the same alleles can be detrimental and protective against CVD in different ages and generations. These alleles can change their role in cholesterol in the same individuals as they age. The results suggest that aging in changing environment can be a key player in genetic predisposition to health.

More detail analyses beyond those offered in standard GWAS can substantially advance the progress in the field.

### GENETIC AND NON-GENETIC FACTORS IN AGING, HEALTH, AND LIFESPAN: INSIGHTS FROM BIODEMOGRAPHIC ANALYSES

*A.I. Yashin, D. Wu, K.G. Arbeev, I. Akushevich, A. Kulminski, P. Stallard, L. Arbeeveva, S.V. Ukraintseva, Sociology, Duke University, Durham, North Carolina*

The results of recent genome wide association studies (GWAS) of human aging and longevity have two common features. The first one is that the SNP alleles selected for their association with longevity traits in one study is difficult to replicate using data on independent populations. The second feature is that most of detected genetic variants do not reach genome wide statistical significance. In this paper we discuss reasons that might cause these effects including interaction among genetic and non-genetic factors, polygenic influence of many small-effect genetic variants on health and longevity traits, as well as underestimating the importance of biodemographic aspects of the problem in the genetic analyses of data. We illustrate our arguments by the results of genetic analyses of simulated data, as well as longitudinal data collected in the Framingham Heart Study. In particular, we show how polygenic score indices affects biodemographic characteristics of aging.

### FAMILIAL FACTORS IN LONGEVITY: EXPLORING COMPLEX ENVIRONMENTAL AND GENETIC EFFECTS

*L.A. Gavrilov, N.S. Gavrilova, NORC and the University of Chicago, Chicago, Illinois*

This study explores the effects of centenarian gender on survival of biological and non-biological relatives of 1,945 validated U.S. centenarians born in 1880-1895. Male gender of centenarian has significant positive effect on survival of adult male relatives (brothers and fathers) but not female blood relatives. However this male advantage disappeared when lifespan of siblings of male centenarians was compared to lifespan of siblings of 103-year old females having similar survival percentile. In this case, sisters of long-lived females lived longer. This study suggests longevity inheritance through sex-specific mechanisms. Lifespan of centenarian siblings in law was lower compared to lifespan of centenarian siblings and did not depend on centenarian gender. Wives of male centenarians who share lifestyle and living conditions had a significantly better survival compared to wives of centenarian brothers. This demonstrates an important role of shared familial environment and lifestyle in human longevity. Supported by NIH grant R01 AG028620.

### FRAILTY AND BIOMARKERS OF INFLAMMATION, IMMUNOSENESCENCE AND CELLULAR AGEING IN THE NEWCASTLE 85+ STUDY

*J. Collerton, C. Martin-Ruiz, K. Davies, M. Catt, C. Jagger, T. von Zglinicki, T. Kirkwood, Institute for Ageing and Health, Newcastle University, Newcastle upon Tyne, United Kingdom*

We report findings from the first comprehensive study of frailty and biomarkers of inflammation, immunosenescence, and cellular ageing in a very old population. Using data from the Newcastle 85+ Study, we confirmed the importance of inflammatory markers in frailty established in the younger old, in the very old. Limited evidence was found to support the role of immunosenescence; although lymphocyte count was inversely related to frailty, no relationships were found for the immune risk profile and those for memory/naïve CD8 T and B cell ratios were in the opposite direction to expected. No associations with frailty were found for CMV sero-positivity, telomere length or markers of oxidative stress or DNA damage and repair. Fried and Rockwood frailty models measured different but overlapping concepts yet biomarker associations were generally consistent between models. Difficulties in operationalizing the Fried model, due to high levels of comorbidity, limit its utility in the very old.

## PREVALENCE OF FRAILTY ACROSS COUNTRIES: IS IT RELATED TO NATIONAL ECONOMIC STATUS?

O. Theou, A.B. Mitnitski, K. Rockwood, *Geriatric Medicine, Dalhousie University, Halifax, Nova Scotia, Canada*

The prevalence of frailty is different across countries and races, which may be due to social and economic factors. Fifteen countries participated in the Survey of Health, Ageing and Retirement in Europe (Austria, Belgium, Czech Republic, Denmark, France, Germany, Greece, Ireland, Israel, Italy, Netherlands, Poland, Spain, Sweden, Switzerland). A Frailty Index (FI) was constructed from 71 measures which were age-related and associated with adverse outcomes. Countries were grouped according to their gross domestic product. The wealthiest countries had a significantly lower mean FI ( $0.19 \pm 0.02$  vs  $0.26 \pm 0.03$ ), upper limit to FI ( $0.59 \pm 0.04$  vs  $0.68 \pm 0.04$ ), prevalence of frailty ( $25.7 \pm 3.9\%$  vs  $43.5 \pm 8.7\%$ ), and death rate ( $14.4 \pm 1.9\%$  vs  $16.4 \pm 1.8\%$ ) in those aged 65+ years. In the least wealthy countries the FI increased 3.5% per year, compared to 2.8% in the wealthiest countries. The ability to compare using the same method suggests socioeconomic factors are important.

## SESSION 435 (SYMPOSIUM)

### STEM CELLS AND FUNCTIONAL IMPAIRMENTS WITH AGE: WHAT ARE WE LEARNING AND WHY DOES IT MATTER

Chair: *C.A. Peterson, University of Kentucky, Lexington, Kentucky*

Co-Chair: *C.A. Peterson, University of Kentucky, Lexington, Kentucky*

The theme 'Opportunities for Interventions in Aging' is designed to present information on interventions that have the potential to reverse functional loss in older adults. This year, the session will be devoted to the potential for stem cell therapy in older adults. There are emerging data that stem cells within the heart, skeletal muscle and brain are important for the long term health and maintenance of these tissues. With age, there is a loss of stem cells and studies suggest that these changes are an important contributing factor in the functional decline with age. These results raise the possibility that intervention either through a pharmacological mechanism to increase the function of the remaining stem cells or by replacement of stem cells directly may improve function in older adults. The focus of this symposium is to discuss the merits of alteration in stem cell number or function as a mechanism for tissue decline with age and discuss the potential for stem cell therapy in reversing these deficiencies.

### OVARIAN AGING AND THE MENOPAUSE: CAN WE REWIND THE FEMALE BIOLOGICAL CLOCK THROUGH STEM CELL-BASED TECHNOLOGIES?

J.L. Tilly, *MGH Vincent Department of Obstetrics and Gynecology, Massachusetts General Hospital/Harvard Medical School, Boston, Massachusetts*

Ovarian aging is defined by a declining reserve of oocyte-containing follicles, and no interventions are known that mitigate the deleterious effects of aging on human ovaries. We have been exploring the use of female germline or oogonial stem cells (OSCs) for management of ovarian aging. Following initial studies identifying OSCs in adult mouse ovaries (Nature 2004 428:145), mouse OSCs have been isolated and shown to generate eggs that yield healthy embryos and offspring. Studies of *Drosophila* and mice indicate that failure of OSCs to support the oocyte reserve with age reflects deterioration of niches that support OSC function. We have also reported the successful isolation of OSCs from ovaries of women, and human OSCs are functionally indistinguishable from their mouse counterparts (Nat Med 2012 18:421). These findings move a large body of animal work into the realm of human biology, and open unprecedented possibilities for controlling the female biological clock.

## MAINTENANCE OF NICHE FUNCTION AND TISSUE HOMEOSTASIS DURING AGING

L. Jones, *Salk Institute for Biological Studies, La Jolla, California*

Adult stem cells support tissue homeostasis and repair throughout the life of an individual. Numerous changes occur with age that result in altered stem cell behavior and reduced tissue maintenance and regeneration. Changes can be cell autonomous including changes in cell cycle progression, increased DNA damage, and epigenetic alterations. In addition, poorly understood changes to the local and systemic environments occur that result in decreased stem cell activity or alterations in commitment or differentiation potential. We have developed *Drosophila melanogaster* as a model to uncover conserved mechanisms regulating stem cell aging and explore how cellular and tissue aging impact longevity. We will compare and contrast age-related changes to germline and intestinal stem cells and present strategies to counter age-related changes in both tissues. Understanding the mechanistic basis for intrinsic and extrinsic age-related changes will facilitate stem cell based therapies to treat age-onset and degenerative diseases in older individuals.

## SESSION 440 (SYMPOSIUM)

### AGE DIFFERENCES IN JUDGMENT AND DECISION MAKING: THE ROLE OF MOTIVATION AND EMOTION

Chair: *C.E. Loeckenhoff, Cornell University, Ithaca, New York*

Co-Chair: *J. Strough, West Virginia University, Morgantown, West Virginia*

Discussant: *M. Schumacher, University of Kentucky, Lexington, Kentucky*

Previous research has found age differences in various aspects of judgment and decision making. Importantly, such effects are not fully explained by cognitive decline. Age-related variations in motivational states and affective responses appear to play a role as well—especially in emotionally-salient scenarios. The presentations in this symposium illustrate such effects with regard to decisions involving financial gambles, sunk costs, consumer choices, and aversive physical outcomes. Mata, Pachur, and Hertwig investigated older and younger adults' preferences about risky lotteries. Following cumulative prospect theory, decision models suggested that age groups differ significantly in the relative weighting of gains and losses. Strough, Bruine de Bruin, and Parker, in turn, examined age differences in decisions about sunk costs in a large, adult, life-span sample. Compared to younger adults, older adults' choices were less likely to be swayed by irretrievable prior investments, even after controlling for a range of relevant covariates. Hess, Ennis, and Queen addressed the role of motivational factors in decision strategies for consumer choices. Higher accountability and personal relevance were associated with more systematic information search, but this effect was more pronounced with increasing age. Loeckenhoff and Rutt gathered the first evidence for age differences in choices about aversive electrodermal stimuli. Specifically, they examined the role of age differences in anticipatory affect when making temporal trade-offs among such stimuli. Finally, Schumacher will integrate these findings with the existing literature on judgment and decision making and discuss directions for future research.

### AGE DIFFERENCES IN RISKY CHOICE: FORMAL MODELING WITH PROSPECT THEORY

R. Mata, T. Pachur, R. Hertwig, *University of Basel, Basel, Switzerland*

Different motivational theories make opposing predictions regarding the impact of aging on risk taking through changes in the weighting of losses, gains, or both. The extant empirical evidence, however, is inconclusive, (see Mata, Josef, Samanez-Larkin, & Hertwig, 2011, for a meta-analysis). We contribute to clarifying potential age differences in risky choice by asking young and older adults ( $N = 120$ ) to make decisions between described risky monetary lotteries and formally modeling decision processes using cumulative prospect theory (CPT).

Behaviorally, the results show clear evidence for increased risk seeking in the gain domain and reduced loss aversion in older adults. The modeling results converge with these conclusions; whether the observed age differences are due to differences in the asymmetric weighting of gains and losses or the processing of probabilities, however, depends on particular implementations of CPT. Our results support theories assuming age-related changes in the relative weighting of gains and losses.

#### **SOCIAL AND MOTIVATIONAL INFLUENCES ON DECISIONS ABOUT SUNK COSTS ACROSS THE LIFE SPAN**

J. Strough<sup>1</sup>, W. Bruine de Bruin<sup>2</sup>, A. Parker<sup>3</sup>, 1. *West Virginia University, Morgantown, West Virginia*, 2. *Carnegie Mellon University, Pittsburgh, Pennsylvania*, 3. *RAND Corporation, Pittsburgh, Pennsylvania*

Studies of aging and decision making often focus on declines, but age-related improvement is found for decisions about sunk costs—older adults' decisions are less likely to be biased by irretrievable prior investments. Using a sample from the American Life Panel (N=335, M age=53.97yrs, range 20-89 yrs; 58.5% Women), we investigated social-contextual moderators of age differences in sunk-cost decisions and individual differences that might account for age differences. As hypothesized, older adults' decisions were less influenced by sunk costs. Irrespective of age, participants' decisions were less influenced by sunk costs when a hypothetical decision affected both oneself and a friend versus only oneself, and the sunk cost was one of time rather than money. Decisions differed systematically depending on the social context and age remained a marginally significant predictor even after accounting for income, temporal perspectives, action orientation, anxiety and avoidance in close relationships, perceived ability, and perceived health.

#### **INTRINSIC AND EXTRINSIC MOTIVATIONAL INFLUENCES ON ADULT AGE DIFFERENCES IN INFORMATION-SEARCH STRATEGIES**

T.M. Hess<sup>1</sup>, G.E. Ennis<sup>1</sup>, T.L. Queen<sup>2</sup>, 1. *NC State University, Raleigh, North Carolina*, 2. *University of Michigan, Ann Arbor, Michigan*

Research has suggested that increasing age is associated with greater reliance on simpler and noncompensatory information-search strategies in decision-making contexts. There has been little attempt, however, to link age differences in strategy use with specific aspects of the decision task. In this study, we examined the role that both intrinsic (personal relevance) and extrinsic (social accountability) motivational factors play in determining age differences in strategy use. Adults aged 21-91 years (N=160) performed two different decision tasks that varied in age relevance under either high or low social-accountability conditions. Both high accountability and personal-relevance resulted in more systematic information search involving use of elaborative, noncompensatory strategies. High arousal was also associated with engagement in simplistic satisficing. Consistent with the selective engagement framework, motivational factors had a stronger impact on performance with increasing age. The results argue for the importance of context in determining age differences in adaptive decision-making processes.

#### **THE ROLE OF AGE AND AFFECTIVE RESPONSES IN DECISIONS ABOUT AVERSIVE PHYSICAL OUTCOMES**

C.E. Loeckenhoff, J.L. Rutt, *Cornell University, Ithaca, New York*

Prior research on age differences in decision making has focused almost exclusively on hypothetical financial and consumer choices. Little is known about decisions involving aversive physical outcomes. This is a critical impediment to understanding age differences in real-life healthcare choices which often involve unpleasant and painful experiences. To address this research gap, we asked younger (<40 years) and older participants (>55 years, 56% male, n = 32) to make trade-offs among aversive electrodermal stimuli that differed in timing and intensity. Stimuli were subjectively calibrated and administered to the wrist.

Age groups did not differ significantly in perceptual thresholds, maximum bearable intensity, electrodermal responses, or decisions involving trade-offs between the timing and intensity of the stimuli. In contrast, there were significant age differences in anticipated and actual emotional responses with older adults showing lower responsiveness to variations in timing and intensity ( $p < .01$ ). Implications for realistic healthcare settings are discussed.

### **SESSION 445 (SYMPOSIUM)**

#### **CHARTING NEW FRONTIERS IN MARITAL QUALITY: CONNECTIONS ACROSS SPOUSES, SYSTEMS, AND CULTURES**

Chair: *K. Fiori, Gordon F. Derner Institute of Advanced Psychological Studies, Adelphi University, Garden City, New York*  
Discussant: *J. Bookwala, Lafayette College, Easton, Pennsylvania*

The theme of this year's conference highlights the importance of connections — e.g., within and across individuals, systems, environments, and cultures. In this symposium, we examine one of the most powerful and influential connections individuals have — that between spouses. Specifically, we investigate the ways in which marital quality can be influenced across the lifespan by connections between spouses (e.g., personality, sleep quality), across systems (e.g., work and home), and across cultures (e.g., race, nation). Fiori, Brown, Birditt, and Orbuch explore interactions between spouses' personalities predicting marital quality in a sample of Black and White couples, and show that personality traits (and interactions between traits) in the first year of marriage predict positive and negative marital quality 15 years later for White couples only. Rauer and Jensen study spousal differences in sleep quality in older married couples, and find the quality of wives' sleep is particularly sensitive to variations in both spouses' reports of positive marital quality. Wan, Birditt, and Antonucci show that both wives' and husbands' reports of job autonomy in the first year of marriage predict marital satisfaction 2, 6, and 15 years later, with moderation by race and gender. Finally, Fuller-Iglesias examines predictors of positivity and negativity in the marital relationship within the Mexican cultural context, with specific attention to gender and socioeconomic differences. Our discussant, Dr. Jamila Bookwala, an expert in the field of marriage and well-being, will discuss the implications of these studies for understanding the powerful spousal connection and why it matters.

#### **DOES PERSONALITY MATTER?: RACE DIFFERENCES IN INTERACTIONS BETWEEN SPOUSAL PERSONALITY TRAITS PREDICTING MARITAL WELL-BEING 16 YEARS LATER**

K. Fiori<sup>1</sup>, E. Brown<sup>2</sup>, K. Birditt<sup>3</sup>, T.L. Orbuch<sup>3</sup>, 1. *Gordon F. Derner Institute of Advanced Psychological Studies, Adelphi University, Garden City, New York*, 2. *University of Connecticut, Storrs, Connecticut*, 3. *University of Michigan, Ann Arbor, Michigan*

Research has shown that personality characteristics as well as discrepancies in personality traits between spouses are predictive of marital quality. However, given race differences in marital stability, it is perhaps surprising that no known research has examined race differences in the effects of personality on marital quality. Furthermore, most research has focused on mean trait levels and discrepancy scores rather than on interactions between spousal personality traits. In the present study we used Actor-Partner Interdependence Models to examine race differences in the interactions of spousal personality traits among long-term married White (n = 95) and Black (n = 65) couples predicting positive and negative marital quality 16 years later (2003-4). Findings indicate that among Black couples, personality characteristics were not associated with marital quality. In contrast, among White couples, personality traits and/or interactions predicted positive and negative marital quality 16 years later. Implications are discussed.

## TWO IN A MARRIAGE, TWO IN A BED: MARRIAGE AND SLEEP IN OLDER ADULTHOOD

A. Rauer, J. Jensen, *Auburn University, Auburn, Alabama*

Being unmarried is associated with poorer health throughout the lifespan, but the effects are felt disproportionately in older adulthood. However, marriage may not be universally beneficial across all health domains. There is growing evidence to suggest that having a partner can be detrimental to an individual's sleep. Using data from a sample of 35 older married couples, we find that these effects are exacerbated for spouses in unhappier relationships, as less happily married spouses reported significantly more sleep disturbances. The quality of wives' sleep was particularly sensitive to variations in both spouses' reports of positive marital quality, as wives whose marriages were more passionate and supportive reported sleeping better at night. Given the deleterious effects of sleep disturbances on a wide range of mental and physical health outcomes, understanding how the marital relationship influences well-being not only during the day, but the night as well is of the utmost importance.

## MARITAL QUALITY ACROSS TIME: THE CONTEXTS OF WORK, GENDER, AND RACE

W.H. Wan<sup>1</sup>, K. Birditt<sup>1,2</sup>, T. Antonucci<sup>1,2</sup>, *1. University of Michigan - Ann Arbor, Ann Arbor, Michigan, 2. Institute for Social Research, Ann Arbor, Michigan*

Much knowledge about work-family conflict is derived from cross-sectional research of men and women not married to each other. The goal of this study is to examine the long-term effects of work on marital quality among White (N = 174) and Black American (N = 199) couples in their first year of marriage in 1986, and in Years 3, 7, and 16. We assessed whether Year 1 work characteristics (e.g., work hours and job satisfaction) predicted marital quality over time. Additionally, because of mixed evidence regarding gender and race differences in work-family conflict, we included gender and race as moderators. Using the Actor-Partner Independence Model, multilevel analyses revealed that actor and partner's job autonomy in Year 1 predicted marital satisfaction in Years 3, 7, and 16. Gender and race moderated these effects. The findings suggest not only does one's work influence one's own marital satisfaction, so does one's partner's work.

## MARITAL QUALITY AMONG MEXICAN ADULTS: 'EL QUE SE CASA POR TODO PASA'

H. Fuller-Iglesias, *Human Development and Family Science, North Dakota State University, Fargo, North Dakota*

Marriage is an interpersonal relationship that can be both highly positive and highly negative. A wealth of research on marital quality in the U.S. has demonstrated that personal and contextual factors (such as gender or culture) may influence relationship quality and that marital quality has implications for well-being. However, there is a lack of understanding of marital quality in other cultural contexts, such as that of Mexico. Using data from the Survey of Social Relations and Well-being in Mexico (Fuller-Iglesias & Antonucci, 2009), this study explores positive and negative qualities of the spousal relationship of 789 married, Mexican adults ranging from age 20 to 90. Results suggested that men and individuals married for fewer years reported more positivity (support, trust, enjoyment, and encouragement) in their spousal relationship; whereas, age and SES were not associated with positivity. Men and individuals of lower SES reported more negativity (controlling behavior); however, age and length of marriage were not related to negativity. Regression analyses indicated that positivity and negativity were both associated with well-being. Findings highlight important distinctions between positivity and negativity within the marital relationship. Implications will be discussed in light of the Mexican cultural context

## SESSION 450 (SYMPOSIUM)

### CHARTING THE INTERDEPENDENCIES IN COGNITIVE AND MOTOR DECLINES IN AGING THROUGH COMPLEXITY

Chair: *J.J. Temprado, Institute of Movement Sciences, Aix-Marseille University, Marseille, France*

Co-Chair: *S.L. Hong, University of Indiana, Bloomington, Indiana*

The theme of this year's conference is "Charting New Frontiers in Aging" seeks to build new connections that cut across disciplines to deepen our understanding of the many facets of human aging. In this symposium, we will present a perspective on cognitive and motor declines in aging based on complexity science. While many still hold the view of mind-body separation, where cognition and action are distinct and independent phenomena, we will present the idea that cognitive-motor aging reflects a loss of complexity in the brain-body system. Effectively, as we age, declines in both cognitive and motor function at the level of the individual can be traced back to a loss of shared "inputs" needed to perform a given task. This symposium charts a course using complexity science as means of making new connections in cognitive-motor aging frontier through the following topical presentations: 1) loss of complexity in aging (Lipsitz); 2) complexity in motor function (Newell); 3) empirical data in cognitive-motor tasks (MacDonald); 4) clinical and epidemiological manifestations (Verghese); and 5) dimensional reduction and interdependency in cognitive and motor aging (Temprado). In sum, we will present a view of cognitive and motor aging as the process that occurs due to a loss of shared "inputs" that can be explained through concepts from complexity science. These presentations will seek to build new connections between cognitive and motor aging upon the foundation of the loss of complexity hypothesis. At the conclusion of the symposium, the discussant will provide a summarized synthesis of the key concepts and findings from the 5 presentations.

### DIMENSIONAL REDUCTION ACROSS COGNITIVE AND MOTOR FUNCTION IN AGING: RE-INTEPRETING COMPLEXITY CHANGES IN BRAIN AND BEHAVIOR

J.J. Temprado<sup>1</sup>, S.L. Hong<sup>2</sup>, *1. Institute of Movement Sciences, Aix-Marseille University, Marseille, France, 2. Indiana University, Bloomington, Indiana*

A prevailing view of cognitive and motor function is that they are separate and distinct processes. However, recent evidence suggests that altered interactions between these functional domains are also prominent aging-induced phenomena. We will present the idea that cognitive and motor domains share a common set of resources or inputs. This approach emphasizes age-related reduces the number of available "degrees of freedom" within the neural and motor system, restricting the number of activities that the system can engage in at any given time. Findings from the extant literature across cognition and action as evidenced by behavioral and brain imaging studies will be discussed through the lens of dimensional reduction. Our presentation will highlight the potential utility of this approach for the discovery of more fundamental and generalizable principles of aging in brain and behavior.

### COGNITIVE AND MOTOR FUNCTION: EVIDENCE FOR COMBINED ROLE IN COGNITIVE DECLINE

J. Verghese, *Albert Einstein College of Medicine, Bronx, New York*

Stemming from the Cartesian argument for mind-body separation, researchers have long considered cognitive and motor aging as distinct and independent phenomena, and a view that cognition has hierarchical priority over action. However, recent evidence suggests that in addition to the losses of the functional integrity in each domain, altered interactions between these functional domains are prominent aging-induced phenomena. Thus, investigations of the interdependency between cognitive and sensorimotor processes are now currently considered as a

crucial step in the direction of cross-level and cross-domain approaches of normal and pathological aging. The goal of this presentation is to review the growing epidemiological evidence that links cognitive and motor function in aging building on recent findings from cross-sectional investigations, prospective cohort studies, and clinical trials. The potential utility of a combined cognitive-motor approach in clinical and research settings for studying and investigating older adults with cognitive decline will also be discussed.

### WHAT INDICATORS OF GAIT CAN TELL US ABOUT COGNITIVE AGING

S.W. MacDonald<sup>1,3</sup>, J. Love<sup>1,3</sup>, T. Quade<sup>1</sup>, C. DeCarlo<sup>1,3</sup>, P. Brewster<sup>1,3</sup>, T. Mack<sup>1</sup>, R.A. Dixon<sup>2</sup>, 1. *Psychology, University of Victoria, Victoria, British Columbia, Canada*, 2. *University of Alberta, Edmonton, Alberta, Canada*, 3. *Centre on Aging, Victoria, British Columbia, Canada*

Gait function has been linked to age-related change in neural and cognitive function, morbidity, and mortality. Using data from several cognitive aging studies, including S1W8 of the Victoria Longitudinal Study, we explored (1) various gait indices as correlates of age differences and up to 25-year change in cognitive function; and (2) the influence of select moderators (increasing cognitive load, health) on gait function and gait-cognition associations. Preliminary results link decreasing cognitive and gait function with increasing age, and document the negative impact of increasing cognitive load on gait and gait-cognition coupling. These patterns will be discussed vis-a-vis the potential utility of individual differences in gait for indexing cognitive aging, perhaps as a proxy for biological vitality due to the demands that mere walking places upon multiple systems (circulatory, musculoskeletal, respiratory). Potential mechanisms underlying age-related linkages in sensorimotor and cognitive function will also be discussed, including cross-domain resource competition.

### SESSION 455 (SYMPOSIUM)

#### CLOSING THE MENTAL HEALTH DISPARITY GAP FOR OLDER AFRICAN AMERICANS: THE BEAT THE BLUES TRIAL

Chair: L.N. Gitlin, *School of Nursing, Johns Hopkins University, Baltimore, Maryland*

Depression in older African Americans remains undertreated and under-detected. As depression is one of the most common and pernicious conditions in late life associated with negative health and quality of life outcomes, new models of care are a public health priority. This symposium presents results from a randomized trial, Beat the Blues (BTB). The BTB involves a partnership between a research institute and a senior center to enhance staff capacity to detect older adults with depression and provide an innovative home based intervention to reduce symptomatology. The symposium papers will present the collaborative partnership which was based on community participatory principles, its challenges and benefits, screening and enrollment results, intervention protocol and treatment processes, main treatment outcomes and its economic evaluation. The practical trial design highlights the benefits of involving community partners as full members of the research team. Screening and enrollment numbers demonstrate that older African Americans self identify depressive symptoms to trusted community advocates and are willing to enroll in a nonpharmacological treatment approach. The home intervention involved five components (case management, referral and linkage, stress reduction, education and behavioral activation) with treatment data demonstrating adherence to the stated protocol. Main treatment outcomes show large treatment effects that were statistically significant and clinically meaningful reductions in depressive symptoms and improvements in quality of life indicators. Costs were lower than pharmacological management. A discussant will provide critical commentary on study findings, the contributions of

this approach for closing the mental health disparity gap, and the translational potential of BTB.

#### ACADEMIC/COMMUNITY-BASED COLLABORATION: BENEFITS ACADEMIC INSTITUTIONS, SENIOR CENTERS AND ELDERS

L.M. Harris, *Center in the Park, Philadelphia, Pennsylvania*

Beat the Blues (BTB) represents a partnership between an academic research institution and an urban senior community center serving primarily African American elders. Using a collaborative model, based in community participatory research principles, we developed the BTB intervention and tested it in a randomized design. This paper will describe key steps in the collaborative process which included direct involvement of senior center staff and end users (the target group) in naming, framing and evaluating BTB. Key challenges and their solutions will be discussed including developing a shared project structure, training staff, adhering to trial design, establishing effective communication channels and procedures across the two sites, recruiting and enrolling participants. This collaborative effort resulted in screening 703 older African Americans over a 2 ½ year period of whom, 208 enrolled in the trial. Also discussed are the value and benefit of partnering for each site and the target population.

#### BEAT THE BLUES INTERVENTION PROTOCOL AND PROCESSES: COMPONENTS, INTENSITY, AND IMPLICATIONS

M.C. McCoy, *Center in the Park, Philadelphia, Pennsylvania*

This paper describes the Beat the Blues (BTB) intervention using case study and treatment data. BTB involved five components: case management, referral/linkage, stress reduction, education and behavioral activation. Licensed senior center social workers trained in BTB met with participants at home for up to 10 one hour sessions over 4 months to assess care needs, make referrals/linkages, provide depression education, instruct in stress reduction techniques, and use behavioral activation to identify goals and steps to achieve them. While all participants received all 5 components, the content of each was tailored to specific care needs, understanding of depression and self-actualization goals. Documentation of treatment sessions revealed adherence to the protocol with an average of 7 sessions involving behavioral activation, and care management, 5 sessions involving stress reduction, 4 sessions involving depression education and referral and linkage. The waitlist control group upon treatment receipt of BTB, similarly received the visit pattern.

L.N. Gitlin, L. Fields Harris, M.C. McCoy, N.L. Chernett, L. Pizzi, E. Jutkowitz, E. Hess, W.W. Hauck, *School of Nursing, Johns Hopkins University, Baltimore, Maryland*

This paper reports main outcomes for Beat the Blues (BTB), a prospective two-group randomized trial involving 208 older African Americans with depressive symptoms. At 4 months, compared to controls, BTB participants had reduced symptomatology (PHQ-9 adjusted mean difference, -2.6; 95% CI, -4.1, -1.0; p=.001; Cohen's d=0.47; CES-D adjusted mean difference, -3.6; 95% CI, -5.1, -2.1; p=.000; Cohen's d=0.61); greater depression knowledge using a 10-item index (adjusted mean difference, 0.3; 95% CI, 0.2, 0.4; p=.000; Cohen's d=0.69); improvements in a 14-item well-being index (adjusted mean difference, 0.6; 95% CI, 0.4, 0.8; p=.000; Cohen's d=.89), life quality 12-item index (adjusted mean difference, 2.9; 95% CI, 1.7, 4.2; p=.000; Cohen's d=.54), 17-item behavioral activation scale (adjusted mean difference, 0.8; 95% CI, 0.5, 1.1; p=.000; Cohen's d=.84); and less anxiety using a 10-item scale (adjusted mean difference, -0.4; 95% CI, -0.6, -0.2; p=.000; Cohen's d=.59) and functional difficulties using an 18-item scale (adjusted mean difference, -0.2; 95% CI, -0.3, 0.0; p=.019; Cohen's d=.25). By 4-months, 43.8% in BTB had no depressive symptoms (PHQ-9<5) compared to

26.9% controls. Older African Americans with mild-to-severe depressive symptoms similarly benefited from BTB with benefits extending to 8 months.

### **COSTS OF A HOME SUPPORT PROGRAM FOR DEPRESSED OLDER AFRICAN AMERICANS: RESULTS FROM THE BEAT THE BLUES TRIAL**

L. Pizzi<sup>1</sup>, E. Jutkowitz<sup>2</sup>, 1. *Health Policy, Jefferson Medical College, Philadelphia, Pennsylvania*, 2. *University of Minnesota, Minneapolis, Minnesota*

The reality of limited societal resources necessitates communicating the cost-effectiveness of aging programs to decision makers. There is a particular need for economic analyses of home support programs for depressed older minorities. Beat the Blues (BTB), a home support program for depressed African Americans  $\geq 55$  years, was tested in a randomized trial, with a formal societal cost effectiveness analysis in progress. In this session, we will present findings on the cost of BTB. Cost components comprise: 1) Screening; 2) Intervention Delivery; 3) Supervision. The cost of conducting BTB was calculated as (time spent performing each task)  $\times$  (the wage rate of the individual who performed the task + fringe benefits). Non-time costs (material and mileage) were also recorded. The average screening cost is was \$2.63 per participant; total cost (screening plus home intervention) was \$146.16 per participant per month. Findings inform the scalability and sustainability of the program.

## **SESSION 460 (SYMPOSIUM)**

### **COGNITIVE/BEHAVIORAL THERAPY FOR LATE LIFE DEPRESSION: PREDICTORS OF TREATMENT RESPONSE**

Chair: D. Gallagher-Thompson, *Stanford University, Stanford, California*

Co-Chair: R. O'Hara, *Stanford University, Stanford, California*

Discussant: B. Lebowitz, *University of California San Diego, San Diego, California*

In this NIMH funded R21 grant, 60 older adults with a diagnosis of depression (based on a structured clinical interview) and self-reported moderate levels of depressive symptoms were recruited from the SF Bay Area to participate in a 12 week open trial of individual Cognitive Behavioral therapy (CBT) for late life depression. There were 38% men and 62% women enrolled. Their mean age was 69.70 years (range: 60–88) and ethnic breakdown included: 70% Caucasian, 5% African American, 10% Asian, 5% Native American and 10% Hispanic. The primary hypothesis was to evaluate whether impairment of skills comprising “executive function” (e.g., decision making, organizational ability) would predict poorer outcome in CBT. Cognitive processing skills were evaluated both by fMRI and extensive neuropsychological testing, including Wisconsin Card Sort (given both in and out of the scanner). Outcome was defined as improvement both on the diagnostic and self-report levels of depression at post evaluation 4 months later. We also collected salivary cortisol at baseline to serve as a secondary predictor. All post evaluations were conducted by independent raters. Our findings suggest that left middle frontal gyrus ( $p=.023$ ), Wisconsin Card Sorting PE ( $p=.027$ ), Wisconsin Card Sorting CLR ( $p=.049$ ), and the Wechsler Memory Scale ( $p=.056$ ), Immediate Memory were significant neurobiological and neuropsychological predictors of CBT outcome. These finding will be explored in more depth during the symposium presentations. Additional research with a larger sample, in a randomized clinical trial, is needed to confirm these findings.

### **COGNITIVE/BEHAVIORAL THERAPY FOR LATE LIFE DEPRESSION: TREATMENT RESPONSE**

R. Marquett<sup>1</sup>, R. O'Hara<sup>1</sup>, S. Kesler<sup>1</sup>, J.M. Holland<sup>2,1</sup>, D. Gallagher-Thompson<sup>1</sup>, 1. *Psychiatry, Stanford University School of Medicine, Stanford, California*, 2. *University of Nevada Las Vegas, Las Vegas, Nevada*

The Positive Experience Project (PEP) was designed to help identify neuropsychological and neurobiological predictors of treatment outcome for older adults with depression. 60 older adults, 60 years and up, participated in 12 weekly session of Cognitive Behavioral Therapy (CBT). This presentation will discuss the overall depression outcomes for this study. We used three different measures to assess for CBT treatment response. Results indicate that 67% of the sample responded to the PEP program when evaluating significant change in depression diagnosis using the MINI. When evaluating the post evaluation Beck Depression Inventory-II cut off score of 13 or less, we noted a 58% response rate; and a 28% response rate when evaluating the post evaluation HAM-D cut off score of 7 or less. This presentation will explore these findings and attempt to explain some of the differences we see when using different depression outcome criteria.

### **COGNITIVE/BEHAVIORAL THERAPY FOR LATE LIFE DEPRESSION: SALIVARY CORTISOL AS A PREDICTOR OF POSTTREATMENT OUTCOMES**

J.M. Holland<sup>2,1</sup>, A.F. Schatzberg<sup>1</sup>, R. Marquett<sup>1</sup>, S. Kesler<sup>1</sup>, R. O'Hara<sup>1</sup>, D. Gallagher-Thompson<sup>1</sup>, 1. *Psychiatry, Stanford University School of Medicine, Stanford, California*, 2. *University of Nevada Las Vegas, Las Vegas, California*

60 Older adults with the diagnosis of depression and elevated levels of self-reported depression were recruited into the study from the SF Bay Area to participate in a 12 week course of Cognitive Behavioral therapy (CBT) for late life depression. There were 38% men and 62% women enrolled, with a mean age of 69.70. The ethnicity of the sample was 70% Caucasian, 5% African American, 10% Asian, 5% Native American and 10% Hispanic. At baseline participants provided saliva samples for cortisol analysis at three time points across two days. Consistent with previous findings, preliminary analyses suggest that flatter diurnal cortisol slopes (which are generally regarded as more dysregulated) were associated with poorer response to treatment on the Center for Epidemiological Studies-Depression measure ( $r = .35$ ,  $p = .01$ ) and the Beck Depression Inventory II ( $r = .28$ ,  $p = .04$ ). Implications for clinical practice and future research will be discussed.

### **COGNITIVE/BEHAVIORAL THERAPY FOR LATE LIFE DEPRESSION: NEUROPSYCHOLOGICAL PREDICTORS OF TREATMENT RESPONSE**

R. O'Hara<sup>1</sup>, L. Thompson<sup>1</sup>, J.M. Holland<sup>2</sup>, S. Kesler<sup>1</sup>, R. Marquett<sup>1</sup>, D. Gallagher-Thompson<sup>1</sup>, 1. *Psychiatry, Stanford University School of Medicine, Stanford, California*, 2. *University of Nevada Las Vegas, Las Vegas, California*

60 older adults with the diagnosis of depression participated in a 12 week course of Cognitive Behavioral therapy (CBT) for late life depression. The primary hypothesis was to evaluate if impairment of executive function was associated with poorer outcomes in CBT. The hypothesis was supported by the neurocognitive measures used: When using the post evaluation MINI as the dependent variable, the significant predictors of improved diagnostic category were the Wisconsin Card Sorting (PE  $p=.027$ ; CLR  $p=.049$ ), and the Wechsler Memory Scale ( $p=.056$ ), Immediate Memory. Other significant predictors of improved diagnostic category were the Wisconsin Card Sorting CLR ( $p=.014$ ), and Verbal Fluency ( $p=.04$ ). A similar pattern with slightly higher accuracy of classification was obtained when using the Beck Depression Inventory-II to define the categories of responders vs non-responders.

## COGNITIVE/BEHAVIORAL THERAPY FOR LATE LIFE DEPRESSION: FMRI PREDICTORS OF TREATMENT RESPONSE

D. Gallagher-Thompson<sup>1</sup>, R. O'Hara<sup>1</sup>, J.M. Holland<sup>2,1</sup>, R. Marquett<sup>1</sup>, S. Kesler<sup>1</sup>, 1. *Psychiatry, Stanford University School of Medicine, Stanford, California*, 2. *University of Nevada Las Vegas, Las Vegas, Nevada*

In this NIMH funding R21 Grant, 60 older adults with the diagnosis of depression and self reported levels of depression were recruited into the study from the SF Bay Area to participate in a 12 week course of Cognitive Behavioral therapy (CBT) for late life depression. The primary hypothesis was to evaluate if impairment of executive function was associated with poorer outcomes in CBT. The hypothesis was supported by the fMRI measures, specially the frontal gyri area of the brain. The fMRI results indicated that the significant predictors of intervention response in regards to the post evaluation Beck Depression inventory-II were left middle frontal gyrus (LMFG) and left superior frontal gyrus (LSFG) activation with 77.3% accuracy, 66.7% specificity and 84.6% sensitivity (Chi Sq. = 9.5, p = 0.023, Hosmer & Lemshow goodness of fit Chi Sq. = 9.5, df = 8, p = 0.31).

## COGNITIVE/BEHAVIORAL THERAPY FOR LATE LIFE DEPRESSION: FMRI PREDICTORS OF TREATMENT RESPONSE

D. Gallagher-Thompson<sup>1</sup>, R. O'Hara<sup>1</sup>, J.M. Holland<sup>2,1</sup>, R. Marquett<sup>1</sup>, S. Kesler<sup>1</sup>, 1. *Psychiatry, Stanford University School of Medicine, Stanford, California*, 2. *University of Nevada Las Vegas, Las Vegas, Nevada*

## SESSION 465 (SYMPOSIUM)

### LOVE IN CYBERSPACE: DATING AND SEXUALITY

Chair: C. Stelle, *Bowling Green State University, Bowling Green, Ohio*

Discussant: E.H. Thompson, *Holy Cross College, Worcester, Massachusetts*

There is a scarcity of research on dating and sexuality in later life. Recently, however, we have not only begun to recognize that new relationships for older adults is an important topic of inquiry, but we have also acknowledged that as with younger cohorts, some older adults are utilizing online dating sites to locate a potential partner. However, as with traditional dating, most of the research on online dating focuses on the experiences of younger adults. Each of the papers focuses on the use of online dating and the potential costs and rewards of both the process of online dating and the relationships developed from this process. Dr.'s Watson and Stelle present results from a content analysis of older men's and women's advertisements with an emphasis on self-presentation and partner preference. Dr. Brennan-Ing examines gay and bisexual men's sexuality using data collected via an online dating site to explore relationships and sexual risk taking. Dr. Levaro uses older men's use of online dating to explore issues of sexuality and the "intercourse imperative" in older men's romantic relationships. Lastly, Dr.

Vandeweerd presents research on the sharing of information on online forums and the potential risk associated with women's use of online dating sites to find a potential partner. Implications for the costs and rewards associated with online dating among older adults are discussed, and areas for education and intervention are explored.

## ONLINE DATING IN LATER LIFE: SELF PRESENTATION AND PARTNER SEEKING

W. Watson, C. Stelle, *Bowling Green State University, Bowling Green, Ohio*

A content analysis examined online personal ads from adults ages 60+ seeking heterosexual relationships. Ads were systematically sampled from two different sources – an online dating site that markets to adults of all ages (match.com) and a dating site specifically geared to older adults (ourtime.com). Analysis focused on presentation of self and characteristics sought described in the narrative portion of online dating profiles. Findings indicate that while some characteristics transcend age, others were characteristics not seen in studies with younger adults. Additions included companion characteristics (intelligence, independence, affectionate), beliefs (spiritual and political) and discussions of health and aging. Additionally, advertisements are examined for differences according to source of advertising. As more adults are expected to enter later life single, we discuss how this approach to finding an intimate partner might be an increasingly relevant tool for older adults and for people who work with them.

## LOOKING FOR LOVE IN CYBER SPACE: ONLINE PROFILES AND RISKS FOR WOMEN 50+ SEEKING RELATIONSHIPS ON MYSPACE

C. Vandeweerd, M. Coulter, J. Corvin, J. Myers, E.A. Perkins, A. Yalcin, B. Yegeedis, *University of South Florida, Tampa, Florida*

Little is known about how older women harness the internet to seek relationships online or the risks associated with online relationship seeking. To delineate a profile of older women who use Myspace to seek relationships and explore ways in which the information shared impacts online vulnerability, systematic case abstractions from online profiles of women 50+ (stratified by age & race), who self-identified as seeking relationships through MySpace were collected (N=163). Data were abstracted across the following domains: demographics, sexual orientation, family constellation, physical and mental health status, health behaviors, abuse history, privacy settings, and contact information shared publicly. Analysis revealed women who use Myspace to seek relationships share a variety of life experiences and information publicly; some of which may place them at increased risk for abuse and exploitation. Implications for the risks associated with E-dating among older adults are discussed and areas for education and intervention are explored.

## SEXUAL HEALTH AMONG OLDER GAY AND BISEXUAL MEN IN THE POST-HAART ERA: DOES HIV STATUS MAKE A DIFFERENCE?

M. Brennan-Ing<sup>1,2</sup>, L. Seidel<sup>1</sup>, B. Larson<sup>3</sup>, S.E. Karpiak<sup>1,2</sup>, 1. *Center on HIV and Aging, AIDS Community Research Initiative of America, New York, New York*, 2. *New York University College of Nursing, New York, New York*, 3. *Center on Halsted, Chicago, Illinois*

Men who have sex with men (MSM) account for half of the HIV cases in the U.S., and half of those with HIV will be over 50 by 2015. Since sexual activity continues until late in life, we examined how HIV-status was related to sexual health among MSM 50 and older (N=149). The average age was 59.8 years, and 46% reported being HIV-positive. HIV+ MSM reported twice as many sex partners on average during the last 5 years than their peers (28.0 and 14.9, respectively), but did not differ significantly regarding the frequency of sex. There were no differences based on HIV-status in the frequency of anal or receptive oral sex, or use of sex toys. While HIV+ older MSM were more likely to

use precautions during oral sex, the groups did not differ in terms of unprotected anal intercourse. Implications for clinical work with older MSM will be discussed.

### THE INTERCOURSE IMPERATIVE AND SINGLE OLDER MEN'S SEXUAL DESIRES, EXPECTATIONS, AND EXPERIENCES

E.B. Levaro<sup>1</sup>, K. Hooker<sup>2</sup>, A.J. Walker<sup>2</sup>, 1. *University of Wisconsin-Stout, Menomonie, Wisconsin*, 2. *Oregon State University, Corvallis, Oregon*

Analysis of transcribed data from in-depth semistructured interviews with 24 heterosexual individuals actively pursuing romantic relationships via Internet ads and dating sites revealed a preference for younger partners, with the women's mean lower age 10 years younger and the men's, 21 years younger. Both also expressed desire for a sexual relationship, defining such a relationship in terms of sexual intercourse. We report findings and discuss the impact of this "intercourse imperative" specifically on the sexual desires, preferences, expectations, and experiences of the 13 men participating in this qualitative study. Between the ages of 70 and 92, nearly all of the men expressed distaste for "old" women and sought and were sexually active with younger partners. We explore the men's perceptions of women's presumption of sexual functionality and performance; the prospect of sexual liaisons made possible by virility-via-Viagra; and the emotionally painful realities of old men's disadvantage relative to younger men.

## SESSION 470 (SYMPOSIUM)

### OVERCOMING CHALLENGES TO HEALTH PROMOTION IN OLDER ADULTS WITH COMPLEX NEEDS

Chair: C.J. Camp, *Center for Applied Research in Dementia, Solon, Ohio*

Interventions with older adults must address the complexity of needs in this population. These include combinations of physical disabilities such as limited mobility, cognitive deficits, serious mental illness (SMI), and chronic illnesses such as Diabetes Mellitus (DM). Specific conditions provide challenges in their own right, as well as in combination with other conditions. While technological advances provide avenues of treatment delivery to such populations, interventions and technologies must be adapted before psychosocial interventions can be made effective. In this symposium, we will overview and discuss the challenges facing effective delivery of psychosocial interventions to older adults with complex needs. Specific examples from ongoing research will be used to highlight novel interventions for such older adults that involve self-management – a critical element in any effective intervention with these populations. Unique delivery systems including the use of tablets, mobile phones, and peer educators are described, along with specific adaptations that must be made to insure effective delivery of treatment for these populations. Implementation of psychosocial interventions in primary care and home settings – necessary components for effective treatment – are highlighted. Attendees will be able to: describe at least three specific DM – SMI comorbidities that frequently occur; describe at least four challenges to the use of technology and teletherapy unique to these populations, along with means of overcoming them; describe at least three evidence-based psychosocial interventions that can be effectively used with these populations; and describe at least four uses of teletherapy technology to improve compliance with and assess outcomes of psychosocial interventions.

### CREATING EFFECTIVE SELF-MANAGEMENT FOR OLDER ADULTS WITH TYPE 2 DIABETES AND MEMORY IMPAIRMENT

C.J. Camp<sup>1</sup>, M.J. Skrajner<sup>2</sup>, V. Antenucci<sup>1</sup>, C. Frentiu<sup>1</sup>, J. Haberman<sup>1</sup>, 1. *Center for Applied Research in Dementia, Solon, Ohio*, 2. *Hearthstone Alzheimer Care, Woburn, Massachusetts*

Older adults with Type 2 diabetes (Diabetes Mellitus – DM) who also have memory impairment are both challenged and at risk when attempting to live independently. The ability to effectively monitor blood glucose levels, exercise regimens, diet and medication regimens often is severely constrained by the combination of DM and the presence of mild cognitive impairment (MCI) or early stage dementia. We describe an exploratory study in which Certified Diabetic Educators (CDEs) are linked with older adults with DM and memory impairment using iPads and the internet. CDEs present personalized education sessions to participants, and half of the participants also receive a cognitive intervention (spaced retrieval) designed to train the effective use of strategies to enhance medication compliance and reach other goals. Challenges to the use of technology and teletherapy with this population are described in detail, as well as methods for meeting these challenges.

### IMPROVING THE REACH AND IMPACT OF PSYCHOSOCIAL INTERVENTIONS FOR OLDER ADULTS WITH SEVERE MENTAL ILLNESSES THROUGH EMERGING TECHNOLOGIES

C. Depp<sup>1,2</sup>, B. Mausbach<sup>1</sup>, L. Vergel de Dios<sup>1</sup>, J. Ceglowski<sup>1</sup>, E. Granholm<sup>1,2</sup>, 1. *Psychiatry, ucsc, La Jolla, California*, 2. *San Diego VA, La Jolla, California*

Despite their effectiveness, few individuals with severe mental illnesses (SMI) have access to evidence-based psychosocial interventions in people with chronic mental health problems. Older adults with SMI have additional barriers to accessing psychosocial care, including mobility. Moreover, the impact of structured self-management interventions often hinges upon transfer of training and "homework", yet cognitive deficits may limit the extent to which skills are recalled and implemented in ecological settings. In this presentation, we describe several ongoing and completed projects at UCSD in which mobile devices have been used to deliver aspects of evidence-based cognitive behavioral treatments for people with SMI. In particular, we demonstrate how mobile phones can be used to facilitate self-monitoring, deliver behavior change strategies, and increase homework compliance in skills training interventions. Finally, we provide an overview of ethical, technical, and clinical challenges facing the field of mobile interventions, along with future directions in technology development.

### TARGETED TRAINING IN ILLNESS MANAGEMENT FOR INDIVIDUALS WITH SERIOUS MENTAL ILLNESS AND DIABETES

M. Sajatovic<sup>1</sup>, N. Dawson<sup>1</sup>, A.T. Perzynski<sup>1</sup>, C. Blixen<sup>1</sup>, E. Seeholzer<sup>1</sup>, D. Kaiser<sup>2</sup>, M. Lawless<sup>2</sup>, C. Falck-Ytter<sup>1</sup>, 1. *Case Western Reserve University, Cleveland, Ohio*, 2. *MetroHealth Medical Center, Cleveland, Ohio*

Diabetes mellitus (DM) is common among individuals with serious mental illness (SMI), complicates health outcomes, reduces quality of life, and leads to premature mortality. SMI and DM outcomes are bidirectional. A majority (82%) of individuals with DM believe that the status of their overall health is related to their recovery from SMI. Therefore, it is essential that interventions address the issue of mental and physical health from the perspective of the individual with the disorder, engage individuals to actively participate in illness self-management, and include consideration of barriers to care. Treatments that blend psychoeducation, problem identification, goal-setting, and behavioral modeling/reinforcement and which have been adapted to the primary care setting may be both acceptable and helpful for people with SMI-DM. One such approach, Targeted Training in Illness Management

(TTIM), uses Peer Educators with SMI-DM to teach and model self-management for these concurrent conditions. TTIM and effects it produced are described.

## SESSION 475 (PAPER)

### AGING IN PLACE

#### CHANGES IN CONTINUING CARE RETIREMENT COMMUNITY (CCRC) RESIDENTS' LIFE EVENTS, STRESS, AND SUPPORT

H. Lee, H. Ewen, *Miami University, Oxford, Ohio*

Relocation of older adults has become an important issue due to the increased life span, older adults' issues related to remaining independent at advanced age (e.g., disabilities, finance), and the advent of many senior housing options. One housing option designed to maximize independent living is the Continuing Care Retirement Community (CCRC), which provides residents continuum of care from independent living to skilled nursing. This study investigated (1) the relationships among life events, stress, and social support networks among new residents of a CCRC and (2) how social support changes over time among residents of a CCRC during their first few years in residence. Our findings indicate that within the first year of the move, new residents relied on their children, spouses, and friends in this order. This pattern changes by year three to friends first, then children, and spouses, indicating development of community support networks. The reliance on "other" support people also increases over time, implying more support from others within the community, such as new residents and staff. Major life events reported include illness of a family member, death of family members/friends, major anniversaries/celebrations, and moving within levels of care. Life events were negatively related to self-reported health consistently through the first three years in residence. However, in the third year interactions between the number of social supports and number of life events were predictive of better self-reported health ( $p < .01$ ) indicating that social support serves as a buffer against health declines associated with life stress.

#### MEDICAID LONG TERM CARE HOME AND COMMUNITY BASED SERVICES FOR THE ELDERLY: TRENDS IN PROGRAMS AND POLICIES, 1999-2009

C. Harrington, T. Ng, *University of California, San Francisco, California*

In response to consumer demand, the Supreme Court decision in the Olmstead case and the New Freedom Initiative, states have unevenly expanded combinations of three Medicaid home and community based services (HCBS): home health, state plan personal care services (PCS), and 1915(c) waivers. By 2009, the federal-state Medicaid program paid for 34 percent of the nation's estimated \$205 billion total long-term care (LTC) expenditures while institutional care (e.g., nursing homes) consumed 55 percent of those expenditures. As states struggle with budget deficits and the loss of stimulus money from ARRA, the Patient Protection and Affordability Care Act of 2010 and its provisions for continued HCBS growth reflects growing concerns about the need to preserve and expand Medicaid HCBS and the need for information on program and policy trends. This paper draws from a unique national dataset to present the latest trends in participants, expenditures and policies for the three Medicaid HCBS programs serving the elderly. While data for 2009 show a steady increase in participants and expenditures, these growth rates have slowed since 2001. Inequities in access to services and limited funds have also resulted in unmet needs for HCBS among the elderly. Findings from the survey of policies such on the programs in 2011 show that states are increasing the number of waiting lists for elderly waiver services even as the number of available "slots" increases. Cost caps such as service and cost limits are also used in

almost half the state plan personal care programs and almost a third of home health programs.

#### CAN NURSING HOME TRANSFER BE DELAYED IF HOME AND COMMUNITY-BASED WAIVER PERSONAL CARE SERVICES ARE INCREASED?

S. Spoelstra, C.W. Given, M. You, *College of Nursing, Michigan State University, East Lansing, Michigan*

There is a pressing need to retain the dually eligible elderly in the community. This research compared the use and cost of personal care services (PCS) and nursing home placement (NHP) among 7302 older adults aged 65 and older in a statewide home and community-based waiver program. A model was developed to estimate costs of increased PCS to compare savings associated with remaining the community versus NHP. The second to last and last Minimum Data Set-Home Care assessments and Medicaid claims files were examined. Median hours of PCS and savings based on average cost were calculated. Median hours of PCS were 34. The rate of NHP for clients above the median hours of PC was 25%. Adding PC hours for those with <34 hours, could possibly reduce NHP to 25%. For example, a total of 3777 hours of PCS need to be added for those below the median, to sustain a 25% rate of NHP. This would keep 33 clients in the waiver. Cost of adding these PCS is \$59,186 ( $3777 * \$15.67$ ). Monthly cost of NHP is \$115,500 ( $33 * \$3,500$ ), compared to \$30,822 ( $33 * 934$ ) in the waiver. Total savings of \$25,492 per month could be realized by retaining 33 clients in the waiver program. Adding PCS hours to waiver clients whom are below the median number of hours of PCS could help retain clients in the home setting, where they most want to be, and allow for tremendous cost savings.

#### ETHICAL USE OF TECHNOLOGIES TO SUPPORT AGEING-IN-PLACE: OLDER PEOPLE AS PARTNERS

A. O'Hanlon<sup>1,2</sup>, S. McGee<sup>1</sup>, A. Sidera<sup>1</sup>, L. Una<sup>1</sup>, J. Finnegan<sup>1</sup>, R. Bond<sup>1,2</sup>, B. O'Mullane<sup>2,1</sup>, *1. Netwell Centre, Dundalk Institute of Technology, Dundalk, Ireland, 2. Centre for Affective Solutions for Ambient Living Awareness (CASALA), Dundalk, Ireland*

Technology offers much potential for supporting ageing-in-place, yet little is known about users' experiences. Studies are reported examining user views around key ethical challenges including confidentiality, informed consent, privacy, and autonomy. Multiple methods were used to collect data across four studies. Study 1 is a large survey examining use and barriers towards technology. Study 2 is the Home Sweet Home EU multi-country trial in which participants are randomly allocated to usual care only, or usual care plus technology. Study 3 is a physical home-environment in a lab setting where a home environment is simulated through CAVE technology. Study 4 is a Lab-in-the-Home study ( $n = 18$ ) which uses data from 16 smart apartments which are the permanent homes of older adults. Open and regular communication with older adults is crucial in achieving informed consent. Older people are willing to sacrifice some privacy in order to receive technology benefits. Older adults as expert users should be full partners in discussions about privacy. Support technology ideally is unobtrusive and converges with users' lifestyles and home décor to empower rather than undermine. Common worries about confidentiality include understanding who has access to information, and the loss of information through error. Technology offers professionals and others ethical dilemmas around issues of informed consent, autonomy and doing no harm. As expert users and problem solvers, older people should be active and full partners in these discussions and debates. Underpinning such discussions is regard for the dignity of the person and their freedom of choice.

#### AN INTERVENTION TO HELP OLDER ADULTS MAINTAIN INDEPENDENCE SAFELY

L. Ganong, M. Coleman, J. Benson, L.A. Snyder-Rivas, J.D. Stowe, *HDFS, University of Missouri, Columbia, Missouri*

Older adults prefer to live in their own homes, but those who are alone are at risk for problems (e.g., falling, sudden illness). They can

benefit from planning ahead to prevent the likelihood of such problems, to maintain themselves safely in their homes, and to get help in emergencies. The purpose of this study was to evaluate the success of an intervention designed to train family members or close friends how to help rural older adults who were living alone make plans to maintain independence safely (MIS) in their homes. In addition, behavioral and household changes made by the older adult to enhance safe independent living were assessed by the research team. In an experimental design, family members and friends of 19 randomly assigned older adults were taught to assist the older adults to create plans for maintaining themselves safely in their homes using multiple segment vignettes as a discussion tool. Control group dyads ( $n = 21$ ) were asked to make plans for MIS after a discussion about home safety. Multiple segment vignettes are effective in helping older adults to develop plans to maintain themselves safely in their homes and to make behavioral and household changes to enhance their safety. Family and friends can be trained to efficiently and effectively assist older adults to maintain themselves safely in their homes.

## SESSION 480 (PAPER)

### CAREGIVING: CHALLENGES AND RESOURCES

#### HASSLES OF CAREGIVING AND PERCEIVED STRESS OF FAMILY CAREGIVERS FOR NURSING HOME RESIDENTS

R.G. Judd, *Social Work, Texas A&M-Commerce, Commerce, Texas*

Entry of a care recipient into a nursing home does not end, and often time ignites the caregiving role of family members (Gaugler, 2005; Hertzberg, Ekman, & Axelsson, 2001; Kolb, 2003). The breadth of research focuses on informal caregivers for community dwellers, while emerging research is demonstrating the impact nursing home entry for a loved one has on outcomes related to stress, adjustment and role transition. The aim of this study was to identify activities of caring carried out by family caregivers for recipients in a nursing home setting, activities they perceived as a hassle and to assess the correlation of these activities with perceived stress, feelings of role captivity, restriction in leisure time and work conflict. A three part self-administered questionnaire was developed specifically for this study and included demographic information; contextual factors related to caregiving and stressors and The Activities of Caring Scale (created specifically for this study) and The Perceived Stress Scale (Cohen, 1988) was used to capture caregiver's perceptions of stress. A non-probability sample of 129 informal caregivers of care recipients in sixteen different nursing homes in North Central Texas and Southern Oklahoma participated in the study. Making financial arrangements and completing paperwork were most likely to be perceived as a hassle. Significant relationships between caregiver perceived stress scores and the act of discussing medical concerns, acting as a primary contact, providing clothing, acting as an advocate, and making financial arrangements were found.

#### PREDICTING COMPASSION FATIGUE FROM PERCEIVED CARE RECIPIENT SUFFERING, EMPATHY, ATTACHMENT, POSITIVE ASPECTS OF CAREGIVING, AND BURDEN AMONG CAREGIVERS OF PERSONS WITH DEMENTIA

J. Day<sup>1</sup>, R.A. Anderson<sup>1</sup>, R. Schulz<sup>2</sup>, 1. *School of Nursing, Duke University, Durham, North Carolina*, 2. *University of Pittsburgh, Pittsburgh, Pennsylvania*

Objectives: To explore predictors of compassion fatigue among caregivers of persons with dementia. Background: Compassion fatigue theory asserts that compassion fatigue may develop when a caregiver has an empathic response for a person who they perceive is suffering, but the suffering cannot be alleviated, the caregiver is unable to detach, finds no positive aspects in caregiving (satisfaction), and has overwhelming life demands. This study hypothesizes, therefore, that higher levels perceived suffering, empathy, attachment, decreased levels of positive

aspects of caregiving, and greater burden will predict lower levels of compassion. Methods: This secondary analysis of baseline data from 109 caregivers in the Characterizing the Experience of Alzheimer's Disease (CEAD) Study used a stepwise multiple regression to assess the relationship between perceived care recipient suffering, empathy, attachment, positive aspects of caregiving, and burden with the outcome variable of compassion. Findings: Greater levels of compassion were associated with higher levels of perceived suffering, greater positive aspects of caregiving, and lower burden. Empathy and attachment did not enter the model at the  $p < .05$  level. Conclusions: The hypothesis was not supported. A limitation of this study is that we did not have a measure of compassion fatigue and instead used a measure of compassion. It is possible that compassion is not a good proxy for compassion fatigue. It is surprising that empathy and attachment do not predict caregiver compassion. Future research might explore the relationship of empathy and attachment to compassion fatigue, particularly in caregivers for persons with dementia.

#### OPTIMISM MEDIATES THE RELATIONSHIP BETWEEN ANGER AND HEALTH IN DEMENTIA CAREGIVERS

J. Lopez<sup>1</sup>, A. Losada<sup>2</sup>, M. Marquez Gonzalez<sup>3</sup>, R. Romero-Moreno<sup>2</sup>, V. Fernández-Fernández<sup>2</sup>, C. Nogales-González<sup>2</sup>, 1. *University San Pablo CEU, Boadilla del Monte, Madrid, Spain*, 2. *University Rey Juan Carlos, Alcorcón, Madrid, Spain*, 3. *University Autonoma de Madrid, Madrid, Spain*

Caring for a loved one with Dementia is a highly stressful experience that is associated with physical health limitations. Previous studies indicate a negative association between caregivers' anger and physical well-being. Moreover, the literature indicates a positive relationship between optimism and physical well-being. The purpose of this study was to test a mediational model of the associations between anger, optimism, and physical health in Dementia caregivers. One hundred and eight caregivers (mean age: 59 years,  $SD = 12.25$ ), primarily female (80.6%), completed measures assessing their anger (temperament and reaction), optimism, and health (vitality). A mediational model was tested to determine if optimism partially mediated the relationship between anger and vitality. Regression analyses indicated that angry temperament was negatively associated with optimism ( $\beta = -0.249$ ,  $SE = 0.125$ ,  $p = 0.049$ ) and vitality ( $\beta = -0.266$ ,  $SE = 0.113$ ,  $p = 0.021$ ). Optimism was positively associated with vitality ( $\beta = 0.421$ ,  $SE = 0.079$ ,  $p = 0.001$ ). Finally, the relationship between angry temperament and vitality diminished upon simultaneous entry of optimism ( $\beta = -0.157$ ,  $SE = 0.104$ ,  $p = 0.132$ ). Regression analyses also indicated that angry reaction was negatively associated with optimism ( $\beta = -0.418$ ,  $SE = 0.116$ ,  $p = 0.001$ ) and vitality ( $\beta = -0.331$ ,  $SE = 0.107$ ,  $p = 0.002$ ). Optimism was positively associated with vitality ( $\beta = 0.399$ ,  $SE = 0.082$ ,  $p = 0.001$ ). Finally, the relationship between angry reaction and vitality diminished upon simultaneous entry of optimism ( $\beta = -0.169$ ,  $SE = 0.102$ ,  $p = 0.100$ ). Sobel tests confirmed that optimism significantly mediated some of the relationship between vitality and angry temperament ( $z = -1.86$ ,  $p = 0.031$ ) and angry reaction ( $z = -2.89$ ,  $p = 0.002$ ). These findings suggest that a reduced optimism may help explain the association between caregivers' anger and a reduced sense of vitality.

#### SUPPORTING FAMILY CAREGIVERS TO NURSING HOME RESIDENTS: SOCIAL SUPPORT AS A KEY PREDICTOR OF LOWER BURDEN AND DEPRESSION

D. Majerovitz, *Behavioral Sciences, York College, CUNY, Jamaica, New York*

This study examines predictors of burden and depression among 103 primary caregivers to nursing home residents. Research shows that families remain actively involved in the resident's care following placement, resulting in continued caregiver stress. Caregivers reported visiting the nursing home an average of 3 times per week and spending an average of 46 hours per month with the resident, indicating a high level

of involvement in the resident's care. Participants completed a structured survey assessing level of involvement in the resident's care, severity of resident's memory and behavior problems, availability of social support to the caregiver, satisfaction with nursing home care, caregiver burden, and depression. The mean score on the CESD depression scale was 16.8, just above the cutoff of 16 indicating likely clinical depression (52% fell below this cutoff). The mean burden score was 25.8 (of 66), indicating moderate burden. Multiple regression identified five predictors of caregiver burden: younger caregiver age, resident memory and behavior problems, frequency of caregiving tasks, dissatisfaction with nursing home care, and less social support. Only lack of social support significantly predicted depression. This is consistent with previous research finding that burden reflects stressors specific to caregiving, while depression is associated with more global predictors of mental health. These findings suggest that interventions to lessen the stress of caregiving are more likely to decrease burden than to alleviate depression. Interventions designed to enhance social and emotional support are more likely to address burden and depression.

### **LONG-TERM FOLLOW-UP OF AN ONLINE INTERVENTION FOR REDUCING DEPRESSIVE SYMPTOMS IN SPOUSAL CAREGIVERS OF MALE STROKE SURVIVORS**

G.C. Smith, J. Chaya, *Kent State University, Kent, Ohio*

We conducted a long-term follow-up investigation of an online psycho-educational program for reducing depressive symptoms in spousal caregivers (CG; n = 32) of male stroke survivors (SS) at 24 months post treatment within a randomized clinical trial. The CG in the intervention condition received an online group intervention involving a blend of peer and professional support, whereas CG in a control condition received minimal support with individualized access to relevant online information. At posttest (T2) and one month later (T3), CG in the intervention condition reported significantly lower depression (assessed by the Center for Epidemiological Studies Depression Scale) than did CG in the control condition with baseline depression (T1) controlled. At 24 months post intervention (T4), however, the prior significant difference in depressive symptoms no longer existed between the two conditions. An analysis of qualitative data revealed that substantial changes had occurred from T3 to T4 that most likely affected the T4 findings. These included entering another CG support program (30%); altering the level of care provided (56%); experiencing major life events (58%); and reporting changes in the physical or mental health of the SS (66%). The challenges of conducting long term follow ups with CG populations are discussed in light of our T4 observations. [Funded by NINR R21 NR010189-02]

## **SESSION 485 (PAPER)**

### **CARING FOR PERSONS WITH DEMENTIA**

#### **DEPRESSION IN DEMENTIA CAREGIVERS: AN ANALYSIS OF ITEM RESPONSE, MEANING, AND SYMPTOM SEVERITY**

L. Noel<sup>1</sup>, J.M. Clem<sup>1</sup>, R. Glueckauf<sup>1</sup>, D. Gustafson<sup>2</sup>, *1. College of Social Work, Florida State University, Tallahassee, Florida, 2. Apalachee Center, Tallahassee, Florida*

**BACKGROUND:** Caring for a loved one with progressive dementia can cause substantial burden for family caregivers. Previous research has shown that dementia caregivers are at high risk for clinical depression. Differences among ethnicities on caregiving stressors, appraisals of caregiving role, overall physical health, and types of depressive symptoms have been documented, but have not been explored adequately from a phenomenological perspective. **PURPOSE:** (1) To examine differences in depressive symptom interpretations on the Patient Health Questionnaire-9 (PHQ-9) between two samples of family dementia care-

givers – an African American and a non-Hispanic White comparison group; (2) to perform item response analysis examining differential symptom endorsement on the PHQ-9; and (3) to assess the impact of item complexity on caregiver severity ratings. **METHODS:** Semi-structured interviews (N = 13) were performed to explore patterns of endorsement of depressive symptoms and symptom interpretation of the PHQ-9 across groups using item response analysis and content analytic procedures (constant comparative method and open coding). **RESULTS:** Item Response Analysis revealed statistically significant differences across groups in item response on three of nine PHQ-9 items. Qualitative analysis revealed differences across groups in meaning associated with items and item complexity was associated with deflated severity ratings. **CONCLUSIONS:** Exploratory results provide some indication that African American and Non-Hispanic White caregivers of family members with dementia express depressive symptomatology in different ways. Also, these findings reveal that when assessing depression symptoms in dementia caregiving groups, severity ratings among African Americans may be deflated as a product of item complexity.

### **PRN ADMINISTRATION IN A GERIATRIC PSYCHIATRIC HOSPITAL; PRELIMINARY FINDINGS FROM A NURSING PERSPECTIVE**

L. Harper<sup>1</sup>, C. North<sup>1</sup>, B. Bachewich<sup>1</sup>, J.R. Reddon<sup>2</sup>, H. Williams<sup>1</sup>, *1. Psychology, Villa Caritas Hospital, Edmonton, Alberta, Canada, 2. University of Alberta, Edmonton, Alberta, Canada*

Pro re nata (PRN) or "as required" medication is often a frequently used adjunct to routinely prescribed medication and is commonly used to manage the behavioral and psychological (BPSD) symptoms of dementia (Baker, Lovell, Harris & Campbell, 2007; Haw, Stubbs & Yarson, 2008). The administration of PRN medication is largely an autonomous nursing responsibility yet the role of clinical decision making by nurses in the administration of PRN medication remains a very much under-researched area, particularly within geriatric psychiatric populations. A nursing questionnaire was developed to explore this important area of nursing practice. Findings obtained from the responses of 12 out of 15 nurses working with dementia patients in a geriatric psychiatric hospital indicate that there are differences in opinion with regard to the use of PRN medication and peer pressure may influence the administration of same. Patient and staff safety was a major factor in decision making for PRN administration for aggression and agitation as was patient familiarity. Although the majority of responses indicated that non-chemical interventions were tried first, most of the nursing staff identified that the primary non-chemical intervention used was restraint rather than a behavioral intervention. The role of alternative non-chemical interventions will also be discussed as well as some of the challenges associated with their implementation.

### **HOPE AMIDST UNCERTAINTY: THE EXPERIENCES OF PHYSICIANS WITH PRESCRIBING CHOLINESTERASE INHIBITORS**

A. Smith<sup>1,2</sup>, K. Kobayashi<sup>1,2</sup>, N.L. Chappell<sup>1,2</sup>, C. Dujela<sup>2</sup>, *1. Department of Sociology, University of Victoria, Victoria, British Columbia, Canada, 2. Centre on Aging, University of Victoria, Victoria, British Columbia, Canada*

Cholinesterase inhibitors (ChEIs) are widely prescribed first-line drugs in the treatment of mild to moderate Alzheimer's disease and related dementias (ADRD) and long-term prescribing of ChEIs into late stage ADRD is increasingly common. The clinical usefulness of ChEIs remains controversial. Several studies of these drugs, including reviews of clinical trials, have concluded that the statistical significance of their effects is modest. A lack of clear guidelines for determining the long term benefits of these drugs makes the issue of how long to continue ChEI therapy highly debatable. Against this backdrop, little is known about how physicians evaluate these drugs in their practice and what

factors motivate them to continue prescribing ChEIs for extended periods of time. This study analyzes data from 19 physicians who participated in four focus groups and 26 in-depth interviews with caregivers to persons with ADRD who were withdrawn from ChEI therapy. The findings reveal that the persistence of ChEI therapy is associated with physicians' efforts to reconcile ambivalent assessment results, which suggest limited or no benefits, with a sensitive appraisal of the hopes and desires of family caregivers and patients to continue treatment. Specifically, physicians stated an unwillingness to initiate conversations about stopping ChEIs unless families and patients brought up the idea themselves or until an adverse reaction precipitated the decision. Physicians also identified the transition to institutionalization as an opportunity to negotiate ending therapy. The findings suggest a need to assist physicians in supporting caregivers and care recipients to discontinue ChEI in a timely manner.

#### **PERSON-CENTERED CARE IN A DEMENTIA CARE ENVIRONMENT: RESIDENTS' VOICES**

P.J. Doyle, *Center for Aging Studies, Sociology/Anthropology Department, University of Maryland Baltimore County, Baltimore, MD*

Person-centered care is considered to be among the best practices in providing formal dementia care. However, there are limitations in the application of person-centered care and information regarding the limitations is lacking in the literature. The dissertation, from which this presentation draws, sought to examine the complexities of this approach to care in one dementia care setting that had an organizational commitment to a person-centered model of care. The ethnographic interviews with residents (N=20) and participant observations (over 400 hours) will be used to discuss one group of the challenges faced when applying person-centered care principles: the underutilization of residents' narratives to meaningfully tailor care. This paper used the residents' words to examine how the lived experiences of people with dementia are accessible through communication and how they could be used to better inform the provision of person-centered care. Through a coding-based qualitative analysis, 'robust' themes related to this topic were identified. The residents' narratives demonstrated that: 1) multiple, sometimes veiled, identities of the person with dementia exist; 2) there were differences in their past and current identities; and 3) residents' narratives were dynamic (changing over short periods of time) and adaptive based on their interactions with the changing environment. These findings demonstrated the need to incorporate the residents' views in care interactions. However, a limitation often cited by direct-care workers was that listening to the residents' narratives and decoding the sometime nebulous meanings are difficult and time consuming. This paper concludes with a translational piece to address these concerns.

#### **THE BURDEN OF CARE AMONG DEMENTIA CAREGIVERS IN HANOI, VIETNAM**

T.Q. Truong, E. Beattie, *Queensland University of Technology, Brisbane, Queensland, Australia*

Extensive researches conducted in many countries have confirmed that caring for a family member with dementia confers considerable burden. In Vietnam few studies have examined the prevalence of dementia or the impact of disease on carers, specifically carer burden Objectives: This study aims were to (1) describe carer's caregiving burden, and (2) explore the associations between family carer's characteristics and perceived burden of care Method: A cross-sectional correlation study was conducted in Hanoi, Vietnam in 2011. 153 current family dementia caregivers completed questionnaire including Barthel Index, Kingston Standardised Behavioural Assessment of people with dementia, Sense of Coherence questionnaire, and Zarit Burden Interview. Result: Moderate to severe burden was found on 25.5% participants while 33.3% showed little or no burden. Perceive burden differed by gender with female daughter carers experiencing higher burden. The higher level

of burden, the lower level of sense of coherence dementia caregiver appeared to have. Multiple linear regression shows that duration of disease, behavioural profile of people with dementia, and caregiver's age contributed to predict the perceived burden of care among those caregiver of people with dement Conclusion: Dementia carers experienced higher perceived burden compared with previous studies in Western countries. The findings relating to female carers are consistent with that found in other studies in many countries. Further research is needed to explore the experience of Vietnamese daughter carers using filial piety perspective and meaning of caregiving. Keyword: Dementia caregiver, Perceived burden of care, Caregiving burden, Vietnam

### **SESSION 490 (SYMPOSIUM)**

#### **ADVOCATING FOR HIDDEN VOICES: SOCIAL JUSTICE AMONG VULNERABLE ADULTS**

Chair: *L.R. Phillips, Nursing, UCLA, Los Angeles, California*

Discussant: *K. May, University of Arizona, Tucson, Arizona*

Social justice, an ethical belief system, is concerned with equal access to goods, services and opportunities. However, while for many vulnerable older adults inequality is predominant, their voices remain hidden. Nurses who conduct gerontological research often find themselves confronted with stories which illustrate inequality, challenge the meaning of social justice, test the boundaries of ethical decision-making and bring into focus unresolved social policy issues. This symposium will explore the concept of social justice and provide examples of the concept as it has arisen in developing and implementing gerontological nursing research studies. The first paper will examine policy issues raised in studying institutional elder abuse. The second paper will discuss issues raised in designing research to study African American men with prostate cancer. The third paper will consider social justice issues encountered in studying the aging among older homeless women. The last paper will explore the concept as it relates to directions in NIH funding over the past five years. The discussant will focus on analyzing these examples to identify the role of nurse researchers in giving voice to the stories they discover in their data.

#### **SEXUAL ABUSE IN CALIFORNIA'S SKILLED NURSING FACILITIES AND THE UNFULFILLED RESPONSIBILITIES OF STATE AGING POLICY**

C.E. Ziminski, L.R. Phillips, *School of Nursing, University of California Los Angeles, Los Angeles, California*

The prevalence of elder sexual abuse in long-term care is approximately 3%. In California, 12% of citations are for sexual abuse. The majority of these citations are for \$1K, the lowest fine category. These small fines issued to financially stable skilled nursing facilities (SNFs) provide little incentive to initiate change in practice. Furthermore these fines don't properly acknowledge the seriousness of the crimes that are taking place. For instance, residents are placed in danger through the hiring of known felons and sexual offenders. Despite the California Senate commissioning a report detailing the tragic state of elder abuse in SNFs, policies continue to marginalize this population. The last five years SNF abuse complaints and citations have dropped, directly related to budget cuts. This policy analysis will provide an examination of sexual abuse citations in California's SNFs in 2007 contrasted against the unfulfilled roles and responsibilities of the state policy on aging.

#### **ISSUES IN EQUITABLE TREATMENT ACCESS FOR VULNERABLE GROUPS**

I.H. Gabbidon, L.R. Phillips, *Nursing, UCLA School of Nursing, Los Angeles, California*

The role of gerontological nurse researchers in addressing treatment inequities is rarely discussed in the literature. Prostate cancer has the highest incidence and mortality rate amongst older African American men. Inadequate healthcare access, low socio-economic status, and race

and ethnicity are key factors that contribute to this problem. Studies show African Americans are less likely to have adequate health insurance to cover detrimental illnesses like cancer, which may contribute to their having lower screening rates, higher incidences of co-morbidities, and late-stage diagnoses for diseases such as prostate cancer. This presentation will focus on the powerful role gerontological nurse researchers can play in addressing problems like this. Men who participate in our studies often share personal stories about the outcomes associated with financially-based treatment inequities. Strategies nurse researchers can use to interpret these stories to policy makers and legislators will be explored.

#### **AGING ON THE STREETS: UNMET NEEDS AND ISSUES OF SOCIAL JUSTICE**

B.E. Salem, L.R. Phillips, *UCLA School of Nursing, Los Angeles, California*

The golden years are often defined by older adults as a period for reflection and enjoyment, but many older adults find themselves destitute and homeless. Approximately 33% of chronically homeless adults are over 50 and are at high risk for chronic illness, social isolation and victimization. Moreover, they lack housing and access to healthcare. This paper will explore factors which influence the substantial unmet needs among this subpopulation, specifically focusing on the sociodemographic characteristics of the population, shelter, and the need for a research agenda to explore and implement programs that can meet the needs of this vulnerable population.

#### **FUNDING FOR HEALTH DISPARITIES RESEARCH WITH OLDER ADULTS: HOW ARE WE DOING?**

K. Skrine Jeffers, L.R. Phillips, *UCLA, Los Angeles, California*

Despite strong and continuing evidence of health disparities and expansive differences in health outcomes, an analysis of the NINR portfolio represented in the CRISP database in 2008, showed that only 8% of studies on primary prevention of chronic conditions and 12% of condition specific studies (e.g., heart failure, diabetes) included a focus on unique racial/ethnic groups. Further, a literature search conducted at the same time combining the search terms “cultural competence” and “chronic illness care” showed only 52 published studies in CINAHL. Most were single group studies, overlooking samples from racial/ethnic groups who are most adversely affected by health conditions. At the same time, NINR was simultaneously funding 11 Partnership Centers on Health Disparities and 7 NRSA's focused on health disparities research. This paper focuses on reanalyzing the RePORTer database and CINAHL to determine our progress since 2008 with a focus on addressing health disparities among older adults.

### **SESSION 495 (SYMPOSIUM)**

#### **EMERGING BIOMARKERS OF PRESYMPTOMATIC & EARLY STAGES OF ALZHEIMER'S DISEASE**

Chair: *S. Asthana, Medicine, University of Wisconsin, Madison, Wisconsin*

Alzheimer's disease (AD) is the most common neurodegenerative disease projected to afflict more than 13 million Americans by 2030. Currently, there are no approved treatments that could either delay or stop progression of AD. There is convincing scientific evidence that AD pathology starts at least a decade before the onset of symptoms, which provides a unique opportunity to initiate potential disease-modifying therapies during presymptomatic stages of the disease. Unfortunately, there are currently no available tests to diagnose AD at presymptomatic stages; consequently, major scientific efforts are being made to discover antecedent biomarkers that could identify individuals at asymptomatic stages of the disease. The present GRECC-sponsored symposium will focus on the neurobiology and state-of-the-art biomarkers that could identify patients at presymptomatic stages of AD. The first pres-

entation by Barbara Bendlin, PhD, will summarize the field of neuroimaging biomarkers and focus on the unique effects of family history and ApoE4 genotype on neuroimaging biomarkers of asymptomatic stages of AD. The second presentation by Laura Baker, PhD, will discuss potential cognitive biomarkers of preclinical stages of AD, and present data on favorable cognitive effects of specific treatment strategies for early stages of the disease. The third presentation by Jane Driver, MD, will target cerebrospinal fluid (CSF) biomarkers of presymptomatic stages of AD. Overall, the three presentations included in this symposium will provide state-of-the-art information and novel research data on potential biomarkers of preclinical stages of AD. This information will be of pivotal clinical significance and relevance.

#### **FAMILY HISTORY OF ALZHEIMER'S AND APOE4 ARE ASSOCIATED WITH CORTICAL THICKNESS AND AMYLOID BINDING**

B. Bendlin, O. Okonkwo, B.T. Christian, J.M. Oh, C.M. Carlsson, M.A. Sager, S.C. Johnson, S. Asthana, *Department of Medicine, University of Wisconsin, Madison, Wisconsin*

Parental family history (FH) of Alzheimer's disease (AD) and APOE4 are known risk factors for AD. However, the independent effects of these risk factors on measures of brain health in middle-aged adults are only beginning to be known. In this study, cognitively-healthy participants (mean age=59 years), with (n=108) or without (n=48) FH of AD underwent 3T MRI, dynamic PiB PET, and neuropsychological testing. We assessed regional cortical thickness and amyloid binding. Twenty-eight percent of the participants showed amyloid binding. APOE4 genotype was associated with amyloid binding, whereas FH of AD was associated with cortical thinning, particularly in medial temporal and lateral parietal cortex. In sum, the data suggest that early AD-related brain changes are measurable in healthy middle-aged adults, and that FH and APOE4 may impart risk for AD through independent mechanisms. Assessing the contribution of modifiable risk factors and longitudinal follow-up are expected to further inform these early-stage findings.

#### **COGNITIVE BIOMARKERS IN PRECLINICAL DISEASE: RESPONSE TO POTENTIAL INTERVENTIONS**

L.D. Baker, *Department of Psychiatry and Behavioral Sciences, University of Washington School of Medicine, Washington, Washington*

Changes in cognition can be detected using sensitive psychometric measures at the earliest stage of preclinical Alzheimer's disease (AD) and vascular cognitive impairment. These pathognomic changes may be improved with interventions that target the somatotropic axis. Age- and disease-related changes in this axis set the stage for targeted therapeutic interventions to improve cognitive function. In three double-blind, randomized pilot studies, we demonstrated that six months of GHRH administration or of aerobic exercise had positive effects on executive function, and on delayed verbal recall for adults with MCI. Both interventions modulated blood biomarkers of aging or AD. In summary, pre-clinical decrements in executive function and delayed episodic memory can be stabilized or improved with interventions that modulate the somatotropic axis. Acknowledgements: Supported by PHS R01 AG025515 (MVV), Theratechnologies Inc., the American Diabetes Association, the Alzheimer's Association, and the Department of Veterans Affairs.

#### **TAU CONFORMATIONS: NOVEL CSF BIOMARKERS FOR ALZHEIMER'S DISEASE**

J. Driver, C. Chen, N. Kowall, K. Lu, *Harvard Medical School, Boston, Massachusetts*

pT231-tau is an established CSF biomarker that becomes elevated in the preclinical phase of Alzheimer's disease (AD) and is useful for diagnosis. We have discovered that pT231-tau exists in pathogenic (cis)

and non-pathogenic (trans) conformations. We generated the first antibodies that are able to distinguish between these conformations. Pilot results have demonstrated 1) that the cis conformation was undetectable in the CSF of patients without AD, 2) that both cis and trans pT231 tau were elevated in AD, and 3) that there was wide inter-individual variation in cis or trans levels, but the cis:trans ratios were very similar between patients. Furthermore, we found that levels of Pin1, the enzyme that promotes conversion from cis to trans pT231 tau, are substantially lower in the serum and white blood cells of outpatients with probable AD than in those with normal cognition. Thus, tau conformations may be a novel early biomarker for AD.

## SESSION 500 (SYMPOSIUM)

### THE USE OF PHYSICAL RESTRAINTS IN DIFFERENT CARE SETTINGS: DEFINITION AND INTERVENTIONS

Chair: *J. Hamers, Maastricht University/school CAPHRI/Department of Health Services Research, Maastricht, Netherlands*

Co-Chair: *E. Capezuti, New York University, College of Nursing, New York, New York*

Discussant: *G. Meyer, School of Nursing Sciences, Faculty of Health, Witten/Herdecke University, Witten, Germany*

The use of physical restraints is contradictory to the call to enhance the autonomy, freedom and right to take risks of older people. Despite the known adverse consequences of physical restraint use, their use continues to be common practice and is justified by healthcare workers in different settings as a safety measure, primarily to prevent falls and their consequences. The lack of evidence to support the physical restraint use as a safety intervention fuels the public debate regarding their persistent usage. Extensive research conducted in Europe, Asia, and the US in both nursing home and acute care settings has demonstrated successful outcomes of restraint reduction programs. However, it is difficult to compare study findings within and across nations due to the varying restraint definitions employed. During this symposium four researchers from the Netherlands, Hong Kong and South Korea present new data on the definition of physical restraints, interventions aimed at reducing the use of physical restraint in different settings. The presentations will focus on: 1) a delphi consensus study to determine an internationally accepted definition on physical restraints by an international workgroup; 2) the long-term effects of a multicomponent intervention program on belt restraint reduction in Dutch psychogeriatric nursing homes; 3) the development of an educational app and website on restraint-free care for Korean nursing home staff; and 4) the effects of a restraint reduction program on length of stay in Hong Kong hospitals. The discussant will reflect on the presentations and will facilitate a discussion on-site.

### A DELPHI CONSENSUS STUDY TO DETERMINE AN INTERNATIONALLY ACCEPTED DEFINITION ON PHYSICAL RESTRAINTS

*M. Bleijlevens<sup>1</sup>, L. Wagner<sup>2</sup>, E. Capezuti<sup>2</sup>, J. Hamers<sup>1</sup>, 1. Maastricht University/school CAPHRI/Department of Health Services Research, Maastricht, Netherlands, 2. New York University, College of Nursing, New York, New York*

Background: Interpretation of results from physical restraint research is hampered by different or varied definitions on physical restraints. In order to make sure that the outcomes of physical restraint studies reflect the interests of researchers, policy makers, and clinicians, an internationally accepted definition is necessary. Aim: To determine an internationally accepted definition on physical restraints. Method: Candidate definitions were identified through a systematic literature search and were presented to a Delphi panel of selected international experts. Results: The literature search revealed 33 definitions which were presented to a panel of 40 international experts. The first Delphi round resulted in a top 4 of definitions which was agreed upon at an expert

meeting during GSA in Boston, MA, in November 2011. Conclusion: International experts emphasize the need and possibility of a consensus definition that will contribute to a better understanding and comparability of international research in the field of physical restraints.

### EFFECTS OF AN INTERVENTION PROGRAM ON BELT RESTRAINT REDUCTION IN NURSING HOMES AFTER 24 MONTHS

*M. Gulpers<sup>1</sup>, M. Bleijlevens<sup>1</sup>, E. Capezuti<sup>2</sup>, E. van Rossum<sup>1</sup>, J. Hamers<sup>1</sup>, 1. Maastricht University/school CAPHRI/Department of Health Services Research, Maastricht, Netherlands, 2. New York University, College of Nursing, New York, New York*

Background: A tailored multi-component intervention program (EXBELT) on belt restraint reduction in Dutch psychogeriatric nursing homes has shown positive results directly after its implementation. However, the long-term effects are unknown. Aim: Evaluating the effects of EXBELT on belt restraint usage 24 months after its onset. Method: This study employed a quasi-experimental longitudinal design. A total of 714 residents were eligible for participation. The primary outcome measure was the use of belt restraints. Data were collected by a blinded observer. Results: A total of 225 residents (intervention group n=134 and control group n=91) were present at both baseline and after 24 months. At baseline, belts were used in 14% (intervention wards) and 15% (control wards) of the residents (p=0.802). After 24 months belt usage was respectively 5% and 14% (p=0.019). Conclusion: Both short-term and long-term EXBELT resulted in a significant and convincing reduction of belt restraints use in psychogeriatric nursing homes.

### DEVELOPMENT OF AN EDUCATIONAL APP AND WEBSITE ON RESTRAINT-FREE CARE FOR KOREAN NURSING HOMES

*E. Kong<sup>1</sup>, L.K. Evans<sup>2</sup>, 1. Gachon university, Sungham, Republic of Korea, 2. University of Pennsylvania, Philadelphia, Pennsylvania*

Physical restraints are used frequently in Korean nursing homes where education regarding harms of restraints is lacking. Internet and smart phone technology is in high use in Korea, and healthcare providers find multimedia education very acceptable. Purpose: To identify nursing home staff's educational needs regarding physical restraints and develop multimedia educational materials on restraint-free care. Methods: Data from qualitative interviews with 40 nursing home staff to identify educational needs were used to develop educational materials for smart phone APP, website, CD-ROM, and print brochure. Revisions were based on focus group evaluation. Results: Educational needs were identified as adverse effects of restraints, myths about restraints, individualized care, practice guidelines, alternative devices, and global success stories. The materials were evaluated as very accessible and useful. Conclusion: The multimedia materials on restraint-free care may be effective for educating gerontological care staff in Korean nursing homes.

### PHYSICAL RESTRAINT REDUCTION IN PATIENTS SHORTENED HOSPITAL STAY

*T. Kwok<sup>1,2,3</sup>, F. Ho<sup>2</sup>, M. Chui<sup>3</sup>, 1. Medicine & Therapeutics, the Chinese University of Hong Kong, Shatin, Hong Kong, 2. Jockey Club Centre for Positive Ageing, Shatin, na, Hong Kong, 3. Shatin Hospital, Shatin, na, Hong Kong*

Background: The effect of restraint reduction on length of hospital stay (LOS) has not been investigated. Aim: To compare the average LOS of patients in convalescent wards before and after a restraint reduction programme. Method: The use of physical restraint and LOS of randomly selected medical patient episodes before and after the implementation of a restraint reduction programme were compared. Subgroup analysis based on cognitive status was performed. Results: 958 and 988 patient episodes in a convalescent hospital in the year before and after implementation of a restraint reduction programme were examined. The

rate of physical restraint declined significantly from 13.3% to 4.1%. The average LOS of patient was also significantly lower (16.8 sd 13.4 days versus 19.5 sd 20.7,  $P < 0.001$ ). The reduction in LOS was significant in the confused patients, but not in the non-confused. Conclusion: Physical restraint reduction shortened average LOS in convalescent medical wards.

## SESSION 505 (SYMPOSIUM)

### VA GRECC SYMPOSIUM: IMPLICATIONS OF PATIENT PERCEPTION, KNOWLEDGE AND BELIEFS ON PATIENT-CENTERED HEALTH EDUCATION

Chair: C.E. Gould, GRECC, VA Palo Alto, Palo Alto, California

Co-Chair: E. Woodhead, GRECC, VA Palo Alto, Palo Alto, California

Discussant: T. Huh, GRECC, VA Palo Alto, Palo Alto, California

Approximately 40% of veterans are over the age of 65 and are frequent users of healthcare. In the effort to improve care for older veterans, Veterans Health Administration (VHA) has made substantial efforts toward a patient-centered model of care known as patient-aligned care teams (PACTs). As part of this model, patient care is Veteran-centric, with a focus on education that is specific to each patient's presenting concerns. Research on patient education suggests that tailored approaches incorporating patient education can lead to improvement in health outcomes. However, little is known about specific beliefs held by older adults about various physical and mental health conditions or the recognition and classification of symptoms, which could significantly advance patient education efforts. Patient-centered education that is consistent with older adults' beliefs about various illnesses may improve adherence and lead to more efficient use of appropriate services. The goal of this symposium is to present research on older adults' conceptualization of specific health and mental health conditions and on patient-centered education for older adults. To address this goal, the presentations in this symposium will present data from studies of Veterans and community-dwelling older adults. Data will be conceptualized according to frameworks that can guide communication with older patients about health behaviors and chronic disease self-care, such as Social Cognitive Theory and Normalization Process Theory. Discussion will focus on the implications for development of patient education interventions and how providers can better meet the older patients' health and mental health needs by using tailored patient education.

### FACILITATING HEALTH BEHAVIORS AND HEALTH LITERACY IN DISEASE SELF-CARE IN OLDER ADULTS

N. Oliva<sup>1,3</sup>, L. Gaskin<sup>1</sup>, P. Heidenreich<sup>1,2,4</sup>, 1. VA Palo Alto Healthcare System, Palo Alto, California, 2. Stanford University School of Medicine, Palo Alto, California, 3. University of California, SF; Institute for Health and Aging, San Francisco, California, 4. VA/HSR&D Chronic Heart Failure Quality Enhancement Research Initiative, Palo Alto, California

Selected results of a self-report survey of health status of older adult Veterans with a diagnosis of Heart Failure (HF) are presented as a context for a discussion of language access in healthcare and fostering health behaviors in older adults. Thirty-three percent (33%) of 1253 Veterans with documented HF diagnoses returned surveys reporting not being advised by a provider that they had HF diagnoses. Evidence-based research regarding individual and system-level barriers and facilitators to health communications and health literacy in older adults is reviewed. Effective self-care is a core component of quality chronic care and patients' knowledge of illness is critical to chronic care success. Social Cognitive Theory and Normalization Process Theory, among several psychosocial models of health behavior, provide a framework for understanding the steps individuals make in making sense of their disease(s) and engaging in self-care activities. These models can guide providers' communication and education techniques and promote desired outcomes of care.

### A PATIENT-CENTERED APPROACH TO UNDERSTANDING OLDER ADULTS' BELIEFS ABOUT DEPRESSION

E. Woodhead, S.R. Brunskill, J. Tenover, T. Huh, GRECC, VA Palo Alto Health Care System, Palo Alto, California

This retrospective study examined beliefs about late life depression to inform the development of patient-centered educational interventions. Older male veterans undergoing treatment for depression ( $N=20$ ;  $M=80.1$  years,  $SD=7.5$ ) completed a semi-structured interview guided by the components of the self-regulatory model (symptoms, cause, control/cure, consequences, timeline). Thematic categories were developed based on prior research. Reliability of categories was acceptable ( $\alpha > 0.70$ ). Commonly endorsed symptoms included worthlessness (65%) and anhedonia (40%). Anhedonia was associated with less post-treatment change in depression severity ( $r = -0.52$ ,  $p = 0.04$ ). Stress was a commonly cited cause of depression (60%) and was associated with fewer health limitations ( $r = -0.52$ ,  $p = 0.03$ ). Increased negativity was the most commonly reported consequence of depression (65%). Depression was viewed as curable through positive coping behaviors (e.g., exercise, socializing). Older veterans may benefit from targeted education about symptoms and causes of late life depression.

### OLDER ADULTS' EXPERIENCE OF ANXIETY AND ITS IMPACT ON PATIENT EDUCATION

C.E. Gould<sup>1</sup>, B. Edelstein<sup>2</sup>, S.A. Beaudreau<sup>3,4</sup>, L.A. Gerolimatos<sup>2</sup>, M. Shreve<sup>2</sup>, 1. GRECC, VA Palo Alto, Palo Alto, California, 2. West Virginia University, Morgantown, West Virginia, 3. VA Palo Alto & the Sierra Pacific Mental Illness, Research, Education, and Clinical Center (MIRECC), Palo Alto, California, 4. Stanford University School of Medicine, Dept. of Psychiatry and Behavioral Sciences, Palo Alto, California

We discuss data from two studies examining age differences in the presentation of anxiety symptoms. In Study 1 (experimental study of worry;  $N=108$ ), older adults reported significantly less anxiety than younger cohorts. Younger adults most frequently endorsed: worrying, fearful, nervous, agitated, irritated, and calm. Whereas, older adults endorsed fewer typical anxiety symptoms: alive, thoughtful, agitated, fine, tense. In Study 2, the frequency of specific anxiety symptoms was examined in the Health and Retirement Study ( $N=6715$ ). Analyses were adjusted for medical conditions. Fearing the worst or feeling nervous were most frequently found in 50-64 year-olds, and least frequently found in 85+ year-olds. Somatic anxiety symptoms (i.e., hands trembling, feeling faint) were most frequently found in 85+ year-olds and least frequently found in 65-74 year-olds. Patient education that takes into account such differences in symptom presentation may improve detection of anxiety in older adults and lead to better access to treatment.

## SESSION 510 (PAPER)

### ARTHRITIS AFFECTS ON FUNCTION AND ASSOCIATED TREATMENTS

### EFFECTS OF YOGA ON SYMPTOMS, SLEEP AND QUALITY OF LIFE IN OLDER WOMEN WITH KNEE OSTEOARTHRITIS

C. Cheung<sup>1</sup>, J. Wyman<sup>2</sup>, B. Resnick<sup>3</sup>, 1. St. Catherine University, St. Paul, Minnesota, 2. University of Minnesota, Minneapolis, Minnesota, 3. University of Maryland, Baltimore, Maryland

Purpose: Yoga is currently a recommended exercise intervention for arthritis but evidence documenting its effectiveness in osteoarthritis (OA) is limited. This study's aims were to assess the feasibility and effect of a group-based Hatha yoga program in reducing pain/stiffness, enhancing physical function, and improving quality of sleep/life in older

women with knee OA. Methods: This was a randomized trial with participants randomized to treatment which included an 8-week yoga intervention involving group-based and home-based exercise sessions, or delayed treatment control group. Data were collected at baseline, 4 weeks and 8 weeks. Results: Participants (N=36) were predominantly white (86%) with a mean age of 72 years (SD 5.6, range 65-86). During the active treatment period, significant improvements were seen in OA symptoms and physical function after 4 weeks (WOMAC global score:  $t = 3.13$ ,  $p = .004$  and SPPB global score:  $t = -2.34$ ,  $p = .026$ ) and after 8 weeks ( $t = 5.40$ ,  $p = .000$  and  $t = -4.379$ ,  $p = .000$ ). There was a trend of improvement in sleep quality ( $p = .065$ ) and in quality of life ( $p = .054$ ) after 8 weeks. OA symptoms were significantly different between the control and intervention groups at 8 weeks ( $p = .022$ ). The dropout rate was 5%. The majority of participants ( $n = 25$ ) attended  $\geq 75\%$  of classes, with common barriers included being too busy/illness. Sixty-nine percent of women practiced yoga at home  $\geq 4$  days/week (average 114 minutes). No adverse events were reported. Conclusions: A weekly yoga program with home practice appears to be a feasible and safe option for older women with knee OA that may lead to improvements in symptoms.

### **RHEUMATOID ARTHRITIS, FALL INCIDENCE AND CONSEQUENCES: A PROSPECTIVE, COHORT STUDY OF 559 MEN AND WOMEN**

E.K. Stanmore<sup>1</sup>, J. Oldham<sup>1</sup>, T. O'Neill<sup>1</sup>, C. Todd<sup>1</sup>, A. Campbell<sup>3</sup>, M. Pilling<sup>1</sup>, D. Skelton<sup>2</sup>, 1. *School of Nursing, Midwifery and Social Work, University of Manchester, UK., Manchester, United Kingdom*, 2. *Glasgow Caledonian University, Glasgow, United Kingdom*, 3. *University of Otago, Dunedin, New Zealand*

Objectives To determine the incidence of falls and to investigate the consequences of falls in adults with rheumatoid arthritis. Design Prospective, longitudinal cohort study. Patients were followed for 1 year after a detailed clinical assessment, using monthly falls calendars and follow up telephone calls. Setting Participants' usual place of residence in the Northwest of England. Participants 559 community dwelling adults with RA (mean age 62; 69% female). Main outcome measures Fall occurrence, reason for fall, type and severity of injuries, fractures, fall location, lie-times, use of health services and functional ability. Results 535 participants followed for 1 year had a total of 598 falls. 36.4% participants (95% CI 32% to 41%) reported falling during 1 year follow-up with an incidence rate of 1313/1000 person-years at risk or 1.11 falls per person. Age and gender were not associated with falls. Over one third of the falls were reportedly caused by hips, knees or ankle joints giving way. Over half of all the falls resulted in moderate injuries, including head injuries (27) and fractures (26). Treatment by general practitioners or other health professionals was required for 15.0% of falls and emergency services were required after 8.8% of falls. Conclusions These results indicate that adults with RA are at high risk of falls and fall-related injuries, fractures and head injuries. Strategies to prevent falls in adults with RA must be prioritised to reduce falls and fall-related injuries, and fractures.

### **COGNITIVE BEHAVIORAL TREATMENT OF SLEEP AND PAIN IN OLDER ADULTS WITH INSOMNIA AND OSTEOARTHRITIS: THE LIFESTYLES RCT**

M.V. Vitiello<sup>1</sup>, S.M. McCurry<sup>1</sup>, M. Von Korff<sup>2,1</sup>, S.M. Shortreed<sup>2</sup>, B.H. Balderson<sup>2</sup>, L.D. Baker<sup>1</sup>, F. Keefe<sup>3</sup>, B.D. Rybarczyk<sup>4</sup>, 1. *University of Washington, Seattle, Washington*, 2. *Group Health Research Institute, Seattle, Washington*, 3. *Duke University, Durham, North Carolina*, 4. *Virginia Commonwealth University, Richmond, Virginia*

Osteoarthritis (OA) affects as many as 60% of those  $> 65$ , half of whom also report significant sleep disturbance. OA pain and sleep disturbance both adversely affect function and quality of life and their likely reciprocal effects provide a compelling rationale for their integrated management. Here we report the results of LIFESTYLES, a RCT test-

ing the effects of such an integrated approach for insomnia and pain management. 367 older adults with co-morbid OA and insomnia were randomized to three groups: CBT-Pain and Insomnia (CBT-PI), CBT-Pain (CBT-P) and Education Only Control (EOC), each of six weekly 90-minute sessions. Sleep, pain, function, affect and cognition were assessed at baseline, post-intervention and 9-month follow-up. All three treatment arms were perceived as comparably credible and subject retention was very high (96.7% post-intervention and 92.9% 9-month). CBT-PI significantly ( $p < .001$ ) improved Insomnia Severity Index (ISI) scores and actigraphic sleep efficiency (SE) relative to EOC over 9-months. CBT-PI significantly ( $p < .001$ ) improved ISI relative to CBT-P, while both significantly ( $p < .001$ ) improved SE relative to EOC over 9 months. Pain was not significantly reduced by any LIFESTYLES intervention. However, a priori planned analysis of subjects with higher baseline pain revealed a CBT-PI-related trend ( $p < .06$ ) towards less pain severity over 9 months. CBT-PI, an integrated cognitive behavioral approach to sleep disturbance and pain in OA significantly improved sleep and showed a trend towards reduced pain in older adults with higher levels of baseline pain across 9-months relative to standard CBT for pain or an education only control.

### **VITAMIN D, RACE, AND KNEE OSTEOARTHRITIC PAIN**

T.L. Glover<sup>1,2</sup>, B.R. Goodin<sup>2</sup>, A. Horgas<sup>1</sup>, C.A. Peloquin<sup>3</sup>, J.L. Riley<sup>2</sup>, R. Staud<sup>4</sup>, L.A. Bradley<sup>5</sup>, R.B. Fillingim<sup>2,6</sup>, 1. *University of Florida, College of Nursing, Gainesville, Florida*, 2. *University of Florida, College of Dentistry, Gainesville, Florida*, 3. *University of Florida, College of Pharmacy/Emerging Pathogens Institute, Gainesville, Florida*, 4. *University of Florida, College of Medicine, Gainesville, Florida*, 5. *University of Alabama at Birmingham, Division of Clinical Immunology, Birmingham, Alabama*, 6. *North Florida/South Georgia Veterans Health System, Gainesville, Florida*

Objective: Low levels of serum circulating 25-hydroxyvitamin D have been correlated with many health conditions, including chronic pain. Recent clinical practice guidelines define vitamin levels  $< 20$  ng/mL as deficient and values of 21-29 ng/mL as insufficient. Vitamin D insufficiency, including the most severe levels of deficiency, is more prevalent in black Americans. Ethnic and race group differences have been reported in both clinical and experimental pain, with black Americans reporting increased pain. The purpose of this study was to examine whether variation in vitamin D levels contribute to race differences in knee osteoarthritic pain. Methods: The sample consisted of 94 participants (75% female), including 45 blacks and 49 whites with symptomatic knee osteoarthritis. Average age was 55.8 years (range 45-71 years). Participants completed a questionnaire on knee osteoarthritic symptoms and underwent quantitative sensory testing, including measures of heat and mechanical pain sensitivity. Results: Blacks had significantly lower levels of vitamin D compared to whites, demonstrated greater clinical pain, and showed greater sensitivity to mechanical and heat pain. Low levels of vitamin D predicted increased experimental pain sensitivity. Group differences in vitamin D significantly predicted group differences in heat pain and pressure pain thresholds on the index knee and ipsilateral forearm. Conclusion: These data demonstrate race differences in experimental pain are mediated by differences in vitamin D level. Vitamin D deficiency may be a risk factor for increased knee osteoarthritic pain in black Americans.

### **SYMPTOM CLUSTERS, QUALITY OF LIFE, AND FUNCTIONAL STATUS IN OLDER ADULTS WITH OSTEOARTHRITIS**

J.B. Jenkins, T.P. McCoy, *Nursing, UNC at Greensboro, Greensboro, North Carolina*

Background: One in two people may develop symptomatic knee osteoarthritis (OA) in their lifetime. Many OA sufferers have multiple concurrent symptoms, such as pain, fatigue, and depression. Examining if symptom clusters exist among older adults with OA of the knee

and their effects on patient outcomes, such as quality of life (QOL) and functional status is essential to provide evidence-based geriatric health-care. Purpose: The purposes of this secondary analysis were to explore the existence of symptoms that form a cluster in older adults with OA of the knee, and to explore the effect of symptom clusters on the QOL and functional status. Method: A cross-sectional, methodological exploration of existing data from a convenience sample (N=75) of adults ages 50 and older was used. Hierarchical and k-means cluster analysis was performed to identify symptom clusters. MANOVA was performed to test for any differences in QOL and functional status jointly. Results: Two large clusters of pain, fatigue, and depression were identified from cluster analysis. Significant mean differences between symptom clusters existed on both QOL (p=0.0082) and functional status (p<0.0001). Conclusions about QOL or functional status differences were similar for alternative clustering strategies or numbers of symptom clusters in sensitivity analyses. Implications: The findings of this study provide a foundation for evaluating symptom clusters in future research and determining whether the clusters vary over time or along disease/treatment trajectory. Linking the symptom cluster to outcomes provides a basis for targeted interventions to improve QOL and functional status of older adults with OA.

## SESSION 515 (PAPER)

### COGNITION: SCREENING, TRAJECTORY, AND INTERVENTIONS

#### LONG-TERM EFFECT OF DELIRIUM ON COGNITIVE TRAJECTORY OF PERSONS WITH DEMENTIA: THE AGING CNS

A.L. Gross, R.N. Jones, D.A. Habtemariam, T.G. Fong, D. Tommet, L. Quach, E.M. Schmitt, S.K. Inouye, *Institute for Aging Research, Harvard Medical School, Boston, Massachusetts*

Background: Delirium is characterized by acute cognitive impairment. We examined the effect of delirium on long-term cognitive trajectory in older adults with Alzheimer's disease (AD). Methods: Prospectively collected longitudinal data from hospitalized patients with AD (n=263) from the Massachusetts Alzheimer's Disease Research Center Patient Registry. Cognitive function was measured using the Information-Memory-Concentration (IMC) section of the Blessed Dementia Rating Scale. Delirium was identified using a validated chart review method. The pace of cognitive deterioration was contrasted using random effect regression models. Results: Over half of patients with AD developed delirium during hospitalization (56%). The pace of cognitive deterioration prior to hospitalization was similar between patients who developed delirium and those who did not (P=0.24). In the year following hospitalization, patients who developed delirium experienced greater cognitive deterioration (3.1 IMC points/year, 95% CI: 2.1,4.1) relative to patients who did not (1.4 IMC points/year, 95% CI: 0.2,2.6) after adjusting for dementia severity, comorbidity, and demographic characteristics. The ratio of these changes suggests that following delirium, cognitive deterioration proceeds at 2.2 times the rate in patients without delirium in the year after hospitalization. The delirium group maintained a more rapid pace of cognitive deterioration throughout the 5-year period following hospitalization. Sensitivity analyses excluding rehospitalized patients produced similar results. Conclusions. Delirium is highly prevalent among persons with AD who are hospitalized and associated with an increased pace of long-term cognitive deterioration. Strategies to prevent delirium may offer a promising avenue to explore for ameliorating cognitive deterioration in AD.

#### CAN COGNITIVE IMPAIRMENT BE A FRAILTY-DEFINING CRITERION IN THE SYNDROMIC MODEL OF FRAILTY?

C. Cigolle<sup>1,2,3</sup>, J. Liang<sup>4</sup>, J. Ha<sup>2</sup>, P. Lee<sup>2,3</sup>, T. Gure<sup>2</sup>, L. Min<sup>2,3</sup>, K. Langa<sup>2,5</sup>, C. Blaum<sup>2,3</sup>, 1. *University of Michigan Department of Family Medicine, Ann Arbor, Michigan*, 2. *University of Michigan Department of Internal Medicine, Ann Arbor, Michigan*, 3. *VA Ann Arbor Geriatric Research, Education and Clinical Center (GRECC), Ann Arbor, Michigan*, 4. *University of Michigan School of Public Health, Ann Arbor, Michigan*, 5. *VA Ann Arbor Center for Practice Management and Outcomes Research, Ann Arbor, Michigan*

Cognitive decline is theorized to play a role in the pathogenesis of frailty and perhaps be a component of the frailty phenotype. We hypothesized that including cognitive impairment as a sixth frailty-defining criterion would fit the syndromic model of frailty (i.e., cognitive impairment and the original frailty-defining criteria would aggregate as a syndrome and not in distinct subgroups). We used data from wave 2006 of the Health and Retirement Study, a nationally-representative longitudinal health survey. The sample included adults >=65 years who completed physical performance measures (n=4,453, representing 35.3 million). We operationalized the original frailty-defining criteria (weight loss/exhaustion/low energy expenditure/slowness/weakness) and used a performance-based measure to determine cognitive impairment. We employed latent class factor modeling to examine how the six criteria grouped in classes, using the Akaike and the Bayesian information criteria and the likelihood ratio test for goodness of fit to select the model best fitting the data. Using latent class factor analysis, the six frailty-defining criteria sorted best by one factor having three hierarchical levels (not by distinct subgroups). Of 894 respondents with mild cognitive impairment, 44.6% were pre-frail; 55.4%, frail. Of 231 respondents with moderate-severe cognitive impairment, 29.0% were pre-frail; 71.0%, frail. The original five-criterion model and the six-criterion model agreed in identifying cognitively unimpaired respondents as pre-frail and frail. Confirming our hypothesis, including cognitive impairment as a sixth frailty-defining criterion satisfies the syndromic model of frailty. Cognitive decline and frailty have a complex and interrelated natural history, with implications for clinical management and future research.

#### ENHANCED RISK OF MILD COGNITIVE IMPAIRMENT AND ITS PROGRESSION TO DEMENTIA AMONG ELDERLY APOE ε4 CARRIERS

W. Xu<sup>1</sup>, B. Caracciolo<sup>1</sup>, H. Wang<sup>1</sup>, G. Santoni<sup>1</sup>, B. Winblad<sup>1</sup>, L. Fratiglioni<sup>1,2</sup>, 1. *Karolinska Institutet, Stockholm, Sweden*, 2. *Stockholm Gerontology Research Center, Stockholm, Sweden*

Objective: The impact of APOE ε4 on mild cognitive impairment (MCI) and its progression to dementia remain controversial. We aimed to examine the association of APOE ε4 with MCI, and to verify the hypothesis that ε4 accelerates progression from MCI to dementia. Methods: In the Kungsholmen Project, 756 cognitively healthy participants and 212 people with MCI aged ≥75 years were identified at baseline. MCI was defined as amnesic MCI (aMCI) and other cognitive impairment no dementia (oCIND). The two cohorts were followed for 9 years to detect incident cases of MCI and dementia following international criteria. APOE genotypes were assessed at baseline. Data were analysed using Cox models. Results: During the follow-up, in the cognitively healthy cohort, 165 people developed MCI (40 aMCI and 125 oCIND), and 176 developed dementia (126 Alzheimer disease [AD]); in the MCI cohort, 118 persons progressed to dementia (100 AD). Compared with APOE ε3ε3 genotype, the hazard ratios (HRs) (95% CIs) of ε2ε4/ε3ε4 were 2.24 (1.10-4.57) for aMCI and 1.78 (1.15-2.75) for oCIND, while the ε4ε4 was related to dementia, with a HR of 4.35 (1.97-9.63) in the cognitively healthy cohort. In the MCI cohort, the ε4ε4 genotype led to a multi-adjusted HR of 2.89 (1.12-7.48) for dementia, and accelerated the progression to dementia by 3.36 years. Conclusion: The APOE ε4 heterozygotes are associated with an increased risk of aMCI and oCIND.

The  $\epsilon 4$  homozygote substantially accelerates progression from MCI to dementia, and anticipate dementia occurrence by more than 3 years in people with MCI.

#### **PARENTAL LONGEVITY AS A MARKER OF PRESERVED OFFSPRING COGNITION AND BRAIN MRI MEASURES**

J.M. Murabito<sup>1,3</sup>, A. Beiser<sup>2,5</sup>, C. DeCarli<sup>4</sup>, S. Seshadri<sup>5,3</sup>, P.A. Wolf<sup>6,3</sup>, R. Au<sup>5,3</sup>, 1. *Medicine, Section of General Internal Medicine, Boston University School of Medicine, Framingham, Massachusetts, 2. Boston University School of Public Health, Boston, Massachusetts, 3. Framingham Heart Study, Framingham, Massachusetts, 4. University of California at Davis, Sacramento, California, 5. Boston University School of Medicine, Department of Neurology, Boston, Massachusetts*

**Background:** Offspring of long-lived individuals have a lower risk for dementia. We examined the relation between parental longevity and cognition and markers of brain aging in middle-aged community-dwelling adult offspring. **Methods:** Offspring participants with both parents in the Framingham Heart Study, aged > 55 years and dementia-free underwent baseline and repeat neuropsychological (NP) testing and brain magnetic resonance imaging (MRI). Parental longevity was defined as having at least one parent survive to age >85 years. NP testing included memory, reasoning, attention, and executive function. Brain MRI included quantification of total and regional brain volumes and white matter hyperintensity. To test the association between parental longevity and measures of cognition and brain volumes, we used multivariable linear and logistic regression adjusting for age, sex, education and time to NP testing or brain MRI. **Results:** Of 728 Offspring participants (mean age 66 years, 54% women, 36% college education, 88% with brain MRI), 407 (56%) had at least 1 parent achieve longevity. In cross-sectional analysis, parental longevity was associated with better scores on tests of attention (beta  $0.21 \pm 0.08$ ,  $p < 0.006$ ) and a lower odds of extensive white matter hyperintensity (odds ratio 0.59, 95% CI: 0.38, 0.92,  $p < 0.02$ ). In longitudinal analysis (6.7  $\pm$  1.7 years later), offspring with parental longevity had slower decline in executive function (beta  $0.15 \pm 0.09$ ,  $p = 0.04$ ) and less increase in temporal horn volume (beta  $-0.24 \pm 0.09$ ,  $p = 0.007$ ). **Conclusions:** Parental longevity is associated with improved attention and executive function as well as lower odds of vascular brain aging in middle-aged adult Offspring.

#### **CNS - POOR EXECUTIVE FUNCTION AND DUAL TASKING GAIT VARIABILITY PREDICT FUTURE FALLS AMONG OLDER ADULTS: FINDINGS FROM A 5 YEAR PROSPECTIVE STUDY**

J. Hausdorff<sup>1,3,6</sup>, A. Mirelman<sup>1,2</sup>, T. Herman<sup>1</sup>, M. Brozgot<sup>1</sup>, M. Dorfman<sup>1</sup>, E. Sprecher<sup>1</sup>, A. Schweiger<sup>5</sup>, N. Giladi<sup>1,4</sup>, 1. *Movement Disorders Unit, Department of Neurology, Tel-Aviv Sourasky Medical Center, Tel Aviv, Israel, 2. School of Health Related Professions, Ben Gurion University, Beer Sheva, Israel, 3. Department of Physical Therapy, Sackler Faculty of Medicine, Tel-Aviv University, Tel-Aviv, Israel, 4. Departments of Neurology, Sackler Faculty of Medicine, Tel-Aviv University, Tel-Aviv, Israel, 5. Department of Behavioral Sciences, Academic College of Tel Aviv, Tel-Aviv, Israel, 6. Harvard Medical School, Boston, Massachusetts*

**Background:** Executive function (EF) plays a critical role in the regulation of gait, especially under complex and challenging conditions. The purpose of this study was to evaluate if reduced EF is a risk factor for future falls. **Methods:** 276 community-living, healthy older adults (mean age:  $76.4 \pm 4.5$  yrs; 61% women) participated in a prospective study designed to follow the subjects for at least 4 years. At baseline, subjects were cognitively intact and had good mobility. A computerized cognitive battery generated an index of EF, attention, and other cognitive domains. Gait was assessed during single and dual task conditions. Falls data were collected using monthly calendars. Negative binomial regression quantified risk ratios (RR). **Results:** The median follow-up

was 53 months. Performance-based tests of mobility and gait predicted future falls. After adjusting for age, gender and a previous history of falls, only the EF index (RR: 0.85; CI: 0.74-0.98,  $P = 0.021$ ), the attention index (RR: 0.84; CI: 0.75-0.94,  $P = 0.002$ ) and dual tasking gait variability (RR: 1.11; CI: 1.01-1.23;  $P = 0.027$ ) were significantly associated with future falls. Other cognitive function measures were not related to falls. Survival analyses indicated that subjects in the worst EF quartile were more likely to fall sooner and more likely to experience multiple falls during the 66 months of follow-up ( $P = 0.017$ ). **Conclusions:** Poorer EF and attention increase the risk for future falls, even over a time span of more than 5 years. Screening and, perhaps, treatment of EF and attention apparently has the potential to reduce the risk of falls among older adults.

#### **SESSION 520 (PAPER)**

#### **NORTH AMERICAN AND EUROPEAN ISSUES AND APPROACHES FOR OLDER ADULT CARE**

#### **IMMUNOLOGICAL INVESTIGATIONS IN THE NEW BERLIN AGING STUDY-II (BASE-II): FIRST CORRELATIONS WITH COGNITIVE FUNCTION**

G. Pawelec<sup>1</sup>, S. Li<sup>2</sup>, U. Lindenberg<sup>2</sup>, E. Steinhagen-Thiessen<sup>3</sup>, G. Papenberg<sup>2</sup>, R. Eckardt<sup>3</sup>, I. Demuth<sup>3</sup>, E. Derhovanessian<sup>1</sup>, 1. *University of Tuebingen, Tuebingen, Germany, 2. Max-Planck Institute for Human Development, Berlin, Germany, 3. Charité Medical School, Berlin, Germany*

The OCTO/NONA longitudinal studies of the very elderly in Sweden pinpointed an “immunological risk profile” together with markers of inflammation and cognitive decline which predicted incipient mortality. These parameters were closely associated with Cytomegalovirus (CMV) infection, which is linked to heightened inflammation and frailty in several other studies. To identify factors associated with “healthy”-vs-“unhealthy” aging, the new Berlin Aging Study-II (BASE-II) aims to assemble health data, immune parameters, genetics, psychology, nutrition and socioeconomics into an integrated database. Baseline recruitment included 1,600 elderly (60-75) and 600 controls (20-35); follow-up is planned. Here we present the first results surveying CMV-serostatus and immune parameters of these subjects ( $n = 723$  and 100, respectively). CMV-seropositivity in younger-vs-older women was 40-vs-64% and in men 32-vs-59% (both  $P < 0.0001$ ), consistent with results in other Western populations. We have correlated the frequency of different blood T-cell phenotypes with processing speed and variability, parameters known to predict 5-year cognitive decline in the elderly, comparing CMV-seropositive elderly with the highest or lowest performance scores ( $n = 100$ ). The two groups differed significantly in frequencies of late-stage differentiated CD8+T cell phenotypes, the accumulation of which is known to be associated with CMV responsiveness. These preliminary data document associations between immunological and psychological parameters and the likelihood that larger-scale studies with different tested factors will yield valuable information on human health and well-being. Measurable objectives for this presentation: learn about BASE-II and its contribution to defining immunological parameters pertinent to healthy cognitive aging.

#### **DETERMINANTS OF RECEIVING HELP AT HOME IN A POPULATION-BASED SURVEY OF CANADIANS WITH PARTICIPATION AND ACTIVITY LIMITATIONS**

D. Goodridge<sup>1</sup>, J. Lawson<sup>2</sup>, D. Rennie<sup>1,2</sup>, 1. *College of Nursing, University of Saskatchewan, Saskatoon, Saskatchewan, Canada, 2. Canadian Centre for Health and Safety in Agriculture, College of Medicine, University of Saskatchewan, Saskatoon, Saskatchewan, Canada*

The number of adults reporting a disability is expected to rise sharply in the coming years as more persons enter the highest risk age group ( $\geq 65$  years). Receiving appropriate help at home will maintain inde-

pendence. Methods: Data from the 2006 Participation and Activity Limitation Survey (PALS), a two-phase stratified post-censal Statistics Canada survey representing 5,185,980 Canadian adults aged 15 and older with participation and activity limitations, were used to develop a profile of the self-reported help received at home. Associations between functional health status (assessed using the Health Utility Index) and socio-demographic variables and help received were assessed using multiple logistic regression. Results: For adults aged 65 and older, the most commonly reported help received was with heavy chores (41.7%), followed by appointments (32.8%), housework (30.2%), meals (17.4%) and personal care (11.8%). Significantly higher proportions of individuals aged 75 and older reported receiving help with each of the activities compared with all other age categories, although there were no significant differences between the age 65-74 year age group and younger groups. After adjustment, functional status was the primary determinant of self-reported help at home. Males had significantly lower likelihood of receiving any type of help. Age greater than 75 years was associated with a lower likelihood of receiving help with meals (OR=0.70, 95% CI 0.55-0.89), but was not associated with reporting other types of help. Income was not associated with the likelihood of receiving help. Conclusions: Functional health status and sex are the most robust determinants of receiving help at home.

### FUNCTIONAL DEPENDENCE AMONGST OLDER SWEDISH ADULTS: TEMPORAL TRENDS IN THE LAST TWO DECADES: 1990-2010

S. Angleman<sup>1,2</sup>, G. Santoni<sup>1,2</sup>, E. von Strauss<sup>1,2</sup>, L. Fratiglioni<sup>1,2</sup>, I. Karolinska Institutet, Stockholm, Sweden, 2. Aging Research Center, Stockholm, Sweden

**Objective:** To examine temporal trends in Activity of Daily Living (ADL) disability, in order to 1) determine whether declines in disability prevalence, as reported for previous decades in Western countries, have continued in the last two decades amongst older Swedish adults; 2) evaluate how incidence, mortality, and study participation rates influence temporal trends of disability prevalence. **Methods:** ADL disability prevalence (in  $\geq 1$  of: dressing, bathing, eating, transfer, or toileting) was calculated at each of seven assessments coming from two longitudinal cohorts, both based in Stockholm: the Kungsholmen Project (KP, 1990-2000) and the Swedish National study of Aging and Care in Kungsholmen (SNAC-K, 2001-2010), with 1084 participants and 381 non-participants from KP and 3363 participants and 1548 non-participants from SNAC-K. Incidence and mortality rates were calculated between consecutive assessments. Mortality rates were stratified by ADL and non-participation status. Analyses were age-stratified (66-72, 73-79, 80-84, 85-88, 89-101 years). **Results:** ADL disability prevalence was similar over time. Prevalence increased with age (1, 5, 11, 22 and 36% across age categories). Age-specific incidence of ADL disability was similar over time. Mortality in non-disabled persons decreased slightly (300-590 vs 230-515 deaths/1000 people), but in disabled persons was similar over time (720-870 deaths/1000 people). Mortality of non-participants was substantially lower in recent assessments, and more similar to non-disabled persons. **Interpretation:** This evidence suggests that prevalence levels for recent assessments overestimate the true population level of ADL disability, meaning that ADL prevalence has actually declined in the last two decades, in this urban population of older Swedish adults.

### PAIN FREQUENCY, INTENSITY, CONTROL AND THERAPY IN EUROPEAN NURSING HOMES – RESULTS FROM THE SERVICES AND HEALTH FOR ELDERLY IN LONG TERM CARE (SHELTER) STUDY

A. Lukas<sup>1</sup>, M.D. Denking<sup>1</sup>, G. Onder<sup>2</sup>, R. Bernabei<sup>2</sup>, T. Nikolaus<sup>1</sup>, I. AGAPLESION Bethesda Klinik Ulm, Ulm, Germany, 2. Centro Medicina dell'Invecchiamento, Università Cattolica Sacro Cuore, Rome, Italy

Background: Pain is common in nursing home residents and is often under-reported, under-assessed, and consequently under-treated. A pre-

requisite for improving pain management in nursing homes is knowing more about current research in the area. Up to now, comparable transcontinental assessment tools for European nursing home residents have been missing. Methods: The Services and Health for Elderly in Long Term care (SHELTER) study is a prospective cohort study that was conducted in 57 nursing homes in seven countries from the European Union and Israel. A complete dataset was available from 3926 residents, 1900 with pain. All participants were assessed using the InterRAI LTCF instrument. For the analyses, cross-sectional data at baseline were used. Treatment satisfaction, incidence of pain therapy as well as pain control (intensity of pain) were measured to evaluate outcomes. Results: 48.4% of the residents were identified as pain patients (currently in pain and/or treated with analgesics). Pain prevalence decreased with cognitive impairment (adj OR 0.78, CI 95% 0.73-0.83). Approximately 24% of people with pain did not receive any analgesic, even if they were in pain in the previous three days. Non-pharmacological treatments were offered regardless of need. Nevertheless in 88.1% of cases pain was estimated as sufficiently controlled. Discussion: For the first time, similarities and differences of approach to pain and pain control in nursing homes across Europe can be analysed and the data used to improve the overall situation.

### THE CANADIAN INTERNATIONAL COLLABORATIVE RESEARCH STRATEGY FOR ALZHEIMER'S DISEASE (ICRSAD)

Y. Joanette, IA-CIHR, Montreal, Quebec, Canada

With the aging of the population worldwide, the prevalence of individuals living with Alzheimer's Disease or related dementias (ADRD) will reach impressive numbers. The International Collaborative Research Strategy for Alzheimer's Disease (ICRSAD) is the Canadian Institute of Health Research's response to this growing Canadian and international health care crisis. ICRSAD has been designed to build upon Canadian research expertise and leadership with the aim of partnering with other countries and their initiatives in order to support collaborative and innovative research on all aspects of ADRD. There is indeed a growing consensus that large-scale international collaboration is the most effective way to respond to this global challenge, and ICRSAD is ideally placed to foster such an international research agenda. The overall goal of the ICRSAD is to reduce the personal, social and economic impact of ADRD by fostering innovative research at three stages: (a) identifying the mechanisms responsible for the neurodegenerative processes leading to ADRD, (b) delaying of the onset and the progression of disease through early intervention and diagnosis and, (c) improving the quality of life of those living with the disease and their caregivers, as well as improving access to quality care and enabling the healthcare system to deal more efficiently with the rising number of people with ADRD. ICRSAD has recently deployed its international component allowing Canadian researchers to participate in key international partnerships, and is in the active preparation process of launching its Canadian component. This presentation will allow participants to learn about ICRSAD and to discuss ways of connecting with this international research strategy.

### SESSION 525 (SYMPOSIUM)

#### EXPANDING THE POOL OF SOCIAL WORK FACULTY ENGAGED IN AGING RESEARCH

Chair: C.M. Mehrotra, Psychology, The College of St. Scholastica, Duluth, Minnesota

Co-Chair: B. Berkman, Columbia University, New York, New York  
Discussant: R.A. Barr, National Institute on Aging, Bethesda, Maryland

With support provided by NIH and the Hartford Foundation we have developed a training program to build and sustain a community of social

work faculty committed to aging research. Program design includes an initial summer institute, ongoing consultation, a mid-year meeting and a follow-up institute. A recent follow-up evaluation indicated that more than 70 percent of the participants have received institutional funds and more than 56 percent have secured external funds (from NIH, CDC, and private foundations) to conduct aging research. The proposed symposium aims to share with the convention audience examples of research conducted by participants representing diverse institutions, backgrounds, and research areas. The presenters describe the funding mechanisms they used to secure grant support, outline the activities they have undertaken, present research methods and findings, and discuss implications of their research. The presenters and their topics include: Faul presents her CDC-supported project aimed at reducing diabetes-related inequalities in rural older adults and persons of low socioeconomic status; Wal-drop compares decision making and service utilization of older cancer patients who enroll in hospice with those who decline to enroll; Rosen focuses on the adaptation, testing, and delivery of a late-life depression intervention for older adults with co-occurring substance abuse and mood disorders; and Lee presents a mobile-phone based intervention she has designed to promote Pap-test utilization among Korean American women. The participants also share their experiences with seeking external funding and outline what they learned during this process. NIH representative reviews common themes and discusses their implications.

#### **BUILDING THE FOUNDATION FOR A RESEARCH CAREER IN SOCIAL WORK AND AGING**

D. Rosen, *Social Work, University of Pittsburgh, Pittsburgh, Pennsylvania*

The Institute's training emphasized investigations that explored under-examined areas within aging research. Depressive disorders among older adult opiate abusers have detrimental effects on their well-being and ability to refrain from illegal drug use. I received a K-08 Award from the National Institute on Drug Abuse. It focuses on the adaptation, testing, and delivery of a late-life depression intervention for older adults with co-occurring substance abuse and mood disorders. The research was conducted at a methadone clinic where a third of the clients were over the age of 50. Patients were randomized to compare 30 participants receiving Problem Solving Therapy to 30 participants receiving treatment as usual. Participants in the treatment group had improved mood disorder scores compared to the control group. Next steps in this treatment include the inclusion of technology to increase the dose of the intervention to address cognitive and memory issues related to aging and substance abuse.

#### **COMMUNICATION IN LATE-STAGE CANCER: EXPLORING HOSPICE DECISIONS**

D. Waldrop, *School of Social Work, Buffalo, New York*

Thirty six percent of all hospice patients have cancer and 83% are over age 65, yet many older cancer patients utilize hospice for short periods of time or decline it altogether. The purpose of this study was to explore and describe how, when and with whom, older cancer patients communicate their concerns and needs for care in advanced cancer and to compare the decision-making and service utilization of those who enroll in hospice with those who decline. This exploratory descriptive study employed a sequential mixed methods design for the purpose of considering the overlapping perspectives of cancer patients and their caregivers. In-depth interviews were conducted with 197 families (N=276 participants; N=47 who enrolled, 29 who declined and 200 caregivers). The results suggest that the rate of functional decline, source of referral to hospice, cancer treatment, caregiving, awareness of terminality and perceptions of hospice influence whether hospice is accepted or declined.

#### **UNDERSTANDING CONTEXT AND HOW IT DETERMINES HEALTH**

A.C. Faul, *Kent School of Social Work, Univ Louisville, Louisville, Kentucky*

The author was selected to take part in the Institute on Aging and Social Work, where she received intensive training in aging research from distinguished professors. After the Institute, she was able to secure a 2.5 million grant from the CDC. The aim of the 5-year project is to reduce the diabetes-related inequalities in vulnerable populations, specifically rural older adults and persons of lower socio-economic status. The skills learned at the Institute, specifically multilevel modeling, were instrumental in the development of a focused research agenda, where the studies focused exclusively on reducing individual blame and on the injustices and inequalities that originate within the social determinants of health. Since the Institute, the presenter's students have been actively involved in her research agenda. She not only teaches them from existing databases where social determinants of health are highlighted, but also makes them an integral part of her CDC funded grant.

#### **MOBILE PHONE TEXT MESSAGING INTERVENTION FOR CERVICAL CANCER SCREENING**

H.Y. Lee, *School of Social Work, University of Minnesota, Twin Cities, St. Paul, Minnesota*

The Institute on Aging and Social Work honed my skills in narrowing broad research ideas into focused NIH grant topics; selecting appropriate research methods and teams; employing reviewers' comments; and utilizing pilot data toward larger-scale grants. After attending the Institute I was successful in securing an exploratory research grant (R21) from the National Cancer Institute (NCI). My preliminary investigation had found that Korean American women have the lowest cervical cancer screening and the highest related mortality rates across U.S. racial/ethnic groups. This alarming statistic fueled my intervention interest and concern for cancer screening disparity. With NCI support, I am developing a mobile-phone based intervention to promote Pap test utilization among Korean American women. Preliminary data are quite encouraging. It is therefore likely that my next step will be to secure an R01 grant to expand the pilot intervention into a multisite research project targeted at a broader age range.

#### **SESSION 530 (SYMPOSIUM)**

##### **GENERATIONS BETWEEN SOLIDARITY AND CONFLICT: THE SOCIAL CONTRACT IN RECESSIONARY TIMES**

Chair: *G.M. Carney, Irish Centre for Social Gerontology, National University of Ireland Galway, Galway, Ireland*

Co-Chair: *C. Phillipson, Keele University, Keele, United Kingdom*

Discussant: *A. Achenbaum, University of Houston, Houston, Texas*

Ultimately, inter-generational solidarity underpins the distribution of resources between citizens in ageing societies. Who gets what, when and how is the result of a complex interplay of political, economic and cultural factors. In the liberalised United States of America 'greedy geezer' debates have been linked to the power of American seniors as a political lobby. This contrasts with the European context, where distribution of resources is more clearly at the behest of the state. Gerontology has not linked the distribution of resources across age groups to the concept of political culture. Yet, fundamental differences in political culture underpin differences between US and European ageing research results. As life expectancy increases, a new set of needs and wants will be expressed by the citizens of ageing states. Age is expected to play an increasingly important role in dictating the re-distribution of resources at state level, directing us to re-examine foundational concepts such as social contract and intergenerational solidarity. This symposium will advance a trans-Atlantic dialogue between gerontologists seeking to understand solidarity and conflict between generations from a comparative perspective. Future research arising from this exchange

will examine how the effects of socio-economic status, generational location and lifecycle stage might be compared cross culturally; perhaps employing civic culture as a framework for understanding ageing in diverse national contexts.

#### **THE CIVIC CULTURE OF AN AGEING STATE: INFERENCES FROM A GROUNDED THEORY OF INTERGENERATIONAL SOLIDARITY IN IRELAND**

G.M. Carney<sup>1</sup>, T. Scharf<sup>1</sup>, V. Timonen<sup>2</sup>, C. Conlon<sup>2</sup>, *1. Irish Centre for Social Gerontology, National University of Ireland Galway, Galway, Ireland, 2. Social Policy and Ageing Research Centre, Trinity College Dublin, Dublin, Ireland*

This paper presents a grounded theory of intergenerational solidarity in the Republic of Ireland. Based on one hundred in-depth interviews with a diverse sample of citizens living in Ireland in 2011-12, the study probes intergenerational solidarity at individual, family and societal levels. Our study reveals much about the fundamental link between attitudes toward own and other generations, and the broader question of age-based resource allocation now and in the future. Passage of time, changing social attitudes and current life stage inform participants' views. The paper uses the concept of political culture, classically recognised as 'civic culture' by Almond and Verba in their seminal 1963 study, to frame these findings. This study of intergenerational solidarity, undertaken in Ireland at a time of national crisis and global recession, reveals much about the values fundamental to maintenance of the social contract in this peripheral, western European state.

#### **GLOBALISATION AND SOCIAL EXCLUSION: CHALLENGES FOR INTER-GENERATIONAL RELATIONS**

C. Phillipson, *Keele University, Newcastle-under-Lyme, United Kingdom*

Framed by the current economic recession, this paper assesses the extent to which processes arising from globalisation are transforming later life and inter-generational relations in particular. Despite the fact that population ageing has frequently been constructed as a global problem and issue, the paper argues that the on-going reduction of expenditure on public programmes increasingly acts to transfer risks to individual older people and their families. This process – referred to in terms of 'exclusionary risks' and 'exclusionary services' – creates new and distinctive forms of social and economic inequality. The paper examines competing trends in the inclusion/exclusion debate in light of such developments and the implications for understanding relationships between generations. The possibility of conflict or the potential for new forms of solidarity between generations, will be a key theme addressed in the paper.

#### **LEAVING A LEGACY: OUR AGING SOCIETY AND FUTURE GENERATIONS**

H. Moody, *AARP, Washington, District of Columbia*

The idea of "justice between generations" receives different responses among those with contrasting political views. For example, political conservatives stress this idea when focusing on government deficits or cuts in public welfare programs, such as Social Security and Medicare. By contrast, those on the Right are skeptical of appeals to intergenerational justice on environmental matters (e.g., global warming). Political liberals, by contrast, support environmental protection but are skeptical of appeals to "generational equity" in social programs. This divided politics of "sustainability" diverts us from an underlying point: namely, the need to engage in long-range thinking and long-range investment when contemporary culture and media reinforce what is momentary and transient. In this presentation, we survey the history of the idea of justice between generations and argue that older people need to reclaim virtues of generativity in order to safeguard the well-being of future generations.

## **SESSION 535 (SYMPOSIUM)**

### **NATIONAL LGBT HEALTH AND AGING RESEARCH: FORGING NEW FRONTIERS THROUGH PARTNERSHIPS IN MARGINALIZED COMMUNITIES**

Chair: *K.I. Fredriksen-Goldsen, University of Washington, Seattle, Washington*

Given the tremendous growth of the age 50 and older population in the next two decades, the number of lesbian, gay, bisexual, and transgender (LGBT) older adults will exceed 6 million by 2030. Yet, LGBT older adults remain an at-risk, underserved, and under-investigated population. The CDC identifies the lack of attention to sexual orientation as a critical gap in our understanding to reduce health disparities. This symposium highlights important findings from the ground-breaking study of LGBT health and aging, with 2,560 demographically diverse LGBT adults 50 and older, conducted through community based collaborations. Fredriksen-Goldsen and colleagues examine the unique risk and protective factors predicting quality of life and health among LGB older adults. The relationship between living arrangement and personal and social resources are explored by Kim and colleagues, as they relate to both loneliness and depression among LGBT older adults. The needs of specific populations are investigated by Emler and colleagues as they present correlates of HIV-risk behaviors among LGBT older adults and examine the relationship between stigma, efficacy, social support, and HIV risk behaviors. From a life course perspective, Muraco and Fredriksen-Goldsen explore the romantic relationships among LGBT older adults, including long-term commitments and transitions in primary relationships such as through the death of a partner. The presentations in this symposium illustrate the importance of forging partnerships in disadvantaged communities to promote healthy aging in our increasingly diverse society.

#### **THE QUALITY OF LIFE OF LGBT OLDER ADULTS: KEY RISK AND PROTECTIVE FACTORS**

K.I. Fredriksen-Goldsen<sup>1</sup>, H. Kim<sup>1</sup>, C.P. Hoy-Ellis<sup>1</sup>, C.A. Emler<sup>2</sup>, E. Erosheva<sup>1</sup>, A. Muraco<sup>3</sup>, H. Petry<sup>4</sup>, *1. University of Washington, Seattle, Washington, 2. University of Washington, Tacoma, Washington, 3. Loyola Marymount University, Los Angeles, California, 4. University of Applied Sciences, Zürich, Switzerland*

Health disparities of lesbian, gay, bisexual, and transgender (LGBT) older adults are of major concern. Based on data from the national project (N=2,560), this presentation examines the interrelationships between victimization, stress, health behaviors, identity management, social relations, and quality of life of LGBT older adults. Identity management is significantly related to experiences of victimization ( $b=.66$ ;  $p<.01$ ), and high rates of victimization ( $b=-.29$ ;  $p<.001$ ) and adverse health behaviors ( $b=-1.41$ ;  $p<.05$ ) are related to diminished quality of life. While stress mediates the relationship between victimization and quality of life, social relations have a moderating effect on the relationship between victimization and stress. While the stress level does not change by the degree of victimization for those with high levels of social support, the stress level is positively associated with victimization for those with low levels of social support. Interventions must be developed to address the unique needs of LGBT older adults.

#### **LIVING ARRANGEMENT AND HEIGHTENED RISK OF LONELINESS AND DEPRESSION AMONG LGBT OLDER ADULTS**

H. Kim, K.I. Fredriksen-Goldsen, *University of Washington, Seattle, Washington*

Few studies have examined the living arrangement of LGBT older adults and its impact on loneliness and depression. Based on a national survey of LGBT older adults (N=2,560), 55% of the LGBT older adult participants live alone, 37% live with a partner or spouse, and 8% live with others (regardless of partnership status). LGBT older adults living

alone as well as those living with others experience increased loneliness and depression as compared to those living with a partner or spouse, with results similar among both men and women. Personal and social resources fully mediate the association between living arrangement and depression. However, living arrangement remains a significant predictor of loneliness, even after controlling for personal and social resources. Results suggest that LGBT older adults living alone or with others (not including a partner or spouse) are at high risk of loneliness and depression and that tailored supports are warranted.

### **CORRELATES OF SEXUAL RISK BEHAVIOR IN OLDER ADULTS WITH HIV: FINDINGS FROM CARING AND AGING WITH PRIDE**

C.A. Emlert, K.I. Fredriksen-Goldsen, H. Kim, *University of Washington, Seattle, Washington*

The number of older adults infected with HIV is increasing rapidly. Yet, few studies have examined HIV risk behaviors among older adults living with HIV. This study utilizes a subsample of LGBT older adults (n=233) diagnosed with HIV/AIDS, with a mean age of 62.84 (SD=7.31; range= 50 to 86); 59% of the LGBT older adults living with HIV are sexually active. The results of bivariate analyses demonstrate that substance use, health care-related discrimination, neighborhood isolation, self-stigma, and sexual identity disclosure are associated with the extent of HIV risk behaviors. When controlling for background socio-demographic characteristics and sexual activity in a multivariate model, health care-related discrimination (b=0.17; p<.05), stigma (b=.21; p<.05), and the lack of sexual identity disclosure (b=-.28; p<.01) significantly and independently account for the extent of HIV risk behaviors among LGBT older adults living with HIV. Prevention strategies are needed to reduce HIV risk behaviors of this vulnerable population.

### **TRANSITIONS AND RELATIONSHIPS IN THE LIFE COURSE OF LESBIAN, GAY, AND BISEXUAL OLDER ADULTS**

A. Muraco<sup>1</sup>, K.I. Fredriksen-Goldsen<sup>2</sup>, 1. *Sociology, Loyola Marymount University, Los Angeles, California*, 2. *University of Washington, Seattle, Washington*

This paper examines romantic relationships and transitions in the lives of lesbian, gay, and bisexual (LGB) adults, age 50 and over. As with the life course emphasis on interconnected lives and social/historical contexts, the presentation will illustrate current cohorts of LGB adults' experiences in romantic partnerships, partner loss, and related transitions. Using mixed-methods data collected from LGB adults age 50 and older (N=2,560) from a cross-sectional national survey and a sub-sample of in-depth interviews with LGB older adults (N=34), the study examines the current state of romantic relationships in our sample, including both long-term commitments as well as challenges in establishing partnerships. We will explore the influence of a romantic partner on well-being and perceptions of the future, the role of prior heterosexual marriages and children on contemporary lives, and the effects of partner loss and how these affect current social support needs and perceptions of aging and health.

## **SESSION 540 (SYMPOSIUM)**

### **SHAPING NATIONAL LONG TERM SUPPORTS AND SERVICES POLICY: THE MONEY FOLLOWS THE PERSON REBALANCING DEMONSTRATION NATIONAL AND STATE EVALUATIONS**

Chair: *J. Robison, University of Connecticut Health Center, Farmington, Connecticut*

Discussant: *R. Applebaum, Miami University, Oxford, Ohio*

The Money Follows the Person Rebalancing Demonstration (MFP), a multi-year, 44 grantee program, funded by the Centers for Medicare and Medicaid Services (CMS), helps states shift Medicaid long term

supports and services (LTSS) from a historically institutional orientation to greater use of Home and Community-Based Services (HCBS). All participating states set benchmark goals for transitioning people out of institutions and for increasing the proportion of Medicaid LTSS dollars spent on HCBS, in addition to other state-specific rebalancing benchmarks. The national MFP evaluation examines financial, quality of care and quality of life data collected at multiple time points from participants who transition. Further, many ongoing state-level evaluations examine other aspects of the transition process and their own success at reaching state-specific goals. This symposium includes one paper presenting data from the national evaluation and papers from the CT and MD state evaluations. The national evaluation paper describes MFP participants' pre-transition level of care needs. CT MFP participants over age 65 with and without mental health challenges are compared on multiple post-transition outcomes including quality of life and reinstitutionalization. The MD paper combines multiple data sources to compare outcomes among MFP participants and between MFP and non-MFP transitions. MFP is ongoing through 2020, allowing a longitudinal, nationwide assessment of the impacts of rebalancing state LTSS systems and transitioning people out of institutions. The data generated from the national and state MFP evaluations will help policymakers and program providers improve transition experiences and delivery of HCBS to LTSS users throughout the US.

### **LEVEL OF CARE NEEDS AMONG MFP PARTICIPANTS**

S. Simon, J. Ross, C. Irvin, *Mathematica Policy Research, Cambridge, Massachusetts*

The MFP program promotes community living for long-stay institutionalized Medicaid beneficiaries. Currently, little is known about MFP participants' level of care needs and whether states are using the demonstration to transition individuals who have low care needs or those who have relatively higher needs. We linked three data sources for participants who transitioned from a nursing home in 2008 or 2009: Medicaid Analytic eXtract (MAX) claims data, Minimum Data Set (MDS) assessments, and MFP program participation data. Among nearly 4,000 MFP participants, approximately 8 out of 10 participants had medium or high pre-transition care needs. On average, participants with medium care needs were dependent in 1.7 of four late-loss ADLs, while those with high care needs were dependent in 3.1 late-loss ADLs. We conclude that MFP successfully transitions nursing home residents with a broad range of care needs, including a large percentage with heavy ADL dependency.

### **QUALITY OF LIFE IN CONNECTICUT'S MONEY FOLLOWS THE PERSON (MFP) PROGRAM FOR ADULTS AGE 65 AND OLDER WITH AND WITHOUT MENTAL HEALTH CHALLENGES**

K. Kellett<sup>1</sup>, I.C. Reed<sup>1</sup>, M.A. Porter<sup>1</sup>, D. Lambert<sup>2</sup>, J. Robison<sup>1</sup>, 1. *Center on Aging, University of Connecticut Health Center, Farmington, Connecticut*, 2. *Connecticut Department of Social Services, Hartford, Connecticut*

The MFP Program is charting new frontiers by aiming to reduce reliance on institutional care, develop community-based Long Term Supports and Services, and enable people with disabilities to participate fully in their communities. Analysis of this program is crucial for understanding challenges that impede or prevent successful transitions from occurring and for ongoing quality of life (QoL) after consumers have transitioned. This paper reports data from a standardized web-based consumer tracking system that is part of Connecticut's MFP evaluation. Bivariate analyses were used to compare differences between adults age 65 and older with and without MH challenges. Results demonstrate significant differences between the two groups in 5 out of 11 pre-transition challenges, but these challenges did not prevent consumers from transitioning. The majority of QoL measures do not differ between the

two groups, though significantly more (24%) older adults with MH challenges report unmet healthcare needs at 12 months.

### **USING INTEGRATED DATA IN DEVELOPING MFP METRICS**

I. Stockwell, *The Hilltop Institute, Baltimore, Maryland*

To better understand the diverse characteristics of MFP participants, researchers should draw on complimentary data sources. While building a set of evaluation metrics for Maryland's MFP program, The Hilltop Institute combined administrative data from the Medicaid Management Information System (MMIS) and assessment information from the nursing home Minimum Data Set (MDS) at the recipient level. Key findings included a much higher preference to return to the community for MFP participants, and yet a more similar than expected distribution of nursing home acuity levels when compared to continuous Medicaid nursing facility residents. There were also differences within MFP participants in reinstitutionalization rates, ADL deficits, length of stay, and pre- and post-transition expenditures between older adults, participants who were physically disabled, and individuals with developmental disabilities. These data can help MFP program managers appropriately target clients, identify specific characteristics associated with successful or unsuccessful transitioning, and promote individualized transitions planning.

## **SESSION 545 (SYMPOSIUM)**

---

### **USING EFFECTIVE RESEARCH-POLICY-PRACTICE COLLABORATION TO ACHIEVE ENHANCED OUTCOMES**

Chair: *K. Love, Center for Excellence in Assisted Living, Falls Church, Virginia*

Co-Chair: *L. Harris-Kojetin, National Center for Health Statistics (CDC), Hyattsville, Maryland* Co-Chair: *L.S. Noelker, Benjamin Rose Institute, Cleveland, Ohio*

Collaborative efforts can effectively integrate knowledge and expertise from the research, policy, and practice sectors to achieve enhanced outcomes. Effective collaboration results in more robust study designs and broadens the diffusion and application of findings. However, the elements leading to effective collaboration and the barriers encountered in translation and diffusion are numerous. For example, research findings are published in peer-review journals that most policy-makers and service providers do not access. Additionally, peer-reviewed articles are not designed to convey information that can be readily understood by non-researchers, thus limiting the impact the findings have to inform policy-making and practice. Tri-sector (research-policy-practice) collaboratives are increasingly being used to improve the translation and application of findings. This session focuses on the knowledge, skills and elements essential to the design and management of successful collaboratives, using examples from local and national projects. Researchers from the National Center for Health Statistics/Centers for Disease Control and Prevention that conducted the National Survey of Residential Care Facilities will detail how they managed a successful collaborative and the enhanced outcomes achieved. Representatives of the Center for Excellence in Assisted Living will discuss how the research team's methods fostered effective collaboration with providers and practitioners. Organizational structures designed to foster practice-research-policy collaboration will be presented using the example of Benjamin Rose Institute on Aging and a local case. The methods and techniques used in the Institute's direct care worker projects that integrate practitioners in residential settings with researchers to apply evidence-based interventions and reduce workforce turnover will be presented.

### **THE 2010 NATIONAL SURVEY OF RESIDENTIAL CARE FACILITIES (NSRCF) – A COLLABORATIVE EFFORT IN LONG-TERM CARE DATA COLLECTION**

*L. Harris-Kojetin, M. Sengupta, National Center for Health Statistics, Hyattsville, Maryland*

Conducted by the National Center for Health Statistics, the NSRCF is a first-time national data collection effort designed to provide nationally representative information about residential care communities and their residents, and that can be used by providers, policymakers, consumers, and researchers. The target survey respondents are directors or administrators of assisted living and other residential care communities. During the NSRCF planning and implementation phases, NCHS pursued a comprehensive outreach strategy to collaborate with several national associations that represent assisted living providers and spread the word about the survey. This presentation reflects on the successful collaboration between NCHS researchers and the provider community. We discuss the collaborative vision and design of the project, the structure and features of collaboration, and the effectiveness of the outreach as measured by project outcomes. Observations and lessons learned from this project may suggest effective ways to collaborate on similar projects in the future.

### **ORGANIZATIONAL FACILITATORS AND BARRIERS TO COLLABORATION: A CASE EXAMPLE**

*L.S. Noelker, F. Ejaz, M. Rose, Benjamin Rose Institute, Cleveland, Ohio*

The challenges of developing and maintaining a direct care workforce of sufficient size and capacity to serve the growing numbers of elderly have been a focus of the Benjamin Rose Institute on Aging for several decades. This presentation reports on the approaches taken to collaborative workforce projects and the methods used by the Institute's service, research and policy units. The inclusion of all three units in a non-profit agency is uncommon and provides a unique context from which to examine leadership, regulatory, and other facilitators and barriers affecting collaborative work. Included among these are the impact of organizational structure, operating environment, resource allocation, and various disciplinary perspectives on the process of collaboration. Strategies to develop a learning organization in which the three units mutually benefit from each other's acquired wisdom and generation of new knowledge will be presented.

### **IMPROVING WORKFORCE OUTCOMES USING A RESEARCH AND PRACTICE COLLABORATION: A CASE EXAMPLE**

*F. Ejaz, L.S. Noelker, M. Rose, Benjamin Rose Institute, Cleveland, Ohio*

This presentation focuses on a local collaboration between researchers and nursing home administrative staff. The project's goal was to implement a variety of best practices in three nursing homes with the aim of reducing staff turnover, promoting incumbent staff to higher paying positions and encouraging minorities to fill management positions. Challenges in setting up an effective collaboration began during the grant writing process and continued throughout various phases of the project. They included ensuring an adequate evaluation budget, setting realistic goals/objectives to assess outcomes, implementing the intervention uniformly across sites, collecting standardized data, obtaining informed consent from staff, evaluating and reporting results and using the findings to improve practice and policy. Discussion will include how effective education and negotiating skills were used by both evaluators and practitioners to understand each other's differing perspectives and create a successful project. The collaboration has implications for planning future research, practice and policy collaborations.

## THE 2010 NATIONAL SURVEY OF RESIDENTIAL CARE FACILITIES (NSRCF): A COLLABORATIVE EFFORT-CEAL

K. Love, *Center for Excellence in Assisted Living, Falls Church, Virginia*

This session will describe the experience from the policy and practice sector perspectives of a successful collaborative outreach effort. Karen Love from the Center for Excellence in Assisted Living (CEAL) will report on the components of effective collaboration the National Center for Health Statistics team skillfully employed on its NSRCF project, and contrast these successful outcomes with less successful ones experienced by CEAL on other research projects.

## SESSION 550 (PAPER)

### ADULT PROTECTION AND ELDER ABUSE

#### EMOTIONAL ABUSE OF THE ELDERLY: STATE STATUTORY REVIEW AND RECOMMENDATIONS

I.C. Freeman, C. Courtney, *William Mitchell College of Law, Minneapolis, Minnesota*

Physical abuse and neglect of the elderly are typically verified with degrees of bodily harm, and financial exploitation is measured in dollar value. Identifying and responding to emotional abuse are often made more difficult by limited objective evidence of harm. While contemporary research is advancing the science of recognizing pain in individuals who cannot report verbally, state laws that define emotional abuse focus largely on the behavior of the alleged perpetrator. This paper presents a 50-state survey of elder emotional abuse laws, inclusive of such related terminology as mental abuse, psychological abuse, emotional distress, and verbal abuse. The state laws are clustered in four categories: states with no provision of this kind, states that include emotional abuse in an overall abuse reporting law without a definition or elements, states that specify elements of emotional abuse in an overall abuse reporting law, and states that have a distinct provision that defines emotional abuse and describes elements. The paper concludes with recommendations for state policies that advance the recognition, investigation, and response to emotional harm in the elderly and other vulnerable adults.

#### RISK FACTORS OF ABUSE AGAINST OLDER WOMEN IN THE HOME-SETTING: A MULTI-NATIONAL EUROPEAN STUDY

L. De Donder<sup>1</sup>, M. Luoma<sup>2</sup>, G. Lang<sup>6</sup>, J. Ferreira Alves<sup>4</sup>, I. Tamutiene<sup>5</sup>, B. Penhale<sup>3</sup>, *1. Vrije Universiteit Brussel, Brussels, Belgium, 2. National Institute for Health and Welfare (THL), Helsinki, Finland, 3. University of East Anglia, Norwich, United Kingdom, 4. University of Minho, Braga, Portugal, 5. Vytautas Magnus University, Kaunas, Lithuania, 6. Research Institute of the Red Cross, Vienna, Austria*

The paper presents the findings of an extensive multi-national survey of abuse of older women in five European countries that took place from 2009-2011. Combating elder abuse requires an integral understanding of those patterns and forces that underlie it. Therefore, this contribution examines the social or ecological risk factors at different levels of severity of abuse against older women. Data from 2,880 older women is randomly collected in five European countries (Austria, Belgium, Finland, Lithuania and Portugal) using a standardized questionnaire. Results indicate that overall 28.1 % older women had at least one experience of abuse in the past year. 5.8 % older women were victim of very severe abuse. Multinomial logistic regression analysis indicated that risk factors could be detected at three levels: individual (e.g. marital status, physical and mental health, coping styles), relationships (cohabitation, loneliness) and macro level (country). In the discussion we will develop the idea that a single emphasis on personal indicators is too simple: abuse and violence are multi-faceted and are embedded

in environmental as well as cultural levels and contexts. Finally, recommendations for policy and practice to reduce abuse among older women, and suggestions for further research will be offered and explored.

#### ELDER ABUSE DETECTION: A SYSTEMATIC REVIEW OF VALIDATED TOOLS

M. Beaulieu<sup>1</sup>, J. Laforest<sup>2</sup>, L. Belzile<sup>3</sup>, *1. U. Sherbrooke, Sherbrooke, Quebec, Canada, 2. National Public Health Institute, Montréal, Quebec, Canada, 3. U. Sherbrooke, Sherbrooke, Quebec, Canada*

Background: Elder abuse detection tools are used to confirm clinical suspicions, to standardise the intake and/or guide intervention. Question: What is the psychometric value of these tools? Aim: After attending this session, participants will be able to compare validated tools based on 18 analysis criteria and make a selection based on these criteria. Method: Systematic review of elder abuse detection tools in French and English scientific journals. Main inclusion criteria: to present some form of psychometric evaluation (validity and reliability). Analysis conducted on 18 dimensions (theoretical framework; types of abuse; aim of the tool; ways to administer it; construct, content and criterion validity; reliability; etc.). Results: 14 tools meet our criteria, which suggest that several tools used in practice are not validated. Tools were developed in USA (5), Canada (4), Australia (2), Spain (1), Israel (1) and Taiwan (1). The first one was published in 1984. There is a diversity of tools such as: specific to one form of abuse or covering several; self-administered by senior or by carer, observation by a practitioner or questions asked by a practitioner to senior or carer; aimed to be used by a specific practitioner or interprofessional, time for completion, etc. Construct validity is the most documented. Discussion: Based on sample size, study limits, diversity of tools, and types of analysis (only one based on sophisticated analysis such as structural equation modeling), many tools need further validation. It is impossible to recommend the use of a single tool for all type of practice.

#### WHAT IS AN ELDER ABUSE FORENSIC CENTER? COMPARING AND CONTRASTING FOUR DIFFERENT MODELS IN CALIFORNIA

J.M. Yonashiro Cho<sup>1</sup>, M.W. Girona<sup>2</sup>, K. Wilber<sup>1</sup>, *1. Leonard Davis School of Gerontology, University of Southern California, Los Angeles, California, 2. School of Dentistry, University of California Los Angeles, Los Angeles, California*

Background: Elder abuse has been recognized as a complex and growing social problem that results in significant personal and societal costs. This session describes the Elder Abuse Forensic Center (FC), an evidence-based model highlighted in the Elder Justice Act that brings together a unique multi-disciplinary team for comprehensive case examination, documentation, consultation, training, and prosecution. This presentation describes the core structural and process components of the FC model by comparing unique and common elements across four different centers. Methods: A mixed-methods analysis utilizes data collected from 4 FCs in California through quarterly progress reports, site visits, and a 22-item team effectiveness survey completed by core team members (N=47). Results: Core collaborative team members meet 2-4 times per month and include program coordinator, geriatrician, neuropsychologist, APS, law enforcement, district attorney, and victim advocate. Sites report that physical/psychological evaluations, medical records review, and home visits are important to moving cases forward. To facilitate greater collaboration and encourage participation two sites co-locate with APS. Team members (n=22/26) report various changes in everyday professional practice as a result of their FC involvement (e.g. adoption of a "forensic eye," clearer documentation, increased prosecution, and improved inter-agency collaboration, communication, and trust). High team effectiveness (3.56/4) was shown across all sites with some differences in domain-specific effectiveness by site. Discussion/Implications: Building on earlier work describing the FC model,

this session examines how structure and process influence team activities to move complex elder abuse cases forward. Implications for future policies regarding FC replication, implementation and evaluation are presented.

### **PERCEPTIONS OF MANDATORY REPORTING BY HEALTH CARE PROVIDERS AND ADULT PROTECTIVE SERVICE WORKERS**

M. Riparetti-Brown<sup>1</sup>, A.E. Navarro<sup>2</sup>, S. Enguidanos<sup>1</sup>, K. Wilber<sup>1</sup>, I. Davis  
*School of Gerontology, University of Southern California, Los Angeles, California, 2. Azusa Pacific University, School of Behavioral and Applied Science, Azusa, California*

**Background:** In California, any person who has assumed full or partial care of an older adult is mandated to report suspected abuse and neglect, including hospice workers and hospital care managers. However, little is known about their attitudes and experiences reporting elder mistreatment, and how APS workers perceive their ability to address reports. **Methods:** An exploratory qualitative study was conducted using three focus groups: hospital senior care managers (n=4), hospice staff (n=16), and APS workers (n=9) in the Los Angeles area. Using a grounded theory approach, transcripts were independently coded by two investigators who reconciled differences in coding patterns and consolidated codes into descriptive themes. **Results:** Thematic analysis of transcripts revealed that focus groups acknowledged similar challenges in reporting and resolving cases of elder abuse—particularly high APS case load and lack of victim cooperation and resources. Hospice staff and senior care managers indicated dissatisfaction with APS's response, preferring instead to remedy abusive situations informally with patients and their families. APS workers recognized these problems, yet identified logistical and legal barriers impeding their effectiveness. Findings suggest that APS's response does not meet the expectations of health care providers, leading some providers to disregard mandatory reporting laws in favor of resolving abusive situations informally. **Implications:** Mandated reporting alone is not sufficient to protect elder abuse victims. Cross-agency collaboration between APS and health care professionals is needed to clarify roles and expectations, and to ensure that reporting leads to successful interventions that improve the lives of victims.

### **SESSION 555 (PAPER)**

#### **HUMANITIES, CRITICAL GENEALOGY, CULTURAL STUDIES, AND METHODS**

#### **ETHICS OF AGING: ART OF LIVING, SELF-REALIZATION AND AGING WELL IN LATE MODERNITY**

J. Dohmen, H. Laccelle, *University for Humanistics, Utrecht, Netherlands*

Late modern society, characterized by individualization, risk, and erosion of traditions, urges people to lead a 'life of their own' (Bauman; Beck; Giddens;). For aging individuals this implies the necessity of shaping the later stages of life according to their own goals and values. Complicating this task is the fact that late modern culture lacks consensus about the meaning and purposes of later life (Baars; Cole, Achenbaum & Carlin; Cole; Holstein). The far-reaching ethical consequences of late modern societal changes have been discussed in a variety of ways, usually criticizing one-sided liberal notions of autonomy and underscoring the constraining, disciplinary influences of structural societal arrangements (Dannefer; Dannefer & Kelley-Moore; Gilleard & Higgs; Hendricks; Hendricks & Hatch; Phillipson; Rose; Taylor). Drawing upon the ethical 'art of living' discourse developed in recent decades (Bauman; Dohmen; Foucault; Hadot; Kekes; Nussbaum; Nehamas; Shusterman; Sennett) we explore the contours of a moral lifestyle for aging individuals. Our concern is with their creation of a solid moral identity. We use recent perspectives on self-realization as a moral orientation

(Honneth; Katz; MacIntyre; Meyers; Taylor; Thomä ; Walker) to propose alternative views of central moral concepts such as identity, agency and autonomy, which we think can do more justice to the life experiences of elderly people, especially when confronted with situations of existential vulnerability. This should provide the outlook of an 'ethics of aging' suitable for coping with the insecurities of late modernity, for exercising autonomous lifestyle choices and for identifying and engaging in goals and experiences providing later life with value and meaning.

#### **WHAT PREDICTS HAPPINESS FOR 45-64 YEAR-OLD ADULTS IN THE WORLD MAJOR METROPOLISES?**

X. Pan, *Miami University, Oxford, Ohio*

**Objective:** the aim of the present study is to identify predictors associated with happiness for 45-64 year-old adults in major metropolises in Europe, East Asia and North America. **Design:** this is a cross-sectional study with the data of Assessing Happiness and Competitiveness of World Major Metropolises, 2006. **Sample:** 3,349 participants aged 45-64 and 1,935 observations are in the study: 30% of them lived in East Asian metropolises, 20% in North America and 50% in Europe. **Method:** ordinal logistic regression is used to analyze the association between predictors and the outcome variable. **Results:** regardless of metropolises' location, women are more likely to be happy than men (OR=0.37, p<.001); people with higher SES are more likely to be happy than those with lower SES (OR=0.39, p<.001); people with higher level of self-rated health (OR=0.68, p<.001) and higher self-efficacy more likely to be happy (OR=0.78, p<.001); people are more likely to be happy if they live closely to their friends (OR=0.20, p<.001). **Conclusion:** the level of happiness differs among age groups, genders, SES; it is also associated with individuals' self-rated health, self-efficacy about one metropolis and satisfaction with economic environment and neighborhood in that metropolis for 45-64 year-old population regardless of the metropolis's location.

#### **MEMENTO MORI: CELEBRATION AND LAMENT IN RENAISSANCE MUSIC**

P. Liebig, *School of Gerontology, University of Southern California, Los Angeles, California*

Historically different and changing social contexts are important in research on aging (Maddox, 2006). A sea change occurred in 14th-16th century Western music, reflecting changes in the centers of power and patronage and the Renaissance emphasis on the classics and the individual. Formal compositions — once dominated by rituals and events of the Church calendar — shifted to commemorating major life events of patrons with political power (e.g., Lorenzo de' Medici) and praising fallen musical colleagues and mentors. This paper focuses on songs of mourning for composers of the Franco-Flemish school by their survivors, creating a circle of empathy (Atchley, 2009) and community of shared loss and acceptance (Cole & Winkler, 1994). Themes include: invoking Apollo, wood nymphs and the Muses instead of Christ and the saints; despair about the survivors' future without their mentors; anger and fear over Death's cruelty; praise for the departed's contributions and character; identification of composers with suffering Biblical figures; and use of emotionally charged words (e.g., bewail, lament, grievous loss). Additionally, an analysis of "family trees" reveals the strength of mentor-mentee relationships, especially in the works of Des Prez and Ockeghem. This focus on death and mourning was expanded in subsequent centuries to songs about death in love (both requited and otherwise), triumphing over mortality, and honoring the legacies of the departed.

## EXPANDING BOUNDARIES: TEACHING AGING TOPICS WITH PHOTOVOICE AND PHENOMENOLOGY

J.E. Ataie<sup>1</sup>, J. McGovern<sup>2</sup>, 1. *Portland State University School of Social Work, Vashon, Washington*, 2. *NYU Silver School of Social Work, New York, New York*

This paper discusses the potential of photovoice and phenomenology as useful pedagogical tools with which teachers can foster interest in and knowledge about a wide range of gerontological topics. As a research method, photovoice gives 'voice' to members of communities not typically heard so they can share their perspectives and concerns through participant-generated photographs, small group discussions, and photo exhibits. As a pedagogical tool, photovoice puts cameras in the hands of students and asks them to explore aging related topics from their social location and point of view. As such, it can assist teachers in developing a way of teaching that encourages students to embrace different perspectives and take on an active role in their own learning. It cultivates critical thinking and reflexivity as a means to discovering both prior assumptions and untapped knowledge about the aging experience. Phenomenology is both a philosophy and a methodology that seeks to deepen understanding of meaning-making processes. Philosophically, phenomenology situates meaning-making as integral to the human experience. As a research method, it offers an approach to understanding the everyday lived experience of individual meaning making. As a teaching tool, it can facilitate the knowledge-building process by providing students with an opportunity to gain insight into the lived experience of late-life. By comparing and contrasting both methods, this paper addresses practical questions pertaining to planning and implementation and discusses issues such as ethics and assignments.

## SESSION 560 (POSTER)

### MECHANISMS OF AGING, CALORIC RESTRICTION AND OTHER INTERVENTIONS

#### MOLECULAR MECHANISMS UNDERLYING GENOTYPE-DEPENDENT RESPONSES TO DIETARY RESTRICTION

S.C. Johnson, J. Schleit, M. Kaerberlein, C.F. Bennett, *Pathology, University of Washington, Seattle, Washington*

Despite the wealth of data indicating that dietary restriction (DR) can slow aging across evolutionarily divergent species there are also examples where DR has been shown to have no effect or even reduce lifespan. Recently, Liao and colleagues (Liao et al. 2010; Rikke et al. 2010; Liao et al. 2011) examined the effect of DR by a 40% reduction in calories on 42 recombinant inbred mouse lines and found a distribution of effects ranging from 98.5% life span extension to a 68.4% reduction in life span. These studies demonstrate that genotype plays a critical role in determining the effect that DR has on longevity. However, the molecular processes that influence genotype-dependent responses to DR remain largely unexplored. Here we examined the effect of DR on the replicative lifespan (RLS) of 169 strains of budding yeast, each lacking a single non-essential gene. Similar to the case in mice, a distribution of effects was observed ranging from dramatic shortening of life span to substantially larger increases in life span relative to what is observed for wild type cells. Three distinct and highly conserved molecular processes were identified as having a profound effect on the longevity-response to DR: defects in vacuolar/lysosomal pH homeostasis or mitochondrial superoxide dismutase cause DR to dramatically shorten RLS, while cells with mitochondrial defects associated with a proteotoxic stress response, such as strains lacking mitochondrial prohibitins or porin, are short-lived under control conditions and respond most positively to DR.

### TIMING OF ANTIOXIDANT INTERVENTION DURING LIFE DETERMINES FUNCTIONAL OUTCOME

N. Sumien, U. Ikonne, J.D. Nguyen, M.A. Rutledge, T. Carbonaro, K. Chaudhari, M. Forster, *Pharmacology & Neuroscience, UNT Health Science Center, Fort Worth, Texas*

Both human and animal studies have yielded variable outcomes with regard to the effectiveness of dietary supplementation with small molecule antioxidants as an anti-aging intervention strategy. The current study evaluated the possibility that the timing of antioxidant intervention during life is a variable that may influence functional outcomes. Mice were supplemented with antioxidants (ascorbate, 1.65 mg/g diet; d- $\alpha$ -tocopheryl acetate, 0.825 mg/g diet, and coenzyme Q10, 0.825 mg/g diet) beginning early or later in life, and these regimens were evaluated for their effect on age-related functional declines. We hypothesized that (i) single and/or combinations of antioxidants would improve psychomotor and cognitive performance if supplemented during late life when age-related deficits were already present and, (ii) long-term supplementation beginning earlier in life would prevent the onset of age-related cognitive and psychomotor deficits. Male C57BL/6J mice received a base diet (NIH-31) or one of seven antioxidant-supplemented diets for either 5 weeks (short-term) or 12 months (long-term), prior to functional testing beginning at 22 months of age. Long-term antioxidant supplementation failed to prevent age-related impairment of psychomotor and cognitive performance as measured in a comprehensive battery of tests. However, a significant improvement in bridge-walking performance (a measure of balance) and running performance on a rotating rod (a measure of coordination) was evident when older mice with pre-existing impairments received the short-term regimens of supplementation. These effects occurred in the absence of any improvement in performance on a wire suspension test (a measure of strength). Furthermore, short-term antioxidant supplementation improved performance on a Morris water maze test (a measure of spatial learning and memory) and on an active avoidance task (a measure of cognitive flexibility). There was no clear indication of beneficial interactions among the antioxidants when supplemented in different combinations on motor function. These results provide a clear indication that timing of antioxidant intervention during aging is a critical determinant of the functional outcome.

#### MODULATING MITOCHONDRIAL BIOGENESIS VIA THE RENIN ANGIOTENSIN SYSTEM IN HUMAN LUNG FIBROBLASTS

B.R. Manwani, C. Lin, P.M. Abadir, J.D. Walston, *Johns Hopkins University, Baltimore, Maryland*

Bhavish Manwani, Chung-Hao Lin, Jeremy Walston, Peter Abadir Division of Geriatric Medicine and Gerontology, Johns Hopkins University Introduction Renin-angiotensin system (RAS) regulates multiple physiological functions through Angiotensin (Ang) II type 1 (AT1R) and type 2 (AT2R) receptors. We recently identified a functional mitochondrial RAS with AT2Rs that declines with age but increases with AT1R blocker losartan. Given that mitochondrial dysfunction is closely linked to age-dependent lung mitochondrial oxidative/nitrosative stress and age-related onset of emphysema and pneumonia, we hypothesize that RAS modulates mitochondrial biogenesis in human lung fibroblasts. Methods Human fetal lung fibroblasts (MRC-5) were grown in culture and treated with losartan & valsartan (AT1R blocker), cgp421140 & c21 (AT2R agonist), or AngII at various concentrations for 48hrs (triplicates). To measure mitobiogenesis, quantitative PCR was used to calculate ND6 (mitochondrial gene)/TK2 (nuclear gene) ratio. Data were normalized with GAPDH and analyzed using the Pfaffl method. Results Losartan increased the ND6/TK2 ratio in a dose dependent manner while valsartan had minimal impact. AngII infusion reduced mitochondrial level (0.74fold) but this effect was interestingly reversed by pre-treatment with valsartan (1.7fold). cgp and c21 treatments, alternatively, significantly increased mitochondrial level (2.5 and 2.0fold respectively).

Conclusion We show that signaling via the AT2R pathway, either by AT1R antagonists or AT2R agonists, increased mitobiogenesis. This is further supported by the dose response observed in the losartan treated cells. Our results indicate that modulating the RAS system does influence mitobiogenesis and may therefore be beneficial in ameliorating the deleterious age-related changes in respiratory physiology associated with mitochondrial dysregulation.

#### **AGING-ASSOCIATED ALTERATIONS IN MAST CELLS LOCATED BY MESENTERIC LYMPHATIC VESSELS**

V. Chatterjee, A.A. Gashev, *SBTM, Texas A&M Health Science Center, Temple, Texas*

Aging impairs mesenteric lymph flow, which is crucial for fluid and macromolecule homeostasis, fat absorption, and immunity. Recent data suggest an important regulatory involvement of some cellular elements in the close proximity of aged mesenteric lymphatic vessels (MLV) and their aging-associated dysfunction. We used immunohistochemical and vital staining to characterize mast cells (MCs) surrounding MLV in adult and aged Fischer-344 rats. We treated mesenteric tissue segments with chemical activator compound 48/80, and with biological activators (IgE, Substance P and peptidoglycan), and used Ruthenium Red staining to identify aging-associated differences in MCs activation. By image analysis we found a greater degree of pre-activation of MCs in aged rats compared to adult animals. Fraction of MCs activated by any treatment was significantly lower in aged mesenteric tissues. These findings reflect lesser ability of aged MCs adjacent to MLV to adequately react to acute inflammatory stimulation in elderly. NIH R01 AG030578, HL094269.

#### **DOWN-REGULATION OF POLO-LIKE KINASE L (PLK1) INDUCES CELLULAR SENESCENCE IN HUMAN FIBROBLASTS AND ENDOTHELIAL CELLS THROUGH A P53-DEPENDENT PATHWAY**

J. Kim, J. Cho, *Aging-associated Disease Research Center, College of Medicine, Yeungnam University, Daegu, Republic of Korea*

Polo-like kinase 1 (PLK1) plays a key role in various stages of mitosis from entry into M phase to exit from mitosis. However, its role in cellular senescence remains to be determined. Therefore, the effects of PLK1 on cellular senescence in human primary cells were investigated. We found that expression of PLK1 decreased in human dermal fibroblasts (HDFs) and human umbilical vein endothelial cells (HUVECs) under replicative senescence as well as premature senescence in response to adriamycin treatment. PLK1 knockdown with PLK1 siRNAs induced premature senescence characterized by large and flattened cell morphology, decreased cell proliferation, increased senescence-associated beta-galactosidase (SA- $\beta$ -gal) activity, and higher protein expression of p53. In contrast, up-regulation of PLK1 in old cells partially reversed senescence phenotypes, including increases in cell proliferation, incorporation of bromodeoxyuridine and population doublings, and a decrease in SA- $\beta$ -gal activity. Cellular senescence by PLK1 inhibition was observed in p16 knockdown cells but not in p53 knockdown cells. Our data suggest that PLK1 might play important roles in the regulation of cellular senescence of human primary cells via a p53-dependent pathway and also contribute to tissue/organismal aging and protection of cellular transformation.

#### **LIFE SPAN EXTENSION BY DIETARY RESTRICTION IN YEAST REQUIRES PROPER CONTROL OF CELLULAR MANGANESE HOMEOSTASIS**

G.L. Sutphin<sup>1,2</sup>, M. Kaeberlein<sup>1</sup>, *1. University of Washington, Seattle, Washington, 2. The Jackson Laboratory, Bar Harbor, Maine*

Dietary restriction extends life span and improves numerous age-associated health parameters in evolutionarily divergent species ranging from the budding yeast to the rhesus monkey. The majority of dietary restriction studies have been carried out in a controlled laboratory envi-

ronment on populations of genetically homogenous individuals. In genetically heterozygous populations such as humans, it remains unknown whether dietary restriction will have a generally positive effect on survival and health, or whether individuals with different genotypes within the population will display a differential response. In the budding yeast, we have identified single gene deletion mutants that show a wide range of responses to dietary restriction, from severely shortened to greatly extended life span. Two of the greatest negative responses to dietary restriction were observed in strains lacking either PMR1 or SOD2. PMR1 encodes a Golgi apparatus calcium/manganese ATPase responsible for transporting calcium and manganese from the cytosol into the Golgi lumen. SOD2 encodes the mitochondrial manganese superoxide dismutase. Further, the poor growth and reduced replicative life span of cells lacking PMR1 subject to dietary restriction are rescued by mutations in SMF2, an Nramp family manganese transporter involved in maintaining manganese homeostasis. Together, these observations indicate that proper control of intracellular manganese is important for an appropriate response to dietary restriction in yeast. This study explores the role that manganese homeostasis and related genes play in the cellular response to dietary restriction.

#### **P49/STRAP MODULATES GENE EXPRESSION AND AFFECTS THE MORPHOLOGY AND STRUCTURE OF MULTIPLE TISSUES**

X. Zhang<sup>1,2</sup>, G. Azhar<sup>1,2</sup>, S.C. Rogers<sup>1,2</sup>, S. Luo<sup>1,2</sup>, J.Y. Wei<sup>1,2</sup>, *1. University of Arkansas for Medical Sciences, Little Rock, Arkansas, 2. Central Arkansas Veterans Healthcare System, Little Rock, Arkansas*

Objective: p49/STRAP (or SRFBP1) is a recently identified binding protein of serum response factor (SRF). It reduces the intracellular NAD/NADH ratio, and induces the deacetylation of SRF protein. It has been showed that p49/STRAP expression is increased in the aging heart. However, the effect of increased expression of p49/STRAP in vivo is not known. Methods/Results: A DNA construct containing p49/STRAP cDNA under the control of CMV promoter was used to generate transgenic mice. After multiple microinjections and screenings, three transgenic mouse lines were established. Western blot and quantitative RT-PCR were used to measure the protein and gene expression, respectively. The p49/STRAP transgenic (p49-Tg) mice had higher level of p49/STRAP expression in mouse tissues, including heart, compared to non-transgenic (NTg) mice (all 3 months old). p49/STRAP down-regulated SRF gene expression. In addition, p49/STRAP over-expression resulted in the dysregulation of some SRF-regulated genes: ANF, beta-myosin heavy chain and cardiac actin. p49/STRAP also down-regulated myocardin, SIRT1 and SIRT2 genes, as well as microRNAs miR-21 and miR-199a. Approximately 10% of the newborn p49-Tg mice had various defects and were dead at birth. The defects and malformations in multiple organs that were apparent on gross and histopathologic examination were found in heart, lung, gut, brain, spine and skeletal muscle. Conclusion: p49/STRAP modulates the transcriptional regulation of SRF, SIRT1, SIRT2 and other genes. Increased p49/STRAP expression significantly affected the morphology and structure of multiple tissues, including heart. These findings suggest that p49/STRAP plays a role in mediating changes from development through maturation and adult aging.

#### **SHORT-TERM RE-FEEDING AFTER CALORIE RESTRICTION ALTERS SUSCEPTIBILITY TO PARASITE INFECTION**

D.M. Kristan, M.C. Cole, S.A. Lang, *Biological Sciences, California State University San Marcos, San Marcos, California*

Long-term calorie restriction (CR) of laboratory mice (*Mus musculus*) increases their susceptibility to infection with the intestinal nematode *Heligmosomoides bakeri*, despite an adequate immune response. The mechanism for increased susceptibility is not yet resolved, nor is

it known if short-term changes in food intake might influence susceptibility to infection. The goals of our study were to determine (1) if short-term re-feeding (RF) would ameliorate the expected increase in worm numbers seen with CR and (2) if RF mice would alter immunoglobulin (Ig) production compared to CR mice in response to infection. We gave male C57BL/6 mice 40% CR for six months and then switched half of the mice to seven days of ad libitum re-feeding (RF) prior to infection; control mice were fed ad libitum (AL). As expected, CR mice harbored more worms than AL mice; RF mice had an intermediate number of parasites that did not differ significantly from either AL or CR mice. In this study, there were no differences in parasite size, sex ratio, egg production, total circulating IgG1, or *H. bakeri* specific IgG1 among mouse treatment groups when mice were infected for 21d. RF mice had intermediate body mass compared to CR and AL mice. We predict that a longer duration of re-feeding may result in a significant decrease in worm numbers of RF compared to CR mice. Longer infection durations should be assessed to determine if RF mice are able to clear infections at a similar rate as AL mice.

### **ESTRUS STATUS AFFECTS SKELETAL MUSCLE STRENGTH, FATIGUE, AND RECOVERY**

T.L. Mader, D.A. Lowe, *Rehabilitation Science, University of Minnesota Medical School, Minneapolis, Minnesota*

There is a marked decline in muscle strength in women with age, particularly at menopause. Because hormone therapy can attenuate the decline, circulating estrogen has been implicated. Low levels of estrogen also occur in young females during the diestrus phase of their cycle. Therefore, we hypothesized that female mice with low circulating levels of estrogen would have lower muscle strength and increased fatigability compared to those with high levels. To test our hypothesis, C57BL/6 mice ( $n=10$ ) were obtained from NIA at 12 months of age (premenopausal). Vaginal cytology was used to identify phases of the cycle when estrogen is high (estrus) and low (diestrus). Muscle strength, fatigue, and recovery of the anterior lower leg muscles were assessed in vivo. Data were compared by T-test. Peak torque was 36% greater for mice in estrus compared to diestrus ( $p=0.011$ ). Fatigue, defined as a loss of 50% initial torque, was reached for mice in estrus and diestrus by contractions 39 and 25, respectively, indicating fatigue resistance for mice in estrus ( $p=0.03$ ). Additionally, rate of recovery from fatigue was faster for mice in estrus ( $p<0.009$ ) with those mice recovering ~95% torque and mice in diestrus only recovering ~50% torque 20 min following the fatiguing contractions. These results further demonstrate that circulating estrogen is beneficial to muscle function. Understanding muscle response to hormones that change with age will better allow for interventions to be designed that will counter muscle weakness, like that experienced by women at menopause. Supported by NIH grants AG031743 and AG036827.

### **MUTATION BURDEN AND AGING**

A.J. Herr, M. Kaeberlein, *Department of Pathology, University of Washington, Seattle, Washington*

The essence of life is the organization and regulation of genetic information encoded in DNA, honed by mutation, selection, sex, and recombination. To maintain the evolutionary innovations of the past, biological organisms invest heavily in a wide variety of DNA repair mechanisms that promote accurate DNA replication during cell division and removal of DNA damage. Mutations nevertheless accumulate in somatic cells and have been proposed to contribute to aging along with other forms of damage. What level of random mutation burden compromises homeostasis of dividing cell populations? Does mutation burden influence the aging of post-mitotic cells? We have previously shown that haploid yeast cell populations collapse when mutation rates exceed an error threshold of one inactivating mutation per essential gene per replication cycle. Here, we show that viable haploid mutator strains with sub-lethal mutation rates exhibit a reduced replicative lifespan, as

measured by the number of times a mother cell can bud. We also show that diploid yeast cells are subject to an error-threshold. Using strains that have combinations of defects in polymerase nucleotide selectivity, proofreading, and post-replicative mismatch repair (MMR), we are defining the upper limit of mutagenesis in diploid yeast. These findings set the stage for determining whether inherited mutation burden synergizes with aging-associated damage to accelerate cellular aging.

**MELATONIN, AGING AND CHRONIC DEGENERATIVE DISEASES. THE TREVISO LONGEVA (TRELONG) STUDY**  
M. Gallucci<sup>1,6</sup>, R. Flores-Obando<sup>2</sup>, S. Mazzuco<sup>3</sup>, A. Zanardo<sup>4,6</sup>, G. Forloni<sup>5</sup>, D. Albani<sup>2</sup>, E. Taioli<sup>7</sup>, 1. *Cognitive Impairment Center, General Hospital of Treviso, Treviso, Italy*, 2. *Laboratory of Molecular Epidemiology, SUNY Downstate Medical Center, Brooklyn, NY, New York*, 3. *Department of Statistics University of Padova, Padova, Italy*, 4. *Department of Clinical Pathology, General Hospital of Treviso, Treviso, Italy*, 5. *Department of Neuroscience, Mario Negri Institute for Pharmacological Research, Milano, Italy*, 6. *FORGEI, Interdisciplinary Geriatric Research Foundation, Treviso, Italy*, 7. *Hofstra North Shore-LIJ School of Medicine, New York, New York*

**Introduction:** It has been reported a compromised ability of the pineal to produce melatonin nightly in elderly humans and that reduced melatonin levels may also be a risk factor for cancer. The purpose of this study was to evaluate the relationship between melatonin, aging and chronic degenerative diseases in the sample of TRELONG Study. **Material and methods:** The TRELONG study started in 2003. Urinary 6-sulfatoxymelatonin (aMT6s), that serves as a useful tool for the estimation of serum-melatonin secretion, was assayed in urine of 260 survivors aging subjects collected in 2010-follow up and stored at  $-80^{\circ}\text{C}$  by using an enzyme-linked immunosorbent assay (ELISA) kit (product 01-EK-M6S, ALPCO Immunoassays, Windham, NH). All aMT6s levels were creatinine standardized ([aMT6s]/[creatinine]). **Results:** Age (77-105 years) mean  $85.3 \pm 6.3$ ; Sex, n (% female) 146 (56.2%); aMT6s  $44.2 \pm 42.7$  ng aMT6/mg creatinine. Melatonin levels tend to have an association with aging and to decline more in males than in females (40.5 vs 47.0) but both not significantly. Melatonin levels are significantly lower in patients reporting insomnia ( $p<0.03$ ). There is a significant inverse correlation between melatonin levels and the Disease Count Index (DCI) ( $p<0.05$ ). The new cases of cancer, after the baseline measurement, tend to have average levels of melatonin lower than in those without cancer (35.6 vs 44.6) even if the difference is not significant. The combination of new cases of cancer with new cases of cerebrovascular disease ( $n=24$ ) show lower levels of melatonin compared to those without these two diseases (35.1 vs 44.9) ( $p=0.08$ ). **Conclusions:** The onset of chronic diseases, after baseline measurement, is still too low to provide meaningful results, but suggests that cancer and cerebrovascular disease are possible candidates for an association with melatonin levels. The association with sleep disorders is confirmed. These early findings would confirm the protective role of melatonin against various chronic diseases.

### **PPAR $\gamma$ PATHWAY IS INVOLVED IN CHLAMYDIA PNEUMONIAE INDUCED FOAM CELL FORMATION**

P. He, B. Cheng, B. Qi, *Department of Gerontology of Union Hospital, Tongji Medical College of Huazhong University of Science and Technology, Wuhan, Hubei, China*

We have previously demonstrated that Chlamydia pneumoniae disturbed macrophage cholesterol homeostasis and induced foam cell formation. To investigate whether peroxisome proliferator-activated receptor  $\gamma$  (PPAR  $\gamma$ ) pathway played a role in the process, we observed the expression of PPAR $\gamma$  and its target genes (SR-A1, ACAT1 and ABCG1) and the effect of PPAR $\gamma$  agonist (rosiglitazone) and inhibitor (GW9662) on foam cell formation in Chlamydia pneumoniae infected lipid-loaded THP-1 macrophage. Results showed that PPAR $\gamma$  and ABCG1 gene expression was suppressed but SR-A1 and ACAT1 gene expression was

increased by Chlamydia pneumoniae. Rosiglitazone could reverse the effect of Chlamydia pneumoniae on these genes while GW9662 showed a similar effect of Chlamydia pneumoniae. Our data demonstrated that PPAR $\gamma$  pathway was involved in Chlamydia pneumoniae induced foam cell formation.

#### ATROPHY PROTEINS IN THE STRIATED MUSCLE DURING ADULT AGING

G. Azhar<sup>1,2</sup>, X. Zhang<sup>1,2</sup>, A. Zuo<sup>1</sup>, J.Y. Wei<sup>1,2</sup>, I. Donald W. Reynolds  
*Department of Geriatrics, University of Arkansas for Medical Sciences, Little Rock, Arkansas, 2. Central Arkansas Veterans Healthcare System, Little Rock, Arkansas*

**Objective:** SRF is a key transcription factor in striated muscle and has been shown to be slightly increased with advancing age in the heart. Young adult transgenic mice with mild cardiac specific over-expression of SRF(Mild-O-SRF Tg) develop features that resemble those in old hearts of non-transgenic (non-Tg), by 6 mos of age, whereas anti-sense SRF (AS Tg) mice have better preserved hearts in old age compared with that of old non-Tg (wild-type) mice. **Method and Results:** We compared protein levels of atrogen-1 and MuRF-2 in the hearts and skeletal muscles in young adult (4-6 mos) and old (18-20 mos) mice of 3 groups: Mild-O-SRF Tg, AS SRF Tg and Non-Tg mice. Atrogen-1 level was higher in hearts of Mild-O-SRF Tg vs. AS and Non-Tg but there was no age-associated difference within each group. In skeletal muscles, atrogen-1 level was not different among the groups, but it was increased with age similarly in all three groups. MuRF-2 protein levels in hearts were higher in Mild-O-SRF Tg vs AS Tg and Non-Tg, but there was no age-associated difference within each group. In skeletal muscles, MuRF-2 level showed no difference among the 3 groups, but it was reduced similarly with age in all 3 groups. **Conclusion:** Atrogen-1 and MurF2 showed opposite age-related differences in skeletal muscle, while there were no age differences for either protein in heart. SRF likely has a role in atrophy pathways in striated muscle.

#### IDENTIFICATION OF AN NRF2 SPLICE VARIANT THAT DOWN REGULATES PHASE II DETOXIFICATION GENE TRANSCRIPTION: IMPLICATIONS FOR THE AGE-RELATED LOSS OF STRESS RESPONSE

N. Thomas<sup>1,2,3</sup>, E. Smith<sup>1,2</sup>, T. Hagen<sup>1,2,3</sup>, I. Biochemistry & Biophysics, Oregon State University, Corvallis, Oregon, 2. Linus Pauling Institute, Corvallis, Oregon, 3. Oregon Statue University IGERT on Aging, Corvallis, Oregon

Nrf2 is an important transcription factor that regulates Phase II detoxification genes containing Antioxidant Response Elements (ARE) in their 5'-flanking region. Thus, it is vital for remediation of the toxicological effects of xenobiotics. The expression of many ARE-driven genes decline with age, rendering the elderly vulnerable to environmental insults at the time of life that these response systems are most needed. Recently, we discovered a splice variant of Nrf2 and showed that it increases in prevalence in aging rat liver via quantitative polymerase chain reaction (qPCR). Sequence analysis revealed that the alternative transcript has a 21 base pair deletion at the intron/exon boundary of Nrf2's NEH4 domain. This truncation thus may affect coactivator binding to the Nrf2 transcriptional complex. To define the relative importance of the alternative splice variant, luciferase vectors containing the promoter region of a quintessential ARE-mediated gene (e.g. gamma-glutamylcysteine ligase, catalytic subunit [GCLC]), and those designed to overexpress either the wild type or truncated isoforms, were co-transfected into H4IIE cells. Results show that overexpression of the alternative transcript does not catalyze reporter gene activity; furthermore, the splice variant actually down regulates even basal activity by >99%. This indicates that the variant may produce a gene product that acts as a dominant negative transcription factor. Because the truncation is in the co-activator domain, we further hypothesized that the lower observed luciferase reporter activity observed resulted from limited co-activator

binding to the Nrf2/ARE transcriptional complex. Chromatin Immunoprecipitation (ChIP) assays performed on young and old rat liver tissue revealed a marked 3.14-fold loss in CREB-activator binding protein (CBP) in the old versus young rats. Thus, we have identified a potential dominant negative isoform of Nrf2 that increases with age in rat liver, which must be considered as a factor in the age-related loss of ARE driven expression.

#### CHEWING THE FAT ABOUT MECHANISMS OF CR

R. Anderson, 1. University of Wisconsin, Madison, Wisconsin, 2. GRECC VA Hospital, Madison, Wisconsin

The primary goal of CR research is to identify novel targets and effective interventions to delay the impact of aging and prevent the onset age-associated diseases. By understanding how CR works, we learn about the underlying causes of disease vulnerability with age. The role of white adipose tissue in systemic regulation has only recently been appreciated. In addition to influencing inflammatory tone, adipose tissue plays a role in metabolic homeostasis. Adipokines and lipokines secreted from white adipose tissue impact peripheral tissue fuel utilization and the balance of energy generation from lipid or carbohydrate sources. White adipose tissue is overtly impacted by the anti-aging regimen of caloric restriction (CR). In addition to a reduction in fat mass, the adipocytes from CR animals are significantly smaller. Changes in adiposity are associated with a change in fat function – adipose tissue metabolism and circulating levels of adipose tissue derived signaling molecules are altered both with age and with CR. We propose that adipose tissue function plays a pivotal role in disease vulnerability with age and its prevention with CR.

#### CHARTING THE SYSTEMS BIOLOGY OF HUMAN AGING - 2012

J.D. Furber, *Legendary Pharmaceuticals, Gainesville, Florida*

This network chart is presented to aid in conceptualizing the many processes of aging, the causal chains of events, and the interactions among them. Viewers studying this network may discover promising intervention points for future therapy development. Viewers of this chart may use it as a study guide or as a reference to knowledge already learned. This diagram is maintained on the Web as a reference for researchers and students. Content is updated as new information comes to light. [www.LegendaryPharma.com/chartbg.html](http://www.LegendaryPharma.com/chartbg.html) The many observable signs of human senescence have been hypothesized by various researchers to result from several primary causes. Inspection of the biochemical and physiological pathways associated with age-related changes and with the hypothesized causes reveals several parallel cascades of events that involve several important interactions and feedback loops. This network model includes both intracellular and extracellular processes. It ranges in scale from the molecular to the whole-body level. Environmental effects and proposed interventions are highlighted around the margins of the network. Important pathways include: **Nuclear mutations**, telomere shortening, chromatin alterations change gene expression. **Extracellular proteins** become damaged, resulting in mechanical stiffness, weakness, inflammation and altered environmental niches for cells. Stiffer blood vessels promote stroke and heart disease. **Lysosomes accumulate lipofuscin**, which impairs autophagic turnover of macromolecules and organelles. **Mitochondrial DNA** mutates. **Lamin-A** splice-variant, **progerin**, accumulates. **Nuclear envelope** pore proteins become oxidized. **Oxidized aggregates** in cytoplasm. **Inflammatory cascades**, promoted by damaged molecules and sick cells. **Neuroendocrine** and **immune** systems degrade. **ER stress:** Misfolded proteins accumulate in ER.

## NITRATE TREATMENT AND THE SKELETAL MUSCLE PROTEIN ANABOLIC EFFECTS OF MIXED NUTRIENT INTAKE IN OLDER ADULTS

K.L. Timmerman, S. Dhanani, C.S. Fry, M.J. Drummond, E.L. Glynn, M.M. Markofski, B.B. Rasmussen, E. Volpi, *Sealy Center on Aging, University of Texas Medical Branch, Galveston, Texas*

Aging is associated with an impaired ability of skeletal muscle to respond to the anabolic effects of nutrient intake. This phenomenon is linked to endothelial dysfunction and may contribute to age-related loss of skeletal muscle and function. We report preliminary data of a study designed to determine if vasodilation with a nitrate (isosorbide dinitrate) improves the anabolic response of skeletal muscle to mixed nutrient intake in healthy, older adults. We measured muscle protein kinetics utilizing stable isotope methodologies ( $^{13}\text{C}_6$  phenylalanine) in the fasting state and during the ingestion of a mixed meal (20g of essential amino acids + 35g of glucose) under two conditions: 1) concomitant sublingual administration of isosorbide dinitrate (ISDN; N=3, 74±3yrs, 26±0.5 kg/m<sup>2</sup>) or 2) no treatment (CON; N=6, 70±3yrs, 25±1 kg/m<sup>2</sup>). Muscle protein fractional synthetic rate (ISDN, basal: 0.059±0.014, meal: 0.076±0.015; CON, basal: 0.059±0.005, meal: 0.057±0.010 %/h) and net balance (ISDN, basal: -25±6, meal: 39±13; CON, basal: -12±3, meal: -2±2 nmol/min-1/100 ml leg) were significantly elevated in ISDN subjects compared to CON (P<0.05). These preliminary data suggest that nitrate treatment may enhance the anabolic effect of mixed nutrient intake and could represent an effective countermeasure against age-related skeletal muscle loss in healthy older adults. ## ZEBRAFISH SENESCENCE IS ALTERED BY CIRCADIAN OSCILLATIONS AND OXIDATIVE STRESS VIA PNPO

M.E. Matzko, H. Chen, K. Bredbenner, S. Zhang, G. Gerhard, *Geisinger Clinic, Danville, Pennsylvania*

Reactive oxygen species (ROS) have been implicated in aging as well as in circadian signaling pathways. In zebrafish embryos, we found that low concentrations of H<sub>2</sub>O<sub>2</sub> can induce senescence-associated  $\beta$ -D-galactosidase (SA- $\beta$ -gal) staining, primarily in the brain region in a dose-dependent manner. Circadian rhythm also affected senescence, with more intense SA- $\beta$ -gal staining in either control or H<sub>2</sub>O<sub>2</sub>-treated embryos kept in a light/dark cycle versus dark/dark conditions, and a light/light condition falling intermediate. Moreover, treatment with antioxidant reverses the effect of circadian rhythm on SA- $\beta$ -gal staining, suggesting oxidative stress pathways mediate this effect. To clarify potential molecular mechanisms, gene expression profiling using Affymetrix microarrays and total RNA isolated from 24 hour post-fertilization (hpf) embryos cultured in light/dark or dark/dark showed strong upregulation of the pyridoxamine 5'-phosphate oxidase (PNPO) gene, whose enzymatic product is H<sub>2</sub>O<sub>2</sub>. In situ hybridization of zebrafish embryos using PNPO as a probe showed high brain region expression largely overlapping anatomic distribution of senescent SA- $\beta$ -gal staining. Transgenic overexpression of the zebrafish PNPO in zebrafish embryos increased SA- $\beta$ -gal staining, suggesting that enzymatic production of H<sub>2</sub>O<sub>2</sub> by PNPO may mediate the circadian effects of H<sub>2</sub>O<sub>2</sub>-induced cell senescence in zebrafish embryos.

## NECESSITY OF NEUROPEPTIDE Y FOR THE EFFECT OF DIETARY RESTRICTION IN MICE

I. Shimokawa, T. Chiba, R. Mori, T. Komatsu, *Nagasaki University Graduate School of Biomedical Sciences, Nagasaki, Japan*

Neuropeptide Y (NPY) may play a role in the neuroendocrine adaptation to long-term dietary restriction (DR), and thus the anti-aging effect of DR. We investigated the effect of DR on the oxidative stress resistance, lifespan, and pathology in the NPY gene knockout (-/-) mice, compared to the wild type (WT) mice. The NPY (-/-) and WT mice were fed ad libitum (AL) or 30% DR diets from 12 weeks of age. The

well-known effects of DR on stress resistance, lifespan, and prevalence of spontaneous tumors were mostly abrogated in the NPY (-/-) mice, suggesting a key role for NPY in the effect of DR. To elucidate mechanisms by which DR affects those via NPY-related endocrine system, we evaluated the growth hormone (GH)-IGF-1 axis, because NPY is known to inhibit the axis in response to stresses including fasting. Under long-term DR conditions, the GH-IGF-1 or insulin axis was suppressed in the NPY (-/-) mice in a similar manner to that in the WT mice. The diurnal pattern of respiratory exchange ratio in the NPY (-/-)-DR mice was also similar to that in the WT-DR mice. These findings indicate redundancy of the neuroendocrine system and energy metabolism under long-term DR conditions in the NPY (-/-) mice. The present study suggests importance of NPY in the effect of DR rather than the neuroendocrine or metabolic adaptation to DR.

## EVALUATING EFFECTS OF GENES AND AGE TRAJECTORIES OF PHYSIOLOGICAL VARIABLES ON MORTALITY AND MORBIDITY RISKS: APPLICATION OF GENETIC STOCHASTIC PROCESS MODEL

K.G. Arbeev, I. Akushevich, A. Kulminski, S.V. Ukraintseva, L. Arbeeva, I. Culminskaya, D. Wu, A.I. Yashin, *SSRI, Duke University, Durham, North Carolina*

We applied the genetic stochastic process model (J Theor Biol 258 (1): 103-111, 2009) to data on mortality and incidence of diseases (such as CVD and cancer) and longitudinal measurements of seven physiological variables (blood glucose, BMI, total cholesterol, diastolic and pulse pressure, hematocrit and ventricular rate) in participants of the Framingham Heart Study with different polymorphisms in the APOE, ACE and ADRB2 genes. The approach allows for indirect estimating different mechanisms of aging-related changes when such mechanisms are not directly measured in the data (which is typical for human longitudinal data available to date) and evaluate respective characteristics for carriers and non-carriers of specific alleles/genotypes using joint analysis of genetic and non-genetic sub-samples of longitudinal data. We found that carriers of different alleles in these genes differ in the shapes and age dynamics of various aging-related characteristics, such as physiological norms (i.e., age trajectories of physiological variables minimizing mortality/morbidity risks), aging-related decline in stress resistance (associated with the narrowing of U-shapes of the risks as functions of physiological variables) and decline in adaptive capacity (associated with an increase in the time needed for trajectories of physiological variables to return to the state which an organism tends to follow), and mean allostatic trajectories (i.e., trajectories of physiological variables that organisms are forced to follow by the process of allostatic adaptation). We conclude that differences in these characteristics and associated aging-related processes may contribute to the observed differential effects of alleles on mortality and morbidity risks.

## ASSESSMENT AND GENETIC ASSOCIATIONS OF THE 2D:4D FINGER-LENGTH RATIO WITHIN THE BERLIN AGING STUDY II (BASE-II)

F. Arnaout<sup>1</sup>, T. Liu<sup>2</sup>, M. Heinig<sup>1</sup>, E. Steinhagen<sup>1</sup>, L. Bertram<sup>3</sup>, I. Demuth<sup>1</sup>, *1. Charité – Universitätsmedizin Berlin, Research Group on Geriatrics, Berlin, Germany, 2. Max Planck Institute for Human Development, Berlin, Germany, 3. Max Planck Institute for Molecular Genetics, Berlin, Germany*

The length ratio of the second to fourth digit (2D:4D) is frequently used as a retrospective surrogate marker for prenatal androgen exposure. Associations with the 2D:4D finger length ratio have previously been recognized for multiple human phenotypes, such as type 2 diabetes or cardiovascular diseases. In addition, an association between the 2D:4D ratio and a polymorphism in the LIN28B gene was recently described. In order to validate this finding and to potentially identify additional genetic determinants underlying 2D:4D variation, we performed digitometric measurements on 748 subjects (477 females, 271

males) in the context of the Berlin Aging Study II (BASE-II), a multi-disciplinary study with a core sample of 2.200 individuals. Polymorphisms were assessed in the context of a genome-wide association study (GWAS) completed in each BASE-II participant. Using 2D:4D ratios as quantitative trait, we were able to confirm the previously reported association with polymorphism rs314277 in LIN28B. Additionally, we identified a number of novel signals which will be presented at the meeting.

### TRADE-OFF IN THE EFFECT OF THE APOLIPOPROTEIN E POLYMORPHISM ON THE AGES AT ONSET OF CVD AND CANCER: THE ROLE OF AGE AND GENDER ACROSS GENERATIONS

A. Kulminski, I. Culminskaya, K.G. Arbeev, S.V. Ukraintseva, L. Arbeeveva, A.I. Yashin, *Center for Population Health and Aging, Duke University, Durham, North Carolina*

Studies show an important role of pleiotropic genes in complex traits. Recently, we demonstrated that pleiotropy could take a complex form with antagonistic action of the same allele on different diseases that constitutes genetic trade-off (Aging Cell 2011;10:533-541). Here we focus on the same apolipoprotein E (APOE) e2/3/4 polymorphism and ages at onset of cardiovascular diseases (CVD) and cancer to elucidate the role of age and gender across generations in the observed trade-off. We used data on two generations of the Framingham Heart Study (FHS) participants followed up 60 years. Kaplan-Meier screening and Cox regression modeling show that the e4 allele carriers live longer lives without cancer than the non-e4 allele carriers in each FHS generation (relative risk (RR) of cancer onset for pooled generations, RR=0.87, p=0.045). Protective role of the e4 allele against cancer is limited to older ages (RR=0.75, p=0.007; 70+ years) with more pronounced effect in men (RR=0.71, p=0.017). The role of the e4 allele in onset of CVD is age and generation-specific. In the parental generation the e4 allele promotes CVD in younger ages (RR=1.49, p=0.0008; <=75 years) but protects older women (RR=0.69, p=0.025). In the offspring generation the e4 allele promotes CVD in all ages (RR=1.22, p=0.009) with more pronounced role in older women (RR=1.56, p=0.039; 70+ years). These results suggest that the aging-related processes in different generations can readily alter the role of genes in late life in a gender-specific manner suggesting critical role of aging in unraveling genetics of traits in late life.

### PLASMA HEPCIDIN LEVELS AND ANEMIA IN OLD AGE. THE LEIDEN 85-PLUS STUDY

W. den Elzen<sup>1</sup>, A.J. de Craen<sup>2</sup>, E. Wiegnerck<sup>3</sup>, R. Westendorp<sup>2</sup>, D.W. Swinkels<sup>3</sup>, J. Gussekloo<sup>1</sup>, *1. Leiden University Medical Center, Department of Public Health and Primary Care, Leiden, Netherlands, 2. Leiden University Medical Center, Department of Gerontology and Geriatrics, Leiden, Netherlands, 3. Radboud University Nijmegen Medical Center, Department of Laboratory Medicine, Laboratory of Genetic, Endocrine and Metabolic Diseases, Nijmegen, Netherlands*

Background. Pro-inflammatory cytokines induce the production and secretion of hepcidin, an important regulator of iron homeostasis, by hepatocytes. Hepcidin is therefore suggested to be causally related to anemia of inflammation. Objective. We explored the role of plasma hepcidin in anemia among older persons from the general population. Methods. The Leiden 85-plus Study is a population-based prospective follow-up study of 85-year-olds in Leiden, The Netherlands, enrolled between September 1997 and September 1999. At age 86, plasma hepcidin was determined with time of flight mass spectrometry (TOF MS) in 490 participants (160 [32.7%] male). Results. The prevalence of anemia was 23.3% (114/490). Median plasma hepcidin level was 3.0 nM (IQR 1.8-4.9). Plasma hepcidin correlated with body iron status, C-reactive protein levels and levels of erythropoietin. Participants with iron deficiency anemia (n=13) had significantly lower plasma hepcidin lev-

els (1.4 nM [IQR 0.5-2.7]) than participants without anemia (n=376, 3.0 nM [IQR 1.8-4.7], p<0.01). Higher hepcidin levels were found in participants with anemia of inflammation (n=22, 5.5 nM [IQR 3.0-9.8], p<0.01), in participants with anemia of kidney disease (n=8, 5.4 nM [IQR 3.8-7.2], p=0.01), and in participants with unexplained anemia (n=29, 4.2 nM [IQR 2.7-7.2], p=0.01). Conclusions. Among older persons in the general population, lower hepcidin levels were found in case of iron deficiency anemia, and higher hepcidin levels in case of anemia of inflammation, anemia of kidney disease, and unexplained anemia. Future studies should establish the potential value of hepcidin in diagnostic algorithms for anemia and the value of hepcidin antagonists in the treatment of anemia of inflammation in older persons.

### AGE-RELATED CHANGES IN CIRCULATING T CELL SUBSET PHENOTYPE AND T CELL RECEPTOR (TCR) DIVERSITY IN CYTOMEGALOVIRUS(CMV)-NEGATIVE HUMANS

J. Nikolich-Zugich<sup>1</sup>, A.M. Wertheimer<sup>1</sup>, M.S. Bennett<sup>1</sup>, B. Park<sup>2</sup>, C.S. Martinez<sup>1</sup>, N.L. Currier<sup>1</sup>, J. Kaye<sup>2</sup>, *1. Arizona Center on Aging, University of Arizona, Tucson, Arizona, 2. Oregon Health Sciences University, Portland, Oregon*

The impact of intrinsic aging upon the peripheral blood T-cell pool remains incompletely understood. This impact must be distinguished from the influence of latent persistent microorganisms, particularly the cytomegalovirus (CMV), which is believed to cause and/or exacerbate some of the age-related changes. In a cohort of 150 CMV-negative individuals, aged 21-100 years, we have found that aging correlated strictly with the absolute loss of naïve CD8 T cells, but did not affect memory CD8 T cell numbers. In CMV+ individuals (244, range 21-96 years), the loss of naïve T cells was not greater than the loss associated with aging alone. However, CMV+ individuals exhibited an absolute increase in memory CD8 cells, due to an accumulation of the effector/effector memory phenotype cells. The circulating CD4 subset was much less affected by either CMV infection or aging. Analysis of the T-cell receptor diversity in CMV- subjects showed that the number and magnitude of CD8+ T-cell clonal expansions (TCE) increased with aging, and this increase was inversely proportional to the loss of naïve T cells. These findings provide important insight into the age-related changes in the peripheral blood pool of older adults and suggest potential therapeutic targets for immune rejuvenation.

### SENESCENCE-ACCELERATED MICE (SAM) ARE NOT AGING MODELS BUT DEGENERATIVE DISEASE MODELS

K. Tanisawa<sup>1,2</sup>, I. Ohsawa<sup>3</sup>, M. Ito<sup>4</sup>, A. Shimada<sup>5</sup>, M. Mori<sup>6</sup>, M. Higuchi<sup>7</sup>, M. Tanaka<sup>2</sup>, *1. Graduate School of Sport Sciences, Waseda University, Tokorozawa, Japan, 2. Department of Genomics for Longevity and Health, Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan, 3. Department of Aging Biology, Institute on Aging and Adaptation, Shinshu University Graduate School of Medicine, Matsumoto, Japan, 7. Faculty of Sport Sciences, Waseda University, Tokorozawa, Japan*

Senescence-accelerated mice (SAM) are a series of mouse strains originally derived from unexpected crosses between AKR/J and unknown mice, from which phenotypically distinct senescence-prone (SAMP) and resistant (SAMR) inbred strains were subsequently established. Although SAMP strains have been widely used for aging research focusing on various age-related phenotypes, such as sarcopenia, osteoporosis, and brain atrophy, the responsible gene mutations have not been fully elucidated. To identify mutations specific to SAMP strains, we performed whole exome sequencing of 6 SAMP and 3 SAMR strains.

This survey revealed 32,019 to 38,925 single nucleotide variants in the coding region of each SAM strain. Among them, we extracted 35 SAMP-specific novel mutations predicted to be deleterious by either the SIFT (score <0.05) or PolyPhen-2 (score >0.5) program. Among the 6 SAMP strains we detected no mutations that were common to all of them. In all SAMP strains except SAMP8, we detected an R473W missense mutation of Ldb3 gene, which has been associated with myofibrillar myopathy. In 3 SAMP strains (SAMP3, SAMP10, and SAMP11), we identified an R167C missense mutation of Prx gene, which mutations have been linked to hereditary motor and sensory neuropathy (Dejerine-Sottas syndrome). In SAMP6 we detected an S540fs frame-shift mutation of Il4ra gene, a mutation that is potentially causative of ulcerative colitis and osteoporosis; and in SAMP10, a Q55X nonsense mutation of Ocm gene, which might lead to brain atrophy. Our data indicate that different combinations of mutations in disease-associated genes may be responsible for the various phenotypes of SAMP strains.

#### **YEAST MOTHER CELL-SPECIFIC AGING: THE ROLE OF AFO1, A MITOCHONDRIAL RIBOSOMAL PROTEIN**

M. Breitenbach, *Department of Cell Biology, Div. of Genetics, University of Salzburg, Salzburg, Austria*

We discovered a yeast mutant in the gene, AFO1, coding for a mitochondrial ribosomal protein, which confers resistance to several oxidants and displays a 60% elongated replicative lifespan. The mutant is respiratory deficient and rho-zero, independent of the retrograde response, and defines a longevity signaling mechanism from the mitochondria to the nuclear/cytoplasmic gene expression system which depends on the presence of an intact TOR1 gene and glucose as a carbon source. The mutant displays an extraordinary low level of oxygen radicals. We show that this mutation grows rapidly and produces ethanol and biomass on glucose with a kinetics comparable to wild type, in stark contrast to a bona fide ethidium bromide induced rho-zero strain, which grows slowly. The growth phenotypes were shown to be the same in two quite different genetic backgrounds, one of them completely prototrophic. Transcriptome and metabolic analysis of wild type and mutant confirms similarity of the two strains and points to futile metabolic cycles in the bona fide rho-zero strain, which could be responsible for slow growth of the rho-zero strain. Taken together, the phenotype of the mutant points to the fact that slow growth of rho-zero strains is not caused by a low production of ATP, but is rather a regulatory phenomenon. It is the objective of this contribution to aid in understanding of the role of oxidative stress response and the mitochondria in the aging process.

#### **MITOCHONDRIA AS THERAPEUTIC TARGETS AND A HUNDRED YEARS OLD DRUG FOR TREATING AGE-RELATED DISORDERS**

H. Atamna, *The Commonwealth Medical College, Scranton, Pennsylvania*

Mitochondrial dysfunction occurs in many of the age-related neurodegenerative disorders. We identified that low-chronic dose of the drug methylene blue (MB) as potent enhancer of mitochondria-specific functions. MB doubled the lifespan of primary human cells (IMR90). We extended these findings to investigate long-term intake of MB in old mice. When we administered MB to old mice it prevented the age-related declines in spatial memory and grip strength. Biochemically, MB increased the activity of mitochondrial complex IV, mitochondrial heme synthesis, GDH, cell resistance to oxidants, and oxygen consumption. MB also enhanced the phosphorylation of AMPK; a key metabolic regulator and inducer of mitochondrial biogenesis and quality control. MB is the only agent to be reported to enhance specific activity of a mitochondrial enzyme i.e., complex IV. The significance of complex IV on energy metabolism is well-known, especially in Alzheimer's patient's brains. MB enhances mitochondrial function, improves cognitive function, and improves grip strength in old mice.

Since these are three major concerns in human aging, MB may be useful agent for delaying the onset of Alzheimer's neurodegeneration and physical impairments associated with aging. MB is an old drug that is acutely used to treat various ailments. We are proposing that chronic low dose of MB could prevent specific age-related disorders. The importance of MB to aging maybe likened to the importance of aspirin to cardiovascular disorders. Repurposing MB, if successful, would save the healthcare system billions of dollars that usually spent to develop new drugs to treat age-related disorders.

### **SESSION 565 (POSTER)**

#### **ANXIETY**

##### **COGNITIVE BEHAVIORAL THERAPY REDUCES NIGHTMARES IN OLDER ADULTS WITH GENERALIZED ANXIETY DISORDER**

M.E. Dozier<sup>1,2</sup>, B. Porter<sup>1,2</sup>, H.M. Rhoades<sup>3</sup>, M.E. Kunik<sup>2,1</sup>, M. Stanley<sup>1,2</sup>, M.R. Nadorff<sup>1,2</sup>, *1. Psychiatry and Behavioral Sciences, Baylor College of Medicine, Houston, Texas, 2. Michael E. DeBakey VA Medical Center, Houston, Texas, 3. University of Texas Health Science Center, Houston, Texas*

Nightmares are co-morbid with a variety of mental health problems, including anxiety and depression. This is also true for older adults with anxiety or depression, who are at increased risk of nightmares relative to their non-anxious or depressed peers. The current study investigated the prevalence and co-morbidities of nightmares in older adults with Generalized Anxiety Disorder (GAD), as well as the efficacy of cognitive behavioral therapy (CBT) for GAD in reducing nightmare frequency. Participants were 227 older adult primary care patients (mean age = 67.4 years), 134 of whom met DSM criteria for GAD, and 93 of whom served as a comparison group. Participants with GAD were treated either with CBT (N = 70) or enhanced usual care (EUC; bi-weekly phone calls in addition to usual care; N = 64). Nightmare frequency was significantly higher in patients with GAD [M = .72 (SD=.97)] than in patients without GAD [M = .35 (SD=.67)] ( $\chi^2=8.09$ ,  $p=.005$ ). Nightmare frequency in the total sample was significantly associated with greater symptoms of depression ( $\rho = .23$ ,  $p = .01$ ), anxiety ( $\rho = .26$ ,  $p = .001$ ), worry ( $\rho = .21$ ,  $p = .01$ ), and poorer quality of life ( $\rho = -.28$ ,  $p = .001$ ). CBT for late-life GAD led to a significant reduction in nightmare frequency compared to EUC ( $t_{112}=2.19$ ,  $p=.03$ ). Thus, older adults with GAD are more likely to suffer from nightmares than those without GAD, and treatment of GAD with CBT can successfully reduce nightmare frequency.

##### **THE UTILITY OF THE GERIATRIC ANXIETY INVENTORY IN A LONG-TERM CARE FACILITY**

L.A. Gerolimatos<sup>1,2</sup>, J.J. Gregg<sup>1,2</sup>, B. Edelstein<sup>1,2</sup>, *1. West Virginia University, Morgantown, West Virginia, 2. Hopemont State Hospital, Terra Alta, West Virginia*

Symptoms of anxiety and worry are common among older adults and are related to increased functional and social impairment, sleep difficulties, and poorer quality of life (Gould & Edelstein, 2010). Thus, the accurate assessment of anxiety in later life is a critical public health issue. The Geriatric Anxiety Inventory (GAI; Pachana et al., 2007) is one well-validated measure designed to detect symptoms of anxiety among older adults; however, few studies have examined its utility in long-term care facilities, where psychological disorders are prevalent. Sixty-nine residents (52% female, 91% Caucasian) at a state-operated nursing home completed the GAI. Participants had a mean age of 69.77 years (SD = 11.14, range 52 to 94 years). Diagnoses included dementia, psychotic disorders, mood disorders, anxiety disorders, substance abuse, sleep disorders, and mental retardation. The mean score on the GAI was 7.65 (SD = 6.12). Internal consistency of the GAI was good ( $\alpha = .92$ ). GAI scores were moderately correlated with scores on meas-

ures of depression,  $r = .39$ ,  $p < .01$ , and adaptive functioning,  $r = -.30$ ,  $p < .05$ , and weakly correlated with scores on a measure of executive functioning,  $r = .24$ ,  $p = .10$ , providing evidence for discriminant validity. To test the predictive validity of the GAI, we conducted a multiple logistic regression analysis in which GAI scores predicted an anxiety disorders diagnosis,  $OR = 1.79$ ,  $95\% CI = 1.15-2.79$ . These results suggest that the GAI may be a useful tool for assessing anxiety among nursing home residents with psychological disorders.

### **ANXIETY PREDICTS HEALTH SERVICE UTILIZATION IN OLDER ADULTS WITH OSTEOARTHRITIS**

J. McPherron<sup>1</sup>, A. Halli<sup>1</sup>, T.L. Harralson<sup>2</sup>, P.A. Parmelee<sup>1</sup>, *1. Center for Mental Health & Aging, The University of Alabama, Tuscaloosa, Alabama, 2. Polaris Health Care, Philadelphia, Pennsylvania*

Psychological distress is among the strongest predictors of health service use among older adults with osteoarthritis (OA). Amelioration of distress could reduce both OA disease burden and service utilization costs; however, the bulk of previous work has focused solely on depression. This study aims to disentangle the roles of depression and anxiety in predicting health service utilization in a sample of older adults with knee OA. Study participants were 48 to 91 years of age ( $M = 68$ ,  $SD = 9.7$ ); 64% female, 73% White, 83% with at least a high school education, 53% married, 93% earned  $\leq \$50,000$ . Baseline  $N = 365$ . Sociodemographic covariates included sex, education, age, marital status, race, and income. Health covariates included: pain, objective health, a count of OA-affected joints other than the knee, and functional disability. Health utilization outcomes included number of doctors, doctor visits, medications, OA-specific medications and hospital stays, and days in a hospital over the past year. In hierarchical OLS analyses, health utilization variables were regressed onto sociodemographic variables (Step 1), health covariates (Step 2), depression (Step 3), and anxiety (Step 4). Depression predicted doctor visits after controlling sociodemographic variables, but not health covariates or anxiety. Anxiety predicted both doctor visits and hospital stays after controlling sociodemographic variables, health covariates, and depression. Discussion addresses the importance of anxiety in contributing to health care utilization, and the importance of preventive and palliative treatment for anxiety in older adults with knee OA. (Supported by R01-MH51800; P. Parmelee, PI)

### **INFORMANTS' PERSPECTIVES ON ANXIETY AND AGITATION IN NURSING HOME RESIDENTS WITH DEMENTIA**

J.C. Williams, L.S. Hess, S. Meeks, *Dept. of Psychological & Brain Sciences, Univ Louisville, Louisville, Kentucky*

Anxiety and agitation are common presentations in dementia. There is confusion regarding how anxiety and agitation may overlap and whether informants can differentiate the two. We examined how well family informants' ratings of mental health history corresponded to resident reports of anxiety, and also how resident-rated anxiety corresponded to nurse aides' reports of resident anxiety and agitation. Thirty-four residents were included who were older than 65 years of age, had a diagnosis of dementia, could communicate in English, and were not currently participating in another research study. Participants were recruited from nursing home facilities in the Kentucky and Southern Indiana areas. Residents completed the Rating of Anxiety in Dementia (RAID) scale and a mental health screener for anxiety derived from the SCID, while their nursing assistants completed the RAID and the Cohen-Mansfield Agitation Inventory (CMAI). Family informants completed the SCID screener. The results indicated little correspondence between residents and their informants on the SCID measures. Findings related to nursing assistants showed a correspondence between resident ratings of anxiety and nursing assistant ratings of agitation ( $r = .47$  between the resident-rated RAID and the CMAI). Overlap occurred between the worry component of anxiety and the verbal component of agitation

( $r = .357$ ). Results have implications for the reliability of informant reports and the utility of staff ratings. Suggestions for future research include how gender, race, and the closeness of the informant's relationship affect the detection of anxiety and agitation.

### **THREE AGE GROUP COMPARISON OF ANXIETY IN OLD AGE**

R.K. Akashi<sup>1</sup>, A. Mui<sup>2</sup>, H. Akashi<sup>3</sup>, *1. Faculty of Sociology and Social Work, Meijigakuin University, Tokyo, Japan, 2. Columbia University School of Social Work, New York, New York, 3. National Center for Global Health and Medicine, Tokyo, Japan*

A review of the literature confirms that psychological well-being is a multifaceted construct consisting of conceptually-related but separate dimensions presenting unique information (Diener, Schollon, & Lucas, 2003). One critical dimension identified in the literature is worries or anxiety (Veroff, Douvan, & Kulka, 1981). The goals of this study are to test the hypotheses of: 1) age groups (ages 50-64, 65-74, and 75 and over) have a unique effect in explaining anxiety after controlling for other factors; and 2) the predictors of anxiety differ among the three age groups. The study was conceptually guided by the stress and coping model and supplemented by socio-emotional selectivity theory, the life course perspective, and critical theory. The data was drawn from the Aging, Status, and Sense of Control study (2001). Overall regression analysis presented no significant differences in anxiety among the three groups. Parallel regression analyses found that the only significant common factor across all the groups was the previous anxiety level in 1995, and all other factors were significant for an age group only. Unique factors predicting anxiety for the soon-to-be-old (ages 50-64) were more stressful life events and less perceived social support. The significant unique factors for the young-old (ages 65-74) were being female, poor perceived health, and less external locus of control. More functional limitations and more financial difficulties were uniquely significant for the old-old (ages 75 and over). The finding of the significant lasting impact of previous anxiety level on the current well-being indicates a crucial implication for early interventions.

### **GENDER DIFFERENCES IN ANXIETY AND DEPRESSION IN MORE ADVANCED OLD AGE**

N.A. Pachana, D. McLaughlin, J. Leung, G. Byrne, A. Dobson, *University of Queensland, Brisbane, Queensland, Australia*

Background: Women report higher rates of depression and anxiety than men, however it is uncertain if this gender difference continues into advanced old age. Barefoot et al. (2001), in a study of an advanced aged cohort (80+ years), found that gender differences in the report of depressive symptoms decreased as the cohort aged. Elsewhere, gender differences in anxiety symptoms are reported as increasing with age (Fuentes and Cox, 2000). Methods: Participants were 78 men and 111 women aged 82-87 years drawn from the Men, Women and Ageing project, incorporating data from two population-based longitudinal studies started in 1996: the 1921-26 birth cohort of the Australian Longitudinal Study on Women's Health (ALSWH) and the Health in Men Study (HIMS). Measures of anxiety (Geriatric Anxiety Inventory), depression (PHQ9), psychological distress (Mental Health subscale of SF-36), general health (general health item of SF-36) and cognitive status (TICS) were analysed. Results: After controlling for cognitive status, general health and education, no significant gender differences emerged on MH scores between men ( $M = 81.92$ ,  $SD = 14.66$ ) and women ( $M = 81.40$ ,  $SD = 14.02$ ),  $t = 0.82$ ,  $p = 0.416$ ; similar findings emerged for the GAI (chi-squared (1) = 0.29,  $p = 0.593$ ) and PHQ (chi-squared (1) = 0.08,  $p = 0.773$ ). Conclusion: These results support the proposition that female predominance in psychological distress diminishes with increasing age. The congruence between men and women may reflect changes in identity associated with age or the effect of decreased emotional valence of some social roles.

## MENTAL HEALTH HISTORY PREDICTS ANXIETY IN LONG-TERM CARE RESIDENTS WITH DEMENTIA

L.S. Hess, J.C. Williams, S. Meeks, *University of Louisville, Louisville, Kentucky*

Psychiatric disorders, including dementia and anxiety, commonly co-occur among older adults in long-term care facilities. Research supports the experience of anxiety in older adults with dementia. However, changes in cognitive functioning may limit their ability to experience anxiety as currently conceptualized. At the same time, many older adults with anxiety report having had anxiety throughout their lives, suggesting older adults with dementia who have a history of anxiety would continue to experience anxiety as their dementia progresses. The purpose of this study is to examine the role mental health history and cognitive functioning play in the experience of anxiety in long-term care residents with dementia. Long-term care residents age 65 and older with a dementia diagnosis (N=47) completed a brief mental health history and the Rating Anxiety in Dementia scale. The measure of cognitive functioning (Brief Interview for Mental Status) was collected from their Minimum Data Sets. A factorial ANOVA was conducted to test the hypothesis that mental health history has an effect on current anxiety, but that this effect is moderated by cognitive functioning. This analysis revealed a significant main effect of mental health history [ $F(1,46) = 8.22, p < .01$ ], suggesting mental health history predicts current anxiety regardless of cognitive functioning. Administration of screening measures to older adults with dementia, specifically those for depression, is standard procedure in long-term care facilities. In light of the persistence of anxiety across the lifespan in this population, screening for anxiety in long-term care facilities should be implemented to provide optimal care.

## SESSION 570 (POSTER)

### CARE FOR THE LONG TERM

#### THE UTILITY OF THE REVISED MEMORY AND BEHAVIOR PROBLEMS CHECKLIST - NURSING HOME VERSION (RMBPC-NH) IN A DEPRESSED LONG-TERM CARE SAMPLE

S. Shah, B. Getz, B. Ludwin, I. Kostiwa, S. Meeks, *Psychological & Brain Sciences, Univ Louisville, Louisville, Kentucky*

The proper detection and delivery of interventions for behavior problems in long-term care residents are important aspects of providing residents with comprehensive care. Medical providers often rely on the report of nursing staff regarding residents' daily psychosocial functioning. The aim of this study was to examine the utility of the Revised Memory and Behavior Problems Checklist - Nursing Home version (RMBPC-NH; Allen et al., 2003) in reference to a sample of 84 clinically depressed long-term care residents. Eighty-four day-shift and 84 evening-shift certified nursing assistants (CNA) were asked to report the frequency of various problematic behaviors exhibited by their respective depressed resident over the last week. Preliminary analyses reveal that although all residents met diagnostic criteria for a depressive disorder, only 36 day-shift and 41 evening-shift CNAs reported observing sad and depressed behavior in the resident over the last week. A significant association was found between the Emotion Subscale of the RMBPC-NH and resident's self-report of negative affect, but not between the Emotion Subscale and residents' self-report of depressive symptoms using the GDS-30. Inter-rater reliability analyses reveal low agreement between day- and evening-shift CNAs across the items composing the Emotion Subscale. These results suggest that CNAs may be better at detecting global levels of emotional distress rather than specific depressive symptoms, and that administration of self-report measures to residents is important for accurately detecting psychological problems. The results also suggest that day- and evening- shift nursing staff report

differences in residents' behaviors, which may have implications on resident care.

#### FAMILY SERVICE USE AND END-OF-LIFE DECISION-MAKING IN THE NHHCS

R.C. Intriери, P. Goodwin, *Psychology, Western Illinois University, Macomb, Illinois*

The 2007 National Home and Hospice Care Survey (NHHCS) represents survey data collected from home health and hospice agencies as well as current patients and discharges. Participating agencies were Medicare and/or Medicaid certified or held a state license to provide home health and/or hospice services. Survey data were collected from agency directors and staff between August 2007 and February 2008. Patient data were abstracted from medical records. The current analysis focuses on the 4,733 identified individuals that received hospice services. Mean age of the sample was 77.36 (SD=13.70). The sample consisted of 2,117 men (M=74.98; 13.48) and 2,616 women (M=79.28; SD=13.57). The current analysis examines the relationship between the patient's family's use of services (for example, bereavement services or services aimed at helping the family manage difficult behaviors) and the presence/absence of an advance directive. Chi square examining bereavement services and advance directives was significant ( $\chi^2(1) = 53.504; p = .0001$ ) indicating that a family's use of bereavement services was related to the presence of an advance directive for the patient. Approximately 90.1% of patients whose families had utilized bereavement services had an advance directive. Chi square examining the link between assistance with dealing with difficult behaviors and presence/absence of advance directives was significant ( $\chi^2(1) = 4.157; p = .041$ ). Approximately 90.6% of patients whose families received assistance with difficult behaviors had an advance directive. Additional analyses highlight the relationship between any type of advance directive and family service use.

#### HOW CERTIFIED NURSING ASSISTANTS IN DIFFERENT LTC FACILITIES FRAME THEIR WORK AS MEANINGFUL

B.B. Shadden, R. DiBrezzo, I. Fort, J. Henry, M. Gray, *Office for Studies on Aging, University of Arkansas, Fayetteville, Arkansas*

Due to the high turnover rates among CNAs, job satisfaction, stress, and recruitment/retention rates have been studied extensively. Since nursing assistants are typically at the bottom of the work hierarchy and report being undervalued (as well as underpaid), they have created a narrative about their experiences that allows them to derive meaning in their work. Qualitative research methods are particularly well suited to exploring the ways in which CNAs enhance intrinsic job satisfaction through their system of beliefs about their work. This abstract reports the outcomes of four focus groups of CNAs from different long term care facilities in northwest Arkansas. Facilities differed in profit status, level(s), and links to independent retirement facilities. Predetermined open-ended questions probed perceptions of positive and stressful aspects of work as a CNA, as well as recommendations for change. All comments were transcribed. A team of researchers coded comments to answer the central question: "What meaning-making themes emerge as CNAs describe their work experience (both the job itself and perceived roles within each facility)?" A secondary question was whether identified themes were consistent across facilities? The five meaning-making themes were: 1) CNA work is good and/or special, 2) relationships with residents are key, 3) CNAs care and protect residents, 4) CNAs are crucial parts of a team, and 5) CNAs are the ones that know the residents. Results are discussed within the framework of understanding factors that motivate CNAs in order to enhance interprofessional interactions, improve resident care, and increase intrinsic job satisfaction for CNAs.

## **I'M STAYING! EXPLORING DIRECT CARE WORKERS' DESIRE TO STAY IN LONG-TERM CARE**

L.D. Vinson<sup>1,3</sup>, J.A. Davis<sup>2,3</sup>, D. Brannon<sup>4</sup>, 1. *Department of Psychology, The University of Alabama, Tuscaloosa, Alabama*, 2. *Department of Management and Marketing, The University of Alabama, Tuscaloosa, Alabama*, 3. *Center for Mental Health and Aging, The University of Alabama, Tuscaloosa, Alabama*, 4. *Department of Health Policy and Administration, The Pennsylvania State University, University Park, Pennsylvania*

As direct care worker (DCW) shortages and high turnover rates continue to plague the long-term care (LTC) industry, there is a dire need to retain individuals in DCW positions. We were particularly interested in understanding how benefits and other job-related factors contributed to DCWs' intent to stay. Data for this project came from a sample of LTC providers in the state of Pennsylvania in 2004. Stratified sampling was used to ensure representation of: 1) all types of LTC providers (e.g. adult daycare centers, home health care agencies, and nursing homes) and, 2) the regions of the Pennsylvania Workforce Investment Areas and rural and urban zip codes. Of the 1,915 providers who received the surveys, 759 providers responded and sent lists of their DCWs (40% response rate). Eliminating providers with missing data resulted in a final sample of 537 DCWs. The data were analyzed using the logistic regression option in Stata 10. DCWs who reported higher job satisfaction, better quality supervision, longer DCW employment, and health insurance benefits had a greater desire to continue working as a DCW. However, DCWs who reported they thought about quitting often, had at least a high school diploma, and had disability insurance had greater odds of leaving. In summary, it appears that having access to benefits has a differential impact on DCW turnover rates in LTC. These results were consistent among all LTC facilities, regardless of type. These results provide LTC leaders with specific intervention target areas for decreasing DCW turnover.

## **BITTER PILLS AND BACK RUBS: THE WORK OF MEDICATION ADMINISTRATION IN ASSISTED LIVING**

P. Carder<sup>1</sup>, R. Rubinstein<sup>2</sup>, 1. *Institute on Aging, Portland State University, Portland, Oregon*, 2. *University of Maryland Baltimore County, Baltimore, Maryland*

How to manage medications administered to persons with dementia who live in assisted living (AL) settings is an important policy and research topic. This paper describes an ethnographic study of the process and culture of medication administration in three Oregon ALs certified for dementia care. Data were collected while shadowing 16 employees throughout the day and evening work shifts for six consecutive days. The observation time averaged 16 hours per day, totaling 316 hours during which approximately 72 scheduled medication passes were observed. Each employee was interviewed about two weeks after the observation. Oregon is one of 31 states that permits unlicensed staff to administer medications; four of the 16 employees in this study had completed formal training courses. "Bitter pills and back rubs" describes the challenges these employees encounter as they coax persons with dementia who do not understand why they are being asked to swallow bitter-tasting pills, to do so anyway. This research makes visible employee—resident interactions, including back rubs, encouraging words, and other employee-generated strategies that have not been previously documented. Further, the findings build on research about the meaning of food to older persons and the dilemma of treating meal time as medication time in the AL setting. Finally, this research provides medication management scenarios that can be used to inform AL policy development and employee training strategies that can improve the care of persons with dementia.

## **THE IMPACT OF SPATIAL CONFIGURATION ON SOCIAL INTERACTION IN LONG-TERM CARE FACILITIES**

F. Ferdous, K. Diaz Moore, M. Rashid, *The University of Kansas, Lawrence, Kansas*

The relationship between the physical environment and the prevalence of social interaction has been a core topic of inquiry within envi-

ronmental gerontology. Social interaction is considered an essential therapeutic intervention for people with Dementia of Alzheimer's Type (DAT). Many studies, including those that use 'space syntax' theories and techniques, show that the physical environment affects social interaction, in turn affecting individual and organizational outcomes. Space syntax is an analytical technique for describing the configurational attributes of a spatial layout. Although studies involving proximity and visibility in Long-term Care Facilities (LTCF) serving DATs are almost absent, based upon previous research in both space syntax and environmental gerontology, this research hypothesized that accessibility and environmental visibility in social spaces found within LTCF-DATs may affect social interactions among residents. After implementing behavior-mapping technique, 50 rounds of behavioral observations related to various levels of social interactions have been collected in the social spaces of the selected facilities by using different metrics of space syntax. The results of correlational analysis show that the residents of the facilities were engaged in very low and high level [0.565 ( $p < .01$ ), -0.538 ( $p < .01$ ) respectively] of social interactions in locations with better and less visibility, accessibility respectively. In conclusion, the findings of this study suggest that spatial variables and configurations of architectural spaces in care facilities could have some positive consequences that affect social interactions among residents and care givers. Based on the findings, a large-scale trial in different spatial layouts of care facilities is also recommended for future analysis.

## **LONG-TERM CARE: WHO IS RESPONSIBLE?**

K. Kimbell, *School of Social Work, The University of Texas at Austin, Austin, Texas*

Individuals are reaching retirement with inadequate planning for potential long-term care (LTC; NASI, 2005, Pinquart & Sorensen, 2002) needs. Yet, most individuals will need some form of LTC in their older adult lives. Public LTC budgets are strained and the LTC system is not expected to endure the weight of the baby boom generation without modifications (CWF, 2006). Total national spending for LTC in 2005 was \$207 billion and is only expected to rise (GULTCFP, 2007). Who is responsible for paying, planning, providing for LTC? This study examined the LTC planning behavior of employed baby boom aged adults, focusing on the influence of individuals' views about whose responsibility is provision of LTC on planning behavior. Data was collected using a mixed modes self-administered 80-item original survey via the internet and regular mail. The study sample (1,066) includes benefit-eligible Black, Hispanic/Latino, and White faculty/staff born in/between the years of 1946 and 1964 from a large southwestern university. Findings suggest baby-boom aged individuals as a whole believe themselves to have a high level of responsibility for their own potential LTC needs, but also that responsibility lies with government, employers, and adult children. Individuals, then adult children, are believed to have greatest responsibility for planning and providing/arranging for LTC, versus, individuals then government for paying for LTC. Regression analyses indicate employer responsibility positively predicts LTCI purchase and LTC-specific savings and government responsibility negatively predicts LTC-specific savings. Racial/ethnic, gender, and SES differences were found. Implications exist for practitioners, employers, program planners, and policy-makers.

## **PREVALENCE AND ASSOCIATED FACTORS OF DYSPHAGIA IN INSTITUTIONALIZED OLDER PEOPLE IN SOUTH KOREA**

Y. Park<sup>1</sup>, H. Chang<sup>1</sup>, S. Yu<sup>3</sup>, J. Lee<sup>1</sup>, B. Oh<sup>2</sup>, 1. *Seoul National University College of Nursing, Seoul, Republic of Korea*, 2. *Seoul National University College of Medicine, Seoul, Republic of Korea*, 3. *Sangi University, Wonju, Republic of Korea*

In South Korea, general data on the prevalence of dysphagia in institutionalized older adults are lacking. Prevalence rates are necessary to

gain insight into the magnitude of dysphagia and to establish a Long-term care policy. This study aimed to obtain insight into the prevalence of dysphagia in Korean older adults in nursing home and to identify factors associated with the dysphagia prevalence. This study was conducted in two urban nursing homes and recruited nursing home residents (N=395, 76.5% women) aged 65 to 103 in South Korea. The dysphagia was assessed using the Gugging Swallowing Screen (GUSS). A standardized questionnaire was used to record demographic data and data on potential factors associated with dysphagia. Out of 395 older adults in two nursing homes, 52.7% had moderate to high risk of dysphagia. Wet-sounding voice (OR 11.006), drooling (OR 8.076), severe dependent functional status (OR 4.507), and feeding time longer than 30 minutes (OR 4.408) were associated with being dysphagia. The dysphagia prevalence of nursing home residents in South Korea is similar to international figures. Older adults with stroke, severe functional status, and 75 years or older may need adequate dysphagia management. Given the negative impact of dysphagia on mortality and morbidity, an emphasis should be placed on an effective long-term care policy.

### VISITORS & RESIDENT AUTONOMY: UNSPOKEN RULES IN ASSISTED LIVING

C.R. Bennett<sup>1</sup>, M. Brazda<sup>1</sup>, A.D. Peebles<sup>1</sup>, R. Perez<sup>2</sup>, M.C. Nemecek<sup>2</sup>, A. Frankowski<sup>2</sup>, 1. *Doctoral Program in Gerontology, UMBC/UMB, Baltimore, Maryland*, 2. *Center on Aging Studies, UMBC, Baltimore, Maryland*

Friends, family and other interpersonal relationships are critical to overall health and well-being for residents in assisted living (AL). When older adults move into AL, however, they often feel distanced from previous social circles. Inviting friends and family to visit in the AL may seem contrived, especially considering the possibility of surveillance and scrutiny by the AL staff or management. Residents may feel uncomfortable inviting a grandchild, for example, to spend the night or weekend with them at their new home. Visits from a spouse or other loved ones who do not reside in the AL may also pose challenges. What might be commonplace visits for community-dwelling older adults can be unacceptable in AL settings. AL policies on visiting are often not officially documented. More likely there are unspoken rules about guests and what they are permitted to do. These rules can inhibit residents' autonomy and curtail important decision-making in daily life. To understand the relationship between visiting and autonomy in AL, this poster examines: (1) both formal and informal AL policies on visiting; (2) residents', families', and staff's views on these policies; and (3) related academic research and policy reports. Data for this poster are drawn from a multi-year, NIA-funded ethnographic study of autonomy. Fieldnotes and interview transcripts from three ALs were coded and analyzed using Atlas.ti software. This poster concludes with recommendations on how best to incorporate visitors into the life of the AL to enhance autonomy of residents.

### SESSION 575 (POSTER)

#### COGNITION AND AGING

##### NARRATING WISDOM: EXPLORING THE LINK BETWEEN GENERALIZED SLOWING AND WISDOM IN AGING

M.C. Costello<sup>1</sup>, L. Manning<sup>2</sup>, A. Hilliker<sup>1</sup>, S. Ratkiewicz<sup>1</sup>, M. Anastasio<sup>1</sup>, A. Jones<sup>3</sup>, D. DeBrule<sup>1</sup>, 1. *Indiana University South Bend, South Bend, Indiana*, 2. *Duke University, Durham, North Carolina*, 3. *Tulane University, New Orleans, Louisiana*

One factor in age-related cognitive decline is generalized slowing, the widespread slowdown in cognitive and behavioral performance. Although generalized slowing is almost universally assumed to be a negative factor in aging, this evaluation is typically based on quantitative tasks that rely largely on timed reaction speeds. Conversely, research exploring the relationship between wisdom and aging typically utilizes

non-timed tasks, and has found preserved or even heightened wisdom capacity with advanced age. Yet the link between generalized slowing and wisdom in aging has been under-explored. In this study, we examine the relationship between these two factors, and whether age mediates the relationship. Older (60-89 yrs.) and younger adults (18-29 yrs.) performed in two testing protocols: 1) a battery of computerized processing-speed tasks; 2) a writing session that assessed lifelong experience and wisdom. Quantitative analyses of processing speed indicate that older adults, compared to younger adults, were significantly slower across all processing speed domains. Qualitative analyses of the writing data indicate strong age-group effects, with younger adults featuring the importance of family, the role of trauma and stress, and the central focus of the self. Older adult writing, in contrast, featured the importance of family dynamics, the pivotal role of major world events, and the role of religious faith. Preliminary analyses of the effect of processing speed on the two age groups indicates that despite generalized slowing in aging, there is little effect regarding the construction and content of the narratives. Implications for research on wisdom in later life are considered.

##### COGNITIVE FUNCTIONING IN ADULTS AGING WITH HIV: EXPLORING COGNITIVE SUBTYPES AND INFLUENTIAL FACTORS

P.L. Fazeli, D. Vance, K. Ball, M. Crowe, V.G. Wadley, L.A. Ross, *Psychology-Graduate School, University of Alabama at Birmingham, Birmingham, Alabama*

Purpose: Research suggests adults and older adults with HIV may be at risk for cognitive declines. Cluster analytic studies have suggested there may be unique cognitive subtypes in HIV. The purpose of this study was to perform a cluster analysis in a sample of adults and older adults (N = 78; Mage = 46.61) with HIV and to compare these clusters with an HIV-negative group (N = 84; Mage = 47.93) on cognitive, functional, demographic, and mental and physical health variables. Method: Two-Step cluster analysis was used to examine cognitive subtypes using six cognitive measures across multiple cognitive domains. MANOVA and chi-square analyses were used to examine differences between the HIV+ clusters and the HIV-negative group. Results: Results revealed a two cluster solution, with Cluster 1 exhibiting lower performance across all cognitive and functional measures except the Finger Tapping Test, and Cluster 2 displaying "normal" performance across all of the measures compared to the HIV-negative group. The most influential factor to cluster membership was age, with Cluster 1 participants being significantly older than Cluster 2. There were no other significant differences between Clusters 1 and 2 on any of the HIV-specific, demographic, or mental and physical health variables. Conclusion: The findings of this study suggest that in this sample there do not appear to be unique cognitive subtypes; rather, there was a subset with "normal" cognitive performance and a subset with lower cognitive performance. Implications for future research and practice are provided.

##### SCAFFOLDING ACROSS THE LIFESPAN: AGE, TASK COMPLEXITY, AND PRESSURE EFFECTS ON DECISION-MAKING

J.A. Cooper<sup>1</sup>, D.A. Worthy<sup>2</sup>, M.A. Gorlick, W. Maddox<sup>1</sup>, 1. *Psychology, The University of Texas at Austin, Austin, Texas*, 2. *Texas A&M University, College Station, Texas*

Recent work from our lab (Worthy, et al, 2011) found an age-related advantage in decision-making that was attributed to older adults' ability to engage additional frontal neural resources. This recruitment of additional frontal neural resources is explained by the neural scaffolding hypothesis. Scaffolding occurs in older adults to compensate for age-related neural declines, and in all age groups when more neural resources must be recruited due to increased task demands (Park & Reuter-Lorentz, 2009). We propose that while scaffolding improves performance on some tasks, increasing task demands will lead older adults

to reach a “crunch” point where the limits of their neural resources are exceeded, resulting in poor performance (Reuter-Lorenz & Cappell, 2008). However, increasing the demands of the task may lead younger adults to engage in scaffolding, improving performance. In the current study, we manipulated task demand through increased complexity or pressure. We had older and younger adults perform a two-choice decision-making task under pressure or no pressure conditions, or a four-choice task under no pressure. We found a three-way interaction between age, complexity, and pressure on decision-making. Whereas older adults performed better under no pressure conditions in the two-choice task, younger adults performed better in the same task under pressure. In addition, younger adults performed better in the four-choice task under no pressure. Thus older adults under no pressure and with low task complexity operate similar to younger adults under pressure and with increased task complexity. We interpret these results as evidence of compensatory scaffolding across the lifespan.

### **STRESS LESS AND REMEMBER MORE: ANXIETY GETS UNDER THE SKULL**

S. Agrigoroaei, M. Lachman, *Brandeis University, Waltham, Massachusetts*

Past studies have found that individual differences and intraindividual variability in control beliefs are related to memory performance, and mediated by anxiety and distraction. Other studies have found that anxiety and intrusive thinking have more deleterious effects for the memory performance of older adults than for the young. We examined trajectories of control beliefs, self-reported anxiety, cortisol reactivity, and distraction in relation to working memory performance and considered whether the relationships change with practice or vary by age. We assessed 56 young and elderly adults on four occasions, one week apart on two working memory tasks, the memory updating numerical test and the N-back, varying in difficulty as a function of speed and number of digits. Younger adults had higher levels of perceived control over performance and increased their control over time, whereas older adults did not. Older adults had higher levels of anxiety at the outset and took longer to reduce their anxiety across sessions. Younger adults showed decreases in cortisol levels across trials. For memory performance, older adults were more responsive to practice, showing greater improvements over time. We found variability in control beliefs was greater for older adults than for younger participants and was positively associated with variability in anxiety and distraction during the tasks. Variability in distraction was negatively related to performance, especially in older adults. Results are discussed in terms of the value of practice and familiarity in reducing anxiety and improving performance for older adults, by increasing the sense of control over performance.

### **COGNITION IN YOUNG ADULTHOOD SIGNIFICANTLY PREDICTS PULMONARY FUNCTION LATE MIDDLE-AGE**

T. Vasilopoulos<sup>1</sup>, M.D. Grant<sup>2</sup>, C.E. Franz<sup>3</sup>, M.S. Panizzon<sup>3</sup>, H. Xian<sup>4,5</sup>, M. Lyons<sup>2</sup>, W.S. Kremen<sup>3,6</sup>, K.C. Jacobson<sup>1</sup>, *1. University of Chicago, Chicago, Illinois, 2. Boston University, Boston, Massachusetts, 3. University of California, San Diego, La Jolla, California, 4. Washington University School of Medicine, St. Louis, Missouri, 5. VA St. Louis Healthcare System, St. Louis, Missouri, 6. VA San Diego Healthcare System, La Jolla, California*

Pulmonary function, a biomarker of aging, is predictive of morbidity and mortality. Furthermore, several studies have demonstrated an association between cognition and pulmonary function and have found pulmonary function to predict cognitive decline. However, few studies have examined how cognition in young adulthood influences later-life pulmonary function. For the present study, we investigated whether cognition in young adulthood predicted pulmonary function in late middle-age. We utilized data from the Vietnam-Era Twin Study of Aging (VETSA), which includes 1237 male twins, mean age=55.4 (range 51-60). Midlife pulmonary function was indexed by forced expiratory flow

(FEF). Young adult cognition (mean age=19.8) was indexed by the Armed Forces Qualification Test (AFQT), a 50-min, 100 question test of general cognitive ability. Young adult AFQT and midlife FEF were significantly and positively correlated ( $r = 0.13$ ). Using linear mixed modeling, we first modeled the effects of age and height on midlife FEF (Model 1). Our second model included Model 1 covariates plus smoking status, pack years, pulmonary disease diagnosis, education, income, and parental education (Model 2). Our third and final model included Model 1 and 2 covariates plus the effect of young adult AFQT (Model 3). Even after controlling for the covariates in Models 1 and 2, young adult AFQT significantly predicted midlife FEF ( $\beta = 0.13$ ,  $p = 0.003$ ). Our findings provide evidence that better general cognitive ability during early adulthood is associated with higher pulmonary function late-middle age. Future analyses will try to identify proximal biological, psychological and social factors that may account for this association.

### **COGMED: A COGNITIVE REHABILITATION INTERVENTION TO IMPROVE WORKING MEMORY IN OLDER ADULTS**

L. Hyer<sup>1</sup>, C.V. Scott<sup>2</sup>, *1. Georgia Neurosurgical Institute & Mercer University School of Medicine, Macon, Georgia, 2. Georgia Neurosurgical Institute, Macon, Georgia*

Deficits in working memory are associated with age-related decline. We report on findings from a clinical trial that examined the effectiveness of Cogmed, a computerized program that trains working memory (WM). We assess this program against a sham control group in older adults. Older adults (N=68) living in the Central Georgia community who had memory impairment during initial screening (RBANS Delayed Memory Index), but had normal MMSEs, ADLs, and IADLs, were assessed. They met criteria for Mild Cognitive Impairment (MCI). Participants were randomized to either Cogmed or to the Sham cognitive program. A total of 25 sessions were completed over 5-7 weeks. Pre, post and post-post (12 weeks after intervention) measures were applied, involving cognitive, mood and function measures. Paired t-tests were conducted to find significant changes in outcomes between pre, post and post-post measures, as well as regression analyses on pre and post/post-post measures. In general, all subjects showed gains relative to the cognitive pre-measures. The Cogmed group showed statistically significant improvements in Digit Span Age, Span Board Age, Letter Number Sequencing Age, Story Memory, and Story Recall evaluations at post assessment. At post-post times, significant improvements were noted for Trails A, Trails B, Coding, Figure Memory, Figure Recall, Coding Age, and Matrix Reasoning Age. The Cogmed group also performed better on adjustment, satisfaction and affect relative to Sham. Results suggest that both the Cogmed group and Sham group enhance working memory in older adults with MCI. Cogmed especially appears to be effective for older adults.

### **SESSION 580 (POSTER)**

#### **COGNITIVE PERFORMANCE AND CHANGE**

##### **OBESITY AND LATE LIFE COGNITIVE ABILITIES - A SYSTEMATIC REVIEW**

A.K. Dahl<sup>1,2</sup>, L.B. Hassing<sup>3</sup>, *1. Department of Medical Epidemiology and Biostatistics, Karolinska Institutet, Stockholm, Sweden, 2. Institute of Gerontology, School of Health Sciences, Joenköping, Sweden, 3. Department of Psychology, University of Gothenburg, Gothenburg, Sweden*

Obesity is a health problem that has reached epidemic proportions. Given the high prevalence of obesity, even a small adverse effect of obesity on cognitive abilities might have a serious effect on public health. The purpose of this review is to examine the relationship between obesity and cognitive function in late life, and to evaluate the evidence for a causal association. Medline was used to search for the following

terms: obesity, overweight, cognition, cognitive, age, and aged. The inclusion criteria were population-based sample, dementia free, and a 5-year minimum interval between measurement of the predictor and the outcome. Only 11 studies met the criteria. Seven studies assessed obesity in midlife and cognitive function in later life, and 4 studies assessed obesity and cognitive function in late life. The reviewed studies showed clear evidence that midlife obesity is associated with lower cognitive performance, whereas this association was weaker in late life; thus, obesity in late life was not uniquely related to lower cognitive function. The findings of this review suggest that, although there is evidence for an association between midlife obesity and low cognitive abilities in late life, the direction of the association and the causality remains to be clarified.

### THE ROLE OF INHIBITORY CONTROL IN MENTAL STATE UNDERSTANDING AMONG OLD ADULTS

Z. Wang, Y. Su, *Peking University, Beijing, China*

**Objective** Mental state understanding, which is also called Theory of Mind (ToM), is the ability to infer other persons' mental states, such as desires, intentions and feelings. It plays an important role in social cognition, social behavior and social interaction. The present study aims to investigate the ability of mental state understanding in old adults, and to determine the role of inhibitory control in mental state understanding. **Method** The participants included 30 young-old people (aged from 65 to 74 years old), 30 old-old people (aged from 75 to 89 years old) and 30 young people (aged from 20 to 35 years old). Their ability of mental state understanding and inhibitory control were examined with The Referential Communication Task and Hayling Sentence Completion Test, respectively. **Results** The correct rate of referential communication task was significantly lower in old-old people than those of young-old people ( $p=0.001$ ) and young people ( $p<0.001$ ). Partial correlation analysis showed that the total errors in Hayling Test-B was negatively correlated with the correct rate of Referential Communication Task ( $r=-0.442$ ,  $p<0.001$ ). Hierarchy regression analysis showed that the total errors in Hayling Test-B entered the equation (Beta was  $-0.451$ ) and could independently explained 16.8% of the variance of mental state understanding ability after controlling for age. **Conclusion** Old-old adults show worse performance in mental state understanding, while young-old adults performance as well as young adults. The impairment of inhibitory control can partly explain the decline of mental state understanding in old-old adults.

### INTERDEPENDENCE OF COGNITIVE DEVELOPMENT AMONG THE OLDEST-OLD

V. Thorvaldsson<sup>1</sup>, T. Svensson<sup>2</sup>, B. Johansson<sup>1</sup>, *1. University of Gothenburg, Gothenburg, Sweden, 2. Lund University, Lund, Sweden*

Previous estimations of interdependence across changes in different cognitive abilities in middle age and old age are generally reported as low to moderate. In this study we evaluate the coupling of cognitive trends in very old age using data drawn from a representative Swedish sample (Lund80+ study), followed annually from age 80 until death, on variety of cognitive abilities. Results from a series of multivariate multilevel growth curve models revealed high, or very high, positive correlations across estimated linear rate of changes, and relatively low positive correlations across time specific deviations from the individual linear trends. In all comparisons, a time to death-based time structure accounted better for data than a chronological age metric (according to Akaike's Information Criterion). The age-based models tended to underestimate the associations. Biological and health related mediators of the interdependence among cognitive changes in very old age are further evaluated.

### THE AGING CNS: ASSOCIATION BETWEEN GENE CANDIDATES IN THE CHOLESTEROL PATHWAY AND LONGITUDINAL COGNITIVE CHANGE

C.A. Reynolds<sup>1</sup>, C. Zavala<sup>1</sup>, M. Gatz<sup>2,5</sup>, L.L. Vie<sup>1</sup>, B. Johansson<sup>3</sup>, B. Malmberg<sup>4</sup>, J.A. Prince<sup>5</sup>, N.L. Pedersen<sup>5,2</sup>, *1. University of California Riverside, Riverside, California, 2. University of Southern California, Los Angeles, California, 3. University of Gothenburg, Gothenburg, Sweden, 4. Jönköping University, Jönköping, Sweden, 5. Karolinska Institutet, Stockholm, Sweden*

The APOE gene, encoding apolipoprotein E, features in cholesterol metabolism and has been associated with cognitive performance and change; however, the relationship of additional candidates in the cholesterol pathway has been rarely examined. We considered the association of 25 genes in the cholesterol pathway with longitudinal cognitive performance, testing for age trends and sex-specific effects. Altogether, we evaluated 432 SNP variants genotyped in over 1600 individuals from three population-based Swedish twin studies with up to six waves of cognitive measurement spanning 19 years. Controlling for APOE, cohort, retest, educational attainment and baseline illness, nominally significant effects were observed for 10-16% of the SNPs across eight cognitive tests representing verbal (Synonyms, Information), spatial/fluid (Block Design, Figure Logic, Card Rotations), memory (Thurstone Picture Memory, Digit Span) and perceptual speed (Symbol Digit). The single smallest p-value was observed for the simple association of an ABCA1 candidate (rs12350560) and perceptual speed decline ( $p = 1.18E-06$ ). For other candidates, such as LRP1 and CETP, we observed potential sex moderation for multiple variants (smallest  $p = 1.22E-04$ ). Consistency of findings across cognitive tests and whole gene (multiple SNP) methods are evaluated. Given recent work suggests that serum lipids may differentially predict cognitive change in men and women, the examination of multiple gene candidates in the cholesterol pathway with cognitive change trajectories ought to consider differences in men and women.

### RELATIONSHIP BETWEEN PHYSICAL AND COGNITIVE PERFORMANCE IN OLDER PEOPLE: RESULTS FROM ELES STUDY

E. Urdaneta, M. Gonzalez, U. Diaz-Orueta, D. Facal, A. Rodriguez-Laso, J. Yanguas, *INGEMA, Donostia-San Sebastian, Gipuzkoa, Spain*

**Objective:** In the last years, the study of the cognitive and physical status has become one of the most interesting topics in the literature (Aichberger, Busch, Reischies et al., 2010; Small, Dixon & McArdle, 2011). The aim of this study manuscript is to analyze the relationship between physical and cognitive performance in a Spanish representative sample over 50 years old. **Methods:** Data presented here derived from the pilot study of the ELES (Spanish longitudinal study on aging). ELES is an interdisciplinary panel study created to track the aging process of the Spanish population for a period of 20 years. Regarding physical performance, two variables were analyzed: aerobic endurance and speed of gait. Cognitive performance was assessed by: verbal memory (immediate and delayed), working memory, visuomanual speed, phonological and semantic fluency, denomination and general cognitive functioning. **Results:** A representative population sample of 1,382 Spanish community dwelling individuals 50 years and over have been interviewed. Partial correlations controlling for age, gender and years of education were carried out between physical performance and cognitive functioning. Statistical significant correlations ( $p<0.05$ ) were found between: (1) speed of gait and immediate verbal memory, learning potential, semantic fluency; (2) aerobic endurance and verbal memory (immediate and delayed), learning potential, semantic and phonological fluency, denomination. **Conclusions:** Relationships have been found between both speed of gait and aerobic endurance and functions even when controlling co-variables like age, gender and years of education. A longitudinal study of these relations would help to under-

stand the trajectories of cognitive and physical functioning as well as the influence between these variables.

### **AGE DIFFERENCES IN REMEMBERING TO RESUME INTERRUPTED TASKS**

L. Willoughby<sup>1</sup>, M. Roffler<sup>1</sup>, K. Huber<sup>2</sup>, E. Hilvert<sup>1</sup>, B. Olbinski<sup>1</sup>, 1. *Saint Louis University, St. Louis, Missouri*, 2. *University of Missouri, St. Louis, St. Louis, Missouri*

Remembering to perform an intended action at the proper time, or prospective memory, is critical in maintaining functional independence. Remembering to return to an interrupted task is one example of when dependence on prospective memory functioning can play a significant role in daily life. In this preliminary study, we investigated age differences in returning to interrupted tasks using a controlled laboratory design. We adapted the procedures used by Dodhia and Dismukes (2009) and examined prospective memory performance under varying levels of interruption length and enhancements at encoding and retrieval. Fifteen community-dwelling older adult participants (age 60 years or older) were compared with data collected from 85 younger adults. Participants were randomized to one of three enhancement conditions (encoding, retrieval, or none) and answered trivia-like questions in thematic blocks. Six question blocks were interrupted with a short, medium, or long interruption (two of each). Fisher's exact tests were used to examine age differences in remembering to resume the interrupted task both times per list length condition or not across the different encoding conditions. The results suggest that older adults were less likely to resume the interrupted task following long interruptions and that this difference may be driven by the condition where no enhancements occurred. This study offers insight into important age differences and considerations when attempting to optimize cognitive performance in a multi-task environment.

## **SESSION 585 (POSTER)**

### **CREATIVE COMMUNICATIONS**

#### **NARRATIVE CREATIVITY IN STROKE SURVIVORS: IMAGES OF APHASIA**

H. Ulatowska, *University of Texas at Dallas, Dallas, Texas*

The investigation is a continuation of our studies of illness stories and specifically stroke stories in the elderly. It discusses quest stories of three writers who regained their written language after the stroke and continued their literary careers. One of them is a Swedish poet who won the Nobel Prize in 2011. The other two are prominent American writers. The analysis of the language produced in their illness stories focuses on the themes of perception of psychological effect of loss, identity change, perceptions of themselves by other people, and reflections on their vulnerability and impending death. The remarkable feature is that the recovered language generated in their illness stories reflects their premorbid style and coherence. The study adds to the field of narrative gerontology by providing an understanding of biographical construction and coherence in old age. It also conveys deep human reflection on life devastation but also triumph in regaining the heights of what makes us unique.

#### **SENSITIVITY TO LISTENER NEEDS AND SOCIAL RELATIONS IN OLDER ADULTS**

D. Keller-Cohen, *Institute for Research on Women and Gender, University of Michigan, Ann Arbor, Michigan*

Speakers have been shown to adapt their speech depending on the real or perceived characteristics of listeners different in age. Does the social engagement of older adults affect their ability to adapt their speech to listeners of different ages? Participants (N=34, mean=82 yrs) were surveyed about their social interactions for the past two weeks: number of people, the frequency of interactions, and their satisfaction. Two

language tasks were each used in speaking to a 10 year and a 30 year old: 1) explain how to make a sandwich and 2) narrate a story from a picture sequence. Language variables were: number of wordsTOTWD, number of different wordsDIFFWD, syntactic complexity SYNCOM, number of clausesTOTCL, idea densityIDEADEN, and number of ideasTOTIDEA. A repeated measures ANOVA for each language variable, using demographics and frequency of total interactions as independent variables, revealed a main effect for frequency of interactions and a significant interaction between task and frequency of interactions. A multiple regression found that the frequency of interactions explained a significant amount of the variance for TOTWD, DIFFWD, TOTIDEA, and TOTCL in the sandwich task when talking to a ten year old. This study suggests that older adults with more social interactions showed more linguistic adaptations when using procedural language with a child and points to the need to examine different types of language use when assessing social engagement in aging. Finally, it points to the need to further assess how social contact impacts language use in aging.

#### **HOW TO COMMUNICATE AND "CONNECT" WITH ALZHEIMER'S: QUALITATIVE OBSERVATIONS OF FAMILY VISITS WITH RELATIVES WITH DEMENTIA IN NURSING HOMES**

L. Chen, L. Levy-Storms, *Social Welfare, University of California, Los Angeles, Los Angeles, California*

Family members may find visiting loved ones with dementia especially challenging. Although communication training interventions exist to improve the quality of their visits, the institutional context requires additional insights and strategies. How do family caregivers emotionally relate to their loved ones with dementia during visits in nursing home? A dyadic perspective in caregiving relationships and attachment theory suggests mutual and simultaneous communication dynamics, which, when observed, may demonstrate the provisions of emotional support. Ten regularly-involved family caregivers and their relatives with dementia were videotaped. Quantitative analyses indicated effective use of verbal and non-verbal communication techniques, but qualitative data analyses, including open-coding, categorizing, and grouping into families, resulted in four inter-related themes: 1) sharing discernible comfort, 2) conducting topically distinct conversation, 3) creating natural interaction, and 4) providing multi-dimensional emotional support. Specifically, family members shared discernible comfort with residents and conducted topically distinct conversations. In doing so, residents began to initiate certain questions to participate in the interaction, which, in turn, led to observations of emotional support. That is, family members' subtle verbal and non-verbal communication enabled them to seemingly provide emotional support. Family members and residents shared physical proximity as well as emotional attachment in a natural, primal manner, despite the potential barriers of dementia. The nuances identified in their interactions and communication training interventions enhanced with these subtle techniques may empower less-involved family members to visit more often, feel more comfortable, and ultimately improve the quality of life of their loved ones with dementia.

#### **HOW DO COMMUNICATION DIFFICULTIES IMPACT THE SOCIAL LIVES OF OLDER ADULTS?**

A.D. Palmer<sup>3,1</sup>, J. Newsom<sup>3</sup>, K.S. Rook<sup>2</sup>, 1. *NW Clinic for Voice & Swallowing, Oregon Health & Science University, Portland, Oregon*, 2. *University of California, Irvine, Irvine, California*, 3. *Portland State University, Portland, Oregon*

It is known that communication impairments affect the nature of social relationships in specific populations and it is also known that the size and nature of adults' social networks change with age. To date, however, there is limited information about the relative impact of communication difficulties in the older population. To examine this relationship, data were analyzed from a representative national sample of

community-dwelling adults aged 65 and older living in the continental United States (n=742). All adults had been screened for cognitive impairment prior to inclusion. Results from multiple regressions indicated that communication difficulty was significantly associated with several parameters of social relationships even after controlling for age, gender, partnership status, health, and functional limitations. Communication difficulty was a significant predictor of loneliness ( $p < .001$ ), fewer positive social exchanges ( $p < .01$ ), smaller network size ( $p < .05$ ), and fewer social activities ( $p < .01$ ) but was not a significant predictor of negative social exchanges. These findings suggest that communication impairments in older adults may have a more significant impact on positive than on negative aspects of social relationships.

### **PRESCRIPTION DRUG ADVERTISEMENTS FOR ALZHEIMER'S DISEASE: A CONTENT ANALYSIS**

J. Gooblar, B.D. Carpenter, R.E. Rieger, L. Oglander, J. Shapero, *Psychology Department, Washington University in St. Louis, St. Louis, Missouri*

**Introduction:** Prescription drug advertising is a major source of healthcare information for consumers and physicians. Previous research has examined pharmaceutical advertising for an array of disorders, but no studies have assessed advertisements for Alzheimer's disease (AD) medications. The purpose of this study was to review AD drug advertisements to begin understanding their potential impact. **Methods:** We searched AD, neurology, and general medicine journals (n=5), as well as high-circulating popular magazines (n=4) for advertisements. We also reviewed advertisements in a pharmaceutical advertisement database. All advertisements appeared in print between January, 2008 and February, 2012. Three independent coders reviewed each advertisement for graphic features and content. **Results:** We identified 130 advertisements, 31 of which were unique. Among the unique advertisements, 26% (n=8) appeared in popular magazines, while 74% (n=23) appeared in journals. Advertisements for donepezil appeared most frequently (n=14), while advertisements for memantine (n=7) and rivastigmine (n=7) appeared less often. Advertisements featured a variety of bar and line charts to communicate information about drug efficacy. Other graphic features included brain images, photographs of presumed family members, and physicians. Benefits and side effects were presented strategically to achieve persuasive aims. Narrative tactics attempted to influence perceptions of the drug's impact on quality of life. **Summary:** Prescription drug advertisements for AD appear in popular magazines and professional medical journals. These advertisements attempt to influence consumers and physicians with a variety of design and narrative strategies. Future research could use experimental methods to examine their impact on consumers and health care professionals.

## **SESSION 590 (POSTER)**

### **CROSS-CULTURAL PERSPECTIVES ON COGNITIVE SCREENING**

#### **A LATENT PROXY FOR DEMENTIA SEVERITY IN THE HISPANIC ELDERLY (HEPESE)**

D.R. Royall<sup>1,2,3</sup>, R.F. Palmer<sup>3</sup>, D. Espino<sup>3</sup>, *1. Psychiatry, UTHSCSA, San Antonio, Texas, 2. STVHS GRECC, San Antonio, Texas, 3. UTHSCSA /Family & Community Medicine, San Antonio, Texas*

**Background:** We have re-conceptualized dementia as "the cognitive correlates of functional status" (Royall et al., JAD in press). A latent proxy, "d" is uniquely related to dementia severity and accurately distinguishes Alzheimer's disease (AD), and Mild Cognitive Impairment (MCI) from each other, and controls [Areas Under the Curve (AUC) 0.91-0.997]. It may be possible to construct d from minimal psychometric assessment. **Methods:** Wave 7 data were used to construct d from MMSE and informant rated Instrumental Activities of Daily Living (IADL) among N = 1078 Hispanics (mean age = 85.7, education = 5.0

yr.; MMSE = 21.7). All observed measures were adjusted for age and gender. **Results:** d contributes variance to a wide range of clinical outcomes independently of "f", i.e., the shared variance in IADL items not-related to cognition. d adds more explanatory variance to these models than multivariate regression models constructed from the same observed variables (i.e., 55% vs. 39% for the prediction of care-giver rated medication management). **Conclusions:** The latent variable "d" can be constructed from a minimal dataset, widely available in many large epidemiological studies. It differs from f only in that MMSE scores load on d, and yet d explains variance in clinical outcomes independent of f and more variance than the observed variables used to construct d and f. In other cohorts, d scores are strongly associated with consensus clinical dementia diagnoses. Optimal thresholds for AD's diagnosis can now be transposed to HEPESE and d-based diagnoses validated against blind clinical assessment.

### **ASSESSING THE CROSS-CULTURAL MEASUREMENT PROPERTIES OF THE NEUROPSYCHIATRIC INVENTORY QUESTIONNAIRE**

P. Sayegh, B.G. Knight, *Department of Psychology, Univ Southern California, Los Angeles, California*

The Neuropsychiatric Inventory Questionnaire (NPI-Q) is commonly used to measure dementia-related behavioral and psychological symptoms, such as agitation, delusions, and apathy. However, little attention has been paid to the cross-cultural measurement properties of this scale, calling into question whether meaningful comparisons can be made across cultures when using this scale. Therefore, we tested the factorial and scalar (i.e., intercept) invariance of the NPI-Q in a sample of 444 Hispanic and 11,081 non-Hispanic White outpatients diagnosed with normal cognition or dementia at their initial Alzheimer's Disease Research Center evaluations nationwide. We conducted confirmatory factor analyses to test the cross-cultural measurement invariance of our hypothesized NPI-Q four-factor structure (hyperactivity, apathy, psychosis, and apathy/vegetative symptoms). Results revealed that this four-factor structure was invariant across groups ( $\chi^2/df = 7.72$ , CFI = .918, TLI = .873, RMSEA = .024), as were the patterns of factor loadings ( $\Delta\chi^2(6) = 6.80$ ,  $p = .34$ ,  $\Delta CFI = .00$ ) and covariances ( $\Delta\chi^2(12) = 12.26$ ,  $p = .43$ ,  $\Delta CFI = .00$ ). However, the NPI-Q failed to demonstrate cross-cultural scalar invariance. These findings indicate that the NPI-Q four-factor structure is equivalent and operates similarly in both Hispanics and non-Hispanic Whites, suggesting that meaningful interpretations can be made using this scale across these groups. However, the lack of scalar invariance suggests that Hispanics may be responding systematically higher or lower across items due to issues unrelated to the constructs of interest and that cross-cultural comparisons of the latent mean estimates of the four NPI-Q factors cannot be made.

### **DEVELOPING A SELF-ADMINISTERED CHECKLIST ON COGNITIVE DECLINE FOR OLDER ADULTS IN JAPAN**

F. Miyamae<sup>1</sup>, M. Sugiyama<sup>1</sup>, H. Inagaki<sup>1</sup>, C. Ura<sup>1</sup>, M. Ijuin<sup>1</sup>, S. Awata<sup>1</sup>, H. Yamaguchi<sup>2</sup>, R. Takahashi<sup>1</sup>, *1. Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan, 2. Gunma University, Maebashi, Japan*

In this study, we developed and validated a self-administered checklist for Japanese older adults to recognize decline in their cognitive function. In Japan, a growing number of older adults live by themselves; thus, it is increasingly difficult to expect their family members to monitor their physical and cognitive functioning. Accordingly, we aimed to create a set of items with which for older adults to evaluate their instrumental ability of daily living, while considering a relatively higher level of education in the current older population. We collected data from 393 community-dwelling older adults who participated in a 3-month exercise-oriented program to prevent cognitive decline in metropolitan Tokyo and suburban Gunma (mean age = 72.9). Most participants maintained a high level of cognitive function (mean score on MMSE = 27.2); only 1.5% had been diagnosed with dementia. We first generated 20 items

through consultation with geriatricians. We then conducted an exploratory factor analysis on these 20 items, which extracted three factors: Activity Related to Domestic Chores (ADC), Activity for Socializing (AS), and Activity for Problem-Solving (APS). After omitting items with limited factor loading, 15 items were selected finally. A high level of internal consistency was indicated among items selected for each factor by computing Cronbach's alpha. Convergent validity was assessed by examining whether scores on the final set of 15 items parallel with MMSE scores. Specifically, we confirmed that those who scored 24 or over on MMSE were higher than their lower-MMSE-score counterparts both in AS and in APS.

### REVISION AND VALIDATION OF THE MULTIDIMENSIONAL SCALE OF CHINESE INDIVIDUAL MODERNITY IN A SAMPLE OF CHINESE OLDER ADULTS

X. Bai<sup>1,2</sup>, D. Lai<sup>3</sup>, N. Chow<sup>1</sup>, 1. Faculty of Social Sciences, The University of Hong Kong, Hong Kong, China, 2. Jockey Club Centre for Positive Ageing, Hong Kong, China, 3. The University of Calgary, Calgary, Alberta, Canada

Research findings have identified that older people adapting well to the societal modernization process would result in a positive self-image and satisfaction in life. Research on individual modernity on older adults from non-Western cultural backgrounds is scant. This study revised and validated the 50-item Multidimensional Scale of Chinese Individual Modernity Scale (MS-CIM) in a sample of older Chinese. The data were collected in survey research with a non-probability sample of 445 Chinese elders at age of 60 and above in Wuhan, China. A structured questionnaire covering a list of topics including individual modernity, self-image of ageing, and life satisfaction was used for data collection. Exploratory Factor Analysis (EFA) using principal component analysis and varimax rotation was conducted with 350 participants randomly selected from the sample, followed by confirmatory factor analysis (CFA) with another 350 participants. Both the EFA and CFA results supported that 25 items from the original MS-CIM were loaded into a conceptually meaningful seven-factor model, which included Affective Hedonism-Freedom of Marriage; Affective Hedonism-Respect for Affection; Egalitarianism and Open-Mindedness-Egalitarianism; Social Isolation and Self-Reliance-Social Isolation; Optimism and Assertiveness; Egalitarianism and Open-Mindedness-Open-Mindedness; and Social Isolation and Self-Reliance-Self-Reliance. The final 25-item MS-CIM vindicated an acceptable level of internal consistency (Cronbach's alpha = 0.76) and test-retest reliability ( $r = 0.83$ ). Its criteria-referenced validity was illustrated by its positive correlation with elders' interest in carrying out daily activities, self-image of ageing, and life satisfaction. This revised version of MS-CIM is a psychometrically sound instrument for measuring individual modernity of older adults from the Chinese culture.

### SESSION 595 (POSTER)

#### CULTURE, ACCULTURATION, AND WELL-BEING

##### IDENTIFYING LEVEL OF ACCULTURATION AND ITS IMPLICATIONS ON HEALTH AMONG COMMUNITY-DWELLING CHINESE OLDER ADULTS IN CHICAGO

F. Huang<sup>1</sup>, M.A. Simon<sup>2</sup>, E. Wong<sup>3</sup>, B. Wong<sup>3</sup>, E. Chang<sup>1</sup>, Y. Li<sup>1</sup>, X. Dong<sup>1</sup>, 1. Rush University Medical Center, Chicago, Illinois, 2. Northwestern University, Chicago, Illinois, 3. Chinese American Service League, Chicago, Illinois

Background: The onset of U.S. population aging calls for a thorough understanding of its effects to provide better care for the elderly. This study aims to identify the level of acculturation from the perspectives of community-dwelling Chinese older adults in Chicago. Methods: This cross-sectional study has the largest cohort of U.S Chinese older adults in epidemiological studies. Acculturation was measured using a 12-

question scale for Hispanics. Results: Among the surveyed participants (N=1,112), mean age was 74.8, and sixty-four percent were female. Acculturation refers to the participants' integration into American society by way of adapting the English language and socially interacting with Americans. With respect to language use, 95.7% of the participants speak only Chinese or very little English and 92 % only think in Chinese. In terms of media usage, 92.3 % prefer only Chinese media, TV programs and movies. Lastly, regarding ethnic social relations, 91.6 % prefer attending social gatherings with only Chinese persons, and 91.3% only have Chinese friends. But with regards to the acculturation of the children of the participants, 44.4 % wish for their children to resist acculturation and interact only with Chinese person while 28.2% wish for their children to have an equal number of Chinese and American friends. Conclusion: The majority of Chinese seniors experience low level of acculturation, but a much smaller percentage wishes the same for their children. A population-based longitudinal study is necessary to examine the complexities of acculturation and its multifaceted effects on the health of Chinese older adults.

##### SIBLING CONFLICTS AND PSYCHOLOGICAL WELL-BEING IN KOREAN OLDER ADULTS: DOES SIBLING SEX MATTER?

Y. Chee<sup>1</sup>, M. Lim<sup>2</sup>, 1. Ewha Womans University, Human Ecology Research Institute, Seoul, Republic of Korea, 2. Ewha Womans University Department of Psychology, Seoul, Republic of Korea

In informal social networks, kinship is most likely to serve as a primary source of support. Particularly in a close knit family oriented society like Korea, relationships with siblings who have shared a long personal and family history can exert significant impacts on mental health in later life. Based on the hierarchical compensatory model suggesting that a preferred order exists in receiving informal support in elderly persons, we examined sibling relationships (warmth, conflict), social support, and life stress as predictors of psychological well-being (depression, life satisfaction) in different sex constellations of siblings (sisters, brothers, mixed sex siblings). Data were drawn from 249 older adults (M age = 71.18, SD = 6.79) recruited in Korea, with one closest sibling in mind. Regression analysis ( $p < .05$ ) showed significant interaction effects of sibling conflict and social support on depression as well as interaction effects of sibling conflict and life stress on life satisfaction in the entire sample. Further analysis of interaction effects indicated that ( $p < .05$ ) brothers receiving low social support with high sibling conflict experienced greater depressive symptoms compared to those with low sibling conflict. Also, brothers experiencing more life stress with high sibling conflict had lower life satisfaction than those with low sibling conflict. Sisters only with high sibling conflict reported higher depression levels than those with low sibling conflict. In mixed-sex siblings, no statistically significant main and interaction effects were found on psychological well-being. Findings partially confirmed the roles of siblings as support sources among same sex siblings.

##### CULTURAL IDENTITY AND FAMILY SUPPORT EXCHANGES AMONG LATINO AND ASIAN AMERICANS

W. Tseng<sup>1</sup>, K. Hoshino<sup>2</sup>, N. Hikoyeda<sup>3</sup>, D. Gallagher-Thompson<sup>4</sup>, J. Ventura<sup>5</sup>, H. Inoue<sup>6</sup>, 1. School of Public Health, UC Berkeley, Berkeley, California, 2. Institute of East Asian Studies, University of California, Berkeley, Berkeley, California, 3. Stanford Geriatric Education Center, Stanford, California, 4. School of Medicine, Stanford University, Stanford, California, 5. East Bay Asian Youth Education Center, Oakland, California, 6. Synarc, Inc., Newark, California

PURPOSE: This research study examined the relationship between cultural identity development and family support from the perspectives of Latino and Asian American adults. METHODS: The study participants included 20 Peruvian, 20 Chinese, and 20 Japanese Americans who were foreign born, lived in the United States less than 30 years,

had at least one child born in the United States, and was between 40 and 59 years old. In-person interviews were conducted in the San Francisco Bay Area. Content analysis was conducted. **RESULTS AND DISCUSSION:** The results indicated all Japanese adults and almost all Chinese and Peruvian adults had expectations that they would provide supports for their children more than expectations that they would receive supports from their children. In addition, most Chinese, Japanese, and Peruvian adults had expectations that they would provide supports for their parents more than expectations that they would receive supports from their parents. Further, those who were evaluated as cultural identity clarification and biculturalism were more likely to have expectations they would receive supports from their children than those who were evaluated as cultural encapsulation). Those who were evaluated as cultural identity clarification and Biculturalism were more likely to have expectations they would provide supports for their elder parents than those who were evaluated as Cultural Encapsulation. Health professionals need to more effectively serve patient needs based on appropriate assessments that include evaluation criteria of patient's cultural identity and family support.

### **THE TRANSITION TO WIDOWHOOD AND TRAJECTORIES OF DEPRESSIVE SYMPTOMS AMONG OLDER MEXICAN AMERICANS**

M. Monserud, K. Markides, *University of Texas Medical Branch, Galveston, Texas*

Despite numerous studies on the association between widowhood and depressive symptomatology among older adults, little is known about the impact of late-life spousal loss on psychological well-being among Mexican Americans. This study draws on six waves of data from the Hispanic Established Population for the Epidemiologic Study of the Elderly (1993-2007) to investigate trajectories of depressive symptoms among recently widowed, continuously widowed, and continuously married Mexican Americans aged 65 to 99 years. Specifically, using growth curve models, this study examines whether the marital status differences in the age patterning of psychological well-being among older men ( $n = 3,157$ ) and women ( $n = 2,856$ ) of Mexican descent are contingent on individuals' social integration, socioeconomic resources, and health status. Regardless of gender and marital status, higher social support, more frequent church attendance, lower financial strain, and the absence of chronic conditions and ADL limitations were beneficial for psychological well-being among older Mexican Americans. For men, coresidence with adult children and higher education were also related to fewer depressive symptoms. The psychological well-being of continuously widowed Mexican Americans did not differ significantly from that of the continuously married. In contrast, the recently bereaved experienced more depressive symptoms. Yet, social support, socioeconomic resources, and, to a greater extent, health status played an important role in the psychological well-being of recently widowed Mexican Americans at the higher end of the study age range. After accounting for these factors, the differences in depressive symptomatology between the recently widowed and the continuously married narrowed in later life.

### **RELIGIOUS AFFILIATION AND INTERNATIONAL RETIREMENT MIGRATION -DISTINCTIVE FEATURES, MOTIVATIONS AND EFFECTS**

J. Spannari, *Theology, University of Helsinki, Finland, Kotka, Finland*

In migrant communities the role of religion is usually emphasized. Several studies show the relative importance of religion in old age. Isn't it, then, self-explanatory that religious participation and affiliation have a significant role in international retirement migration (IRM) communities? There are, however, distinctive features in IRM communities that call for a closer look. Many IRM communities or persons are on the border of being immigrants or emigrants in their practice of seasonal migration, regularly splitting their year between the country of origin

and their seasonal second home. This gives seasonal IRM a distinctive nature for example in questions of assimilation, motivation and identity. This presentation examines the religious life in the community of Finnish older adults of the sunbird community in Costa del Sol, Spain. The community is studied via mixed methods approach, data ranging from a survey to in-depth interviews and ethnographic observation. The key questions are: What are the motivating factors in participating religious activities in IRM communities? What are the pronounced and perceived effects of the participation? To answer these questions this paper discusses three distinctive factors of the religious participation and affiliation in an IRM community: First the notions of personal liberation or intensification of life related to motivations in both religious participation and the decision to migrate; Second the underlying blend of religion, culture, history and national identity used as a toolkit in the new circumstances; Third the distinctive meanings, roles and functions given to the religious community in the foreign country.

## **SESSION 600 (POSTER)**

### **DEMENTIA/DELIRIUM**

#### **PREDICTING QUALITY OF LIFE IN COMMUNITY-DWELLING OLDER ADULTS WITH MILD COGNITIVE IMPAIRMENT (MCI)**

S.M. McCurry, R.G. Logsdon, K.C. Pike, E.L. McGough, L. Teri, *University of Washington, Seattle, Washington*

Quality of life is a complex construct that incorporates objective and subjective perspectives; medical, psychosocial, and environmental factors; and individual behavioral responses to each unique situation. The current study sought to examine predictors of self-rated quality of life (QOL-AD) in a group of independently-living older, physically inactive adults with MCI based upon Lawton's five categories of behavioral competence (health, functional health, cognition, time use, social behavior). Subjects were 201 participants in a randomized trial of exercise in older adults with MCI. Average age was 84.8 years (range 70-105), 80% were female, and 79% had some education past high school. Mean MMSE score was 26.5 (range 18-30). All participants had a Clinical Dementia Rating of 0.5. At baseline, fatigue (Multidimensional Fatigue Inventory; MFI) accounted for 47% of the predictive variance in QOL, and depression (Geriatric Depression Score) accounted for 9% of the variance. Other measures of health (age, number of co-morbid medical conditions), function (ADAS-FAS, SPPB), cognition (ADAS-Cog, Trails B), time use (PASE), and social behavior (lives alone) were non-significant in the model. Similar results were found in models using individual MFI subscales (general, physical, and mental fatigue; reduced activity and motivation), with the exception of general fatigue, which was not significant. MFI subscale inter-item correlations and descriptive statistics were comparable to those reported for other chronically ill populations. Results suggest that fatigue has a significant impact on QOL in mildly cognitively impaired older adults, and that interventions specifically targeting fatigue may be crucial for maintaining independent function in this population.

#### **QUALITY OF LIFE IN DEMENTIA: RELATIONSHIP TO SUBJECTIVE PAIN REPORTS BY PATIENTS AND THEIR CAREGIVERS**

G. Santangelo, L. Gitlin, *Johns Hopkins University, Baltimore, Maryland*

Pain in dementia patients is often under-recognized and under-treated because of limited assessments for this population and patients' cognitive limitations that prevent self-reporting. Untreated pain adversely affects all aspects of quality of life (QOL). This study evaluated relationships between QOL as rated by caregivers and patients and pain as rated by patients with moderate to severe dementia. Eighty-eight dyads (patients with dementia and caregivers) were interviewed using 3 QOL

measures; Quality of Life in Alzheimer's Disease, DEMQOL and EQ5-D (health-related utility scale). Patients reported pain level using the Pain Assessment in Advanced Dementia (ranging from 0-6 on the scale with 10 being the worse pain). For this sample, 64% of patients reported having some level of pain. However, only 17% were on pain medications. Independent T-tests revealed differences between patients with and without pain such that patients with pain had lower QOL on all three scales and as rated by patients and caregivers, except for EQ5-d patient scale (DEMQOL [patients]:  $p < 0.015$ ; DEMQOL [caregivers]:  $p < 0.000$ ; QOLAD [patients]:  $p < 0.016$ ; QOLAD [caregivers]:  $p < 0.012$ ; EQ5-d [caregivers]:  $p < 0.000$ ). Also, having pain was significantly correlated with sleep medication use ( $r = 0.410$ ,  $p < 0.000$ ). In a regression, patient age and pain medication use did not predict pain level. This cross-sectional study highlights that pain is poorly managed and under-treated in dementia patients. Yet, its presence erodes QOL as perceived by patients and caregivers and for all measures except patient ratings on EQ5-D. This index may be too broad to differentiate patients' perceptions.

### **AN EVALUATION OF A TRAINING PROGRAM TO INCREASE QUALITY OF LIFE FOR INDIVIDUALS WITH DEMENTIA**

C. Garrison-Diehn, C. Rummel, J. Fisher, *Clinical Psychology, University of Nevada, Reno, Reno, Nevada*

Long-term care residents with dementia displaying behavioral problems are often prescribed psychiatric drugs to manage their behavior (Kamble et al, 2009; Stevenson, 2010). These drugs can decrease quality of life for these individuals due to adverse effects including sedation, falls, loss of language, and premature death. This presentation describes the evaluation of a training program funded by the State of Nevada's Bureau of Healthcare Quality and Compliance. The training program utilized a train-the-trainer protocol to promote a contextual model of dementia care. This model emphasizes the: (1) detection, reduction, and prevention of excess disability due to factors such as over-medication and untreated pain; (2) preservation of adaptive behavior; and (3) prevention and management of challenging behaviors through behavioral and environmental strategies. Training was provided to staff in eight skilled nursing facilities and 13 group homes. Outcome data, including observations of residents at two long-term care facilities in northern Nevada, pre- and post- self-report measures of staff member knowledge in the application of restraint free care, and facility-wide descriptive statistics on psychotropic drug use at pre-training and three months post-training will be presented. Barriers to the generalization of training content to resident care will be discussed.

### **A MULTIDIMENSIONAL APPROACH TO ASSESSING QUALITY OF LIFE IN PERSONS WITH DEMENTIA**

C. Rummel, J. Fisher, *University of Nevada - Reno, Reno, Nevada*

Assessing quality of life (QoL) in persons with dementia presents a number of challenges due to the inherently subjective nature of the construct and the verbal deficits that develop over the course of degenerative dementias. Proxy judgments about affected individuals' functioning and QoL can directly influence crucial care decisions for this vulnerable population. The current study employed a multi-trait multi-method paradigm to examine the discrepancies and congruencies between proxy (i.e., family and professional caregivers), direct observation, and self-report measures of QoL for persons with dementia residing in long term care facilities. Participants included 48 long-term care residents with dementia and their respective family and professional caregivers. Results indicated that persons with dementia, professional caregivers, and family caregivers have distinctly different perspectives on the QoL of the person with dementia. Resident and professional caregiver ratings of QoL were significantly higher than family caregiver ratings. Multiple regression was used to examine the extent to which clinical factors predicted QoL ratings, as well as discrepancies in the QoL

ratings. Cognitive impairment, functional status, psychiatric symptoms, and observed affect were variably associated with QoL ratings across the three participant groups. After attending this session, professionals will have an increased understanding of the importance of assessing multiple indicators and perspectives of the quality of life of elderly persons with dementia.

### **FORGET ME NOT: DEMENTIA IN PRISON**

T.M. Maschi, M.E. Morrissey, *Graduate School of Social Service, Fordham University, New York, New Jersey*

The number of older adults with dementia in U.S. prisons is rapidly rising. Yet, the vast majority of this marginalized subgroup of the aging population is left neglected behind bars without access to adequate medical and mental health care services. A proactive, interdisciplinary collaborative efforts to improve practice, policy, and research and to develop a high quality evidence-based continuum of care for this aging population are urgently needed. The objective of this presentation are to raise awareness of the life and experiences of persons with dementia in prison, and to stimulate discussion, research, and advocacy efforts for this forgotten subgroup of older Americans. It describes the growing number of older adults with dementia in U.S. prisons, high risk factors for dementia present in the prison population, and the life and experience of persons with dementia in the culture and environment of prison that is primarily not designed for them. The current state of services and programs for dementia in prison are reviewed. It concludes by proposing practice, policy, and research related priority areas and strategies for interdisciplinary gerontological responses.

### **LIVING WELL WITH DEMENTIA: A NEW FRONTIER FOR AGING-AFFIRMATIVE SOCIAL WORK RESEARCH AND PRACTICE**

J. McGovern, *NYU, New York, New York*

Without a cure, enduring treatments, or sufficient interventions, dementia continues to be perceived as one of the most dreaded late life outcomes, with consequences to how the illness is experienced by the 30-million people who are affected worldwide. However, emergent scholarship that challenges the medical model by addressing the experience of affected relationships, rather than the illness of individuals, hints at a more nuanced experience than was previously suspected. Without denying the challenges of the experience, this paper suggests that recognizing — and facilitating — the possibility of positive outcomes many constitute a new frontier in aging-affirmative social work research and practice. Following in the footsteps of recent qualitative research that submits that the experience cannot be solely defined by loss, the purpose of this phenomenological study is to deepen understanding of the dementia experience in the context of relationships. Ultimately, the study makes recommendations for care based on its emergent findings, which suggest a relationship between couplehood, meaning-making and quality of life for older couples affected by cognitive impairment. The recommendations call for an increase in the range of social work interventions for affected family systems, greater preparedness of the workforce to meet the needs of this growing and vulnerable population, and future research that problematizes assumptions about the disease, addresses the experience of a wider range of affected participants, and challenges restricting research methodologies. By adopting a lifecourse and interdisciplinary approach to problem solving, the paper defines a new frontier in Aging and dementia.

### **SHE'S THE ONE I TOLD YOU ABOUT: RESIDENT PERCEPTIONS OF OTHERS' BEHAVIOR IN A DEMENTIA CARE UNIT**

A.D. Peoples<sup>1,2</sup>, R. Rubinstein<sup>2</sup>, J.K. Eckert<sup>2</sup>, *1. Doctoral Program in Gerontology, UMBC/UMB, Baltimore, Maryland, 2. Center for Aging Studies, UMBC, Baltimore, Maryland*

Dementia care units (DCUs) provide specialized care for older adults with dementia. They are often situated within a larger setting, such as

a nursing home or assisted living residence. Unfortunately, DCUs are susceptible to stigma from residents of the other levels of care. DCUs function to shield residents with dementia from the disapproving remarks and comments from residents without dementia. A parallel function is to shield those without dementia from exposure to those with dementia. Our findings suggest that even within the DCU, residents with dementia are subjected to stigma from other residents. Those who are higher functioning often disapprove and take note of the so-called "problem behaviors" of their fellow residents. For example, a resident who steals things from others' rooms is likely to be remembered, and possibly avoided, by other residents for this behavior. This presentation describes how residents in a DCU react to their fellow residents' behaviors. We discuss how different types of behaviors (e.g., urination, perseveration) elicit different reactions from residents (e.g., comments, warnings, avoidance). The ways in which these behaviors are perceived by the observing residents are also examined. Strategies for improving interactions between higher- and lower- functioning residents in dementia care units are discussed. Data for this presentation were drawn from a 5-year, NIA-funded qualitative study on Stigma in long-term care and from an independent project on Stigma. Data consists of over 80 sets of observational field notes and more than 20 ethnographic interviews with staff, family, and residents.

### **PROACTIVE DEMENTIA CARE: INTEGRATING HEALTH EDUCATION AND SOCIAL WORK SERVICES INTO A NEUROLOGY CLINIC**

T.C. Andersen, *Neurology & Social Work, University of Utah, Salt Lake City, Utah*

A diagnosis of Alzheimer's disease entails the need for significant education and support systems for the patient and caregiver. Unfortunately, educational and social work interventions are often delayed until a specific need, or even a crisis, is evident. We have developed proactive dementia care (PDC) - a program integrating health education and social work interventions into the management plan. The goal of PDC is to empower patients and family members with a unified plan tailored for their needs to enable maximizing quality of life. We are conducting an ethics committee approved randomized clinical trial, comparing the effectiveness of PDC and standard dementia specialist care (SDSC) in achieving important caregiver and patient outcomes. SDSC is defined as the usual care a dementia specialist provides unassisted by social work or health education, which depends solely upon patient and family initiated psychosocial interventions. We compare PDC and SDSC using two separate and mutually informative analyses: directly compare PDC and SDSC outcomes at 4 months, analyze within group changes in the PDC group at 4 months to determine effectiveness. Subjects clinically identified as likely to have a degenerative dementia in a specialty clinic are approached for enrollment in the study.

### **DEMENTIA LITERACY AMONG COLLEGE STUDENTS**

M. Pavletic, C. Anderson-Hanley, *Union College, Schenectady, New York*

For the first time in history, the USA will have more old people (above the age of 65) than young people (Alzheimer's Association, 2010). Although many individuals above the age of 65 live productive lives, approximately 10% of those within this demographic suffer from dementia. How can an outnumbered younger population keep these vulnerable members of society functional and safe for as long as possible? Early diagnosis and intervention seem to help, but Generation Y, the group of America's citizens that will face the brunt of the burden from graying Baby Boomers, must be able to recognize the prodromal symptoms of dementia. Learning about the current state of potential caretakers' knowledge of dementia, or dementia literacy, can help experts measure preparedness for this future epidemic. This study examined the dementia literacy of college students, specifically if the degree of contact with those with Alzheimer's affected the amount of knowledge par-

ticipants. Twenty-eight college students completed a dementia literacy questionnaire and were asked to identify symptoms and diagnoses after viewing four video clips of older adults with varying symptoms of dementia. Correlations revealed an association between familial dementia experience and ability to identify prodromal symptoms ( $r = .44$ ). This study's findings resonate with previous research: laypeople's dementia literacy is fair at best (Werner, 2003). Further research should continue to examine college-aged individuals' ability to recognize the early symptoms of Alzheimer's. By understanding the general population's degree of dementia knowledge, education interventions can be tailored to address this serious, debilitating condition.

### **AN INSIDER PERSPECTIVE OF PREFERRED ACTIVITIES IN NURSING HOME RESIDENTS WITH DEMENTIA**

S.H. Tak, *University of Arkansas for Medical Sciences, Little Rock, Arkansas*

Cognitively stimulating and enjoyable activities appropriate to individual needs are important not only to meet regulatory requirements but also to implement resident-centered care for improving quality of life in the nursing home. The purpose of this study was to explore the extent of activity involvement, motivators and barriers from the perspective of NH residents with mild dementia. Twenty six study participants participated in semi-structured, individual interviews. Content analysis of the interview transcriptions was used. The mean age of participants was 85 (S.D., 6.0) years. The majority of them (76.9%) was women. The mean year of education was 13.3 (S.D., 3.2). Their cognitive impairment ranged from moderate to mild dementia with a mean Mini Mental State Exam score of 15.8 (S.D. 4.2). Preliminary results revealed six types of preferred activities: music and arts, social/interpersonal, spiritual/religious, literal, exercise/physical, and games/cards. Family members, friends, and nursing staffs were the motivators for trying out or engaging in activities. Participants reported a wide range of barriers to participating in activities, including cognitive and physical health status and environmental factors. It is critical to assess the needs and abilities of nursing home residents in order to provide tailored activities and promote engagement in activities in nursing home residents with dementia.

## **SESSION 605 (POSTER)**

### **EDUCATIONAL EVALUATION**

#### **WHAT DETERMINES WHETHER A KNOWLEDGE TRANSFER TOOL TO REDUCE MEDICATION RISK SUCCEEDS OR FAILS?**

C. Tannenbaum, *Université de Montréal, Montreal, Québec, Canada*

We conducted an in-depth qualitative study using the phenomenology approach with a sub-set of 32 older adults with polypharmacy taking at least one inappropriate benzodiazepine prescription who participated in a randomized controlled trial of medication risk reduction. Participants received a paper-based knowledge transfer tool comprising a self-assessment component, presentation of the evidence-based risks associated with benzodiazepine use, knowledge statements designed to create cognitive dissonance about the safety of benzodiazepine use, education about drug interactions, peer-champion stories intended to augment self-efficacy, suggestions for equally or more effective therapeutic substitutes for insomnia and anxiety, and simple tapering recommendations. Participants were selected for interviews using a contrast sample design with three crossed strategic variables: cessation of benzodiazepines (yes or no), duration of benzodiazepine use (<5 years or > 5 years), and age (stratified at age 75). Thematic content

analysis comparing the discourses according to the subject types developed from the strategic variables revealed two important categories of information: 1) mechanisms underlying the success of the knowledge transfer tool (components of the tool, duration of use of the benzodiazepines); and 2) reasons for the failure of the knowledge transfer tool (age-related trade-offs between the quantity and quality of remaining life years, and the presence of non-modifiable internal (anxiety traits) or external (“my doctor told me it was OK”) components). Knowledge transfer interventions aimed directly at medication consumers to reduce risk work best for shorter-term drug users who possess the mental flexibility to embrace and incorporate new knowledge, regardless of age.

### **RIGHT UNDER OUR NOSES: WHY ONE NEW FRONTIER ON AGING SHOULD BE A POST-SECONDARY INTERGENERATIONAL CLASSROOM**

M. Murphy, *Social Work, UBC, Kelowna, British Columbia, Canada*

This session will review the findings of a two year multi-method investigation of an innovative post-secondary intergenerational classroom on the Sociology of Aging with students ages 18-102. The session will provide participants with background on intergenerational theory, explain the theoretical framework employed (including social distance theory), and provide an overview of the research methods used. These methods included five different pre-and-post scales (i.e. ; classroom observations; and focus groups with students. This study was approved by an institutional ethics review board and funded with an internal university innovation grant.

### **FRONTIERS, BORDERS AND CROSS PLAYERS IN INTEGRATING MENTAL AND PHYSICAL HEALTH CARE OF AGING PSYCHIATRIC PATIENTS BY CLINICAL INSTRUCTORS AND YOUNG UNDERGRADUATE STUDENTS**

J. Da Silva, A.M. Marins, L. Fernandes, M. Reis, M. Jardim, R. Cotrofe, T. Silva, *Federal University of Rio de Janeiro, Rio de Janeiro, Rio de Janeiro, Brazil*

The aging of psychiatric patients has posed challenges to health care providers and clinical instructors. In particular related to promotion of healthy lifestyles and protective behaviors of more complex aging adults, with mental disorders and physical co-morbidities. This exploratory descriptive study was developed with 150 day patients who had one or more physical co-morbidities and presented physical and mental accelerated aging process, discrepant from their chronological age in the lifespan and 60 young undergraduate students over the course of two years. Educational games were developed to facilitate undergraduate nursing students explore frontiers, borders and cross players in the first contact with psychiatric day-hospital patients and to set discussion on health issues towards motivating day-hospital patients to sustain mental and physical self-care practices. Key objectives were to (i) provide ice and fear breaking positive experiences in working with psychiatric aging patients; and (ii) develop with undergraduate nursing students thematic games on health issues by cognitive domain to provide learning experiences in creating materials and tailoring these with patient participation and evaluation. Labs, physical exams, cognitive and psychiatric evaluations showed substantial improvement. Students reported no fear after the first experience in caring for psychiatric aging patients and adoption of new paradigms in caring for people with special needs. Additional repercussions were the increase in extra-curricular practicum requests by students and the continuous request of patients, families, undergraduate nursing students and the hospital administration for the study to become a program to be offered on a permanent basis.

### **BUILDING COMMUNITY RESEARCH CAPACITY THROUGH EDUCATION: AN OUTCOME EVALUATION STUDY OF HEALTH EDUCATIONAL INITIATIVES IN CHICAGO CHINESE COMMUNITY**

Y. Li<sup>1</sup>, M.A. Simon<sup>2</sup>, E. Wong<sup>2</sup>, B. Wong<sup>2</sup>, E. Chang<sup>1</sup>, F. Huang<sup>1</sup>, X. Dong<sup>1</sup>, *1. Rush University Medical Center, Chicago, Illinois, 2. Chinese American Service League, Chicago, Illinois, 3. Northwestern University, Chicago, Illinois*

Background: Community-academic partnership is among the most commonly practiced collaborations in community-based participatory research (CBPR) projects. Our study aims to create culturally-appropriate educational programs to increase community's capacity to understand aging research and evaluate its effectiveness. Methods: CBPR approach was utilized to partner with Chicago Chinese community. Key stakeholders constituted the Advisory Board that identified workshop topics most concerning to the community. We conducted 7 educational workshops (English, Cantonese, and Mandarin). We performed pre- and post- tests before and after the workshops, and sent out a follow-up in three weeks' time. SPSS analysis was performed to examine the test scores. Results: There were 208 participants in total. The test scores are based on the accuracy of each question from all participants. The test scores of 74 questions from 7 workshops, increased from 36% in pre-test, to 46% in post-test, to 50% in follow-up (p value=0.001). Depression session had the lowest accuracy score in pre-test (9%) whereas breast cancer session had the highest (69%). The elder abuse session experienced the most significant increase in accuracy, from 29% in pre-test to 55% in post-test, presenting a 26% increase. The grant-writing session had the highest knowledge retention rate after 3 weeks, showing 69 % accuracy in post test to 86% in follow-up test. Conclusion: Culturally and linguistically-appropriate health educational initiatives are effective to increase the knowledge base of health sciences research in the Chinese community. Our study has wide implications for future health educational programs in minority aging population.

### **RESEARCH ON THE INFLUENCE OF THE INTERGENERATIONAL RELATIONSHIPS IN FAMILY TO THE PARTICIPATION OF THE OLD-AGE EDUCATION IN CHINA**

Y. Song, *Institute of Population Research, Peking University, Beijing, China*

Following the reviews of literatures in the old-age education in China, most studies focus on how to advance and polish the existed old-age education systems and policies, describe the current situation and anticipate the development trend, however, few research focuses on the old people themselves, who are the core participant group in aging education. In fact, based on the collected data about elderly education, it indicates that China have a low rate of the old-age education participation. Due to the profound impact of the Chinese traditional culture, the effect of “family” on the elderly behavior will be long-term and significant. This study considered, in the study of Chinese elderly educational issues, the relationship between them should be paid more attention. As a result, this paper aims to explore the factors which might be the key points to confine the participation of aging education activities, and hypothesis has been proposed that intergenerational relationships in family would be the principal factor. In order to test this hypothesis, we use data on 2,000 men random sampled from the East, Middle and West of China, questionnaire was been developed to investigate whether the degree the old age education participation was affected by the wealth flow, emotional intimation and family structure, which were three principal dimensions of the intergenerational relationships in family. This study expects to draw following conclusions: the intergenerational relationships in family would influence the old age education participation significantly.

## INCREASING INTEREST IN GERIATRIC PRIMARY CARE IN AN NP PROGRAM: IT TAKES A VILLAGE

D.A. Hunt, *College of Nursing, University of Central Florida, Orlando, Florida*

**Aim:** To compare the use of a 'Village' of practice patients and caregivers with usual instruction to increase NP student understanding and appreciation of caring for older adults and their caregivers. **Background:** Currently, almost one out of eight Americans is 65 years of age and older. As Baby Boomers age, the demand for geriatric primary care providers will outpace the growth of graduates who specialize in geriatrics. Currently, less than 4% of nurse practitioner students self-identify a desire to specialize in geriatrics. **Methods:** The Village, adapted from the Village Concept for teaching pharmacology to undergraduate nursing (Howe, 2010), is an active teaching method that blends use of practice patients and caregivers, case studies, problem based learning and open discussion in teaching geriatrics to nurse practitioner students. Practice patients and caregivers are introduced early in the semester through the Village directory. The directory includes the names, photographs, demographic data, medical history, and current health status of each community member. During week three of the academic semester, practice patients and caregivers become an integral part of the classroom education experience, with focus on diagnosing and treating geriatric syndromes. During the first and last class meeting, the Kaiser Medicare Quiz and the Reaction to Aging Questionnaires are administered. **Findings:** Students grades and evaluation of the course was compared between spring 2011 and spring 2012. Grades significantly improved and course evaluations were significantly improved with use of the 'Community'. Scores on the questionnaires were significantly improved as were student self-report of perceptions of aging.

## INTERDISCIPLINARY HEALTH PROFESSIONS TRAINING: TRANSITIONING A FACULTY DEVELOPMENT PROGRAM FROM 36 TO 160 HOURS

C. Ford<sup>1</sup>, P. Sawyer<sup>1</sup>, A.G. Rothrock<sup>1</sup>, C.J. Brown<sup>1,2</sup>, C. Ritchie<sup>3</sup>, *1. Gerontology, Geriatrics & Palliative Care, University of Alabama at Birmingham, Birmingham, Alabama, 2. Birmingham/Atlanta VA GRECC, Birmingham, Alabama, 3. University of California, San Francisco, San Francisco, California*

The UAB Geriatric Education Center (GEC) Faculty Scholars Program (FSP) is an interprofessional training program for health professions faculty, which focuses on priority areas identified by the Institute of Medicine (advanced illness, care coordination, frailty, health literacy, medication management, pain management and palliative care). Initially established as a 36-hour curriculum, the program was expanded to a 160-hour curriculum in its fourth year. The new one-year curriculum includes: 1) Five in-person day-long interactive workshops (40 hours); 2) Eight self-study modules (16 hours); 3) Required attendance at a GEC-sponsored interprofessional conference focusing on the care of the complex older adult (2 days; 16 hours); 4) Development of two interprofessional continuing education newsletters by each faculty scholar, one of which is a team project developed with fellow scholars and the other an individual effort (32 hours); and 5) Mentored scholarly products, including manuscripts, geriatric-based curriculum, and other projects approved by the UAB GEC directors (56 hours). The focus of this presentation is Year 4 of the FSP, the first year of the 160 hour program, with enrollment of 24 scholars from 9 universities located throughout the state. This cohort includes faculty from Dentistry, Medicine, Nursing, Nutrition Sciences, Pharmacy, Physical Therapy, Physiology, Psychology, and Social Work. We will discuss the expansion of the curriculum, the recruitment process, and program implementation. After attending this presentation, participants will be able to discuss opportunities and challenges associated with expanding a faculty development program, curriculum development, recruitment strategies, program implementation and evaluation.

## IMPACT OF A COLLABORATIVE INTERPROFESSIONAL LEARNING EXPERIENCE UPON MEDICAL AND SOCIAL WORK STUDENTS, AND MEDICAL RESIDENTS IN HEALTH CARE WITH OLDER ADULTS

Y. Lee, P.R. Gould, L. Bronstein, *Social Work, Binghamton University, Binghamton, New York*

**Purpose:** While interprofessional collaboration is often thought to be a pre-requisite for effective health care delivery for older adults, graduate students and medical residents are rarely trained to work together. Consequently, physicians, social workers, and other health care providers enter practice with limited understanding of one another's roles, which impedes their ability to maximize complementary expertise and patient outcomes. Focus groups evaluated the impact of a collaborative practice experience upon Social Work and Medical graduate students and medical residents, and explored factors related to participants' perception of the effectiveness of the interprofessional team in geriatric health care. **Design and Methods:** Medical and social work students, and medical residents participated in a collaborative practice experience conducting comprehensive geriatric assessments. Two focus groups with six medical students, three social work students, and three medical residents were conducted post-experience to investigate the effectiveness of the model of interprofessional collaboration. Data analysis was conducted in three steps: (1) open coding, (2) axial coding, and (3) selective coding. **Results:** Three major themes relating to the effectiveness of the interprofessional education and implications for practice emerged: (1) benefits of collaborative experiential learning environment, (2) recognition of complementary roles in developing a holistic intervention with complex geriatric patients, and (3) challenges to interprofessional communication. **Implications:** Students in health care professions benefit from interprofessional experiential learning opportunities which translate into improved patient care. Students would benefit from earlier and more frequent exposure to interprofessional practice.

## ENHANCING NURSING CURRICULA TO INCORPORATE BEST PRACTICES IN THE CARE OF OLDER ADULTS: THE GERIATRIC NURSING EDUCATION CONSORTIUM (GNEC)

S. Sofaer<sup>1</sup>, J. Fortin<sup>1</sup>, M. Mezey<sup>2</sup>, A. Shire<sup>1</sup>, J. Stanley<sup>3</sup>, R. Watman<sup>4</sup>, *1. School of Public Affairs, Baruch College, New York, New York, 2. The Hartford Institute, New York, New York, 3. American Association of Colleges of Nursing, Washington, District of Columbia, 4. John A. Hartford Foundation, New York, New York*

Nursing students will care for older adults in the future regardless of where they work and their specialization. To ensure that nursing graduates understand the special needs of older people and the best practices in their care, the John A Hartford Foundation-funded Geriatric Nursing Education Consortium (GNEC) was created by the American Association of Colleges of Nursing (AACN) and The Hartford Institute at New York University. The project aimed to infuse geriatric content into a variety of existing senior level courses in nursing programs across the country. Using evidence-based modules created by The Hartford Institute, the AACN conducted six Faculty Development Institutes (FDIs) across the country for faculty whose Dean/Director committed to support curricular change post FDI. Eight hundred and eight faculty from 481 nursing programs participated in GNEC trainings. An external evaluation, using follow-up surveys one and two years post-FDI, found that among 344 responding organizations, 281, or 82%, enhanced or revised at least one course within two years. Impressively, a total of 676 courses were affected thereby arming nursing students with the skills to provide competent care to our aging population. We will present descriptive and inferential data from the external evaluation which confirms that key elements of the GNEC model, such as support from Deans/Directors, user-friendly modules, the FDIs, and specific actions are returning faculty members all contributed to the number of senior courses revised. This model of achieving curricular change has great

promise and needs to be extended to more nursing programs, faculty and students.

### **GERIATRIC EDUCATION IN THE HEALTH PROFESSIONS: ARE WE MAKING PROGRESS?**

S.H. Bardach, G.D. Rowles, *Graduate Center for Gerontology, Univ of Kentucky, Lexington, Kentucky*

Older adults consume a disproportionately large percentage of health-care resources. Despite advocacy and efforts initiated more than a quarter of a century ago, the number of providers with specialized training in geriatrics is not commensurate with the growing population of older adults. This presentation provides a contemporary update on the status of geriatric education and explores how geriatric coverage is valued, how geriatric competence is defined, and how students are evaluated for geriatric competencies. Semi-structured interviews were conducted with curriculum representatives from seven health professions disciplines –communication disorders, dentistry, medicine, nursing, pharmacy, physical therapy, and physician assistant studies - in a case study of one academic medical center. A comprehensive literature review indicated that geriatric training varies across health professions disciplines but remains limited. All interviews were transcribed and themes were identified through a process of constant comparative analysis. The variability among disciplines and need for greater geriatric coverage were confirmed through our case study. Interviews also revealed that while participants recognized the unique needs of older patients and valued geriatric coverage, they identified shortage of time in packed curricula, lack of geriatrics-trained educators, absence of financial incentive, and low student demand as barriers to improving geriatric training. Findings suggest the need for institutional commitment to enhance geriatric education as a component of health professions curricula. We discuss current efforts to engage educational leaders to develop this commitment.

### **THE NEED FOR PROFESSIONAL TRAINING IN GERIATRIC MENTAL ILLNESS: FINDINGS OF AN URBAN ENVIRONMENTAL SCAN**

D.B. Kaplan<sup>1,2</sup>, M.B. Friedman<sup>2</sup>, K. Williams<sup>2</sup>, K.T. Chan<sup>3</sup>, *1. School of Social Work, Columbia University, New York, New York, 2. The Geriatric Mental Health Alliance of New York, New York, New York, 3. Boston College, Boston, Massachusetts*

Numerous reports have pointed to inadequacies in service provision for older adults with mental health needs. These include overuse of institutions, limited access to services, minimal capacity to serve cultural minorities, ignorance about geriatric mental illness and its treatment, and more. Academic knowledge of geriatric mental health is not being effectively translated to the service providers who directly impact older adults. The proposed paper reviews a mixed-methods environmental scan which evaluated the need for and obstacles to obtaining training regarding geriatric mental illness. Data were collected in a large, urban community in the Northeastern United States. First, a stakeholder advisory committee was established to design the research study. Then, nine focus groups and 16 interviews were facilitated with mental health, aging services, health, and residential providers, leaders of community organizations and professional associations, consumers and advocates, and academics. Finally, based on the findings from qualitative analysis of transcripts, an electronic survey was designed and distributed to health and mental health practitioners and administrators. 180 individuals completed the survey, and those data were evaluated with basic quantitative techniques. The environmental scan illuminates organizational practices across professional fields, the current state of training and program design for geriatric mental health, systemic challenges to improved care within industries, personal capacities among providers, and much more. These findings offer critical insights regarding barriers which must be overcome in order to improve the quality of care for older adults with mental illness.

### **LET'S TALK ABOUT SEX: AGING AND SEXUALITY. DEVELOPMENT AND IMPLEMENTATION OF A WEBINAR FOR PROFESSIONALS, ACADEMICS AND STUDENTS**

P.A. Greenberg, H. Nordell, P. Woischke, *Gerontology, St. Cloud State University, St. Cloud, Minnesota*

This webinar was developed by faculty and students in response to concerns raised by professionals, academics, and students. The focus was if the topic of sexuality and intimacy for older adults is so important and why is it so neglected. To not talk about sex can result in diminished physical and mental health and autonomy for older adults. It is essential for health care and service providers to listen and/or initiate the conversation. Questions raised: why is there such discomfort in approaching this topic; what are the possible implications for older adults themselves (physical, social and mental health), community and health care systems if we do not have this conversation? Foremost it is important to operationalize the terms sex and intimacy. It is crucial to expand our concept of sex beyond just intercourse between heterosexual couples to include all modes of intimate expression between Lesbian, Gay, Bisexual, Transgender and Heterosexual persons. It is the act/expression of intimacy with others and/or with oneself that is at the heart of this webinar. Forty-one people attended the Webinar. Of those 21 were professionals (primarily in residential facilities), 13 were students and 7 were affiliated with an academic institution. Of those, 23 completed evaluations and 74% rated the webinar and its content exceeding/met expectations. Even when respondents stated that they were knowledgeable about the topic they found that the webinar provided means to initiate conversations. In addition to the webinar a companion google site was developed that provided access to research and educational tools.

## **SESSION 610 (POSTER)**

### **EMOTIONS AND MENTAL HEALTH**

#### **PATTERNS OF ALCOHOL CONSUMPTION AND PSYCHOLOGICAL DISTRESS: AN EXAMINATION OF THE RELATION AMONG OLDER ADULTS**

A.N. Bryant, G. Kim, *The University of Alabama, Tuscaloosa, Alabama*

The differences in psychological distress among older adults who participated in varying alcohol consumption patterns were examined. Any past year alcohol consumption and frequency of binge drinking were the consumption patterns used. Data were obtained from the 2009 California Health Interview Survey and selected samples included adults aged 60 and older (CHIS) (n=19,925). Hierarchical multiple regression analyses were conducted. Significant covariates indicated that individuals who were younger, female, unmarried, and had lower annual income were likely to experience elevated levels of psychological distress. Racial/ethnic covariates tested indicated that Asians and Blacks were likely to experience less psychological distress than their White counterparts. A significant main effect was found for frequency of binge drinking indicating that an increased frequency of binge drinking significantly predicted an increase in psychological distress (B=.10, p<.001). The results indicate that older adults who binge drink more frequently may experience increased levels of psychological distress which provides further evidence for the negative effects of binge drinking on the mental health of this age group. These results suggest that

the development of binge drinking interventions for older adults may be an important step in improving the mental health of this age group.

### **A CROSS-SECTIONAL STUDY ON LONELINESS AND WELL-BEING OF COMMUNITY-DWELLING CHINESE OLDER ADULTS IN CHICAGO**

E. Chang<sup>1</sup>, M.A. Simon<sup>2</sup>, E. Wong<sup>3</sup>, B. Wong<sup>3</sup>, F. Huang<sup>1</sup>, Y. Li<sup>1</sup>, X. Dong<sup>1</sup>,  
*1. Rush Institute for Healthy Aging, Rush University Medical Center, Chicago, Illinois, 2. Northwestern University, Chicago, Illinois, 3. Chinese American Service League, Chicago, Illinois*

**Background:** Despite loneliness is an important health indicator of psychological well-being, little attention has been paid to understanding loneliness among immigrant population. Less is known about loneliness in U.S. Chinese older adults whose psychological needs are relatively under-studied. **Methods:** This is a cross-sectional study on 1,112 Chinese persons over the age of 60, and is the largest cohort of U.S. Chinese older adults in epidemiological studies. We examined loneliness among community-dwelling Chinese older adults in Chicago. R-UCLA scale was administered to investigate loneliness in an interview setting. We utilized community-based participatory research approach partner with key stakeholders in Chicago Chinese community. Participants were recruited in community settings such as community centers, churches, senior facilities throughout Chicago. **Results:** Among surveyed participants (N=1,112), the mean age was 74.8 and sixty-four percent were female. With respect to loneliness, 23.9 % of participants reported lack of companionship, in which 6.3% often felt lack of companionship. 17.8 % of participants reported feeling of being left of life. 8.2 % of participants reported feelings of isolation. **Conclusion:** Loneliness is common in Chinese urban population that warrants public attention. Our findings call for future longitudinal population-based study to establish risk and protective factors of loneliness, and to further establish a deeper understanding of loneliness and psychological health. Future prevention and intervention programs with culturally sensitive approach are needed to improve the psychological well-being of this population. This study has wide implications for healthcare professionals, social services agencies and policy makers.

### **GENDER DIFFERENCES IN REPORTED SYMPTOMS OF DEPRESSION IN OLDER ADULTS**

A. Bilbrey<sup>1,2</sup>, J. Rengifo Nevarez<sup>1,2</sup>, A. Stepanenko<sup>1,2</sup>, R. Marquett<sup>2</sup>,  
D. Gallagher-Thompson<sup>2</sup>, *1. Palo Alto University, Palo Alto, California, 2. Stanford University, Stanford, California*

**Background:** One of the oldest and most robust findings is the gender gap in depression, with women averaging higher levels of depression than men. While there are studies exploring the difference between how men and women report their symptoms of depression, there are limited studies that explore these gendered symptoms in older adults. **Method:** Used the BDI-II to examine the differences between men and women in reporting individual symptom severity of depression administered as part of the pre-evaluation battery to depressed older adults (men N=23, women N=37), age range of 60 to 88 (mean age 69.7), who participated in a highly structured CBT-based 12-week intervention program called PEP: Positive Experience Project. **Results:** Women reported higher levels in change in appetite ( $r(58) = -0.273, p < .04$ ), change in sleep pattern ( $r(58) = -0.306, p < .021$ ) and loss of interest in sex ( $r(58) = -0.448, p < .000$ ) when compared to men. **Conclusion:** A majority of older adults regard sexuality as an important part of life and though the prevalence of sexual activity declines with age, a substantial number of older adults are participating in intimate relationships into their 80's and 90's. Sexual desire is an important influence on sexual satisfaction, which is significantly correlated with a quality of life. Depression impacts three important criteria for quality of life for older women. While they may initiate a discussion about changes in appetite or sleep

patterns, women are not likely to discuss loss of interest with their physician.

### **CBT INTERVENTION EFFECTIVE FOR TREATING DEPRESSION IN ETHNICALLY DIVERSE OLDER ADULTS**

J. Rengifo Nevarez<sup>1,2</sup>, A. Stepanenko<sup>1,2</sup>, A. Bilbrey<sup>1,2</sup>, R. Marquett<sup>2</sup>,  
D. Gallagher-Thompson<sup>2</sup>, *1. Palo Alto University, Palo Alto, California, 2. Stanford University, Stanford, California*

There are numerous studies showing the effects of CBT interventions to treat depression in young adults. There are fewer studies demonstrating the effectiveness of CBT in older adults. Additionally, there are myths that older adults may not be good candidates for such interventions due to age, confusion, or cultural competency. Furthermore, little research has been done to show the effectiveness of CBT in an ethnically diverse older adult population. This research aimed to determine whether a group of ethnically diverse older adults can improve depressive symptoms with a 12 week individual CBT intervention. Our study provided a 12 week intervention program called Positive Experience Project (PEP), a highly structured protocol based on cognitive behavioral techniques, to an ethnically diverse group of older adults with depression age 60 and older. Of the 60 participants, 48 (80%) self identified as White and the remainder self identified as either Black (5%), Asian (10%) or American Indian (5%). Ethnically, the sample was quite diverse: while European-Americans comprised 70% of the sample, the remaining 30% were of different cultural backgrounds: 10% identified as Hispanic-Americans; 5% as African Americans; 5% as Native Americans and 10% as Asian Americans. English was the native language for 72% of the participants, while the remaining 28% reported a different native language. All participants had to be English speaking in order to participate. Results showed that this form of CBT intervention was effective in treating depression without culturally modifying the program for ethnically diverse older adults.

### **IDENTIFYING DETERMINANTS OF HAPPINESS: THE ROLE OF AGE, WORK CONDITIONS AND BIOMETRICS**

G. Kyriotakis, *1. Geriatric Research Education and Clinical Center (GRECC), Louis Stokes VAMC, Cleveland, Ohio, 2. Case Western Reserve University, Cleveland, Ohio*

The empirical literature on happiness suffers from serious model uncertainty due to a relatively large number of possible model specifications and theoretical formulations. In this study I address the problem of model uncertainty in the identification of determinants of happiness using data from MIDUS (Midlife Development in the U.S.), a national longitudinal survey. I conduct Bayesian Model Averaging (BMA) to account for the large number of potential models found in the literature. I include in the total model specification both interview data - such as neighborhood conditions and work history, and biometric indicators of physical health, such as blood pressure and cholesterol and serotonin levels. I identify variables having a high posterior probability of being significant determinants of happiness. I examined the possibility of presence of heterogeneity in the results between two age-groups (Middle-Aged - form 40-60 yrs., and Young-Old - 61-80 yrs.), I evaluated the sensitivity of the results to the selection of both model and parameter priors, and I compared the BMA results to traditional models. The findings show that biometric indicators have little to no effect on the level of happiness for both MA and YO. Work characteristics are the most consistent and powerful determinants of happiness. I assessed the models' predictive performance by utilizing the Log Predictive Score, the Continuous Ranked Probability Score (CRPS), and by splitting the samples in testing and training sets. I found that the BMA model specification performs better in all measures of predictive accuracy in identifying determinants of happiness.

## IS IT ALWAYS GOOD TO PERSEVERE? ASSOCIATIONS AMONG HOPE, GRIT, AND COGNITIONS THAT PROMOTE GAMBLING

K.N. Erickson-Dockter, B.A. Randall, *North Dakota State University, Fargo, North Dakota*

Hope (i.e., an individual's ability to see options through which to meet desired goals and the motivation to make use of those options) and grit (i.e., perseverance in striving toward goals, even in the face of challenge and failure) are psychological constructs that are theoretically associated with positive outcomes for individuals. Some empirical evidence supports these linkages. For example, hope has been associated with academic achievement, physical health, and psychological adjustment, while grit has been linked to grade point average, educational attainment, and conscientiousness. Although both hope and grit may help people continue to pursue meaningful worthwhile tasks and to envision the likelihood of their eventual success, these same attitudes may underlie the continued pursuit of harmful behaviors. Problem gambling has been previously associated with cognitions that encourage continued gambling in the face of loss, which on the surface is similar to both hope and grit. Thus, hope and grit may share some common characteristics with problematic gambling cognitions, and may also be associated with elevated levels of gambling. A community sample of upper-Midwest adults (aged 37-89, N=202, 51 were aged 65+) was used to compare the associations for middle-aged and older adults. Results showed that hope and grit were associated with lower levels of cognitions related to problem gambling and lower levels of motivation to engage in gambling for middle-aged adults, but not older adults. Discussion will focus on the implications of the results for promoting well-being.

## WHO LIVES LONGER AND HEALTHIER?: THE EFFECT OF PERSONALITY TRAITS, PHYSICAL ATTRACTIVENESS, AND INTELLIGENCE ON HEALTH AND MORTALITY

K. Kim, *Sociology, University of Wisconsin - Madison, Madison, Wisconsin*

This study explores the effect of personality traits, physical attractiveness, and intelligence on health and mortality using three large longitudinal data: the Wisconsin Longitudinal Study (WLS), National Survey of Midlife Development in the United States (MIDUS), and the Americans' Changing Lives. Past studies suggested that each of those individual characteristics has significant implication for various life course outcomes, including health and longevity. However, prior studies tend to be cross-sectional and based on small samples. Furthermore, inconsistent instruments for measuring those properties resulted in mixed empirical results. Using the Big Five personality instrument and physical attractiveness ratings from multiple judges, this paper is the first to incorporate all of three essential individual characteristics in a single model predicting mortality, self-rated health, and number of doctor-diagnosed physical symptoms. Results from discrete-time event history analyses indicate that Neuroticism is a significant risk factor for all cause mortality both for men and women even after controlling for socioeconomic indicators as well as health behaviors, such as smoking, alcohol consumption, and psychological depression. However, contrary to past research, Conscientiousness did not have a significant protective effect on mortality. Results also suggest that physical attractiveness was significantly and inversely associated with mortality only for women while intelligence did not have any effect on health outcomes for men and women. When sibling fixed-effects model was estimated, the effects of these factors became insignificant, suggesting a significant genetic inheritance. The potential reciprocal relationship between health and personality will be addressed using a cross-lagged model.

## SESSION 615 (POSTER)

### EMPLOYMENT & OLDER WORKERS

#### PATTERNS OF WORK EXPERIENCE AMONG BABY BOOMERS IN KOREA

J. Kim<sup>1</sup>, J. Kim<sup>2</sup>, G. Han<sup>3,4</sup>, *1. Department of Sociology, Social Work and Criminal Justice, Idaho State University, Pocatello, Idaho, 2. Institute on Aging, Seoul National University, Seoul, Republic of Korea, 3. College of Human Ecology, Seoul National University, Seoul, Republic of Korea, 4. Research Institute of Human Ecology, Seoul National University, Seoul, Republic of Korea*

Korean Baby Boomers have highly valued 'work' since they experienced adulthood while Korean economy has been rapidly developed. This generation also has experienced uneasiness and uncertainty associated with current global economic downturn as well as Korean economic crisis in late 1990. So, 'work' has brought a lot of opportunities and challenges to them over the life course. This study aims to explore work experience of Korean Baby Boomers in three dimensions: positive experience, negative experience, job insecurity. We attempted to classify subgroups of work experience and explore attributes for each subgroup by applying Latent Profile Analysis (LPA) to three dimensions. Data used in this study has drawn from the 1st wave (2010) of Korean Baby Boomers Panel Study. The study sample (N=3,511) was comprised of currently working Boomers born in Korea between 1953 and 1964. LPA identified 4 subgroups of work experience: Average, High-Risk and High-Benefit, Insecure, Insensible Types. Multinomial logistic regression analysis revealed that high-risk and high-benefit type was more likely to work longer, have higher level of environmental mastery but experience negative physical symptoms than compared to average type. Insecure type was more likely to be temporary employees and boomers with broken career paths than average type. Insecure type showed lower level of mastery and self-acceptance, but higher rates of having chronic illnesses than the average type. The findings suggest career history is also a central piece of work experience and differently tailored to needs and resources for each group should be developed.

#### COMPUTER ACCOMMODATIONS IN YOUNG AND OLDER WORKING INDIVIDUALS WITH AND WITHOUT DISABILITY

D.S. Jopp<sup>1</sup>, M.E. Paggi<sup>1</sup>, A. Franke<sup>3</sup>, J.A. Sanford<sup>2</sup>, *1. Psychology, Fordham University, Bronx, New York, 2. Georgia Institute of Technology, Atlanta, Georgia, 3. Goethe University Frankfurt am Main, Frankfurt, Germany*

Although more and more people have to rely on computers in the workplace, research on the use of accommodation with respect to computer usage is rather limited. This is especially surprising as also more and more older individuals use computers. The present study investigated the extent to which younger and older individuals use computer accommodations and whether the type of accommodation differs between individuals without and with disability (i.e., visual, auditory, manual, mobility, and cognitive issues). We assessed 391 workers with disabilities (Mage = 50.94, SD = 12.39; age range = 18-80) and 246 workers without disabilities (Mage = 53.67, SD = 12.43; age range = 19-84). Overall, most individuals reported changing the environment of the computer (18%) to deal with work-related computer difficulties, followed by changing the settings (17%), and using add-ons (15%). Only very few people indicated that they would rely on others' assistance. As expected, individuals with specific disabilities reported specific accommodations: for instance, individuals with auditory mostly change settings, whereas those with visual issues mostly used add-ons. Of those with disabilities, older individuals used more add-ons and

changed the environment, whereas younger individuals changed settings more often. Of those without disability, age differences regarding different accommodations used were minimal. In sum, findings suggest that young and older individuals with and without disability use accommodations to deal with computer issues and that more research is needed to determine which accommodations are most successful and for whom.

### **DIFFICULTIES WITH COMPUTER USE IN THE WORKPLACE IN OLDER AND YOUNGER INDIVIDUALS WITH AND WITHOUT DISABILITIES**

M.E. Paggi<sup>1</sup>, D.S. Jopp<sup>1</sup>, J.A. Sanford<sup>2</sup>, *1. Fordham University, Bronx, New York, 2. Georgia Institute of Technology, Atlanta, Georgia*

Studies indicate that the majority of workers with disabilities have been unable to perform a range of work tasks at some point during their employment, but no studies have identified the specific computer-related difficulties they experience. The current study filled this gap, comparing older and younger workers with disabilities ( $n = 391$ ;  $Mage = 50.94$ ,  $SD = 12.39$ ; age range = 18-80) to those without disabilities ( $n = 246$ ,  $Mage = 53.67$ ,  $SD = 12.43$ ; age range = 19-84). For workers with disabilities, 58.9% reported at least one difficulty, compared to 26.1% of workers without disabilities. For workers with disabilities, the most common difficulty was with the monitor (42.9%), followed by the mouse (22.3%), keyboard (18.4%), computer unit (17.6%), word processor (15.0%), and email (13.4%). In contrast, 20.3% of workers without disabilities had difficulty with the monitor, whereas the majority of other problems ranged from 1.2% to 6.2% of the sample.  $\chi^2$  tests indicate that these differences are significant.  $\chi^2$  tests also show that significantly more older workers (50+ years) than younger workers (under 50) with disabilities had difficulty with the monitor (46.9% vs. 35.0%) and word processor (18.3% vs. 9.8%). These findings highlight the unmet needs of workers with disabilities in that most of them report difficulty with at least one computer component and some difficulties are more pronounced in older workers. Thus, employers should ensure that workers with disabilities have the accommodations necessary to complete job tasks to prevent loss of productivity and untimely exit from the workforce.

### **RETURNING TO WORK AFTER RETIREMENT: THE INFLUENCE OF UNPAID PRODUCTIVE ACTIVITIES**

D.C. Carr<sup>1</sup>, B. Kail<sup>2</sup>, *1. Institute on Aging, University of North Carolina at Chapel Hill, Chapel Hill, North Carolina, 2. Georgia State University, Atlanta, Georgia*

In recent years, pathways to final retirement have become increasingly blurred. Currently most Americans retire gradually from career jobs, but because of gains in life expectancy and overall health, people of traditional retirement ages can expect to spend a growing number of years during which they are capable of being productively engaged. For some, continued productive engagement involves returning to work after initial retirement — and this trend is likely to increase as the broader impact of the Great Recession continues to affect the retirement portfolios of many retirees. Concurrently, a growing number of initiatives seek to increase older adults' engagement in unpaid productive activities. We know little about how engagement in unpaid productive activities relates to whether individuals return to work after retirement. Using the Health and Retirement Study, we use hierarchical linear modeling to examine the relationship between formal volunteering, informal volunteering, and caregiving for a spouse, parents, or grandchildren and returning to work after retirement. Net of health and social location, preliminary results indicate formal volunteering and caring for grandchildren are associated with greater odds of returning to part-time work after retirement, whereas the other unpaid productive activities do not influence this transition. Similarly, returning to work after retirement was associated with greater odds of formal volunteering, but not associated with other unpaid productive activities.

## **SESSION 620 (POSTER)**

### **END-OF-LIFE PLANNING**

#### **THE ROLE OF PHYSICIAN TRUST IN END-OF-LIFE CARE PLANNING**

S.A. Keary, S.M. Moorman, *Boston College, Chestnut Hill, Massachusetts*

American adults of high socioeconomic status (SES) are more likely than those of low SES to have advance care plans for medical treatment at the end of life (EOL). However, the mechanisms linking SES to EOL preparedness have not been investigated. Prior research has yielded mixed results regarding SES and physician trust; some studies have found people of high SES to be more likely to trust their physicians, while other studies have found people of low SES to have greater levels of physician trust. Therefore, the present cross-sectional analysis tests whether two facets of physician trust mediate or moderate the relationship between patient SES and EOL planning. This sample consists of 3,310 white, Wisconsin high school graduates who were 65 years old when data were collected in 2004. Multinomial logistic regression was used to test the role of physician trust and SES in the following four outcomes: formal plans only (having a living will and/or durable power of attorney), informal plans only (discussion of one's EOL preferences), neither type of planning, or both types of planning. People with more assets, higher education, a financial will, and long-term care insurance were more likely to have made both formal and informal plans for EOL care. Greater trust in physicians and higher SES were associated with a greater likelihood that respondents had completed EOL planning. These findings have important implications with regard to primary care physicians' efforts to facilitate EOL care planning among their patients of low SES.

#### **DECISIONAL CONFLICTS IN MAKING END-OF-LIFE DECISIONS AMONG PARKINSONS OR DEMENTIA PATIENT SURROGATES**

J. Kwak<sup>1</sup>, M. Wallenda<sup>2</sup>, G. Leo<sup>2</sup>, K. O'Connell Valuch<sup>1</sup>, *1. University of Wisconsin-Milwaukee, Milwaukee, Wisconsin, 2. Parkinson Research Institute, Aurora Sinai Medical Center, Milwaukee, Wisconsin*

Family members must often make important end-of-life (EOL) treatment decisions for their relatives with dementia or Parkinson disease (PD) who are cognitively impaired. Yet, little is known about factors influencing EOL decision-making process among surrogates. This study aimed to identify correlates of decisional conflicts experienced in making EOL decisions among family caregivers of persons with dementia or PD by conducting survey. Eighty-four primary family caregivers ( $M\ age = 69, SD = 11, 68\%$  female; 50% completed college or higher) were recruited from a PD research registry, PD support groups, and a community-based program serving frail elders. Ninety percent of caregivers were designated as power of attorney for health care, POAHC. Under hypothetical scenarios about making end-of-life care decisions for relatives, 51% family caregivers chose a palliative care-oriented goal while 36% chose a functional maintenance oriented care goal and 7% chose life-prolonging care goal. Factors predicting subjective measures of decisional conflicts were: relative having communicated preferences for use of feeding tube ( $B = -.470, p < .05$ ) and for ventilator ( $B = .461, p < .05$ ) predicting uncertainty about the decision made ( $R^2 = .293, p < .05$ ); relative having been hospitalized more than once in the last six months ( $B = .307, p < .05$ ), the family caregiver being the POAHC ( $B = -.450, p < .05$ ), and relative having communicated preferences for use of feeding tube ( $B = -.375, p < .05$ ) predicting uncertainty about the role as a surrogate ( $R^2 = .391, p < .05$ ); and higher level of family dysfunction ( $B = .303, p < .05$ ) predicting overall uncertainty about the effectiveness of decision-making ( $R^2 = .303, p < .05$ ). Results suggest that practitioners may need to target efforts to facilitating communication

between patients and surrogates about specific EOL treatment preferences and family functioning and potential conflicts.

### **ROMANTIC RELATIONSHIP QUALITY AND KNOWLEDGE OF A PARTNER'S END-OF-LIFE PREFERENCES**

S.M. Moorman, M. Inoue, *Boston College, Chestnut Hill, Massachusetts*

Terminally ill patients are often physically or cognitively incompetent to make health care decisions for themselves, although choice while dying is a key component of a "good" death. Healthy persons can appoint a durable power of attorney for health care (DPAHC), a surrogate who is legally authorized to make medical decisions on their behalf in such a situation. However, numerous studies that match participants' end-of-life health care treatment preferences to their surrogates' guesses of those preferences indicate that surrogates may often be inaccurate: Random guesses are just as likely as surrogate choices to match the participants' preferences. The present study uses the interdependence model of couple communal coping and behavior change (Lewis et al., 2006) to shed further light on whether (a) relationship quality, (b) health status, and (c) gender are associated with romantic partners' accuracy as one another's health care surrogates. We examine these questions in a nationally representative sample of 1,075 heterosexual American couples aged 18 to 64. We find that a surrogate's own high ratings of relationship quality are associated with a greater likelihood of him/her making an error of overtreatment, whereas a partner's high ratings of relationship quality are associated with a reduced likelihood of the surrogate making an error of overtreatment. These results vary with the health of both partners, but hold for both men and women surrogates. These findings have important implications for gerontologists who work with dying persons and their families.

### **COGNITIVE IMPAIRMENT INCREASES THE LIKELIHOOD OF HAVING ADVANCED DIRECTIVES IN THE NHHCS**

R.C. Intrieri, P. Goodwin, *Psychology, Western Illinois University, Macomb, Illinois*

The 2007 National Home and Hospice Care Survey (NHHCS) represents survey data collected from home health and hospice agencies as well as current patients and discharges. Participating agencies were Medicare and/or Medicaid certified or held a state license to provide home health and/or hospice services. Survey data were collected from agency directors and staff between August 2007 and February 2008. Patient data were abstracted from medical records. The current analysis focuses on the 4,733 identified individuals that received hospice services. Mean age of the sample was 77.36 (SD=13.70). The sample consisted of 2,117 men (M=74.98; 13.48) and 2,616 women (M=79.28; SD=13.57). The current analysis examines the relationship between the cognitive impairment and the likelihood of having an advanced directive. Cognitive status was assessed using a five-level instrument where 0 = No impairment (n=1367 or 28.9%), 1 = Occasional reminders (n=632 or 13.4%), 2 = Some assistance in certain situations (n=692 or 14.6%), 3 = Great deal of assistance/direction in routine situations (n=960 or 20.3%), and 4 = Severe cognitive impairment (n=510 or 10.8%). Approximately 89% of the total sample had some type of advanced directive. Chi Square showed that advanced directives were related to cognitive impairment levels among those with advanced directives ( $\chi^2(4) = 35.996$ ;  $p = .0001$ ). Specifically, greater cognitive impairment increased the likelihood of an advanced directive. Additional analyses will examine the link between type of advanced directive and cognitive impairment.

### **NURSING HOME RESIDENTS' EXPERIENCES WITH COMMUNICATING END-OF-LIFE CARE WISHES**

J.K. Chahal, *Sociology & Gerontology, Miami University, Oxford, Ohio*

Research has indicated that Hospice use within nursing homes has increased from 14% to 33% over the past ten years; it is projected to

double within the next two decades (Daaleman et al., 2009; Miller et al., 2010). Therefore, it is more important to understand nursing home residents' end-of-life care goals in order to provide quality care until death. With a goal of creating open communication regarding end-of-life care wishes, this qualitative study explored how residents have experienced advance care planning, and current perceptions of the role of nursing home staff in initiating and facilitating conversations about end-of-life care issues. The study consisted of seven total participants of which four individuals participated in one group interview and three additional residents, one couple and one individual, agreed to individual interviews. Each interview lasted between one and two hours and was held in a private location within a nursing home in the Greater Cincinnati area. Analysis involved open, axial, and selective coding with grounded theory and a constant comparative approach. Results indicate that residents assume their healthcare provider and the nursing home staff are aware of their end-of-life care wishes, even though they had only communicated wishes with family. Additionally, residents want to only initiate further conversations about care if they experience a major health event, such as a stroke. Future implications show that healthcare staff needs to empower residents to openly communicate their goals for end-of-life care in order to honor residents' wishes in the future.

### **IMPROVING END-OF-LIFE CARE: PRESENCE OF ADVANCE CARE DIRECTIVES AND LENGTH OF HOSPICE UTILIZATION**

J.K. Chahal, *Miami University, Oxford, Ohio*

Advances in medicine combined with higher prevalence of chronic conditions reinforce the need for advance care planning in an aging population. Advance care planning is extremely essential for older adults, who are more likely to experience disease related complications and end-of-life care issues within nursing homes. Although almost 70% of US nursing home residents and 93% of those receiving palliative and/or Hospice care have completed an advance care directive, only 26% have completed two or more forms (Resnick et al., 2009). The goal of this study was to determine if nursing home residents were likely to have more than one form of an advance care directive. Additionally, the study aimed to establish if the presence of an advance care directive, such as a Do-Not-Resuscitate (DNR) form, led to an increased length of Hospice utilization. Data for the study was collected from chart reviews of the fifty previously deceased residents of a nursing home in the Greater Cincinnati area. Findings indicate that although 96% of the residents had a DNR form and 69% had multiple forms of other advance care directives in their chart, only 58% used or were referred to Hospice services, with 55% of those referred averaging a length of stay between 0-6.01 person days. These findings suggest that even with adequate advance care planning, nursing home residents are still not receiving timely referrals to Hospice care. Future implications associated with this study focus on communicating the benefits of timely Hospice referrals as providing quality end-of-life care.

### **PERSPECTIVES AND NEEDS ABOUT ADVANCE CARE PLANNING AMONG LOW-INCOME OLDER ADULTS**

E. Ko<sup>1</sup>, J. Kwak<sup>2</sup>, M. Esperanza<sup>3</sup>, T. Pham<sup>1</sup>, S. Hall<sup>1</sup>, M. Piwowarski<sup>3</sup>, M.U. Mazzyk<sup>3</sup>, *1. San Diego State University, San Diego, California, 2. University of Wisconsin-milwaukee, Milwaukee, Wisconsin, 3. Senior Community Centers, San Diego, California*

This study explores the perspectives and needs regarding advance care planning among low-income older adults. A qualitative design, using in-person interviews with 21 residents at the Transitional Housing Program (THP) in an urban community in southern California was implemented. The majority (71.4%, n=15) of participants had experienced living on the street with average length of 47 months. The mean age of the participants was 65 and two-thirds (62%, n=13) had some

college or a college degree. The majority had been diagnosed with hypertension (n=16, 76.2%), followed by arthritis (n=12, 57.1%), a heart problem (n=7, 33.3%), or psychiatric disorder (n=10, 47.6%). In regard to advance care planning, only three participants completed advance directives (AD) and 43% reported having no one to designate as a health care proxy. The major themes identified through the interviews regarding advance care planning include the importance of 1) gaining control of one's life; 2) having faith with god; 3) having dignity in the last moment of life, and 4) the needs of AD education. A majority of participants rejected the idea of relying on life supports as it is considered to be not "living" and undignified. Faith and spirituality played a significant role in embracing death. Lack of knowledge about AD was predominant.

## SESSION 625 (POSTER)

### ENVIRONMENT AND AGING

#### IMPACTS OF HOME MODIFICATIONS ON AGING-IN-PLACE

E. Hwang<sup>1</sup>, L. Cummings<sup>2</sup>, A. Sixsmith<sup>2</sup>, J. Sixsmith<sup>2</sup>, 1. *University of Tennessee, Martin, Tennessee*, 2. *Simon Fraser University, Vancouver, British Columbia, Canada*

The purpose of this study is to analyze the relationship between home modifications and aging-in-place. Using the ENABLE-AGE UK sample (n=376), we hypothesize that seniors who have modified their housing are likely to have stayed longer in their current housing. The average age of the sample population was 84.9 (SD = 2.7) and the vast majority of the sample was women and widowed. To explore the impacts of home modifications on aging-in-place, we carried out multiple regression analysis. There is a positive relationship between home modifications and aging-in-place. The results indicated that those who had home modifications done were likely to stay longer at their existing housing than those who did not. Home modification positively related to aging-in-place. The results underscore the importance of supportive environments to prolong living in housing settings. With this recent emphasis on aging-in-place policy, specific housing programs and grants have been initiated and this encourages many older people to modify their housing to remove barriers at their housing.

#### EXPLORING CONNECTIVITY AND RURAL AGEING: ISSUES AND CHALLENGES FROM 'THE GREY AND PLEASANT LAND?' PROJECT

R. Means<sup>1</sup>, V. Burholt<sup>2</sup>, C. Hennessy<sup>3</sup>, 1. *Faculty of Health & Life Sciences, University of the West of England, Bristol, United Kingdom*, 2. *University of Swansea, Swansea, United Kingdom*, 3. *University of Plymouth, Plymouth, United Kingdom*

'Grey and Pleasant Land? An Interdisciplinary Exploration of Older People's Connectivity in Rural Civic Society' was a New Dynamics of Ageing project in the UK based on a collaboration between five universities and the project contained seven different work packages varying from a community survey to a work package seeking to engage older people in the research through the internet. From the outset, the challenge of 'holding' such diversity was recognised and 'connectivity' was adopted as an 'heuristic device' to help keep all the different elements of the project together. During the life of the project, the popularity of the term 'connectivity' took off in assorted policy and research funding documents with AHRC leading the multi Research Council programme on 'Connected Communities'. This paper argues that the exploratory power of connectivity make it much more than an heuristic device (a kind of convenient research cellotape). Drawing on the work packages, the diverse ways in which rural elders connect will be illustrated. It will be argued that connection to place still matters to many rural elders but that overall they are starting to transition from place based to a more geographically dispersed connectivity. This movement is

driven by greater mobility (many more of us move from place to place throughout the lifecourse) but also by the transformational power of the internet. The paper concludes with a Connectivity Continuum which embraces the full spectrum of connectivity options from 'place' to the 'virtual'.

#### THE PREFERENCE OF UNIVERSAL DESIGN FEATURES IN RETAIL ENVIRONMENTS

M.G. Pace<sup>1,2</sup>, M.H. Teaford<sup>2</sup>, S.L. Zavotka<sup>2,1</sup>, 1. *Montclair State University, Montclair, New Jersey*, 2. *The Ohio State University, Columbus, Ohio*

As we age, retail shopping continues to be prevalent in our daily activities. This exercise is connected to personal care, leisure, mobility and social interaction. Ultimately, shopping is a channel of independence. Thus, store design should accommodate the functional changes of customers, ages 55 and older. The solution here is to implement Universal Design features, which overall provide an accommodating and pleasing environment (Null, 1989). Examples of measurable design features in this study included wide aisles, visual contrast and signage. Through newly created instruments including a Universal Design Retail Preference Survey, a model combining Approach – Avoidance Theory and the Ecological Model of Aging/Person Fit Theory, black and white photography, and open-ended questions, this study determined that older customers do prefer Universal Design features. The researchers used 24 pairs of photographs showing both Universal Design features and Non Universal Design features. Spatial configuration, including wide aisles and open spaces on the selling floor, was most preferred.

#### THE LOUTH AGE FRIENDLINESS FOR ENVIRONMENTS AND COMMUNITIES TOGETHER STUDY (AFFECT): A MULTIDIMENSIONAL INSTRUMENT FOR ASSESSING LEVELS OF AGE-FRIENDLINESS

R. Bond, A. O'Hanlon, *Netwell Centre, Dundalk Institute of Technology, Dundalk, Ireland*

The Louth AFFECT Study: Age Friendliness For Environments and Communities Together is an interdisciplinary and multi-site project which aims to understand and measure levels of age-friendliness in Co. Louth, on the north east coast of Ireland, i.e. the extent to which people feel that their communities support them as they grow older. The study involved extensive consultation processes around Co. Louth with community based mid-life and older adults, multidisciplinary professionals and those with applied and / or academic expertise. The main study (n=1000) includes interviews with adults aged 50+ years, recruited via the geodirectory and convenience sampling. Information is collected on eight main themes: outdoor spaces and buildings, transportation, housing, social participation, respect and social inclusion, civic participation and employment, communication and information, and hospital and community services. The study draws on international evidence and research to make contributions to knowledge and consider overlaps and inter-relationships with other countries and research centres. The measures developed will be useful to those interested in making communities more supportive and friendly towards adults in mid- and later years.

#### IMAGINING DISTANCE: THE IMPACT OF GEOGRAPHY ON MOVES OF OLDER ADULTS

T. Perry, *University of Michigan, Ann Arbor, Michigan*

Distance is relative. Distance in moves of older adults can be conceptualized in terms of spatial relationships to original homes, adult children, and to doctors, and other professionals in one's life. Geographical distance does not always map onto emotional support. There are some older adults whose children live in other states and countries that participate in the moves and others, adult children live close and would not be part of moving day, packing or unpacking. This paper presents case examples of local and non-local moves of older adults, dis-

cussing the challenges of each type of move on older adults and members of their kin network. This ethnographic study of older adults, their family members and supportive professionals highlights the experiences of older adults and their network as they embark on relocation from their homes. Some older adults will move to senior living communities (either CCRCs or subsidized senior housing) while others choose to move to condos or build their own homes. To complete this project, I conducted interviews, participant observation of the moving process (packing, garage sales, moving day, adjustment) and document review with over 35 older adults from Ann Arbor, MI, their kin and supportive professionals in three stages: pre-move planning, move in-process, and post-move adjustment.

#### **ADVERSE EFFECTS OF FINE PARTICULATE AIR POLLUTION ON MARKERS OF INFLAMMATION IN OLDER U.S. ADULTS**

J.A. Ailshire, *Andrus Gerontology Center, Univ Southern California, Los Angeles, California*

Exposure to high levels of air pollution is associated with increased levels of inflammation. Older adults are particularly susceptible to the health consequences of exposure to high levels of air pollution. There are only a few existing studies of the link between air pollution and inflammation among older U.S. adults. However, these studies tend to focus on specific communities of older adults and the results may not be generalizable to the broader population. This study examines the link between residential air pollution exposure and levels of C-reactive protein (CRP) and lung function among older U.S. adults. The study sample includes about 4,000 non-Hispanic white and non-Hispanic black men and women ages 60 and older who participated in the 2006 Health and Retirement Study, a nationally representative study of older adults, and lived in their residence since 2004. CRP was measured using dried blood spots and lung function was assessed using a puff test. Individual data were combined with data on 2004 levels of fine air particulate matter (PM) from the Environmental Protection Agency's Air Quality System monitors. Older adults who lived in more polluted areas had higher CRP levels, net of individual risk factors such as race, education, smoking status, and body mass index. In addition, those who lived in the most polluted areas had reduced lung function even after adjusting for individual characteristics. This study contributes to the growing literature on air pollution and health and provides further evidence of the link between fine air PM and inflammation.

#### **EXPLORING THE CONCEPT OF "PLACE": THE SPATIAL PRACTICES OF LGBQ OLDER ADULTS LIVING IN SAN FRANCISCO**

J. Yeh, *University of California, San Francisco, San Francisco, California*

The spatial concentration of populations in cities influenced by attributes of the urban form has a changing impact on society especially in the way the concept of "place" is understood to have a relationship with aging, health, and well-being. This research used a qualitative approach to examine the lived experiences of lesbian, gay, bisexual, and queer (LGBQ) older adults in San Francisco through photo-elicitation techniques and narrative methods. Participants were asked to identify and represent their environments by recording them with disposable cameras. The photographs served as catalysts for conversation and robust platforms for articulation of their taken-for-granted, varied, and/or hidden cultural practices, social processes, and social and spatial relations. Through grounded theory, narrative, and visual analysis of participants' interviews and photographs, a description emerged of urban space as both a site of queer culture and as one of the many possible milieus for growing older. This presentation will discuss the way in which participants' spatial practices were productive of particular outcomes for LGBQ older adults as well as the way "place" and location shaped the way aged-identities and queer-identities were embodied,

emerge, and enacted. Furthermore, the way in which participants continually worked to re-integrate with their "place" in the face of changes and uncertainty – within their bodies and in their environment as they aged in San Francisco – through social actions, will be discussed. Finally, a theoretical exploration of the concept of "place" will be elaborated and the implications for considering "place" in aging will be discussed.

#### **"I'M JUST NOT GONNA GIVE AN INCH." PHILOSOPHY OF OLDER ADULT MEMBERS OF AN AGING IN PLACE VILLAGE PROGRAM**

A. Lavery Benson, *University of Denver, Denver, Colorado*

Interest in and implementation of village model programs of support are increasing as the older adult population within the United States grows. Membership benefits of a village program often include transportation for doctor's appointments and shopping, assistance with yard work, light home maintenance, referrals to vendors and opportunities for participating in social gatherings. Methods: This qualitative research project explored the experience of older adults who utilize a village model program. The sample included older adults who utilized village services within an urban setting. Eight older adults between the ages of 69 and "91 and a half" participated in individual in-depth interviews. In vivo, initial and then pattern coding were used for analysis. Constant comparative analysis was used to help the data come into place between the different transcripts reviewed. Results: Preliminary findings suggested that older adults who utilized this village model emphasized the importance of supporting each other and the need to resist internal and external messages, thoughts and attitudes that hinder involvement in life, such as participating in social or community activities. Implications: This project provides a better understanding of the strengths and challenges of the older adult who utilizes a village model of aging in place. The findings inform practitioners' about the losses and transitions older adults may experience as they try to live independently. The knowledge and awareness obtained through the voice of these older adults will inform the field about how an older adult's experiences and perspectives inform their decision to age in place.

### **SESSION 630 (POSTER)**

#### **FAMILY & HEALTH**

##### **CAREGIVING AT THE END OF LIFE: A NATIONAL PERSPECTIVE**

J.G. Cagle<sup>1</sup>, A.K. Smith<sup>1</sup>, D.C. Carr<sup>2</sup>, K. Covinsky<sup>1</sup>, 1. *University of California, San Francisco, San Francisco, California*, 2. *University of North Carolina, Chapel Hill, North Carolina*

Care at the end of life is often provided by a network of formal and informal care providers yet nationally representative data describing these networks is lacking. We used the Health and Retirement Study (HRS), a nationally representative study of older adults to present a description of end-of-life caregiving. Exit interviews were conducted with family members following the death of an HRS participant. Family members were asked to describe the decedent's needs for ADL/IADL assistance in the 3 last months of life, and who provided the assistance, i.e., the caregivers. A total of N=8159 HRS participants died between 2000 and 2010. Among these, N=5862 (72%) received ADL or IADL assistance prior to death from at least one unpaid family member/friend. Among these decedents, 54% were female, 76% White, 16% Black, and 7% Hispanic. Their average age at death was 80(SD=10.6) and they had an average of 2.6(SD=1.6) caregivers at the end of life. Caregivers, of which 69% were female, provided a mean of 7 hours of care per day. Primary caregivers, (i.e., the one who provided the most care) provided a mean 11(SD=8) hours of care. For 23% of care recipients, the primary caregiver for ADLs was a spouse, 34% an unpaid relative/friend, and 33% were paid caregivers. For the remaining 9%, only IADL assistance was provided. Family caregivers provide a substantial amount of

care in the last 3 months of life, and need to be viewed as a key component of the end of life care system.

### HEALTH COMMUNICATION NETWORKS OF OLDER ADULTS: WILLINGNESS TO SHARE FAMILY HEALTH HISTORY

S. Ashida, E. Schafer, *University of Memphis School of Public Health, Memphis, Tennessee*

Family health history (FHH) information can inform primary prevention of major chronic diseases, thus, CDC and NIH identified dissemination of FHH as one of the public health priorities. FHH can only be disseminated by older- to younger generation family members, placing a great amount of responsibility on older adults. This study explored the characteristics of social relationships associated with older adults' willingness to share FHH information with their network members. In 2011, 110 senior center participants (ages 60 years and older) were interviewed in Memphis, TN. A total of 1,058 social network members were enumerated, and a two-level logistic regression model was built. Participants were willing to share information about diagnoses (e.g., heart disease, diabetes) of family members to 456 (43%) network members; 63% of children and 46% of siblings. Participants' communication partners were less likely to be older-generation (OR=0.24) and more likely to be younger-generation (OR=1.94) members than same-generation, and those who provided emotional support to (OR=1.67) and were very close to respondents (OR=2.07); these members were more likely to be in the network of respondents who had higher perceived severity if family members encountered heart disease (OR=1.33). Although participants were willing to communicate FHH with younger members, large proportions of those who could benefit were not listed as those they were willing to share, suggesting the need to facilitate FHH dissemination among older adults. Perceptions about family members' risks for chronic diseases and quality of supportive relationships may play roles in how older adults communicate FHH.

### INTERGENERATIONAL HEALTH PROMOTION PROGRAM BY OLDER ADULTS -THREE-YEAR EXPERIENCE AND EFFECTS-

Y. Fujiwara<sup>1</sup>, H. Ohba<sup>1</sup>, M. Yasunaga<sup>1</sup>, K. Nonaka<sup>1</sup>, M. Nishi<sup>1</sup>, Y. Murayama<sup>1</sup>, H. Uchida<sup>2</sup>, S. Shinkai<sup>1</sup>, *1. Research Team for Social Participation and Community Health, Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan, 2. University of Hyogo, Himeji, Japan*

**Objective:** We are conducting a longitudinal, intergenerational study, known as REPRINTS, in which senior citizens are engaged in reading picture books to children. This paper will focus on findings obtained during the first three years, and will evaluate the potential effectiveness of such social activities. **Methods:** 139 volunteers and 179 controls, all aged 60 years and over (Mean=67.33, SD=5.46), living in three areas in Japan, participated in baseline health check-ups starting in June, 2004. After completion of a 3-month training seminar (once a week, 2 hours per session), volunteers visited elementary schools and kindergartens in groups of 6-10 people for 30 months. They were assessed again with an annual health check-up. **Results:** At baseline, the average number of school years (13.1±2.6 vs. 12.0±2.3 years, p=0.002) was significantly higher in volunteers than in the control group. There was no significant difference in other baseline characteristics between the two groups. At the subsequent follow-up assessments, social network scores for the volunteers were significantly improved: the frequency of contact with children, new friends and acquaintances increased, as compared to the controls. Self-efficacy and Sense of Coherence (SOC) also significantly improved. In addition, the loss of hand-grip strength was significantly less in volunteers. **Conclusions:** Engagement in intergenerational and intellectually stimulating volunteer programs over a period of 30 months, led to markedly improved social network scores, and various aspects of psychological and physical performance were significantly less

declined or improved among senior volunteers, in comparison to the control group.

### FAMILY HEALTH LEGACIES: DIABETES MANAGEMENT AMONG OLDER RURAL ADULTS

M.M. Manoogian, *Gerontology, Psychology Division, Western Oregon University, Monmouth, Oregon*

Economic, cultural, and familial contexts influence health outcomes for older adults in Appalachia where rates of type 2 diabetes (T2DM) are among the country's highest (<http://www.cdc.gov/Features/dsObesityDiabetes/>). As part of a university initiative, this qualitative paper focuses on dyad interviews with older adults diagnosed with T2DM (n = 21; average age 67 years) and family support members (n = 16). Criteria for participation included: (a) a self-report of a diagnosis of T2DM for at least one year; (b) identification of a family support member willing to participate; (c) minimum of 18 years of age; (d) current resident of an Appalachian county; and (e) family history of residence in Appalachia. Relational status of dyads included spouses (n = 10), older parents/adult children (n = 9); sisters (n = 1); and best friends (n = 1). Grounded theory guided data analysis (Strauss & Corbin, 1990) and Erikson's (1950) focus on generativity emerged in narratives. Participants described health legacies that created links between generations, were crafted and negotiated by older family members, and were shared with succeeding generations. Themes included: (a) Diabetes as an expected and ambiguous visitor; (b) Family stories as sources of disease information and management expectations; (c) Health legacies shaping personal health outcomes; and (d) Transmissions of health legacies to younger generations. These intergenerational health legacies had implications for how T2DM was personally understood and managed as well as how disease management occurred within family and health provider relationships.

### A LONGITUDINAL MODEL OF SYMPTOM INCONGRUENCE & FUNCTION IN LUNG CANCER FAMILIES

K.S. Lyons<sup>1</sup>, S. Hiatt<sup>1</sup>, J. Bennett<sup>1</sup>, L. Nail<sup>1</sup>, E.K. Fromme<sup>2</sup>, L.M. Miller<sup>1</sup>, P.J. Johnson<sup>1</sup>, *1. School of Nursing, Oregon Health & Science University, Portland, Oregon, 2. OHSU - School of Medicine, Portland, Oregon*

Previous research on patient-family member incongruence (differing perceptions) suffers from several limitations. Traditional methods (e.g. percent agreement, Pearson correlation, difference scores) are limited in what they can tell us about incongruence; factors associated with incongruence are seldom examined; and changes over time are rarely included. Lung cancer patients (PTs) and their family members (FMs) struggle to manage symptoms, which are often severe, based on their individual perceptions of the PT's experience. Incongruent perceptions can lead to poor symptom management. Without understanding how incongruence changes, and factors associated with change, we cannot know the clinical relevance of incongruence or how best to intervene to support families at end of life or in severe illness. This study examined trajectories of PT-FM incongruence in perceptions of PT symptoms and function. A sample of 114 lung cancer dyads recruited through a cancer registry were followed for up to 12 months. This is one of the first studies to examine trajectories of incongruence using multilevel modeling. Results revealed that, on average, FMs rated PT fatigue, shortness-of-breath, and pain severity higher, and their physical function as lower, at baseline, than did PTs. On average, trajectories of incongruence were stable over time, except for physical function, which showed less incongruence over time. There was significant variability around average trajectories, suggesting a sample of dyads with varying degrees of change. Level 2 models found concealment and communication between dyad members significantly predicted incongruence over time. Discussion will include the importance of the family dyad relationship in managing symptoms.

## EFFECTS OF A LIFE STORY INTERVENTION ON CAREGIVING BURDEN RISK FACTORS

F. Zanjani, B. Downer, A.F. Hosier, J.F. Watkins, *Gerontology, University of Kentucky, Lexington, Kentucky*

**Objectives:** To examine the feasibility of Memory Banking (MB), an intervention emphasizing life story development for caregiver and care recipient preparation. MB is structured to provide the knowledge and skills for collecting, documenting, sharing, and maintaining life stories within the context of social support, brain exercise, and legacy. Dyads participate in MB to strategically document and share their life story, including future dreams, aspirations, plans and decisions. **Methods:** Data (2010-2012) from five MB workshops was examined to determine feasibility of community implementation and the effect of the intervention on indicators of caregiver burden: mental health, social support, and quality of life. Recruitment efforts resulted in N=42 participants. Participants were primarily female (75% white/Caucasian (93.1%), with an average age of 71 years. Results: Participants improved in all mental health domains, with significant improvements in anxiety ( $p=0.015$ ), mood disturbance ( $p=0.0028$ ), and emotional well-being ( $p=.02$ ). Results also indicated patterns for improvement in depression ( $p=0.11$ ) and instrumental support ( $p=0.12$ ). A significant improvement in cognition ( $p=0.0062$ ) was also observed. **Discussion:** The MB intervention resulted in improvement in mental health, but no noteworthy social or functioning improvements. MB outcomes indicate that the intervention is promising and supports continued investigation and development in the area of life story development for caregiver and care receiving preparation. MB effectiveness and versatility can have a major impact on improvement in social care burden, and can positively change the lives of many older adults. Future research is needed to examine the versatility and long-term effects of the MB intervention.

## SESSION 635 (POSTER)

### FAMILY CAREGIVING 1

#### CHALLENGES FACING CHINESE-AMERICAN FAMILY CAREGIVERS FOR ELDER WITH DEMENTIA

X. Lu<sup>1</sup>, H. Chen<sup>1,2,3</sup>, L. Xing<sup>1</sup>, M. Chen<sup>5</sup>, S. LevKoff<sup>1,2,4</sup>, 1. *Environment and Health Group, Inc., Cambridge, Massachusetts*, 2. *Harvard Asia Center, Cambridge, Massachusetts*, 3. *Harvard Medical School, Brookline, Massachusetts*, 4. *University of South Carolina, Columbia, South Carolina*, 5. *Charles B. Wang Community Health Center, New York, New York*

Chinese-American family caregivers face the typical strains of dementia caregiving, compounded due to cultural values. To better understand challenges they face, two focus groups were conducted in New York City: one with 11 Mandarin-speaking, and one with 11 Cantonese-speaking dementia caregivers. Average length of time being a caregiver was 4.45 years (range: 10 months to 10 years). Housing was a significant concern because most landlords refuse to accept families with someone with dementia, and assistant living facilities do not allow paid caregivers to stay. Caregivers of individuals with early-stage dementia were stressed due to uncertainties as to the future, and lack of knowledge about handling behavioral problems and keeping individuals socially active. Caregivers of individuals with late-stage dementia found life difficult due to the demands of 24/7 care. Participants liked seeking professional advice, which was perceived to be helpful. Participants relied on the services of paid caregivers, were highly satisfied, and wanted more services. Most caregivers chose not to send their loved ones to nursing homes, which was viewed as abandonment according to Chinese cultural values. Most participants would not share their concerns with family members, and instead preferred sharing experiences with other caregivers with similar backgrounds. Isolation due to language barriers and unfamiliarity with available resources were common. They are in urgent need of, and willing to accept support and assis-

tance from outside the family, when provided in a way that is consistent with their Chinese values and beliefs.

#### MEXICAN AMERICAN FAMILY CAREGIVER MEDICATION ADMINISTRATION HASSLES FOR OLDER ADULTS

H.S. Kao, *School of Nursing, The University of Texas at El Paso, El Paso, Texas*

Older adults rely increasingly on their families for assistance with taking their medications at home, but little is known about factors influencing this caregiving task. This study explores the effect of acculturation and social exchange on the hassles that Mexican American family caregivers face in administering medication regimen to their older adults residing at home. The study used a descriptive and correlational design with a convenient sample. Multiple regression was used to analyze data. A total of 239 Mexican American adult caregivers of an older adult on a daily prescription medication regimen were recruited in Dallas, Texas, and San Diego, California, where are the two leading states with most Mexican American residents. The caregivers' scores on the medication administration hassles scale were significantly affected by acculturation (such as language preference) and social exchange factors (such as the overall services provided by the elder) that explained 36% of the variance in the scale scores. The social exchange block (23%) had a larger influence than did the acculturation block (13%). Caregiving may be an outcome of dynamic family exchange relationships between the caregiving dyad. The study findings can help healthcare professionals detect potentially at-risk Mexican American families and provide them with timely and culturally appropriate interventions.

#### THE EFFECT OF CAREGIVING ON RN JOB SATISFACTION, WORKPLACE RELATIONSHIPS, AND WORK-FAMILY SPILLOVER

L.J. Clark-Shirley, 1. *Social Gerontology Researcher, Honolulu, Hawaii*, 2. *University of Maryland Baltimore County, Baltimore, Maryland*

Despite a rich literature documenting effects of informal caregiving on work-related outcomes of caregivers, little is known about how providing care to older persons impacts certain professions. For example, only a limited number of studies have explored the impact of registered nurses (RNs) providing informal care in addition to working. This preliminary study builds upon the literature, examining relationships between informal caregiving and RN work outcomes. A web-based survey was administered to 882 RNs, measuring job satisfaction, workplace relationships, and work-family spillover. Respondents self-identified as informal caregivers via a single item; caregiver burden, gains, and quality of support scale scores were collected for those identifying as caregivers. 41.2% (n=363) of RNs self-identified as informal caregivers. Linear regression models were used to first explore the effect of caregiver status on job satisfaction, relationships with managers and co-workers, positive work-family spillover, and work-family conflict. Objective and subjective caregiver burden, caregiver gains, and quality of support were then added into the models. For all outcome variables, caregiver status was not significantly associated with higher or lower scores. However, higher objective and subjective caregiver burden scores significantly predicted higher work-family conflict ( $B=.271, .205, p<.001$ ), lower objective burden and higher caregiver gains scores significantly predicted higher positive work-family spillover ( $B=-.154, .279, p<.001$ ), and higher perceived quality of support significantly predicted higher job satisfaction ( $B=.118, p=.016$ ). Co-worker and manager relationship scores were not influenced by caregiving. These results underscore the importance of caregiving context to future research on the effect of caregiving on RN work outcomes.

## HEALTH BEHAVIOR

**PHYSICAL QUALITY OF LIFE AND BMI AMONG OLDER ADULTS IN BEHAVIORAL WEIGHT MANAGEMENT**

K. Olson, E.A. Kellogg, C. Emery, *Clinical Psychology, The Ohio State University, Columbus, Ohio*

Obesity is a major public health concern in the United States, with one-third of all adults and approximately 20% of individuals over the age of 65 obese (i.e., body mass index (BMI) of 30 or more). Across age groups, obesity is associated with a variety of medical complications as well as impaired physical functioning. Although age-related disability may compound the effects of obesity on physical functioning, behavioral weight management programs do not typically address age-related differences that may exist among treatment-seeking individuals. This study evaluated effects of age on the association between BMI and physical quality of life. Eighty-six obese (average BMI=47.9±11.1) adult participants (mean age = 45.4±11.8 years; age range: 19 to 73 years; 76% female) in a university-based behavioral weight management program completed self-report questionnaires at program entry, including an indicator of quality of life (SF-36). In the total sample, BMI was negatively associated with physical functioning ( $r=-0.47$ ,  $p.001$ ), as measured by the physical functioning subscale of the SF-36. To examine age-related effects, correlations of BMI and physical functioning computed among older (age  $\geq 60$ ) and younger (age  $< 60$ ) participants revealed significantly greater magnitude in the older participants ( $r=-0.89$ ) than in the younger participants ( $r=-0.51$ ; Fisher's  $z=-1.67$ ,  $p=0.048$ ). Thus, obesity was more strongly associated with impaired physical functioning among individuals over age 60, suggesting older patients in behavioral weight management may require additional resources to address limitations in physical functioning.

**PATIENT-PROVIDER COMMUNICATIONS AND THEIR IMPACT ON ELDER HEALTH**

F. Alpass, C. Stephens, R. Flett, *Psychology, Massey University, Palmerston North, New Zealand*

Effective communication is a key component of the patient-provider encounter. While problems with communication may occur in any patient-provider encounter, there are also patient-related factors, such as age which may contribute to miscommunication. Compared to younger patients, there is greater variability in life histories, SES, financial resources, number and severity of illnesses and disabilities, and cognitive and functional ability in older cohorts. Older adults also bring other challenges to the patient-provider encounter. Health literacy decreases with age in patients 65+ years. Age-related changes such as sensory changes and cognitive declines may hinder the communication process. Even relatively healthy, high-functioning older adults experience patient-provider communication problems, with difficulties in comprehending information the most frequently reported problem cited. Ageism in the healthcare system is well documented with older patients less likely to receive a range of treatments and being treated less aggressively than younger patients for the same condition. Clearly, older adults experience greater challenges in the patient-provider encounter. Little is known about the impact of patient-provider communication on health outcomes in older adults. This study uses a nationally representative sample to investigate older community-dwelling New Zealanders' perceptions of the quality of communications with their health care providers, the factors that influence those communications and the impact they have on their health care utilization, and health status. Gaining a better understanding of these communications and their impact on elder health is essential for the development of interventions and policies that promote health, independence and efficient use of health resources.

**FOOD INSECURITY AND HEALTH CARE UTILIZATION IN OLDER ADULTS**

V. Bhargava, J. Lee, *University of Georgia, Athens, Georgia*

Food insecurity is a clinically relevant problem, however its effect on health care utilization among older adults is not known. This study examined the relationship of food insecurity with health care service utilization in older Georgians enrolled in Medicare and meals services using two complementary datasets, Georgia Advanced Performance Outcomes Measures Project (GA POMP) and the 2008 Medicare claims data ( $n=903$ , mean age 76.9, 31.0% male, 35.8% black). Health care utilization during 2008 (i.e., inpatient, outpatient, emergency, and home health visits and prescription medication use) was compared between food insecure and secure participants using negative binomial regression while controlling for potential confounders. About half of the sample (50.4%) was food insecure and they tended to have more chronic diseases than their counterparts. There were no differences in inpatient, outpatient, and emergency room visits and prescription medication use by food insecurity. Food insecure participants, however, had significantly fewer home health visits than food secure participants. These findings suggest unique health care usage patterns by food insecure older individuals. This study was funded in part by Administration on Aging and University of Georgia.

**SOCIAL INTERACTION AND DEMENTIA PREVENTION: EVIDENCE FROM FOLLOW-UP STUDY**

T. Anme, *University of Tsukuba, Tokyo, Japan*

Objectives Prevention-oriented services for dementia are essential to realize healthy longevity. Emphasis is going on developing community-based services which help prevent seniors from becoming dependent by intervening while their need levels are still low. This follow-up study was clarify the relationship between social interaction and the prevention of dementia. Method All participants (aged 65 years and above) lived in farming communities near major urban centers in Japan. The contents of the questionnaire covered social interaction (using an index of social interaction constituting 18 items), health status, physical function, family structure, life events, age, and gender. Results After the baseline survey, participants were analyzed in the three-year, and six-year period: (1) baseline age and physical function were related to dementia; (2) greater social interaction was positively related to reduced dementia; (3) the multiple logistic regression analysis adjusted for baseline age, gender, and physical function indicated that social curiosity and social contribution related to prevent dementia. Discussion These findings highlight the importance of social interaction for dementia prevention. The introduction of new services such as "strengthening of social curiosity" and "social contribution" represent initial steps in establishing systems that enable elderly persons to live healthy longevity. An ongoing longitudinal study of elders in one community demonstrate that prevention-oriented services are essential to improving the healthy longevity of citizens, and that seniors will accept such services.

**CHARACTERISTICS OF ADOPTING AND NON-ADOPTING SITES: EVIDENCE FROM THE FIT AND STRONG! PROGRAM**

R. Smith-Ray, P. Desai, S.L. Hughes, *Center for Research on Health and Aging, Univ Illinois, Chicago, Illinois*

There is growing need to understand factors that influence the dissemination of evidence-based (EB) programs. The National Council on Aging recommends that organizational readiness to adopt EB programs should be assessed by examining two constructs; willingness and capacity to adopt. Willingness assesses the organization's motivation, whereas capacity assesses organizational resources and demand for the program. We surveyed the universe ( $N=226$ ) of potential adopters of Fit and Strong! - an EB physical activity (PA) program for older adults with osteoarthritis (OA) - to examine the characteristics of organizations that did and did not adopt the program. Adopting providers ( $N=26$ ) were

more rural (35%) and less urban (65%) relative to non-adopters (15% and 85%, respectively). Adopting providers were more likely to be medical centers (23% vs. 5%) and senior centers (46% vs. 25%) and less likely to be private gyms (0% vs. 10%), rehabilitation/PT centers (0% vs. 4%), or senior housing facilities (0% vs. 9%). Capacity to adopt Fit & Strong! among non-adopters was high - 85% of organizations had clients who would be interested in the program and 84% had clients with OA. Almost all non-adopter providers had space to conduct exercise programs (90%), employed exercise instructors, and 97% were definitely or probably willing to adopt the program. Findings showed that both willingness and capacity to adopt a program like Fit and Strong! were more pervasive across providers than anticipated and indicate that stepped up marketing efforts should be made increase awareness of the program.

### **MAXIMIZING HEALTH AND FUNCTION: DIETARY AND PHYSICAL ACTIVITY ADVICE AMONG OLDER ADULTS IN PRIMARY CARE**

S.H. Bardach, N.E. Schoenberg, *University of Kentucky, Lexington, Kentucky*

Since older adults frequently interact with the healthcare system, primary care providers (PCPS) may be well situated to provide lifestyle behavior recommendations. To better understand how PCPS discuss diet and physical activity with their older patients, we audio-recorded approximately 110 routine primary care visits and interviewed patients immediately following their visits to ascertain what they recalled and found influential during the PCP visit. We transcribed these interactions and coded the transcripts. Participants ranged in age from 65-95 (mean = 74) years. Lifestyle behavior discussions were initiated by both patients and providers, often in response to functional/health concerns. Over half of the patients reported some recollection of diet or physical activity discussion, though many of these discussions were quite brief and involved minimal provider input. Patients reported appreciating encouragement for recent and planned changes, but also indicated a desire for more specific recommendations and PCP feedback to demonstrate whether their efforts have been beneficial. We discuss implications for PCPs' prevention counseling.

### **MEASUREMENT OF BASIC KNOWLEDGE OF ALZHEIMER'S DISEASE IN RURAL POPULATIONS**

L.K. Wiese, C.L. Williams, R.M. Tappen, *Christine E. Lynn College of Nursing, Florida Atlantic University, Boca Raton, Florida*

Instruments currently in use to assess knowledge of Alzheimer's disease (AD) are either outdated or directed to persons of high socioeconomic and educational levels, rendering the items irrelevant or incongruent for high-risk populations. The Basic Knowledge of Alzheimer's Disease (BKAD) assessment tool is a 30-item, closed-ended test designed to measure levels of knowledge of AD in rural populations. The questions address knowledge of risk, onset, treatment, progression, and prevention of the disease, as well as symptoms and behaviors associated with AD. The measure was field tested with twenty older adults attending a rural health care clinic in Fayette County, West Virginia, a low income, non-Hispanic white population. Preliminary assessment for validity and internal reliability included completion of a content validity index by health professionals currently working among the target population. Lay leaders examined the tool for language, reading level and cultural appropriateness. Nurse researchers with expertise in cognitive screening for AD edited items for appropriateness and clarity. Phase 2 consisted of administration of the revised survey and a qualitative technique using "think aloud" to illuminate reasons for the chosen answers. Findings included that 90% of those surveyed believed that memory loss is a normal part of aging and 60% thought that persons with AD are unable to understand what they see on television. Eighty percent agreed that earlier detection means earlier treatment. Future research will include further tests of reliability and validity to

evaluate worthiness of the tool and administration to a greater and more representative sample of Appalachian residents.

### **DOES COMMUNITY HEALTH EDUCATIONAL INITIATIVES IMPROVE THE UNDERSTANDING OF DEPRESSION AMONG U.S. CHINESE OLDER ADULTS? FINDINGS FROM AN OUTCOME EVALUATION STUDY IN CHICAGO**

Y. Li<sup>1</sup>, M.A. Simon<sup>3</sup>, E. Wong<sup>2</sup>, B. Wong<sup>2</sup>, E. Chang<sup>1</sup>, F. Huang<sup>1</sup>, X. Dong<sup>1</sup>, *1. Rush Institute for Healthy Aging, Chicago, Illinois, 2. Chinese American Service League, Chicago, Illinois, 3. Northwestern University, Chicago, Illinois*

Background: Chinese aging population has been disproportionately affected by mental health issues such as depression. Chinese older women may be at higher risk, specifically, suicide rate among U.S. Chinese older women is a higher leading cause of death compared with the general population. Our study aims to conduct culturally-appropriate educational programs to increase community understanding toward depression and evaluate program effectiveness. Methods: We partnered with Chicago Chinese community to conduct a workshop on depression in English, Cantonese, and Mandarin. Participants received a one-hour didactic workshop on depression symptoms, treatment and prevention. We performed a 15 questions pre-workshop test, post-test and follow-up test after 3 weeks. SPSS was performed to examine the data. Results: The test scores are based on the accuracy of each question from 24 participants. 67% were female. Participants' knowledge of depression increased from 9% in pre-test, to 24% in post-test, to 17% in the follow-up test. Across all questions, "The best way to treat depression" had the lowest accuracy score in pre-test (0%) whereas "older, more depressed" had the highest (38%). "Ginseng's effect on depression" received the highest accuracy rate, from 8% in pre-test to 62% in post test, indicating a 54% increase after the session. With respect to gender, no significant differences was found between men and women (p=0.593). Conclusion: Our study has wide implications for future mental health educational programs in minority aging population. More effort should be devoted to devising culturally appropriate mental health educational initiatives at the community level.

### **ATTENTION HIV: OLDER AFRICAN AMERICAN WOMEN DEFINE SEXUAL RISK BEHAVIOR**

L. McCord, *Social Work, University of Louisville, Lexington, Kentucky*

With the increased sexual transmission of HIV in women and men (CDC, 2010; Orel, Stelle, Watson, & Bunner, 2010; Emler, 2006), this epidemic will continue to be a social problem for aging members in society if they do not become a target population for prevention education. Heterosexual sex with an infected person is the primary mode of transmission for women over the age of 40 (Winningham et al., 2004). Deep insight needs to be considered to the ideologies, social norms, and sexual practices of older adult women of color in order to ascertain the breadth and depth of knowledge and behaviors that exist among this group. The goal of this study was to unearth how older black women define sexual risk behavior. A qualitative approach using a focus group was the design for this project to explore the nature of sexual risk. Seven African American women ages 45 to 62 participated in this research study. After coding, three emergent themes were identified: impulsivity, new status with old habits, and red lights. This study is significant because it addresses the knowledge gap of aging and high risk behavior and introduces a way for creating a culturally sensitive empirical base of knowledge about the how a sub-group of older, ethnic adults define an issue such as sexual risk behavior. This information will benefit gerontologists and social workers, generating multidisciplinary conversations to advocate for aging services and policies to address the importance of aging sexually as an important part of health and lifestyle.

## **SUBSTANCE & PRESCRIPTION DRUG MISUSE AMONG OLDER ADULTS: AN ANALYSIS OF SELECT TREATMENT PROGRAMS**

S. Pasupuleti, A. Masters, *Criminal Justice & Social Work, The University of Toledo, Toledo, Ohio*

The presentation portrays how harm reduction treatment model is more effective in treating alcohol, substance and prescription drug misuse. The poster presents analysis drawn based on the select intervention studies. Developing more evidence based practice is imperative since the numbers of older adults are expected to increase from 1.7 million in 2000 to 4.4 million in 2020. More than 17 percent of older adults are estimated to abuse alcohol and prescription drugs and 2.5 million with problems with alcohol (Center for Substance Abuse Treatment, 1998). Seniors disproportionately account for 30% of prescription drug use in the United States. Majority of older adults who misuse alcohol do not meet DSM-IV criteria and these problems are left untreated (D'Agostino, 2006). Among the treatment strategies, harm-reduction approach has been found to be more effective than other treatment models, either abstinence or integrated care. Although abstinence is the ultimate goal but researchers found better outcomes with harm-reduction approach (Lee et al., 2010, p.55). The harm-reduction strategy employed in the multidimensional care treatment group influenced the completion rate of inpatient and outpatient treatment utilization in a positive manner. Another revelation is that many healthcare professionals in a variety of settings need to be trained to deal with the complex needs of this older adult population suffering from comorbid mental health and substance use problems. With the ever-increasing older adult population, there must be a fundamental shift in training and service delivery catered to this specific population (D'Agostino et al., 2006).

## **SESSION 645 (POSTER)**

### **IMPROVING THE AGING EXPERIENCE**

#### **ENVIRONMENTAL CONTEXTUAL CUES AND DISTRIBUTED PRACTICE AID LONG-TERM MEMORY RETRIEVAL IN OLDER ADULTS**

K. Bercovitz, P. Simone, M. Bell, *Santa Clara University, Santa Clara, California*

With adults over the age of 65 representing the most rapidly growing demographic in the United States, research on maintaining cognition in the second half of life has garnered much attention. Our research focused on the role of environmental contextual cues and spaced practice in long-term memory retrieval in this population. Distributed (spaced) practice leads to increased memory performance on verbal tasks for younger and older adults (Cepeda et al., 2009; Balota et al., 1989). Moreover, environmental contextual cues do not seem to benefit the memory performance of older adults in these retrieval tasks (Puglisi, 1988). In this study, older adults (age 60+) were tasked with learning 20 English/Swahili word pairings on a computer in the first session and recalling what they remembered either immediately (massed) or 24 hours later (spaced) and then tested again 10 days later. Participants were randomly assigned to use the same location or a different location for the second practice session. We found a significant effect of spacing (those who returned 24-h later for a second session did better than those who recalled the words immediately), replicating and extending earlier findings to a retention interval of 10 days. We also found a significant effect of context. When context was constant (all sessions in the same room) participants remembered more words than when context was changed. These findings suggest that not only do older adults benefit from distributed practice, but they also rely on environmental contextual cues to remember information.

## **SERIOUS LEISURE AND SUBJECTIVE WELL-BEING OF OLDER RESIDENTS IN NORTHERN SPAIN**

B.D. Linde<sup>1</sup>, D. Kleiber<sup>1,2</sup>, M. Monteagudo<sup>2</sup>, F. Bayon<sup>2</sup>, J. Cuenca<sup>2</sup>, *1. University of Georgia, Athens, Georgia, 2. Deusto University, Bilbao, Spain*

There is now considerable evidence that active engagement contributes significantly to subjective well being in later life (cf. Menec, 2003; Rowe & Kahn, 1998). Just what constitutes active engagement is not entirely clear, however. Must it have some payoff in terms of a physical health benefit or some other work-like productive outcome? Indeed, beyond the views of Rowe and Kahn that suggest as much, the value of active engagement has most often been associated with "productive" aging, i.e., that associated with paid and volunteer work and other involvement of socio-political significance. This research examined the connection with leisure that is serious enough according to sociologist Robert Stebbins (2002) to mimic some of those more valuable work-related meanings and effects, without the focus on the outcome. Furthermore, the possibility that the apparently lesser value of 'non-productive' engagement for successful aging is a culturally-specific finding, depending particularly on work and business ethics and values (cf. Ekerdt, 1986), suggests a need for cross-national studies at least. Thus, we examined the leisure patterns of 719 older residents of Pais Vasco in Northern Spain, both urban and rural dwellers, to determine what, if anything, of their leisure involvement seemed to predict subjective well-being, as assessed by standardized measures of sense of competence, relationships with others, orientation toward personal growth, depression and life satisfaction. Preliminary results indicated that serious leisure involvement, as indicated by activities in which there was strong identity salience, was significantly associated with warm relationships with others but with no other measure of subjective well being, whereas leisure repertoire was negatively associated with personal growth on the measure of psychological well-being. Cultural factors contributing to these findings are discussed.

## **PET PALS: A PILOT STUDY TO EASE RELOCATION TRANSITION**

J. Bibbo, R. Johnson, C.A. McKenney, *University of Missouri, Columbia, Missouri*

Pet Pals was a pilot study which explored the effects of a dog visit protocol (DVP) on older adults' experiences of adjusting to a nursing home. Participants in this three group pretest-posttest design were first time nursing home residents over the age of 60. The study explored changes in the residents' sense of coherence, mood, attitude, daily hassles and uplifts, and salivary cortisol. Participants (n = 15) were randomly assigned to three groups: DVP, human visit (HV), and a control group. The DVP and HV groups received three 20-minute visits per week for six weeks by a registered and certified therapy dog and handler or a friendly human visitor respectively. The control group received the standard care at the facility. Within group T-tests indicated that there were no significant changes in the DVP group. Results for the HV group indicated that posttest depression scores (M = .60, SD = 1.34) were significantly lower than pretest scores (M = 1.60, SD = 1.52), p = .0341. Results for the control group indicated that participants experienced fewer uplifts at posttest (M = 11.60, SD = 7.44) than at pretest (M = 15.60, SD = 9.29), p = .0189. Social integration for the control group approached significance suggesting that social integration scores were lower at posttest (M = 4.20, SD = 2.49) than at pretest (M = 4.80, SD = 2.77), p = .0705. More research on the effect of DVP on relocation transitioning is needed.

## **PRIMARY CARE OF THE OLDER ADULT: LET'S TALK**

W.P. Moran, P.J. Iverson, *Internal Med and Geriatrics, MUSC, Charleston, South Carolina*

Ageing Q3 is a systematic educational change program that uses successful educational techniques and team-based effort to teach medi-

cine residents about geriatrics and improve the quality of care for the older adult patient in the ambulatory care setting. Aging Q3 encompasses 3 quality domains: Quality of Resident Education, Quality of Life, and Quality of Care for the older adult. Our goal is to saturate the learning environment with prompts and cues that will lead to clinical discussions of aging-related issues between resident physicians and their patients. This paper will focus on only 1 of these domains and explain how a clinic saturated with cues, prompts and reminders has achieved 80% participation in discussions with older adult patients on topics that may otherwise not have been addressed during a patient encounter.

### **THE EFFECT ON SOCIAL WORKER'S PSYCHOEDUCATIONAL INTERVENTION PROGRAM HELPING END OF LIFE DECISION MAKING FOR THE FAMILY CAREGIVER OF DEMENTED KOREAN ELDERLY IN A NURSING HOME**

S. Kim<sup>1</sup>, J.J. Han<sup>2</sup>, J. Kim<sup>1</sup>, 1. *Bergen Regional Medical Center, Paramus, New Jersey*, 2. *Columbia University, Pre Med Program, Menhatten, New York*

This study examines the effect of social worker's PsychoEducational Intervention Program(PEIP) that helps family caregivers in End of Life Decision Making(ELDM) for demented Korean elderly nursing home residents. Social worker conducted 2 hours, one session interview with family caregiver, designed for sharing family caregiver's concerns, educating about Dementia and end of life health care decision, and practicing basic skill of stress relaxation. The data was collected by telephone interview with 106 family caregivers, using quantitative methods with close-ended questions about the understanding of ELDM, decision factors, and completion of decision making in pre and post three months of PEIP. The study uses T-Test with SPSS 14.0 version to examine the effect of PEIP. Results indicated the family caregiver's understanding about ELDM( $p < .01$ ) and completion of ELDM( $p < .001$ ) significantly increased to compare them before PEIP. But physician's consulting did not show significant differences. Family caregivers decided to involve the resident's ELDM for resident's pain relief, medical condition, mental capacity, and treatment type. But their religion, age, and sex were not associated with it. The study suggests that social worker's emotional and educational approach encourages the family caregiver to involve in ELDM for demented elderly residents with respect of resident's quality of life during stressful family events. Also, PEIP will be more effective when conducted by a social worker who can provide bilingual and bicultural service.

## **SESSION 650 (POSTER)**

### **LIFE COURSE AND DEVELOPMENTAL CHANGE**

#### **A CROSS-TIME EXPLORATION OF INFLAMMATION, PSYCHOLOGICAL WELL – BEING AND FRAILITY IN OLDER ADULTS**

R. Roiland<sup>1</sup>, S.M. Heidrich<sup>2</sup>, 1. *School of Nursing, University of Wisconsin Madison, Madison, Wisconsin*, 2. *William S. Middleton Memorial Veterans Hospital, Madison, Wisconsin*

Studies of older adults have focused on biological (inflammatory biomarkers) and clinical correlates and predictors of frailty. Few studies have focused on psychosocial factors that potentially influence both frailty and inflammatory processes. The purposes of this study were to compare bio - psychosocial factors in frail and non – frail older adults and to explore the relationships between inflammatory biomarkers, psychological well – being and frailty. A secondary analysis of baseline and 10-year follow-up data from 239 participants aged 65 years and older from National Survey of Midlife Development in the United States (MIDUS) was completed. At time 2, 124 participants were classified as non – frail, 101 as pre – frail, and 11 as frail, using the Fried classification. At baseline and Time 2, frail participants were significantly

older and reported more chronic illnesses than non – frail participants, but psychological well – being did not differ. At Time 2, frail participants had significantly higher levels of C – reactive protein, but not IL-6, than non – frail participants (controlling for age, gender, number of chronic illnesses, and medications). Future research on frailty should include the examination of different psychosocial factors in order to gain a better understanding of how multiple types of factors may influence the development and progression of frailty.

### **TESTING A MULTIVARIATE MODEL OF SOCIAL COMPARISONS ACROSS ADULTHOOD**

K. Hinkle, S.J. Kohn, *Psychology, Valdosta State University, Valdosta, Georgia*

Much of the previous seminal research on later life social comparisons has focused primarily on issues related to physical well-being, domestic relocation and living arrangements. These points of concentration are important to the lives of older adults because they are salient to health and adaptation. Yet, social comparison research regarding adult development and aging as a function of more abstract areas of perceived social cognition, such as problem-solving, moral reasoning, social interactions, and social roles has been scarce. In this study, we surveyed 616 older ( $n=191$ ;  $M\text{-age}=72.62$ ,  $sd=6.76$ ), middle age ( $n=164$ ;  $M\text{-age}=48.45$ ,  $sd=4.95$ ), and younger ( $n=261$ ;  $M\text{-age}=20.54$ ,  $sd=2.53$ ) adults on perceptions of how they fare relative to age peers on four discrete dimensional clusters that pertain to physicality and health; social-roles and interpersonal skills; problem-solving ability; and moral-reasoning and life-knowledge, respectively. Participants indicated whether they perceived themselves to be, better off (downward comparison), about the same (lateral comparison), or worse off (upward comparison) compared to persons of the same or similar age-range. A 3 (age) X 2 (gender) MANOVA revealed statistically significant main effects regarding cross-sectional differences between the three age groups on a host of the variables within each cluster. A significant age X gender interaction was also found, which suggests that females might make more lateral comparisons as they age; while males appear to maintain a more consistent stance regarding downward comparisons as they mature. These findings demonstrate consistency of gender differences regarding theories of social construals (Cross & Madson, 1997) and self-enhancement in adulthood (Goethals, et al., 1991).

### **AGE AND EXPERTISE DIFFERENCES IN THE SUNK-COST FALLACY**

T. Karns, J. Strough, *Psychology, Morgantown, West Virginia*

The objectives of the present study are to address the extent to which age differences in decisions about sunk costs are moderated by expertise and to investigate reasoning underlying decisions about sunk costs. The sunk-cost fallacy (SCF) occurs when people base decisions on irretrievable “sunk” investments instead of future returns. Older adults are less subject to the SCF, which could reflect that older adults have learned to ignore sunk costs. To disentangle age and expertise, experts (those trained in economics or accounting) and naïve participants were recruited: 56 young adults ( $M\text{ age} = 20.65$ ; 25 naïve, 31 expert), 37 middle-aged adults ( $M\text{ age} = 51.65$ ; 24 naïve, 13 expert) and 37 older adults ( $M\text{ age} = 73.92$ ; 27 naïve, 10 expert). Participants made decisions about 13 hypothetical situations presented using written vignettes (range = 0 to 13) and then provided written justifications for their decisions for five vignettes to investigate why decisions were made. Young adults demonstrated the SCF more than middle-aged and older adults,  $p < .001$ . Expert young adults made more normatively correct decisions than naïve young adults,  $p = .01$ . Young adults justified their answers by focusing on the investment more than middle-aged and older adults,  $p < .001$ . Middle-aged adults justified their answers by stating that the amount of the investment does not matter,  $p < .001$ , and older adults more frequently stated emotional concerns as their justification,  $p =$

.005. Implications for improving decisions about sunk costs across the life span are discussed.

### TRAJECTORIES OF HASSLES AND UPLIFTS IN RELATION TO MORTALITY: THE VA NORMATIVE AGING STUDY

Y. Jeong<sup>1</sup>, H. Igarashi<sup>1</sup>, C.M. Aldwin<sup>1</sup>, A. Spiro<sup>2</sup>, 1. *School of Social and Behavioral Science, Oregon State University, Corvallis, Oregon*, 2. *VA Boston Healthcare System & Boston University, Boston, Massachusetts*

Cross-sectional studies provide conflicting information on how stress varies with age (for reviews, see Aldwin et al., 2011; Almeida et al., 2011), and few longitudinal studies include multiple stress measures. Aldwin et al. (2011) identified four different patterns of life events over 17 years; individuals with either medium or high levels of chronic stress had higher mortality rates. The purpose of the present study is to examine whether hassles and uplifts showed similar patterns over time, and to explore whether these different patterns were related to mortality. The sample included 822 men from the NAS (at baseline, MAge = 63.84, SD=6.7, range=48~83) who completed at least three assessments of hassles and uplifts (Delongis et al. 1981) over a 17 year period (Massessments =4.7, SD=.78, range=3~6). Four patterns for both hassles and uplifts were identified using a growth mixture model (SAS Pro TRAJ; Jones et al. 2001): consistently low (44.9/22.5%), medium (39.5/46.0%), high (13.7/27.2%), and an inverted U (1.9/4.3%). Comparing patterns between hassles and uplifts revealed that fewer than half of individuals were in comparable groups on both variables, suggesting considerable individual differences in hassles/uplifts concordance. Cox proportional hazards models were used to predict mortality. Controlling for health behaviors and demographics showed that patterns of hassles and uplifts, unlike life events, were not in general associated with mortality, although there was an intriguing suggestion that those with high hassles were less likely to experience premature mortality, HR = .612, 95% CI = .037 – 1.003 p = .051), supporting a hormesis model.

### VARIABILITY IN NIGHTLY SLEEP AMONG MIDLIFE AND OLDER ADULTS

M.E. Braun<sup>1</sup>, B. Whitehead<sup>2</sup>, C. Bergeman<sup>2</sup>, J. Payne<sup>2</sup>, 1. *Psychiatry, University of Pennsylvania, Philadelphia, Pennsylvania*, 2. *University of Notre Dame, Notre Dame, Indiana*

Having sufficient quantity and quality of sleep is important for optimal emotional and cognitive functioning. Individuals who habitually receive too little sleep or suffer from poor quality sleep are at increased risk of impaired daytime performance. Night-to-night variability in sleep is another potential factor related to health and well-being outcomes. For example, establishing strict sleep routines is an important part of treating behavioral insomnia, and several sleep therapies have been developed to treat depression. It is also known that sleep is susceptible to age-related changes. In order to better understand how within-person variation affects sleep behavior, 296 adult subjects, ages 33 to 88 (grouped by decades of age), from the Notre Dame Study of Health and Well-Being first completed a measure of global sleep quality (Pittsburgh Sleep Quality Index), followed by 56 consecutive sleep diary questionnaires. Multilevel modeling was used to investigate age-related night-to-night variability in sleep quality, sleep quantity, time to bed, wake time, and total bedtime. Results suggest that global sleep quality suffered with increased age; however, the oldest group age group (>70) reported better night-to-night sleep quality as compared to younger groups. In addition, an increase in age was associated with a decline in variability in all sleep variables, except wake time. Across all ages, greater variability in night-to-night sleep quality and total bedtime was related to poorer nightly sleep quality and less total bedtime, respectively, particularly for poor sleepers. This study provides evidence for

the influence of within-person variability in night-to-night sleep behaviors in adults.

### TRAJECTORIES AND CORRELATES OF CHANGE IN PHYSICAL AND MENTAL HEALTH ACROSS ADULTHOOD AND OLD AGE

J. Morack<sup>1</sup>, F.J. Infurna<sup>1,2</sup>, N. Ram<sup>1</sup>, D. Gerstorf<sup>1,2</sup>, 1. *Pennsylvania State University, State College, Pennsylvania*, 2. *Humboldt University, Berlin, Germany*

Subjective ratings of health predict outcomes such as mortality. However, less is known about how subjective health changes across adulthood and what moderates those changes. We applied growth models to ten-waves of data from the Household, Income and Labour Dynamics in Australia Survey (HILDA, N = 7,268; 15-93 year olds; 54% women) to examine age-related changes in the physical and mental health components of the Short-Form 36 health survey. On average, physical health declined from early midlife through old age, whereas mental health remained relatively stable across adulthood. Examination of individual differences suggested that being a woman, less education, higher neuroticism, lower extraversion and conscientiousness, having a health condition, and reporting a greater number of negative life events were each related to less successful aging. Of note was also that participants higher on openness reported lower mental health. Multi-phase models of change were used to estimate the specific ages at which decline emerged as a prominent feature. Results indicated that mental health increased slightly until about age 70, with a shift to minor declines thereafter. In contrast, physical health declines began already 20 to 30 years earlier than mental health. Discussion focuses on avenues for future research that might target the pathways through which the noted differences in individuals' health trajectories emerge.

### EARLY ADOLESCENT PERSONALITY PREDICTORS OF LIFESPAN TRAJECTORIES OF PSYCHOLOGICAL HEALTH: FINDINGS FROM THE INTERGENERATIONAL STUDIES

C. Jones<sup>1</sup>, D. Banse<sup>1</sup>, H. Peskin<sup>2</sup>, 1. *psychology, california state university, fresno, Fresno, California*, 2. *university of california, berkeley, California*

Longitudinal studies allow researchers the luxury of examining development in "real time," without depending upon fallible retrospective recall. The Intergenerational Studies are rare long-term longitudinal studies, with data collected from participants from birth/early childhood to age 77/85 (Eichorn, 1981). Here the focus is on trajectories of overall psychological health, based on the 100-item California Q-sort (Block, 1961), available from age 14 through to age 75. When lifespan trajectories of psychological health were classified via finite mixture modeling (Nagin, 2005), three patterns emerged: Stable Low (SL), Increasing from Low (IL), and Increasing from Moderate (IM). We explored differences between two of the three trajectories—SL and IL—intriguing because participants begin adolescence with the same overall level of psychological health, yet by late adulthood, those in the IL group achieved significantly higher psychological health than the SL group. We searched for more specific personality characteristics, taken from the Q-sort, that differentiate these two groups in early adolescence, with the aim of then linking those characteristics to later marriage partners and work experiences. When examined separately by gender, at age 14, IL girls were significantly more likely than SL girls to be more conventional and more friendly; IL boys were significantly more likely than the SL boys to be less conventional and less friendly. Results begin to uncover the processes of psychological health development, clearly tied to gender roles and differential pay-off for sociability and conventionality, at least for this cohort of individuals born in the 1920s.

## GENETIC RISK FACTORS MODERATE THE BENEFITS OF LIFESTYLE ACTIVITIES ON COGNITIVE DECLINE IN HEALTHY AGING

S. Hendrix-Buxton<sup>1</sup>, G. McFall<sup>2</sup>, B. Small<sup>1</sup>, R.A. Dixon<sup>2</sup>, *1. School of Aging Studies, University of South Florida, Tampa, Florida, 2. University of Alberta, Edmonton, Alberta, Canada*

Genetic polymorphisms may contribute to heterogeneity of cognitive decline in aging by moderating effects of cognitively-stimulating activities (CSA). Polymorphisms of the Catechol-O-Methyltransferase (COMT) enzyme, the brain-derived neurotrophic factor (BDNF) protein, and the Apolipoprotein E (ApoE) e4 genotype have previously been associated with differential patterns of cognitive decline. This study used 5-wave data from the Victoria Longitudinal Study to examine whether ApoE, BDNF, and COMT moderated relationships between self-reported CSA and cognitive functioning. Participants included 264 individuals between the ages of 55-94 years old. Conditional process modeling was used to quantify the moderating effect of genetic risk factors on the mediating effect of participation in CSA and changes in cognitive functioning. Results indicate the ApoE4 e4 genotype significantly moderates the indirect relationship between age and participation in one class of CSA on word recall and two classes of CSA on verbal fluency ( $p < .02$ ), with non-e4 carriers showing the greatest benefit of CSA. Similar results are seen for the moderating effect of the COMT genotype on vocabulary and one class of CSA ( $p < .02$ ). No interactions between BDNF genotype, participation in CSA and changes in cognition were found. The results suggest that the benefit of participating in cognitive activities may be moderated by genetic predisposition, at least for some cognitive outcomes and genetic variants.

## MENOPAUSAL STATUS, CLIMACTERIC SYMPTOMS, AND FAMILY RELATED VARIABLES IN KOREAN FEMALE BABY BOOMERS

E. Kim<sup>1</sup>, K. Lee<sup>2</sup>, *1. Dept. of Child Development and Family Studies, Changwon National University, Changwon, Republic of Korea, 2. Dept. of Food and Nutrition, Changwon National University, Changwon, Republic of Korea*

For the majority of women, the process of menopause occurs between 45 and 54. This means most of the female baby boomers (born between 1955 and 1963 in Korea) are currently going through the process of menopause. The objectives of this study are to: (1) identify the perceived climacteric symptoms of Korean female baby boomers; (2) whether perceived climacteric symptoms differ by menopausal status (premenopausal, perimenopausal, and postmenopausal); (3) how family related variables, such as living with children, satisfaction with children, and marital satisfaction are associated with the perceived climacteric symptoms by menopausal status. In this study, community sample of 468 Korean female baby boomers who were married and had at least one child were included. Feelings of tiredness, aches in the joints and lumbago were relatively common climacteric symptoms. However, participants reported a low rate of all other symptoms. Postmenopausal women reported menopausal symptoms more frequently than the other two groups. For both premenopausal and postmenopausal stage women, self-rated health, family related variables associated with climacteric symptoms. The results suggested that in the face of the developmental challenges experienced during menopausal transition, family related variables played as primary protective factors for pre- and postmenopausal females. But for perimenopausal women, self-rated health, employment status, and attitudes toward menopause were significant predictors of climacteric symptoms. This finding indicated that to reduce menopausal symptoms, different treatment should be applied based on menopausal status.

## PRIMARY AND SECONDARY CONTROL OF VERY OLD MEN: THE MANITOBA FOLLOW-UP STUDY (MFUS)

A.U. Swift, R.B. Tate, D.J. Bayomi, *Manitoba Follow-up Study, University of Manitoba, Winnipeg, Manitoba, Canada*

It has been theorized that two ways to gain perceived control over otherwise uncontrollable negative circumstances include primary control, or taking direct action upon the environment; and secondary control, or psychologically adapting to negative situations and events. Secondary control beliefs (including psychological adjustment and acceptance) are thought to become particularly important during times of low primary control, such as when facing age-related decline. Limited related research has found that control strategies can be endorsed in combination, but this research has focused mainly on older women. Little is known about control beliefs in older men. The specific and measurable objectives of the present study were twofold: To examine the frequency of primary and secondary control beliefs in very old men over a ten-year timeframe; and to determine whether the amount of overlap between primary and secondary control beliefs changed as the men aged. The study sample included a subset of very old community-dwelling men (mean age 76 years in 1996,  $n = 1756$ ; mean age 86 years in 2006,  $n = 807$ ) from MFUS, one of the longest running studies in the world. Consistent with expectations, the primary-secondary control belief combinations were endorsed with decreasing frequency over time, whereas endorsement of the adjustment-acceptance (secondary control) combination remained constant. These findings shed new light on perceived control by suggesting that unlike primary control, secondary control belief combinations remain important to very old men as they age. The adjustment-acceptance combination may represent how very old men psychologically adapt to age-related decline.

## SESSION 655 (POSTER)

### MANAGING CHRONIC DISEASE

#### MARITAL HISTORY AND TYPE 2 DIABETES PREVALENCE AND MANAGEMENT: WHAT ARE THE RELATIONSHIPS?

C.L. LaCoe, L.A. Wray, *Biobehavioral Health, Pennsylvania State University, University Park, Pennsylvania*

Type 2 diabetes affects over 26% of adults over age 65 and doubles the risk of premature death; proper diabetes management can delay or prevent premature diabetes-related deaths. Cross-sectional and short-term longitudinal studies suggest that there are generally positive relationships between some aspects of marital history (i.e., current marital status and sequence, timing, duration, and types of marital transitions across the lifespan), health behaviors, and non-diabetes health outcomes. Type 2 diabetes prevalence and management patterns are unknown in those who experience a marital dissolution (i.e., divorce/separation and becoming widowed). Using the 1998-2008 core interviews of the nationally representative HRS ( $n=14,815$ ) to examine these relationships, our preliminary analyses show that, at baseline, the prevalence of diabetes was significantly lower in those who were widowed (11.07%) and divorced/separated (10.90%), compared to those who were continuously married (11.21%,  $p<.01$ ). In participants with diabetes, those who were widowed, compared to those who were continuously married, were more likely to report increased severity of diabetes, less likely to report that their diabetes was generally under control, less likely to engage in vigorous physical activity, more likely to report unhealthy weight loss, and likely to have more comorbidities. Results were similar, but not identical, in those with diabetes who were divorced. Other life course factors, such as age and gender, were important covariates. Finally, marital transitions—controlling for other marital history (e.g., duration), health, and sociodemographic factors—had an important effect on diabetes prevalence and management.

## HOME MODIFICATIONS TO IMPROVE THE COMMUNITY PARTICIPATION OF OLDER ADULTS WITH CHRONIC CONDITIONS

S. Stark, E. Somerville, J.C. Morris, *Washington University School of Medicine, St. Louis, Missouri*

Community-dwelling older adults with chronic conditions are at significant risk for disability in activities of daily living. Vulnerable to barriers in the physical environment such as stairs, low lighting or unsafe bathrooms, they may develop excess disabilities caused by environmental barriers. Notably, disabled older adults also report reduced community engagement. The purpose of this study was to determine if a home modification intervention can improve daily activity performance at home and in the community among chronically diseased older adults with mobility impairments. We conducted a matched controlled trial of home modifications in a sample of 40 older adults with chronic conditions. We measured their performance before and after the intervention with a 6 month follow-up. Treatment was provided by occupational therapists according to a manualized intervention protocol. The average age of the participants was 78.8 years. Most (92%) were female and widowed (53%). The average number of comorbidities was 10. The average number of daily activity problems addressed was 6. For the primary endpoints of performance of activities and satisfaction with activities, as measured by the In-Home Occupational Therapy Evaluation, there is a main effect of improved performance and satisfaction in the treatment group ( $p < .000$ ). Geo-coded maps of before and after intervention community participation indicate differential patterns of community participation. The intervention and assessment procedures were well tolerated. Home modifications do improve the performance of daily activities at home and may impact community participation. Limitations of the study include a brief activity monitoring period.

## EVALUATING RECENT HEALTH CARE QUALITY INITIATIVES IN BARBADOS USING PREVENTABLE HOSPITALIZATION

J. Bushelle-Edghill, J.N. Laditka, S.B. Laditka, *University of North Carolina at Charlotte, Charlotte, North Carolina*

Barbados is a developing nation with universal health insurance that should ensure reasonably accessible primary health care. We examined effects of health quality initiatives in Barbados in the past decade on access to primary care. Hospitalization for ambulatory care sensitive conditions (ACSH), sometimes called preventable hospitalization, has been used extensively to indicate access to primary health care of reasonable quality. Using 2003-2008 data from the Queen Elizabeth Hospital ( $n=32,764$ ), the only public acute care hospital in Barbados, linked to the Barbados 2000 Census files, we calculated ACSH rates per 1,000 adults for each study year, adjusting for annual population growth. We examined ACSH total rates and disease-specific rates for the six most prevalent ambulatory care sensitive conditions among adults age 50+. For women and men in both age groups, population ACSH rates generally increased across the study years. For example, the rate per 1,000 women ages 50+ grew 33.6% across the study years, from 19.98 to 26.70 ( $p < 0.0001$ ); the corresponding increase for men was 30.6%, from 24.01 to 31.36 ( $p < 0.0001$ ). Conditions with relatively high rates for both women and men ages 50+ included influenza and pneumonia, hypertension, and heart failure. Rates for diabetes decreased somewhat during the study period. Population rates of preventable hospitalization generally increased during the study period, a time when Barbados worked to improve access to quality health care. Findings suggest an opportunity to enhance chronic disease management, and to further improve access to primary care.

## CSII AND MDII: PERCEPTIONS OF OLDER ADULTS AND SIGNIFICANT OTHERS

M.M. Rosenkoetter, M.E. Stachura, E.A. Wood, D. Brown, J. Dias, *Georgia Health Sciences University, Augusta, Georgia*

Purpose: We investigated the impact of continuous subcutaneous insulin infusion (CSII) (insulin pumps) and multiple daily insulin injection (MDII) on patient lifestyle and diabetes management as perceived by the patient and a "significant other".

Methodology: In Phase I, we developed, tested and validated detailed parallel questionnaires for four groups of patients and their corresponding "significant others": Continuous Subcutaneous Insulin Infusion (pump) (CSIIpt/CSIIso) and Multiple Daily Insulin Injections (MDIIpt/MDIIso). Phase I yielded results from 261 pairs. In Phase II, using results from Phase I, all four instruments were revised, and validity & reliability established. Cronbach's  $\alpha = .901$  (CSIIpt);  $\alpha = .940$  (CSIIso);  $\alpha = .912$  (MDIIpt);  $\alpha = .940$  (MDIIso). For participants  $>50$  yrs  $\alpha = .901$  (CSIIpt);  $\alpha = .940$  (CSIIso);  $\alpha = .912$  (MDIIpt);  $\alpha = .940$  (MDIIso). Instrumentation: Sociotechnical Systems Theory and the Life Patterns Model framed the study. Instruments consisted of 20 demographic items; 43 perception items (5-pt Likert Scale); 10 True/False items; and 2 items (4-pt Likert Scale) on overall satisfaction with diabetes management and impact on lifestyle. Findings: A substantial number of SO's did not know how to suspend the pump in case of severe hypoglycemia ( $< \text{or} = 40$  yrs, 41.86%; 41-60 yrs, 43.88%;  $>60$  yrs, 41.30%). Although management improves with either intensive therapy, fear of hypoglycemia is not reduced. Each age group reported improved satisfaction with disease management, but in co-dependent relationships, improved independence in CSII patients can negatively impact the SO. CSII satisfaction scores were generally more positive than MDII scores for both patients and SOs.

## EXPLORING DETERMINANTS OF MENTAL HEALTH UTILIZATION IN A PALLIATIVE CARE OUTPATIENT SETTING

C. Azuero<sup>1,2</sup>, R.S. Allen<sup>1,2</sup>, P.A. Parmelee<sup>2,1</sup>, E. Kvale<sup>3</sup>, *1. Psychology, University of Alabama, Tuscaloosa, Alabama, 2. Center for Mental Health and Aging, Tuscaloosa, Alabama, 3. University of Alabama at Birmingham, Birmingham, Alabama*

Psychological disorders assume an important role in the etiology, course, and outcomes associated with chronic disease. Prevalence estimates indicate 25% of Americans are affected by mental disorders during a given year. Increased recognition of the high comorbidity of depression with chronic disease has catalyzed integrated mental health (MH) services into care settings treating individuals with chronic conditions. This study investigated the individual association between MH service utilization and fifty patient demographic and clinical characteristics, in a palliative integrated care clinic. Data from one retrospective and one prospective study conducted within the clinic were combined (total  $N=149$ ). These studies assessed patient care and collected similar information on patient characteristics and MH service utilization. Linear regressions were used to test for association between each patient characteristic and the number of MH visits, controlling for total palliative care appointments. Average participant age was 55 years ( $SD=14.7$ ), race and gender were predominantly white (82%) and female (75%) with a primary diagnosis of cancer (78.5%). Participants averaged 4.3 ( $SD=3.84$ ) palliative care visits and 1.7 ( $SD=3.7$ ) MH visits. Depression ( $p=.034$ ), anxiety ( $p=.007$ ), palliative care provider ( $p=.009$ ), and a comorbid gastrointestinal disorder ( $p=.033$ ) were suggestive of association with MH service utilization. MH services located within a palliative care outpatient clinic might improve the likelihood that individuals with psychological disturbances utilize MH services at a rate greater than the general population. Also, provider differences in patient likelihood of utilization might indicate individual differences in ability to detect psychological disturbance and patient's need for services.

## THE EFFECTS OF AGE, GENDER AND EDUCATION ON THE ENDORSEMENT OF DEPRESSIVE SYMPTOMS IN OLDER ADULTS WITH DIABETES

E. Wayne, M. Wood, S.R. Black, F. Scogin, M.R. Crowther, *Psychology, The University of Alabama, Tuscaloosa, Alabama*

Diabetes is one of the leading causes of death and disability in the world. The WHO describes diabetes as a "growing epidemic" and esti-

mates that by the year 2025, there will be 300 million cases worldwide. Diabetes can also have serious effects on individual's mental well being. Research has shown a link between depression and diabetes. We conducted analyses using the The National Health and Nutrition Examination Survey (NHANES), a combination of studies that attempt to assess the health and nutritional status of individuals with diabetes (and other chronic diseases) across the United States. In keeping with earlier research, a secondary data analysis of the 2009-2010 NHANES data set shows that age, gender and education account for a significant amount of variance associated with depressive symptoms among adults with diabetes. The aforementioned variables account for 5.5% of the variance,  $F(3, 630) = 12.21, p < .001$ . Additional data analysis indicated that older adults with diabetes were less likely to endorse depressive symptoms on a questionnaire than younger adults with diabetes,  $F(3, 633) = 2.971, p = .031$ . The implications of this data are that older adults with diabetes are more likely than younger adults to use effective coping skills for dealing with diabetes.

#### POST-POLIO IN AN AGING POPULATION

B. Malmberg, *Institute of Gerontology, Jönköping University, Jönköping, Sweden*

In western countries poliomyelitis nowadays is extinct or show very low prevalence. People that were infected in the 1940ties and 1950ties are now getting older and some of them show post-polio symptoms. In a register of all persons treated for polio at hospital between 1942 and 1955, a sample forty-nine participated in a study of post-polio problems. Among the refusals some stated that they never had had polio. The mean age was 69 years with a range of 52 to 88, 58 % were men and about half working class. Age is inversely correlated to reported general health. Persons that had a severe polio infection also at the time of investigation report more problems than less severely affected. The results show women to report more severe original problems and also more severe post-polio. Women report more problems climbing stairs and walking. There are no gender differences in feelings of depression. In both gender half show pre-obesity or obesity, but this is unrelated to post-polio severity. As the prevalence of polio decreases the consciousness of the disease will be reduced in the general public and health care. Some persons with post-polio symptoms are unaware of that they ever were affected. There is a risk that post-polio symptoms will be intermingled with age changes. General practitioners should be aware of polio as a contributor to daily life problems. Word count 226

#### VIBRATING UNDERPANTS, SMELL SENSORS AND HOSPITAL CONTINENCE SERVICES: TOOLS AND TECHNOLOGIES FOR IMPROVING THE LIVES OF PEOPLE WITH INCONTINENCE

M.L. Gilhooly<sup>1</sup>, E. van den Heuvel<sup>1</sup>, F. Jowitt<sup>1</sup>, I. Sutherland<sup>1</sup>, J. Bichard<sup>3</sup>, A. Long<sup>2</sup>, K. McKee<sup>4</sup>, L. Dahlberg<sup>4</sup>, *1. Brunel Institute for Ageing Studies, Brunel University, Uxbridge, United Kingdom, 2. Bristol Urological Institute, Bristol, United Kingdom, 3. Royal College of Art, London, United Kingdom, 4. Dalarna University, Falun, Sweden*

Social isolation, loss of self esteem and depression are often a consequence of incontinence. The overall aim of this interdisciplinary project was to reduce the impact of continence difficulties and, thus, assist older people in maintaining a positive identity and good quality of life. The TACT3 project was comprised of three research workpackages: Assistive technology development: Vibrating underpants: A washable fabric underwear wetness sensor and alert mechanism has been developed to alert continence pad users of leakage. In addition, a colour change odour indicating formula has been developed to indicate the presence of the odour of urine at a just imperceptible level. Challenging environmental barriers to continence: Two sets of stakeholders were involved, older people with continence difficulties and toilet providers. Focus groups, workshops, interviews and photographic diaries were conducted to identify key issues. A web based map locating toilets in

London was developed which is called the Great British Toilet Map. Improving continence interventions and services: 140 patients and their carers were interviewed twice within a 12 month interval from a specialist continence clinic for older people and generic continence clinic. Twenty Health and social care managers and 200 practitioners were also be interviewed. Care outcomes are being analysed from each clinic and a cost benefit analysis will be carried out. Key findings from this three year interdisciplinary project are highlighted. Prototypes of the vibrating underpants and the odour sensor will be on display. This research was funded by the UK New Dynamics of Ageing Programme.

## SESSION 660 (POSTER)

### MENTAL HEALTH SERVICES

#### COLLABORATIVE CARE FOR DEPRESSION INFLUENCES BOTH TREATMENT AND RELAPSE PREVENTION

S.M. Thielke<sup>1,2</sup>, P. Diehr<sup>1</sup>, J. Unutzer<sup>1</sup>, *1. University of Washington, Seattle, Washington, 2. Puget Sound VA Medical Center, Seattle, Washington*

**Background:** For dynamic conditions like depression, outcomes may be achieved through either treatment or relapse prevention: making the sick healthy, or keeping the healthy from becoming sick again. Little previous research has modeled how interventions accomplish outcomes through relapse prevention. **Methods:** We analyzed data from 1801 depressed older adults in the IMPACT care management program for depression. Half received a collaborative/stepped care intervention, and half received treatment as usual. Outcomes were measured at baseline, 3, 6, 12, 18, and 24 months. Depression was defined as  $\geq 1.0$  on the Hopkins Symptom Checklist (HSCL). Probabilities of transitioning between the depressed and non-depressed states between each of the time intervals were computed. Adjusted regression models estimated the likelihood of treatment success or relapse prevention. **Results:** Of those who started depressed ( $SCL \geq 1$ ), 36% in the intervention had their depression remit between intervals, compared to 22% in the control group. Of those who started nondepressed, 26% in the intervention group became depressed, compared to 37% in the control. In an adjusted generalized estimating equation model adjusted, the intervention group was associated with a 1.8 OR of treatment success, and a 1.7 OR of relapse prevention ( $p < 0.001$ ). **Conclusions:** The intervention reduced the number of depressed patients in the sample by both treatment and relapse prevention. Interventions that work only to treat the sick may be ignoring an important opportunity to reduce the population burden of disease.

#### AGE DIFFERENCES IN SATISFACTION WITH AND PERCEIVED BENEFIT FROM MENTAL HEALTH SERVICES: RESULTS FROM THE COLLABORATIVE PSYCHIATRIC EPIDEMIOLOGY SURVEYS

K. Ford, A.N. Bryant, G. Kim, *University of Alabama, Tuscaloosa, Alabama*

**Objective:** Although an extensive body of research reports older adults' attitudes toward and under-utilization of mental health services (MHS), relatively few studies have focused on age differences in mental health care among those utilizing MHS. This study examined variation by age in satisfaction with and perceived benefit from MHS. **Methods:** Drawn from the Collaborative Psychiatric Epidemiology Surveys (CPES, 2001-2003), 2,179 adults aged 18-87 who used MHS during the past year were included in analyses. Multiple linear regression analyses were performed. **Results:** Results showed that older age was positively associated with both MHS satisfaction ( $p < .05, \beta = .105$ ) and perceived amount of benefit ( $p < .05, \beta = .106$ ), as was better self-rated mental health ( $p < .001, \beta = .186; p < .001, \beta = .177$ ). Having more comorbid psychiatric diagnoses was negatively associated with satisfaction ( $p < .05, \beta = -.089$ ). Marital status was found to be a moderator of the effect of

age: for married respondents, age had a significant effect on both outcome variables ( $p < .05$ ,  $\beta = .102$ ;  $p < .05$ ,  $\beta = .105$ ), but for unmarried respondents, it did not. **Conclusions:** Our findings show clear evidence of age differences in satisfaction with and perceived benefit from MHS. The findings provide important implications for future interventions targeted to improve MHS satisfaction. Age-specific strategies should be developed in order to prevent delaying mental health treatment.

### THE RELATIONSHIP BETWEEN CULTURAL PREFERENCES AND CLINICAL OUTCOMES AMONG OLDER ADULTS RECEIVING MENTAL HEALTH CARE

S. Mavandadi<sup>1,2</sup>, B. Miller<sup>1</sup>, D. Sorokin<sup>3</sup>, D. Oslin<sup>1,2</sup>, 1. *Mental Illness Research, Education, and Clinical Center, Philadelphia VA Medical Center, Philadelphia, Pennsylvania*, 2. *University of Pennsylvania, Philadelphia, Pennsylvania*, 3. *University of California, Irvine, Irvine, California*

**Objective:** Patients' cultural preferences for treatment-related factors (e.g., patient-provider ethnic and language concordance) have been shown to influence engagement in and satisfaction with mental health care. What is less clear, however, is whether preferences and satisfaction with the care received translate into differential clinical outcomes. The current study examined racial/ethnic group differences in older adults' cultural preferences related to mental health care and whether patient preferences and satisfaction were associated with changes in depressive symptoms over time. **Methods:** Participants included 570 older adults with major depression who participated in the Primary Care Research in Substance Abuse and Mental Health for the Elderly study. Psychiatric and psychosocial assessments were conducted at baseline and 6 months. **Results:** Participants (mean age=73.8 (SD=6.5)) were primarily male (65.7%) and non-Hispanic White (33%; 25% African American, 29% Hispanic, 12% Asian/Pacific Islander). At baseline, Asians/PIs reported greater preference for patient-provider ethnic and language concordance, while African Americans reported greater preference for providers understanding their culture. Although there were minimal differences across ethnic groups in satisfaction with care, regression models revealed that when controlling for baseline sociodemographics, depressive symptoms, and treatment group, greater baseline preference for providers' cultural understanding ( $p = .02$ ) and subsequent perceptions that mental health providers did not take their culture, religion, or race/ethnicity into account over the course of treatment ( $p = .001$ ) were related to significantly higher depressive symptoms at 6 months for Asians/PIs. **Conclusions:** These findings underscore the importance of taking older adults' cultural preferences and provider-patient cultural concordance into account when treating mental health problems.

### SUBSTANCE USE IN OLDER ADULTS RECEIVING PRESCRIPTION OPIOID TREATMENT

Y. Chang<sup>1,2</sup>, L.O. Wray<sup>2</sup>, S.A. Maisto<sup>3</sup>, 1. *School of Nursing, The State University of New York, University at Buffalo, Buffalo, New York*, 2. *Buffalo VA Medical Center, Center for Integrated Healthcare, Buffalo, New York*, 3. *Syracuse University Department of Psychology, Syracuse, New York*

**Background:** Older adults are frequently prescribed prescription opioids for their chronic pain. Substance use can have very detrimental effects on one's health and is a risk factor for prescription drug misuse. Additionally, the concurrent use of substances and prescription opioid is especially concerning because of the possible drug-substance interactions which can lead to adverse events. **Purpose:** This study aimed to describe the use of alcohol, tobacco, and illegal drugs in older adults receiving prescription opioid for their chronic pain. **Methods:** This ongoing study uses a cross sectional design. Participants (aged 50 and above) are recruited from a pain management clinic, senior centers in Buffalo area, and Buffalo VA medical center. Instruments used in this study include the Timeline Follow Back (TLFB) and a demographic questionnaire. The TLFB is a semi-structured interview that uses a calendar

format to record the quantity and frequency of substance use (alcohol, tobacco, and marijuana) for the 30 days preceding the interview. **Results:** A total of 102 participants have enrolled in this study. Preliminary findings indicated that 32% of participants reported alcohol consumption with 15 participants reporting binge drinking (consumption of 5 standard drinks on the same day in the past month) and 12 participants reporting heavy drinking. Thirty-three percent of the participants reported tobacco use and 10% reported marijuana use. **Conclusions:** Our findings indicated that substance use in older adults receiving opioid treatment is a common problem. It is important that clinicians assess substance use in this population and provide education to reduce substance use.

### STUDENT PERCEPTION OF THE PROCESS OF AGING AND THE PROVISION OF COUNSELING SERVICES TO OLDER CLIENTS: A GROUNDED THEORY STUDY

S.V. Santiago, *Counseling and Counselor Education, Rochester, New York*

By 2030, persons aged 65 and over will increase to 78 million; approximately 15 million will have mental health concerns. Despite the anticipated demand for gerocounselors, research indicates that counselors are not adequately trained thus, not prepared to serve older clients. The purpose of this qualitative study was to understand how counselors-in-training perceive the aging process and the provision of services to older clients. Grounded theory was used to capture age-related perceptual nuances of students. Data collection was achieved through focus groups and interviews. Preliminary findings revealed ten themes. Participants identified a lack of discourse normalizing the reality that aging happens on a continuum as fostering a disinclination to seek knowledge addressing the needs of older clients. Other themes include how coursework is geared toward mental health issues in early adulthood rather than across the life span, mental wellness as well as mental health concerns should be addressed across the curriculum, classroom discourse is needed to normalize how everyone is in the process of aging, and issues surrounding death and dying are salient for students who want to help families "work through" end-of-life issues. This poster session will be aimed at both educators and practitioners and will hopefully attract a broad transdisciplinary audience interested in understanding how students perceive the process of aging and the likelihood that they will serve older adults in various professional settings. This research has implications for addressing gaps in gerontological literature that will add knowledge to the field of counselor education.

### IMPACT OF EXERCISE ON DEPRESSION TREATMENT FOR OLDER ADULTS

A. Stepanenko<sup>1,2</sup>, A. Bilbrey<sup>1,2</sup>, J. Rengifo Nevarez<sup>1,2</sup>, R. Marquett<sup>2</sup>, D. Gallagher-Thompson<sup>2</sup>, 1. *Palo Alto University, Palo Alto, California*, 2. *Stanford University, Stanford, California*

Late life depression affects from 8-11% of all older adults. Depression in late life is associated not only with mood problems, but also with functional difficulties, cognitive impairment, and medical co-morbidity. Thus, it is important to evaluate what factors may affect treatment outcomes in psychological treatments of depression. Research has demonstrated that exercise can be a valuable and effective treatment for late life depression. This study looked at the mediating role that exercise plays in treatment for older adults with depression. Participants were 60 older adults (37 female, 23 male), ages 60 and over, enrolled in an individual CBT psychoeducation treatment program at Stanford University (the Positive Experience Project). All participants completed self-report questionnaires and participated in a structured clinical interview pre- and post- intervention. All participants met criteria for depression. Participants then underwent a 12-session program based on a CBT intervention, after which their depression was evaluated in a second interview. Results demonstrated that exercise was positively significantly correlated (Spearman  $\rho = .273$ ,  $p = .035$ ) to response to treatment

based on the BDI-II cut off score of 13 or less. There was also a significant correlation between exercise and response to treatment based on the results of the MINI (Pearson  $r=.267$ ,  $p=.039$ ), indicating that a significant number of participants who exercised no longer met criteria for depression. This suggests that exercise may play a mediating role in treating depression. Further research is needed to verify these results.

#### **MENTAL HEALTH COMPONENTS OF GRACE TEAM CARE AT A VETERANS ADMINISTRATION MEDICAL CENTER**

B. Mossbarger<sup>1,2</sup>, C.C. Schubert<sup>1,4</sup>, P. Beaman<sup>1</sup>, M. Rao<sup>1,4</sup>, C.J. Suelzer<sup>1,4</sup>, B. Sutter<sup>1,4</sup>, S.R. Counsell<sup>3,1,4</sup>, 1. *Veterans Administration Medical Center, Indianapolis, Indiana*, 2. *Indiana University School of Medicine, Department of Psychiatry, Indianapolis, Indiana*, 3. *Indiana University Center for Aging Research, Indianapolis, Indiana*, 4. *Indiana University School of Medicine, Indianapolis, Indiana*

GRACE (Geriatric Resources for Assessment and Care of Elders), a model of care delivery developed to improve geriatric and transitional care for high-risk elders, has a positive track record in safety-net, community based medical centers. For more than a year, the GRACE program also has been implemented at the Indianapolis VAMC, with similarly promising results emerging. In addition to medical outcomes (e.g., re-hospitalization rates, condition-specific protocol implementation, etc.), GRACE addresses certain mental health concerns of enrolled patients as well. This poster describes standard mental health protocols utilized, the measures on which they are based, frequency of use, and mental health liaison service affiliated with GRACE Team Care.

#### **THE HEALTHY AGING GROUP: A METHOD FOR REDUCING AGEISM AND PROMOTING SUCCESSFUL AGING IN LATER LIFE**

A. Stripling, J. Doughan, *Psychology, Department of Veteran Affairs San Francisco VA Medical Center, California, California*

A number of unique physical, psychological and social factors affect individuals as they achieve late life. Societal-imposed and internalized ageism are unfortunately one of these factors, which although previously examined in relation to optimal mental and physical health remain largely overlooked as an underlying mechanism for the treatment of late life psychological concerns. The goal of the current presentation is to disseminate a manual and lessons garnered from developing and enacting a time-limited skills-based cognitive-behavioral treatment program that targets the myths and misconceptions regarding aging. The ten, weekly, 90 minute sessions focus on opening a dialogue about aging related issues, reduction of ageist stereotypes, increased awareness of successful aging, as well as, identification and maintenance of preventative health care goals and behaviors. The intervention included psychoeducation about group identified aging related topics (i.e. physical activity, healthy eating, smoking cessation, falls, medical conditions in advancing age, pain sensory decline (vision, hearing), driving, mood, sleep, learning and memory, medication management, and sexuality); relaxation training; behavioral coping techniques; self-monitoring procedures; cognitive restructuring procedures; and problem solving techniques. As previous research indicates providing care for mentally or physically impaired older adults has adverse health consequences group members were recruited in client/caregiver dyads to provide caregiver support and increase adherence, reinforcement, and maintenance of learned knowledge, skills and behaviors. Implications of the current presentation include distribution of a novel treatment program, as well as, presentation of a theoretical framework which incorporates directly addressing ageism as a mechanism of action for treatment of age related concerns.

## **SESSION 665 (POSTER)**

### **MONEY MATTERS**

#### **ALTRUISM AMONG HRS RESPONDENTS: CAN DICTATOR GAMES PREDICT REAL-LIFE GIVING BEHAVIOR?**

D. Gans<sup>1,2</sup>, M. Hurd<sup>2</sup>, L. Carvalho<sup>2</sup>, 1. *UCLA, Los Angeles, California*, 2. *RAND, Santa Monica, California*

Each year individuals give substantial amounts of money to family, friends, and charitable organizations. Two research approaches—real-life giving through survey methodology and laboratory experiments—have been used to study such giving behavior with. A common experiment is the dictator game, where subjects are given some endowment and asked to decide whether to pocket the allowance or to share it with an unknown recipient or a recipient with specific known features. However, whether dictator game behavior relates to real-life giving remains an open question. We took advantage of a special module in the Health and Retirement Study (HRS) in which a sub-sample of respondents played a variant of the dictator game in 2010. By linking the data from the module to extensive data on giving from the 1992-2010 waves of the HRS on the same individuals and applying economic theory, we aimed to: (1) Understand the dictator game predictive power of real-life giving; (2) Estimate the intrinsic propensity to give, independent of economic circumstances; and (3) Study the relationship between such propensity and observable socioeconomic and psychological characteristics. Preliminary findings demonstrated that among those who gave to charity in the game, 56.1% gave in real life and among those who did not give to charity in the game, 55.4% did not give in real life. The difference between fractions giving to charity in real life conditional on giving in the game was significant at 1%. That the dictator game may predict real-life giving is of significance to future research design.

#### **INTERGENERATIONAL FINANCIAL TRANSFERS FROM SHARE: A DETAILED ANALYSIS**

S. Bould, G. Schmaus, *sociology, University of Delaware, Newark, Delaware*

With the aging of the population in Europe together with proposed changes in the retirement age, the question of intergenerational financial transfers has become a significant area of study. Albertini, Kohli and Vogel (2007) analyze intergenerational transfers of money in the first wave of Survey of Health, Ageing and Retirement (SHARE). Their results indicate significant differences between the amount given by the older generation to their children relative to the amount given by the adult children in different European countries. The adult child generation gives almost as much as it receives in France but this is not the case in Germany. Our results confirm their findings for France and Germany for the second wave (2006/2007) of SHARE. A more detailed analysis of the amounts given in Germany, however, indicates that the distribution of given transfers is highly skewed. The majority of respondents gives rather small amounts to their children and only a minority gives higher amounts. There are also a few cases where extremely high amounts are given. Measures such as mean or median do not summarize the distribution very well. The calculation of balances – as seen from the perspective of the children – is problematic; only the fact that the balance is positive or negative is relevant. This paper will present our results for Germany and we will provide a comparison with France in order to better understand which groups are involved in a high level of exchanges and which groups report only a small amount given and received.

## A FRONTIER BEYOND THEIR PARENTS': THE LIFESTYLES AND EXPECTATIONS OF MIDDLE-AGED ADULTS IN THEIR LATE FORTIES AND FIFTIES

S. Lum, *Waseda University, Tokyo, Japan*

Middle-aged adults in their forties and fifties are well aware of the aging population situation in Japan. Currently the men in these generations are in the peak of their careers and the women, having seen their nests emptying, have dabbled with part-time work or businesses. Often, both their parents and parents-in-law are living. Some of their own children have married and have children of their own and some have children who are still unmarried and living with them. This paper will focus on adults in these middle generations and describe their different living arrangements, relationships with their parents, and expectations of their parents' future as well as their own future. The results are based on a qualitative research of healthy, older adults and their adult children living in the Greater Tokyo area. The research was conducted in an 18-month period between 2009 and 2010. Results found that these generations of adult children are very concerned over aging. They are searching for a model out of their parents' experiences and learning from what they see as their parents' mistakes. At the same time, they worry about the predictions of worse economic conditions for themselves in terms of social security. Some actions that they have taken include setting out early to make new friends and find new hobbies before their retirement, actively maintaining their health, and preparing financially for their own aging. While perceiving their parents to be living successfully, they see themselves at a frontier beyond their parents'.

## THE IMPACT OF PUBLIC LONG-TERM CARE INSURANCE ON CAREGIVERS' TIME ALLOCATION: FINDINGS FROM JAPANESE MICRO DATA

M. Kan, *School of Economics, University of Hyogo, Kobe, Japan*

[Objectives] This study investigates how public long-term care (LTC) insurance, which was introduced in the year 2000 in Japan, affected at-home caregivers' labor market activities and other behaviors. [Methods] A type of difference-in-differences estimation was conducted using the data from Survey on Time Use and Leisure Activities. To examine the effect of LTC insurance, two pooled data sets—1996 and 2001, and 1996 and 2006—were constructed. The samples consisted of women aged 40 to 69. They were limited to household heads, spouses of household heads, daughters of household heads, and spouses of household heads' sons. The total number of the sample was 23,828. The sample was divided into two groups depending on whether they are at-home caregivers. [Results] Some positive effect in labor force participation among female caregivers was observed although no significant effects on working hours were observed at all. There was a negative effect on sleep duration, but a positive effect on rest time. Among caregivers, the care time decreased in 2006. The effect in 2001 was negligible. [Discussion] Since care of the elderly has long been borne by women and it has prevented them from labor force participation, the socialization of the care was one of the main objects of the introduction of public LTC insurance. The result suggests that it had a positive effect on female labor participation. However, the Japanese population is aging rapidly, and the care needs are becoming large and diverse. Hence, additional ways to sustainably support caregivers are needed.

## POSSIBLE DETERMINANTS OF EXPECTED MONTHLY PENSION INCOME FOR CHINESE RURAL PEOPLE

H. Mi<sup>1</sup>, C. Niu<sup>1</sup>, C. Shen<sup>2</sup>, 1. *College of Public Administration, Zhejiang University, Hangzhou, Zhejiang, China*, 2. *Graduate School of Social Work, Boston College, Boston, Massachusetts*

Objective: The new rural old-aged social insurance in China has been started to implement in 2009 with the goal to cover all vast rural areas by the end of 2012. It will provide a uniform, low-level basic pension to all rural people 60 years or older nationwide. Because it is a low-level pension scheme the monthly pension income is not adequate to cover

living expenses for majority rural people in most rural areas in China. This study aims to investigate possible determinants of the expected monthly pension income (an ordinal measure) of Chinese old-aged people in rural China. Data and Methods: We utilize data obtained from a survey sample of 2200 aged 60 years or older rural people from 100 villages of 10 counties all around China. We used Chi-squared Automatic Interaction Detector (CHAID) and logistic regression to perform the analyses. Results: CHAID model shows significant effects of age, main income sources and the medical expense in the past year on expected pension income. The logistic model suggested the significant impact of income sources, health condition, family support, and whether living together with their children on expected pension income. Implications: With fast urbanization and rural-to-urban migration for young people in China, the expected pension income will further increase in years ahead. To raise pension payment for older-old and disables people is even more urgent because unlike young-old people who are still productive and have some income of their own.

## "LATE BLOOMERS OR LAST RESORT?": ENTREPRENEURSHIP IN OLD AGE

A. Franke, *Working Group Interdisciplinary Ageing Research, Goethe University Frankfurt am Main, Frankfurt am Main, Hessen, Germany*

Aging societies and hence economical implications indicate the question of new frontiers and potentials for entrepreneurship in every age. While in the USA almost half of the entrepreneurs are 45plus (Fairlie, 2011, Zissimopoulos & Karoly, 2007), in Germany this trend is still relatively uncommon, although it represents an attractive alternative relative to trainings fostering the skills of older unemployed individuals in attempts to reintegrate them into the workforce. Studies investigating which motives and personal factors increase the likelihood of successful entrepreneurship are rare. The goal of the present study was to identify specific characteristics of elderly entrepreneurs by using reports of the entrepreneurs themselves as well as reports provided by experts from banks and consulting institutions. Qualitative interviews were conducted with 18 elderly entrepreneurs between 51 and 69 years (mean age 51) who were self-employed for 4 years, on average. Additional interviews were conducted with 17 experts from 17 renowned banks, business development players etc. Data was coded following the grounded theory approach by Strauss and Corbin. The findings indicate that older entrepreneurs are becoming of increasingly popular due to non-linear biographies and the increasing risk of poverty in old age. In addition, older entrepreneur show a high degree of heterogeneity and diversity, as well and gender differences. The individual work history is reflected in all dimensions of the new business as motives, skills, networks and financial background. In sum, findings suggest that successful "silver entrepreneurship" contributes to individual and social productivity if accompanied by personal preconditions and an age-friendly social policy framework.

## IMPACT OF THE GLOBAL FINANCIAL CRISIS ON MOVING PRACTICES OF OLDER ADULTS

T. Perry, *University of Michigan, Ann Arbor, Michigan*

The global financial crisis has highlighted the tenuous nature of the global markets on the well-being of all generations. This paper highlights the impact of the global financial crisis on older adults who were planning to voluntarily relocate. Through ethnographic case studies, this paper presents the impact of asset reduction and housing insecurity on older adults. Additionally, the paper also demonstrates how concerns about the salability of one's home impacted ideas about home ownership and the desire to continue owning a residence. This study of older adults, their family members and supportive professionals highlights the experiences of older adults and their network as they embark on relocation from their homes to either senior living communities, condos, or other types of housing. To complete this project in the mid-west-

ern United States, I conducted interviews, participant observation of the moving process (packing, garage sales, moving day, adjustment) and document review with over 35 older adults, their kin and supportive professionals in three stages: pre-move planning, move in-process, and post-move adjustment.

### **THEORY OF PLANNED BEHAVIOR: DO DESCRIPTIVE NORMS AND ANTICIPATED REGRET PREDICT INTENTION TO PLAY THE LOTTERY AMONG DIFFERENT AGE GROUPS?**

Y.H. Huang, M. O'Bryan, W. Tang, K. Yung, *Claremont Graduate University, Claremont, California*

The present study added descriptive norms (DN) and anticipated regret (AR) to the Theory of Planned Behavior (TPB) model. Due to potential emotional differences in older adults, age was explored as a possible moderator between AR and intention. The results replicated the findings of previous TPB research: attitudes, subjective norms, and perceived behavioral control significantly predicted intention. Additionally, DN was found to predict intention above and beyond attitudes, subjective norms, and perceived behavioral control. Results indicated that older adults experienced less AR, but AR wasn't a unique predictor of intention. Age did not moderate the relationship between AR and intention. Keywords: theory of planned behavior, descriptive norms, anticipated regret, older adults

## **SESSION 670 (POSTER)**

### **NEURONAL AGING**

#### **APOE E4 STATUS AND ASSOCIATION BETWEEN BRAIN VOLUME AND OLFACTORY PERFORMANCE**

V. Rupp<sup>1</sup>, J.P. Hegarty<sup>2</sup>, K. Hayashi<sup>3</sup>, C. Sumida<sup>1</sup>, C. Murphy<sup>1,3</sup>, *1. San Diego State University, San Diego, California, 2. University of Missouri-Columbia, Columbia, Missouri, 3. University of California, San Diego, San Diego, California*

APOE E4 status is associated with increased risk of developing Alzheimer's disease and reduced volumes on average in brain regions implicated in olfactory processing. Manually delineating regions of interest in neuroimaging data entails long hours, anatomical expertise, and rigorously defined reliability measures. Alternatively, FreeSurfer is a software toolkit for fast, automatic analysis and has been shown to be reliable and accurate in a variety of studies. However FreeSurfer's ability to work with brain regions implicated in olfactory activities, which may be more difficult or impossible for FreeSurfer to detect and measure accurately, has not yet been investigated. The present study uses a correlational analysis to compare performance on tasks requiring olfactory activation with volumetric measurements of manual and automatic segmentation of olfactory brain regions in 39 adult subjects. The manual segmentation was performed using the AFNI neuroimaging software suite and inter-rater reliability was assessed by computing intra-class correlation coefficients with a secondary rater. Significant correlations between manual and automatic measurements of some regions were found, and APOE E4+ subjects were found to have significant correlations between odor identification performance scores and the volumes of the hippocampus and orbitofrontal cortex, while APOE E4- subjects were not. This suggests that diminished performance during olfactory tasks predicts a reduction of volume in these regions. Supported by NIH grant #AG04085 To Claire Murphy from National Institute on Aging

#### **DIFFERENCES IN P2 LATENCY AS A FUNCTION OF AGE, RESPONSE TYPE, AND ELECTRODE SITE**

M.R. Cervantez<sup>1</sup>, L. Graves<sup>1</sup>, A. Green<sup>2</sup>, C. Morgan<sup>1</sup>, C. Murphy<sup>1,2</sup>, *1. San Diego State University, San Diego, California, 2. University of California, San Diego, San Diego, California*

The current study investigated odor memory retrieval in healthy adults across three different age groups. The focus was to examine differences in OERP latencies for response type and how they differ between age groups. OERPs were recorded from the Fz, Cz, and Pz midline scalp electrode sites in 60 participants among 3 different age groups: young (10 F, 10 M, mean= 21.35 years), middle (10 F, 10 M, mean= 50.35 years), and old (10 F, 10 M, mean= 68.95 years). Subjects were instructed that they were performing an odor memory task and completed three sessions: session 1 was an exposure trial for encoding, session 2 was a retrieval trial using odors, and session 3 was a retrieval trial using odor labels. The odors were presented for 200 msec with an inter stimulus interval of 30 secs by a computer-controlled olfactometer. The odor retrieval trial produced significant differences in OERPs as a function of age, electrode site, and response types: hits, misses, correct rejections, and false positives. Among the middle age group, correct rejections and false positive response types had significantly longer P2 latencies than hits and misses, across electrode site. However, older adults had significantly longer P2 latencies for hits and misses than correct rejections and false positives [ $F(12,48) = 2.198, p = 0.028, \eta^2 = .087$ ]. These findings suggest that older adults take longer to retrieve odors that were previously presented while middle age adults take longer to retrieve new odors, both regardless of response accuracy.

#### **NEURAL CORRELATES ASSOCIATED WITH GRASP FORCE MATCHING TASKS IN OLDER WOMENCNS\_NEUROSCIENCE**

D.E. Adamo<sup>1,3</sup>, A.M. Daugherty<sup>2,3</sup>, *1. Department of Health Sciences, Wayne State University, Detroit, Michigan, 2. Psychology Department, Wayne State University, Detroit, Michigan, 3. Institute of Gerontology, Wayne State University, Detroit, Michigan*

Central effects on motor behaviors have been significantly advanced by the use of Magnetic Resonance Imaging (MRI) techniques. Neuroanatomical volumetric differences have been associated with age-related cognitive and motor deficits (Kennedy & Raz, 2005). However, few studies have considered the neuroanatomical correlates to age-related differences in motor tasks that vary as a function of cognitive demand. To investigate this, older right hand dominant women (mean laterality index of  $0.84 \pm 0.18$ ) grasped cylindrical devices embedded with strain gauges and performed two matching tasks, based on a 20% maximum voluntary exertion reference force. In the Ipsilateral Remembered condition, the reference and matching forces were produced with the same hand and for the Contralateral Remembered condition the memorized reference force information was transferred to the opposite hand/hemisphere to produce the match. Dependent variables included relative matching error and constant error. Relative matching error was greater in the contralateral than ipsilateral remembered condition. Directional differences (right hand overshoot, left hand undershoot) were significant in the CR condition for individuals who showed greater left than right hand strength and equivalent hand strengths. Findings from this study showed that asymmetries in the directional differences of grasp forces are related to differences in force perception derived from contralateral reference limb information and differences in grip strength. Correlations between MRI indices of brain integrity and the grasp data are currently being processed.

#### **OLDER ADULTS AND EPILEPSY: THE LONG AND WINDING ROAD TO DIAGNOSIS**

W. Miller, J. Buelow, *Nursing, Indiana University, Bloomington, Indiana*

Background: The incidence of new-onset epilepsy is highest in older adults. Results of preliminary studies indicate that older adults face

difficulties in being diagnosed with epilepsy, but researchers have not investigated their experiences. The purpose of this study was to describe experiences of older adults diagnosed with epilepsy at or after age 60. Methods: Qualitative description was employed using semi-structured interviews and content analysis. Results: Twenty older adults (mean age 70), 12 women and 8 men, participated. There were three types of diagnosis experiences: Satisfactory (n=2), Unsatisfactory (n=13), and Mixed (n=5). The majority who had unsatisfactory experiences were women (n=11), and all of these participants cited a delay in diagnosis as the prime dissatisfying factor. Delays ranged from six months to seven years and occurred mostly in women. Participants attributed delays to their own actions (n=3), those of providers (n=8), or both (n=2). Those attributing delays to their own actions did not seek treatment due to lack of recognition of their symptoms as seizures. Providers contributed to the delay by not taking participants' concerns seriously, failing to consider epilepsy as a diagnosis, misdiagnosing them with other conditions, or contributing symptoms to co-morbidities. Implications: Lack of a timely diagnosis for older adults with epilepsy leads to improper treatment, increased costs, and decrements in quality of life. The pervasiveness of the problem of delayed diagnosis is in this population, the typical length of the delay, and why women are more susceptible remains unknown. Research with a larger, more diverse sample is needed.

## SESSION 675 (POSTER)

### PERCEPTIONS OF AGING

#### ASSESSING PERCEPTIONS OF AGING: USING WORD CLOUDS AS A DATA VISUALIZATION TOOL

J.K. Chahal, E.A. Fenster, *Sociology & Gerontology, Miami University, Oxford, Ohio*

Research on undergraduate students' perceptions about aging note that current perceptions are influenced by past experiences and contact with older adults (Cottle & Glover, 2007; Van Dussen & Weaver, 2009). Data visualization strategies, such as word clouds, can help us explore existing and/or potentially changing perceptions regarding aging. Word clouds are created based on frequency of word use by participants; this technique creates discussion opportunities and is a different way to examine how ideas are understood or interpreted (Bandeem & Sawin, 2012; McNaught & Lam, 2010). This study utilized word clouds to analyze how students' perceptions of aging and gerontology change over the course of a semester. Undergraduate students in five sections of an introductory gerontology course were asked, at the beginning and end of the semester, to provide 3-5 words that they associated with "aging" and "gerontology." Pre- and post-semester word clouds were created for each section to see how perceptions changed. Analyses included frequencies of specific words and a content analysis. Across course sections, over the course of a semester, students' perceptions changed from general negative and/or ageist to open, positive, and/or realistic perceptions of aging. Individual instructors' preferences and specific course content resulted in variation in perceptions across course sections. The use of data visualization tools can aid in creating open interdisciplinary dialogues regarding the aging experience. Future implications associated with utilization of word clouds outside of the classroom should be considered in order to make research and interventions more accessible to the general public.

#### CORRELATES OF LIFE-EXTENSION ATTITUDES

N. Kogan<sup>1</sup>, S. Halpin<sup>2</sup>, *1. Psychology, New School for Social Research, New York, New York, 2. Veterans Affairs Medical Center, Atlanta, Georgia*

A previous publication by the present co-author described the development of a Life-Extension Questionnaire (LEQ) which was administered to two New York City samples (one of mixed age and the other homogeneously elderly). Exploratory factor analysis generated three

replicated factors labelled Utopian Vision, Personal-Emotional Rejection, and Socio-Economic Burden. In the present study, the LEQ was administered to a sample drawn from senior citizen centers in a large Texas city (N=203, 75% female, mean age= 59.4 years). A partial replication of the earlier factor structure was obtained—Socio-Economic Burden items merged with some of the Personal-Emotional Rejection items. Personality correlates of the LEQ—time perspective, death anxiety, and life-longings ("Sehnsucht")—were examined. A more limited time perspective was associated with a rejection of negative life-extension items. Those comforted by God and an after-life were more negative about life extension, whereas those fearful about death were more likely to endorse positive life-extension items. Life-longing focused on the meaning of life was significantly associated with a negative view of life extension. Those endorsing a pro-life cluster (against abortion, euthanasia, and suicide) were significantly more likely to endorse negative life-extension items. It is thus evident that the pro-life cluster cited above does not imply acceptance of experimental, biologically based efforts to extend the life span, even though the latter could be considered pro-life.

#### GERO-MODELLING: NEW WAYS OF LOOKING AT 'OLD' ISSUES

R. Woolrych, A. Sixsmith, P. Borwein, V. Dabbhagian, U. Glässer, P. Jackson, V. Mago, S. Namazi, *Simon Fraser University, Vancouver, British Columbia, Canada*

An increasingly ageing population presents immediate challenges to the discipline of gerontology, requiring the need to adopt innovative approaches and new ways of working to address them effectively. One potential area is the development of new collaborations, pooling expertise across applicable disciplines to forge new insights into issues impacting on older people. This paper discusses the emergence of approaches in mathematical modelling as an opportunity to operationalise complex areas of ageing and older people, through better visualising scenarios, designing appropriate solutions and modelling and testing real world interventions. This paper explores recent developments and potential applications in 'gero-modelling', presenting collaborative work between computer scientists and gerontologists at Simon Fraser University. We highlight ongoing work from three specific projects: a complex systems approach to understanding falls within long-term care; a modelling approach for monitoring activities of everyday living amongst those living with dementia; and modelling homelessness in old age. Through these projects, the paper highlights the potential benefits of adopting a modelling approach within gerontology, where modelling offers us 'new ways of looking' at 'old' issues. We also identify the challenges in bringing the two disciplines together, specifically highlighting the different skills that are required from both gerontologists and computer scientists to interpret what are complex problems within an aging society. Lastly, we identify a number of shared priorities for continuing development in the area of 'gero-modelling'.

#### NOVICE NURSING STUDENTS' ATTITUDES, KNOWLEDGE AND PERCEPTIONS ABOUT OLDER ADULTS

R.M. Phillips, *Nursing, Towson University, Towson, Maryland*

Novice nursing students enter nursing programs with varied experiences and perceptions about older adults. Many identify misconceptions about this population. In addition, many come to nursing education with experiences, both positive and negative, that potentially impacts individual attitude, knowledge and perception. This project uses Kogan's Attitudes toward Aging Scale and an adapted version of the Palmore's Facts on Aging quiz to evaluate entry level nursing students' attitudes toward the aged and basic knowledge about aging before their first clinical experiences in an extended care facility and at the end of the experience. Data will be presented from entry level nursing students in the first semester of a baccalaureate program. Understanding this information is important because nursing students' attitudes and perceptions

about older adults impacts the quality of patient care provided in all settings and the ability of graduate nurses to effectively advocate for this vulnerable group. This information is also helpful in developing education programs and experiences in nursing homes and other long term care settings to improve attitudes toward the elderly and enhance knowledge and perceptions about the aging process.

### **CHANGING NEEDS FOR AGING SERVICES: RESULTS FROM A COMMUNITY-DESIGNED AND COMMUNITY-IMPLEMENTED SURVEY**

L.L. Bryant<sup>1</sup>, C. Ledonne<sup>2,6</sup>, K.E. Lind<sup>1</sup>, S. Davis<sup>3,6</sup>, P. Gomez<sup>4,6</sup>, J. Lopez<sup>6</sup>, P. Morgan-Lloyd<sup>3,6</sup>, 1. *Community and Behavioral Health, Colorado School of Public Health, Aurora, Colorado*, 2. *San Luis Valley Area Health Education Center, Alamosa, Colorado*, 3. *San Luis Valley Citizen Corps, Alamosa, Colorado*, 4. *Casa De Oro, La Jara, Colorado*, 5. *National Senior Service Corps RSVP, Alamosa, Colorado*, 6. *San Luis Valley Healthy Aging Research Network Community Team, Alamosa, Colorado*

A community team (older adults and service providers) in Colorado's rural San Luis Valley (SLV), a partner with the Colorado member center of the Centers for Disease Control and Prevention Healthy Aging Research Network, envisions "a healthier and more active senior population, with an improved quality of life that includes remaining independent and being able to stay at home longer." Concerned that aging services as they now exist in the community will not meet the needs and desires of the growing aging population in the next 5-10 years, the team in 2010-2011 designed and implemented a 24-question survey about current and anticipated health status and perceived importance of available and desired community services that would allow them to stay in their homes as they age. The 242 respondents age 50 or older came from all 6 SLV counties. The greatest concerns for being able to stay in one's home included: income, physical health, and indoor and outdoor mobility. Respondents' preferences for services reflected those absolute needs (e.g., home healthcare, caregiving) as well as desired resources that support and improve quality of life: transportation (often an expressed desire in these rural communities), home-delivered and congregate meals, and home maintenance. Younger respondents reported less current and potential interest in senior centers as they currently exist than their older colleagues and expressed preferences for different senior center services and activities. These findings support the need for this review and creative responses. Next steps include comparisons with existing resources and development of policy recommendations.

### **PERCEPTION OF AGING IN FACES: THE TABOO OF TOUCH**

E. Covan, A.W. Belsler, B. Pavill, D.M. Monahand, K. Ricanek, *Gerontology, School of Health and Applied Human Sciences, UNC Wilmington, Wilmington, North Carolina*

Professors of Gerontology, Theater, Nursing, Film Studies, and Computer Science collaborated to study how people on a university campus perceive aging, especially with regard to the taboo of face aging. Subjects viewed cropped images of faces of younger and older adults, followed by images depicting adults of different ages touching each other's face. Subjects then provided written comments on what they perceived in those images. A content analysis of comments was conducted in consideration of the university status of subjects. All respondents commented on age differences of those photographed. When examining cropped images of faces, comments were primarily neutral or negative. An older woman was repeatedly described in terms of wrinkles and serious demeanor, while a younger woman's oily skin and lack of emotions were mentioned. Comments concerning facial touching were more positive. Although some noted people were hesitant about being touched, viewers commonly mentioned observations of happiness and smiling, as indicators of social engagement. Speculation about what prompted touching occurred regardless of the academic status of the viewer or

who touched whom in the photographs. Viewers wondered if those touching one another were kin, perhaps a grandparent and a grandchild. Other comments suggest that although observers find touching between persons of different age groups to be therapeutic, they also recognize facial touch between persons in different age groups is unusual. Authors employ transdisciplinary research findings to present implications for clinical practice and gerontological education.

### **WISDOM IN LIFE: AN EXTREME CASE ANALYSIS OF WISDOM NOMINEES, SUBJECTIVE PERCEPTIONS, AND WELL-BEING**

H. Oh, *Sociology, University of Florida, Gainesville, Florida*

This study sought to illustrate and clarify how and to what extent wisdom characteristics are understood differently between top-10 and bottom-10 wisdom-score groups in terms of their wisdom nominees in person and their own version of wisdom definition. The concurrent triangulation mixed-method design adopted a nonparametric, content, and social network analysis for a quantitative configuration and qualitative specification. The results indicated that the top scorers had higher life satisfaction and better health status than the bottom-10 group. The bottom group, on the other hand, identified more self-centered attributes as wisdom characteristics, whereas people in the top appreciated the virtue of perspective-taking, and learning from experiences and from others. The content analysis and network analysis confirmed these distinctions indicating the importance of altruistic, reciprocal attributes as prerequisites for wisdom development.

### **RV LIVING AND POSITIVE AGING: HOW DO OLDER RVERS CHALLENGE NEGATIVE STEREOTYPES ABOUT AGING?**

E. Sikorska-Simmons, S. Halbert, A. Gens, *UCF, Orlando, Florida*

Despite the increasing evidence suggesting that the large majority of older people are healthy and active into late old age, little is known about positive aspects of aging. In particular, there is a dearth of knowledge about well-being of older people who lead alternative lifestyles. This study examined how "RV living" (as an alternative lifestyle) challenges negative stereotypes about aging. Consistent with the model of successful/positive aging, the assessed dimensions of well-being included health, life satisfaction, and social support. The sample included 117 residents of an RV retirement park. Data were collected, using a self-administered questionnaire. Of the 117 participants, 48% were women, all were white, and 69% were married. The mean age was 76, and 59% residents were 75 or older. The majority of RVers (95% males and 88% females) assessed their health as "good" or better and the majority (72% males and 68% females) were "delighted" or "pleased" with their lives. Almost all reported having someone who provided them with emotional (97%), instrumental (80%), and companionship (97%) support. Spouses were the most common source of support, followed by children. Both males (88%) and females (95%) reported having confidants and an adequate contact with them. Clearly, older RVers experience good quality of life that is indicative of successful aging. More research is needed to better understand the effects of RV living on well-being. Such research could counter some of the negative stereotypes about older people and help reduce ageism in society.

## **SESSION 680 (POSTER)**

### **PERSONALITY**

#### **INDIVIDUAL DIFFERENCES IN OPENNESS TO EXPERIENCE AND RISK FOR MORTALITY**

E.S. Sharp<sup>1</sup>, C.A. Reynolds<sup>2</sup>, N.L. Pedersen<sup>3,1</sup>, M. Gatz<sup>1,3</sup>, 1. *University of Southern California, Los Angeles, California*, 2. *University of California, Riverside, Riverside, California*, 3. *Karolinska Institutet, Stockholm, Sweden*

Previous research has found that openness to experience exhibits small but significant declines in older adulthood. The purpose of this

study was to examine whether individual differences in level or change in openness were related to mortality. It was hypothesized that individuals with a lower level and greater rate of decline in openness would have an increased risk for death. Participants were 1947 individual twins from the Swedish Adoption/Twin Study of Aging (SATSA) with up to 6 measurements of openness. The first year in which participation was possible was 1984; the last year was 2007. Nearly 70% had more than 3 measurements of openness. By 2010, approximately 55% of the sample had died. This study combined a latent growth model with a survival model to examine the relationship between openness intercept (level) and slope (change) and mortality risk. Results of both a two-stage as well as a simultaneous growth and survival model indicated that a steeper decline in openness was associated with an increased risk of death, adjusting for age at study entry, sex, and education. Level of openness was unrelated to risk for death. Graphs of participant drop out as well as the statistical model results suggest that nearness to death accounted for a large part of the observation that openness declines in older adulthood. Overall, the relationship between decline and death may be best conceptualized by theories of terminal decline.

### PERSONALITY, SUBSTANCE USE, AND LONGEVITY: THE HEALTH BEHAVIOR MODEL OF PERSONALITY

N.A. Turiano<sup>1</sup>, T. Gruenewald<sup>2</sup>, D. Mroczek<sup>3</sup>, 1. *University of Rochester Medical Center, Rochester, New York*, 2. *University of Southern California, Los Angeles, California*, 3. *Human Development & Family Studies, Purdue University, West Lafayette, Indiana*

Personality traits predict both substance use and mortality risk across the life course. However, there are few investigations that have examined both of these effects in a single study. Utilizing 12-year mortality data from a national sample of over 6,000 adults from the Midlife in the United States Study (MIDUS), we tested whether alcohol use, smoking behavior, and drug use mediated the personality-mortality association. Higher levels of conscientiousness predicted a reduction in mortality risk over the follow-up (HR = 0.90; CI = 0.81-0.98;  $p < .05$ ). Mediation tested in a structural equation modeling framework (with censored outcome) provided evidence that the three substance-use behaviors significantly mediated the conscientiousness-mortality association (OR = 0.92; CI = 0.85-0.99;  $p < .05$ ). Smoking behavior had the strongest mediating effect of the three (OR = 0.98; CI = 0.97-0.99;  $p < .05$ ). The current study provides empirical support for the Health Behavior Model of Personality, which holds that personality influences health behaviors, which in turn affects health and longevity.

### PERSONALITY AS A PREDICTOR OF INTRAINDIVIDUAL VARIABILITY IN COGNITIVE FUNCTION ACROSS ADULTHOOD

J. Boron<sup>1</sup>, S.L. Willis<sup>2</sup>, K. Schaie<sup>2</sup>, 1. *Youngstown State University, Youngstown, Ohio*, 2. *University of Washington, Seattle, Washington*

Prior research examined the relationship between personality and various cognitive abilities. Results have been somewhat inconsistent regarding which personality factors show association with cognition, possibly due to the variety of cognitive abilities investigated. Rather than focus on level of cognition, the current study examined the association of personality with intraindividual variability (IIV) in cognition, as higher IIV may be indicative of cognitive decline. A series of regression analyses were employed to investigate the relationships between NEO personality factors in 2001 and a global measure of cognitive IIV from 2005 for participants aged 25-96 years ( $M=65.81$ ;  $SD=14.41$ ) from the Seattle Longitudinal Study ( $N=1172$ ). For the total sample, agreeableness ( $p < .05$ ), conscientiousness ( $p < .05$ ), and openness to experience ( $p < .07$ ) showed a negative relationship with cognitive IIV, while the association with age ( $p < .001$ ) was positive. Openness to experience was a significant predictor ( $p < .05$ ) for those aged 25-57 years; Agreeableness was significant ( $p < .001$ ) for individuals aged 58-73 years; Conscientiousness emerged as significant ( $p < .001$ )

for those aged 74-96 years. Age was significant in all models, and all associations with personality domains were negative, suggesting that higher levels of agreeableness, openness to experience, and/or conscientiousness were associated with less IIV in cognitive function. Only openness to experience was consistently, positively related to mean level of cognitive function (rather than IIV) in the total sample, and in all age groups, supporting prior research. Thus, if indicators of cognitive decline are of interest, consideration of NEO personality factors of agreeableness and conscientiousness, in addition to openness, may be warranted.

### CONSISTENCY IN DAILY GOAL PROGRESS: POSSIBLE SELVES IN ACTION

H. Ko, S. Mejia, K. Hooker, S. Choun, T. Pham, R. Metoyer, *Human Development and Family Sciences, Oregon State University, Corvallis, Oregon*

For older adults, managing social connections with friends and family in daily lives is essential for maintaining their health and well-being. Consistent with theory that possible selves are cognitive representations, motivating individuals to pursue their goals, our previous work found that having either hoped-for and/or feared possible selves in the social domain significantly predicted higher social goal progress over a 100-day study period. In the current study we further investigated older adults' within-person variation in the process of pursuing their social goals across the study period. The data were collected via the web-based survey, Personal Understanding of Life and Social Experiences (PULSE) project ( $n=99$ , mean age = 63.29,  $SD=7.98$ ). At baseline, participants provided two of their most important hoped-for and feared possible selves and a social goal, which they rated on a daily basis. We controlled for optimism as well as age and gender for all analyses. Those with lower variability had significantly higher daily social goal progress than those with higher variability ( $p < .001$ ), independent of the effect of having social possible selves ( $p < .05$ ). These results emphasized the importance of congruence between implicit motivation and explicit action, and enhance our understanding of how older adults pursue their goals on a daily basis. Having possible selves as an overarching goal-construct significantly guided participants working towards their social goals. In addition, those who were better able to stay on the course in pursuing their social goal also made more averaged goal progress.

### DOES PERSONALITY MODERATE PAIN AMONG OLDER AMERICANS WITH CHRONIC HEALTH CONDITIONS AND FUNCTIONAL LIMITATIONS?

A.D. Tiedt, *NORC at the University of Chicago, Chicago, Illinois*

This research examined personality traits as correlates of greater psychological resiliency and reduced pain in a representative sample of older Americans. Resilience to pain is a concern for elders who require help with activities of daily living and have chronic health problems, but have smaller social support networks due to reduced mobility. This study analyzed data from the 2010-2011 National Social Life Health and Aging Project (NSHAP). Results confirmed that traits from the Five Factor Personality Inventory correlated with reduced pain after adjusting for health. Respondents who scored low on traits capturing extraversion and high on neuroticism reported more pain than their counterparts. However, low scores on traits related to openness and agreeableness were associated with less pain overall. These results suggest the benefits of "having thick skin" since elders who were not open or agreeable seemed less distressed by poor physical and mental health. Overall, these findings contribute to an understanding of the mechanisms wielded by elders in coping with chronic and acute pain.

## DO FACETS OF CONSCIENTIOUSNESS AND EXTRAVERSION PREDICT FATIGUE AMONG OCTOGENARIANS AND CENTENARIANS?

J.B. Baenziger<sup>1</sup>, G.D. da Rosa<sup>1</sup>, P. Martin<sup>1</sup>, L. Poon<sup>2</sup>, 1. *Human Dev Fam Studies, Iowa State Univ, Ames, Iowa*, 2. *University of Georgia, Athens, Georgia*

This study investigated the effects of two personality facets (Conscientiousness and Extraversion) on two dimensions of fatigue (total fatigue and mental fatigue) using octogenarians and centenarians proxy reports. Three-hundred and twenty one community and long term care participants and their proxies from the Georgia Centenarian Study were interviewed. Hierarchical multiple regression results suggest, after controlling for demographics (gender, age, ethnicity, living situation, education) and depression, for Conscientiousness, age  $\beta = .15$ ,  $t(310) = 2.00$ ,  $p < .05$  and depression  $\beta = .44$ ,  $t(310) = 5.89$ ,  $p < .001$  were positively related to total fatigue. The trait of self-discipline was negatively related to both total fatigue,  $\beta = -.41$ ,  $t(310) = -3.13$ ,  $p < .01$  and mental fatigue,  $\beta = -.33$ ,  $t(310) = -2.28$ ,  $p < .05$ . For Extraversion, depression was positively related to total fatigue,  $\beta = .35$ ,  $t(310) = 4.75$ ,  $p < .001$  while physical health, activity and positive emotions were negatively related to total fatigue:  $\beta = -.03$ ,  $t(310) = -.48$ ,  $p < .001$ ;  $\beta = -.23$ ,  $t(310) = -2.61$ ,  $p < .01$ ; and  $\beta = -.27$ ,  $t(310) = -2.96$ ,  $p < .01$ , respectively. Participants in long term care  $\beta = .26$ ,  $t(310) = 2.65$ ,  $p < .01$  or with higher depression,  $\beta = .31$ ,  $t(310) = 3.21$ ,  $p < .01$ , had more mental fatigue. In conclusion, better physical health, activity, and positive emotions resulted in lower levels of total fatigue. Low self-discipline, long term care and higher depression resulted in higher total fatigue and mental fatigue.

## PSYCHOLOGICAL PROFILES OF MEN IN THE VA NORMATIVE AGING STUDY

L. Lee<sup>1,3</sup>, A. Spiro<sup>1,2,3</sup>, 1. *Department of Epidemiology, Boston University School of Public Health, Boston, Massachusetts*, 2. *Department of Psychiatry, Boston University School of Medicine, Boston, Massachusetts*, 3. *Behavioral Science Division, National Center for Posttraumatic Stress Disorder, VA Boston Healthcare System, Boston, Massachusetts*

Considerable research has examined separately the roles of personality, cognitive and social functioning on health. However, few have adopted a wholistic approach in examining psychological profiles underlying these predictors (Smith & Baltes, 1997). This study sought to extract and characterize patterns of psychological functioning. Data were collected 1965-67 from 1,189 healthy men aged 24-82 (mean age=43.6, SD=9.3) enrolled in the VA Normative Aging (Bossé, Ekerdt, & Silbert, 1984). Measures included: (1) intellectual performance (Generalized Aptitude Test Battery; Fozard & Nuttall, 1971); (2) personality (16 Personality Factor Questionnaire; Institute for Personality & Ability Testing, 1962); (3) value orientations (Study of Values; Allport, Vernon & Lindzey, 1960); and (4) occupational interests (Strong Vocational Interest Blank; Strong & Campbell, 1966). Latent profile analysis was used to identify subgroups with different patterns of psychological functioning. A 4-class solution optimally fit the data. Class distinctions were most apparent in personality and vocational measures. The largest class (31%) had near-average scores on most traits, and was best described as somewhat dependent and lacked interest in specialized occupations. One class (26%) was marked by leadership and extraversion, tended to be decisive and fact-oriented, and had lower neuroticism and anxiety. Another class (26%) was characterized by independence, creativity, and interests in specialized occupations. The smallest class (18%) was prone to higher levels of anxiety, neuroticism, and lower levels of extraversion and leadership. These results add to current knowledge of psychological profiles, and provide the basis for further research on the influence of psychological functioning on later life outcomes.

## INDIVIDUAL DIFFERENCES IN HEALTHY AGING CONTROLS SEEKING DIAGNOSTICS STATUS OF ALZHEIMER'S DISEASE

M. Szumska<sup>1</sup>, D.K. Johnson<sup>1,2</sup>, E. Vidoni<sup>2</sup>, R.J. Bothwell<sup>2</sup>, E. Cope<sup>2</sup>, J.K. Morris<sup>2</sup>, 1. *University of Kansas, Lawrence, Kansas*, 2. *University of Kansas Medical Center, Kansas City, Kansas*

Background: There exists a clear relationship between personality and the adoption of health behaviors (Mroczek, et al., 2012). In Young Older Adults, there also exists a relationship between the Transtheoretical Model of Behavior Change (TMBC) and health behaviors (Marcus, et al., 1992). However, health behavior research in Older Adults typically ignores the TMBC. This model may be an important factor for health behavior adoption in Older Adults. This study evaluates the extent to which intention to change health behavior is influenced by conscientiousness. We examine the individual differences and effect of level of conscientiousness on lifestyle change after disclosure of amyloid status. Methods: This report is from a pilot study of 30 individuals aged 65 and more was selected from volunteers enrolled in a neuroimaging study of cerebral amyloidosis among healthy older adults. The Clinical Dementia Rating (CDR) was used to determine the presence or absence of dementia. The personality trait level was assessed via the self-administered adjectival measures of the Big Five. Responders were asked how much each of 25 adjectives described themselves on a scale ranging from 1 (not at all) to 4 (a lot). The Transtheoretical Model of Behavior Change (TMBC) was used to test lifestyle change with baseline and 6-week and 6-month follow up after the disclosure of amyloid status. Results: Results indicated that conscientiousness was positively related to readiness to change. The results are consistent with the previous findings (Bogg, T.; Roberts, B., 2004). Key words: Alzheimer's Disease, conscientiousness, Transtheoretical Model of Behavior Change.

## SESSION 685 (POSTER)

### PHYSICAL ACTIVITY & EXERCISE

#### GENETIC INFLUENCES ON PHYSICAL ACTIVITY IN LATE LIFE

A. Aiken Morgan<sup>1</sup>, G. Bennett<sup>2</sup>, C.L. Edwards<sup>2</sup>, K.E. Whitfield<sup>2</sup>, 1. *Center for Aging, Duke University Medical Center, Durham, North Carolina*, 2. *Duke University, Durham, North Carolina*

Rates of physical inactivity tend to increase with age, and physical inactivity is related to higher rates of chronic disease. The purpose of this study was to examine individual variability in physical activity in African American twins. Data from the second wave of the Carolina African American Twin Study of Aging (CAATSA) was used and included a subset of 30 twins (14 identical and 16 fraternal pairs; age range 57-84 years, mean = 70, S.D. = 7.86). Physical activity was measured as average metabolic equivalent (MET) hours per week. There were no significant associations between physical activity and body mass index ( $r = -.20$ ,  $p > .09$ ) or age ( $r = .05$ ,  $p > .69$ ); however, there were significant associations between physical activity and activities of daily living (ADLs) ( $r = -.26$ ,  $p < .03$ ). After residualizing the effect of ADLs, twin correlations were higher for identical twins ( $r = .72$ ) than for fraternal twins ( $r = .37$ ). As a result, 70% of the individual variability was from genetic sources, and the remaining proportions of variance from shared environment (2%) and non-shared environment (28%). These

findings suggest that genetic influences account for a significant variability in physical activity in later life.

### THE INTERACTION OF HEALTH-RELATED SOCIAL CONTROL AND EXERCISE SELF-EFFICACY ON PHYSICAL ACTIVITY

K. Cotter, N.G. Lancaster, D.J. Rodda, C.R. Padilla, *Psychology, Sacramento State University, Sacramento, California*

Physical activity is important for healthy aging, and among older adults its frequency is strongly predicted by exercise self-efficacy. Health related social control, which is an effort by social partners to influence health behavior, was explored for its impact upon the relationship between exercise self-efficacy and physical activity to further our understanding of the social component that often accompanies physical activity. Based on a regression analysis examining cross-sectional data from 82 community-dwelling older adults (Mage = 74 years, 64% women), age, exercise self-efficacy, and positive social control explained 16% of the variance in physical activity,  $F(4, 77) = 3.76, p = .007$ . Consistent with predictions, younger age was associated with more frequent physical activity ( $\beta = -.06, p = .006$ ). Furthermore, while neither variable had a direct influence on physical activity, positive social control moderated the relationship of exercise self-efficacy to physical activity frequency ( $\beta = -.18, p = .04$ ), with the interaction explaining 4.6% of the variance in physical activity,  $F(1, 77) = 4.24, p = .04$ . Results revealed that participants reporting high positive social control were similarly active, while participants reporting low positive social control were more active when they perceived high exercise self-efficacy and less active when they perceived low exercise self-efficacy. Results suggest that without confidence in their abilities to be active, older adults might rely on positive social control messages for physical activity motivation. Thus, physical activity interventions for older adults should include supportive encouragement.

### DEVELOPING ACCELEROMETER CUT-POINTS TO MEASURE FUNCTIONAL EXERCISE CAPACITY IN OLDER ADULTS

K. Wasilenko, S. Marshall, J. Kerr, S. Godbole, K. Crist, J. Chen, K. Bolling, *University of California, San Diego, La Jolla, California*

Background. Accelerometry is recognized as a field-based criterion of physical activity (PA) but outcome variables are based on energy expenditure-referenced criteria which may be inappropriate for older adults or insensitive to important changes in their functional capacity as a result of intervention. Methods. Forty-eight older adults (mean age =  $82.8 \pm 6.4$ ; range = 70-98 yr; 69% female) completed a validated test of functional exercise capacity (the timed 400m walk test) while wearing a hip-mounted ActiGraph GT3X+ accelerometer. Mean accelerometer counts per minute (ct.min-1) were computed for participants able to complete the walk test in <15 min without resting. 400m walk time (s) was regressed on mean ct.min-1 with cut-points of functional walking capacity derived by solving the regression equation for ct.min-1 at the 25th and 75th percentile of 400m walk time. Results. Mean ct.min-1 during the 400m walk test was 2372 ( $\pm 749$ ), 1870 ( $\pm 1063$ ), and 1362 ( $\pm 525$ ) for 70-79 yr, 80-89, and  $\geq 90$  yr olds, respectively. The Pearson partial correlation (adjusting for age and cognitive function) between accelerometer ct.min-1 and 400m walk time was  $r = -0.67$ . Cut points associated with the 25th and 75th percentile of 400m walk time were 2854 and 1402 ct.min-1, respectively. Conclusion. Accelerometer ct.min-1 during the 400m walk test suggest that commonly used cut-points to measure PA among older adults may be inadequate for detecting meaningful changes in functional exercise capacity. Individualized ct.min-1 from a 400m test could also be used as a threshold to measure intervention-related changes in functional PA capacity among older adults.

### THE ROLE OF PAIN IN UNDERSTANDING RACIAL/ETHNIC DIFFERENCES IN FREQUENCY OF PHYSICAL ACTIVITY AMONG OLDER ADULTS

E. Grubert<sup>1</sup>, T. Baker<sup>2</sup>, K. McGeever<sup>3</sup>, B.A. Shaw<sup>4</sup>, 1. *University at Albany, SUNY, School of Public Health, Rensselaer, New York*, 2. *University of South Florida, South Florida, Florida*, 3. *University at Albany, SUNY, Department of Sociology and Center for Social and Demographic Analysis, Albany, New York*, 4. *University at Albany, SUNY, School of Public Health and Center for Social and Demographic Analysis, Rensselaer, New York*

Physical activity (PA) is a complex behavior that can help maintain and improve individuals' health, decrease disability, and delay the onset of functional limitations. Significant associations between pain and PA have been documented in the general population, however less is known about this association among racial and ethnically diverse older adults. This study aimed to evaluate racial/ethnic differences in PA among white, black and Hispanic adults >65 years of age, and to assess the potential role of pain as a mediator. Data were taken from the 2008 Health and Retirement Study. Logistic regression was used to evaluate associations between race/ethnicity and pain and the odds of regular PA participation. The odds of engaging in frequent light PA were about 49% lower among blacks (Odd ratio (OR) = 0.51; 95% Confidence interval (CI): 0.44, 0.60) and about 22% lower among Hispanics (OR = 0.78; 95% CI: 0.66, 0.92). Similarly, the odds of engaging in frequent moderate/vigorous PA were about 42% lower among blacks (OR = 0.58; 95% CI: 0.50, 0.67) and about 19% lower among Hispanics, compared to whites (OR = 0.81; 95% CI: 0.68, 0.95). A graded inverse association between levels of pain severity and the odds of PA was found, but pain did not mediate racial/ethnic differences in PA. When compared to whites, older blacks appear to have relatively low rates of PA with low rates of pain, while older Hispanics experience relatively high rates of pain, but are perhaps more resilient to the effects of pain on PA.

### SELF AND SPOUSAL EFFICACY AND PHYSICAL ACTIVITY: THE ROLE OF RELATIONSHIP SATISFACTION

B.J. Ayotte<sup>1</sup>, J. Margrett<sup>2</sup>, J.H. Patrick<sup>3</sup>, 1. *Psychology, University of Massachusetts Dartmouth, North Dartmouth, Massachusetts*, 2. *Iowa State University, Ames, Iowa*, 3. *West Virginia University, Morgantown, West Virginia*

Marriage is related to a number of positive health-related outcomes, including better overall health, more frequent health behaviors, and lower overall mortality rates. This study examined how self-efficacy, spousal self-efficacy, and marital satisfaction were related to physical activity in middle-aged and older married couples. A total of 116 couples (M=58.86 years, SD=7.16, Range 50-75) completed measures assessing physical health, self-efficacy for physical activity, marital satisfaction, and physical activity. Couples were categorized as mutually satisfied (both spouses scored above median on marital satisfaction) or not-mutually satisfied (one or both spouses scored below median). Hierarchical regression models were performed separately for husbands and wives. The first step of the models included age, health conditions, and self-efficacy. The second step added spousal self-efficacy. Results indicated that self-efficacy was positively related to physical activity in mutually satisfied and not-mutually satisfied husbands and wives. Spousal self-efficacy accounted for a significant amount of variance in physical activity after accounting for physical health, self-efficacy, and age only among husbands (R-squared change=11%) and wives (R-squared change=8%) in mutually satisfied couples. Overall, the models accounted for a significant amount of variance in physical activity in mutually satisfied husbands (R-squared=44%), mutually satisfied wives (R-squared=51%), non-mutually satisfied husbands (R-squared=37%), and non-mutually satisfied wives (R-squared=40%). These results provide evidence for the importance of considering individual, spousal, and relationship characteristics when investigating physical activity during middle and later life.

## THE INFLUENCE OF LEISURE SPORTS PARTICIPATION MOTIVATION ON CHINESE SENIORS' LIFE HAPPINESS

Y. Zheng, Y. Won, A. Sheard, *Yonsei University, Seoul, Republic of Korea*

The purpose of this study was to examine the influence of leisure sports participation motivation on the life happiness of Chinese seniors. Using the stratified cluster random sampling method, 550 participants 60 years and older who live in Beijing and Tianjin were analyzed in 2011. All resulting data was calculated with SPSS version 17.0 utilizing factor analysis, reliability analysis, one-way ANOVA, multiple regression and correlation analysis methods. The conclusion is as follows: First, the analysis of the correlation between leisure sports participation motivation and life happiness showed that there was a static correlation between them. Second, leisure sports participation motivations of Chinese elderly have a significant influence on life happiness, physical health, economic lifestyle, emotional health, family and outside-family relationships. Lastly, it was found that according to the frequency of Chinese elderly participation in leisure sports activities that there were differences in life happiness. In terms of emotional health: 66-70 year olds were found to have higher levels of emotional health than those who were 76 and older, upper class had higher levels than middle class, and finally those that graduated University had higher levels than those who graduated only high school, middle school and/or elementary school.

## PATTERNS OF LEISURE-TIME PHYSICAL ACTIVITY IN A BRITISH BIRTH COHORT AT EARLY OLD AGE

K.R. Martin<sup>1,2</sup>, R. Cooper<sup>2</sup>, T.B. Harris<sup>1</sup>, J.M. Guralnik<sup>3,1</sup>, R. Hardy<sup>2</sup>, D. Kuh<sup>2</sup>, *1. Laboratory of Epidemiology, Demography, and Biometry, National Institute on Aging, Bethesda, Maryland, 2. MRC Unit for Lifelong Health and Ageing, University College London, London, United Kingdom, 3. University of Maryland, Baltimore, Maryland*

Participation in leisure-time physical activity (LTPA) confers many health benefits yet population levels of physical activity often do not meet established guidelines (150+ minutes/week of moderate intensity activity), especially at older ages. Data from a nationally representative British birth cohort (1034 men, 1149 women) were used to examine sedentary activities and self-reported LTPA at age 60-64y in relation to gender, employment status, body mass index (BMI) and self-reported health. Participants had a mean of 24 ( $\pm 10$ ) hours/week of sedentary time from television and leisure-time computer use. Those not currently employed, with a BMI  $\geq 25$ kg/m<sup>2</sup>, or who reported worse self-reported health had higher mean sedentary times than those employed, with a lower BMI or with good self-reported health, by 3, 3.5, and 2 hours/week respectively. 52% of participants reported engaging in moderate-to-vigorous LTPA for 150+ minutes/week; only 6% reported 150+ min/week of vigorous LTPA. Men, those not currently employed, with a BMI  $< 25$ , or reporting good self-reported health engaged in more moderate-to-vigorous LTPA than others, by an average of 33, 25, 45, 105 minutes/week, respectively. While 16% of participants reported no LTPAs, 22% engaged in one, 20% in two, 15% in three and 29% in more than four. 71% reported walking for pleasure/recreation; other common activities were swimming (33%), floor-exercises (24%), conditioning exercises (15%), recreational cycling (15%), hill-walking (14%), dancing (14%), golfing (12%) and weight-bearing exercises (11%). Public health practitioners and clinicians should continue to encourage older adults to participate in a diverse range of LTPA and reduce time spent in sedentary behaviors.

## HEALTH SYMPTOMS AND PERCEIVED BARRIERS TO WALKING IN OLDER POPULATIONS

M. Kealey, W. Satariano, S.L. Ivey, E. Kurtovich, A. Hubbard, *University of California, Berkeley, Berkeley, California*

Background: Mobility is important to healthy aging. Walking, both for recreation and for transportation, has been suggested to be partic-

ularly accessible, affordable, and safe way to be physically active. It is important to understand the barriers to and supports for walking in one's neighborhood for older adults. Health symptoms may be important determinants of walking and physical activity for older adults. Objective: Determine the leading health symptoms reported by older people as causing difficulty when walking outdoors. Methods: The study titled "Environmental Correlates of Physical Activity among Older Adults: A Healthy Aging Research Network (HAN) Collaboration" ("HAN Walking Study") was designed to examine how the neighborhood environment may influence physical activity and walking behavior in older adults, and how this relationship may be modified by the functional capacity of older adults. Data were collected from 884 older adults at four sites across the country, from a diversity of physical environments. Data collection included in person interviews, lower-body functional capacity testing, accelerometers, walking diaries, and secondary GIS data. Results: Most participants report multiple barriers to walking outside. Overall, 95.5% report at least one health symptom or other barrier to walking, with a range of 0-37 and a mean of 7.9 barriers. Conclusions: Walking is engaged in by the majority of both older men and women in this study, however, they perceive multiple barriers to walking.

## EFFECT OF FALL-PREVENTION PROGRAM ON SUBJECTIVE HEALTH AND LIFE EXPECTANCY AMONG OLDER ADULTS

Y. Cho<sup>1</sup>, B.S. White<sup>2</sup>, K. House<sup>2</sup>, O. Mohamed<sup>2</sup>, S. Singh-Carlson<sup>2</sup>, *1. Psychology, California State University, Long Beach, Long Beach, California, 2. California State University, Long Beach, Long Beach, California*

Purpose: Past studies demonstrated the effectiveness of group exercise programs in reducing falls among older adults (Barnett et al, 2007). However, the psychological effects of these programs have not been thoroughly examined. The current study investigated whether a fall prevention program of exercise and education improves seniors' subjective estimation of health and life expectancy. Increased estimation of one's life expectancy is important because: (a) it is associated with increased actual life expectancy (van Doorn & Kasl, 1998) and (b) it represents the increased value that elders place on their life and thus has practical implications on daily life decision-making (Mirowsky, 1997). Methods: Participants (n = 42) were seniors, aged 65 or older, who attended an exercise class for eight weeks. The twice-weekly exercise program was designed to address the several systems that contribute to balance. Data were collected before and after the exercise program. Subjective health was measured by directly asking how they felt about their health using a Likert scale ranging from 1 (poor) to 5 (excellent), and subjective life expectancy by asking the age that participants thought that they would live. Results: The results of within-subjects ANOVA showed that the exercise intervention program marginally improved participants' view of their health ( $p = .051$ ) and marginally increased subjective estimation of life expectancy ( $p = .056$ ). These results imply the prevention program has a direct impact on psychological well-being of older adults and the appropriate intervention produces positive perception of improved health and increased will-to-live.

## BENEFITS BEYOND THE PHYSICAL: INTERGENERATIONAL WII® ACTIVITY PROGRAM AND AFFECTIVE WELL-BEING

J. Margrett, M.S. Heinz, S. Francis, K. Strand, W. Franke, M. Peterson, *Dept. of Human Development and Family Studies, Iowa State Univ, Ames, Iowa*

Prior research demonstrates synergistic effects between mental health, social context, physical activity, and physical health in adulthood. Negative affect in particular appears to be related to physical functioning and chronic disease and is strongly related to everyday well-being and quality of life. The purpose of the LIFE (Living [well though]

Intergenerational Fitness and Exercise) study was to improve whole-person wellness via an eight-week intergenerational Wii® physical activity program which also included social and cognitive stimulation, followed by a sixteen-week newsletter intervention. One hundred older adults were recruited to participate. Sixty-eight participants started the program and 46 participants completed the entire 25-week program, including a pre-test and two follow-up assessments at weeks 8 and 25. Of participants completing the program, 87% were female and 80% lived independently. The mean age of participants was 75.30 years old (range = 60-92). In addition to physical activity and fitness, analyses were conducted to examine the effect of the intervention on older adults' mental health (i.e., positive and negative affect, satisfaction with life, and depression) at 8 and 25 weeks post intervention. Analysis of variance tests revealed a significant effect of the intervention on negative affect. Participants who self-defined as physically inactive at baseline demonstrated a significant ( $p < .05$ ) decrease in negative affect at 8 and 25 weeks. These results suggest an intergenerational exergaming program is an effective strategy in improving negative affect among community-residing older adults. Discussion focuses on the benefits of a whole-person wellness approach to improving older adults' quality of life.

## SESSION 690 (POSTER)

### PROMOTING HEALTH

#### ACTIVITIES TO PREVENT ALZHEIMER'S DISEASE: WHO DOES THAT?

K.S. Page, B. Hayslip, D. Wadsworth, *Department of Psychology, University of North Texas, Denton, Texas*

Fear of developing Alzheimer's disease (AD) is common in middle to late adulthood. While research cannot make definitive statements regarding the prevention or reduction of the risk for AD, individuals may still engage in social, cognitive, or physical activities in hopes of reducing their chances of developing AD. In the context of a longitudinal study on fear of dementia, participants were surveyed regarding activities they engaged in to reduce their risk for developing AD ( $N = 638$ ). A binomial logistic regression examined the role of seven independent variables (age, gender, education, knowledge about AD, aging anxiety, memory self-efficacy, and fear of dementia) on the likelihood of persons reporting that they actively perform an activity to prevent onset of AD. The full model was statistically significant,  $\chi^2(7, N = 638) = 142.30, p < .001$ , and explained between 20% and 27% of the variance in prevention activity status, and 72% of the cases based upon activity status were correctly classified. Surprisingly, only fear of dementia and memory self-efficacy did not make significant contributions to the model predicting preventative activity status. The strongest predictor in this respect was gender; with females being almost three times as likely as men to report engaging in such activity. Qualitative findings among those who engaged in preventative activities suggested that such activities were quite diverse in nature. Implications for understanding how individuals view their ability to control the onset of dementia will be discussed.

#### THE ROLE OF AGE AND MINDFULNESS IN PAST AND FUTURE HEALTH PROMOTING BEHAVIORS

A.L. Bevan, M. Maxfield, *Psychology, University of Colorado at Colorado Springs, Colorado Springs, Colorado*

Mindfulness has long been associated with emotional health (Rejeski, 2008); however, research has only recently addressed the role of mindfulness in physical health. Based on previous findings that younger adults' level of mindfulness was predictive of greater physical activity and healthy eating (Gilbert & Waltz, 2010), a study of age differences in mindfulness and their impact on overall health promoting lifestyle behaviors was conducted. Younger adults and community-dwelling older

adults completed assessments of mindfulness (Cardaciotto et al., 2008), future and past health-promoting behaviors (Walker & Hill-Polerecky, 1996), and indicated their current level of self-perceived health. Mindfulness was characterized as awareness (continuous monitoring of current experiences; Kabat-Zinn, 1994), and acceptance (attitude of openness, curiosity, and non-judgment; Bishop et al., 2004). Results indicate that older adults' acceptance was significantly greater than younger adults; older and younger adults' awareness did not differ. Older adults reported greater frequency of health-promoting behaviors in the previous 6 months and intended for the next 6 months. Interestingly, self-reported mindfulness was not associated with older adults' future health-promoting behaviors; however, older adults' awareness was positively correlated with health-promoting behaviors in the previous 6 months. Among younger adults, acceptance was positively correlated with past and future health-promoting behaviors. Current self-perceived health was positively correlated with acceptance for both younger and older adults. Collectively this suggests that mindfulness training might have different health-related effects in older and younger populations.

#### META-ANALYSIS OF THE HEALTHY BRAIN STUDY: AN APPROACH FOR PROMOTING BRAIN HEALTH

J.N. Laditka<sup>1</sup>, S.B. Laditka<sup>1</sup>, D.B. Friedman<sup>2</sup>, *1. Public Health Sciences, University of North Carolina at Charlotte, Charlotte, North Carolina*, *2. University of South Carolina, Columbia, South Carolina*

Promoting brain health is on the national public health agenda. To identify an approach for promoting brain health, we conducted a meta-analysis of 20 published papers from the Healthy Brain Study, which conducted a large national survey of Americans, another of physicians, and 80 focus groups in nine U.S. states. We found that many older adults already believe that physical activity, healthy diets, social interaction, and community engagement promote brain health. They often do not know how much physical activity is needed, or how to overcome barriers including health problems, inconvenience, and environmental obstacles. Even physicians said they found it hard to keep current on brain health. We asked participants about concerns regarding memory or "ability to think," which includes judgment, problem solving, decision making, social conduct, visual and spatial abilities, and language. Their descriptions of others with dementia included loss of many of these cognitive functions, mood swings, and major behavioral disorders. Yet, their representations of their own future selves were similar to their present selves. The only change they typically envisioned should they develop dementia was memory loss, which many people considered manageable unless it is severe. If individuals see risks of dementia primarily for others, health messages on dementia may not trigger attention and behavior change. A more successful approach may lie in promoting brain health as a way to maintain or enhance the positive characteristics that most people already see in themselves. Based on our meta-analysis, we present an approach for doing so.

#### HEALTH FOCUSED POSSIBLE SELVES IN A SENIOR LIVING COMMUNITY

S. John, M. Kluge, M. Maxfield, *University of Colorado, Colorado Springs, Colorado Springs, Colorado*

Life within a senior living community provides its residents with a unique perspective on their relative health by allowing for direct comparison to other members of the same aged cohort. Neighbors become the measuring stick used to evaluate personal health and direct observation of others contributes to goals and fears of the future. Possible selves research encompasses future conceptualizations that entail self-examination related to what one hopes to become as well as avoid (Markus & Nurius, 1986). For an older adult cohort, chronic illness and present health concerns likely influence future perceptions (Frazier, Cotrell, & Hooker, 2003) and continued observation of similar others may precipitate this process further. In-person interviews with residents in independent living of The Palisades senior living community (Silva-

Smith, Feliciano, Kluge, Yochim, Anderson, Hiroto, & Qualls, 2011) were conducted upon resident transition into housing and provided insight about health focused possible selves. A grounded theory qualitative data analysis on responses (n = 40) revealed future hoped-for selves that included living without pain, maintaining cognitive functioning, and being resilient enough to care for one's partner. Feared future selves included dependency on others, loss of physical and mental functioning, and separation from one's partner for care. Residents' coping and preventative strategies were also evaluated. Research focused on the goals and motivations of residents will allow for a better understanding of the concerns faced by this population, as well as a better tailored program of interventions.

#### **DETERMINING AND INFORMING HEALTHY AGING AND HEALTHY PROMOTION AMONG AFRICAN AMERICAN ELDERS**

C.N. Marsack, C. Waites, *Social Work, Wayne State University, Detroit, Michigan*

**Background-** Despite considerable focus on health disparities (Centers for Disease Control, 2011; Smidley, Stith, & Nelson, 2003), very little information is available concerning the impact of the environmental context on the aging process for older African Americans. The purpose of this study was to use an ecological framework to obtain information from African American elders about their perceptions regarding "healthier aging", access to health promotion resources, and motivation to stay healthy. **Methods-** Drawing on the social ecological perspective, we conducted focus groups utilizing a purposive sample of community-dwelling African American elders (N=33), age 60 and over, from Metropolitan Detroit. Qualitative data analysis procedures were conducted on the three focus group transcripts. We utilized a grounded theory approach that involved focused coding, and constant comparison using ATLAS.ti V6.2 software. **Results-** Several themes were illustrated: desire to be independent, importance of healthy eating, necessity for activity and engagement with others, difficulties related to grocery shopping, and inadequate transportation. In addition, fear of injury and pain, as well as unsafe environments, and lack of access to resources were inhibitors to health promoting activity. **Implications-** Participants expressed interest in maintaining healthy lifestyles, but encountered challenges and environmental barriers. They desired self reliance, convenient transportation access, affordable nutrition and physical activity programs and amenities. This research suggest a critical role for social workers and other health care professionals in helping to promote community support services, including transportation, community programs and activities.

#### **SESSION 695 (POSTER)**

##### **SAFE DRIVING**

##### **RELATING ANT MEASURES TO COGNITIVE TEST SCORES FOR DRIVER SCREENING IN CANDRIVE STUDY PARTICIPANTS**

L. Morrison<sup>1</sup>, B. Weaver<sup>1,2</sup>, M. Bedard<sup>1,2,3</sup>, *1. Centre for Research on Safe Driving - Lakehead University, Thunder Bay, Ontario, Canada, 2. Northern Ontario School of Medicine - Lakehead University, Thunder Bay, Ontario, Canada, 3. St. Joseph's Care Group, Thunder Bay, Ontario, Canada*

We examined associations between Attention Network Test (ANT) measures and cognitive test scores for older drivers (aged >70) enrolled in the Candrive common cohort research study. A major goal of the 5-year Candrive study is to develop a screening tool for determining fitness to drive. Participant enrollment totals 927 across seven Canadian cities. Annual assessments of participants include various cognitive and physical tests, plus the ANT. The latter is a computerized reaction time test that measures three distinct functions of attention— alerting, ori-

enting and conflict (executive function)—and overall response time. Previous research has suggested the ANT may be associated with driving performance. Data were collected from 144 Candrive participants at the Ottawa, Victoria, and Thunder Bay sites (58 females; mean age=77yrs). Correlations were computed between ANT measures and these: Montreal Cognitive Assessment (MoCA), Mini Mental State Exam (MMSE), Motor-Free Visual Perception Test (MVPT-3), Trail Making Tests A and B (TMT), the Demtect, and the SIMARD-MD. Median response time for all correct trials from the ANT was significantly correlated with MVPT-3 (r=0.264), TMTB (r=0.346), MMSE (r=-0.240) scores (p<0.01), as well as TMTA (r=0.181) scores (p<0.05). Alerting efficiency, orienting efficiency, and conflict efficiency were not significantly correlated with any of the cognitive tests, including the SIMARD-MD (r=-0.121, p=0.15) and the Demtect (r=-0.059, p=0.48). Preliminary evidence relating the ANT to cognitive test scores demonstrates that it is reasonable to continue collecting data within the Candrive common cohort study and further explore its potential role in screening older drivers.

##### **THE IMPACTS OF STOPPING DRIVING: PROSPECTIVE AND RETROSPECTIVE VIEWS**

N.W. Mullen<sup>1</sup>, B. Parker<sup>1</sup>, E. Wiersma<sup>1</sup>, M. Bedard<sup>1,2</sup>, *1. Centre for Research on Safe Driving, Lakehead University, Thunder Bay, Ontario, Canada, 2. St. Joseph's Care Group, Thunder Bay, Ontario, Canada*

This project aimed to identify impacts of driving cessation from the perspective of older drivers and former drivers. Identifying discrepancies between anticipated impacts and those impacts actually experienced has the potential to affect how one prepares in advance for driving cessation or the experience itself of transitioning to former-driver status. Participants included 17 adults aged 65–88 years residing in a small city (approximately 120,000 people) in Ontario, Canada. Using a semi-structured interview guide, focus groups and interviews were held with 11 current drivers (5 men, 6 women) and 6 former drivers (1 man, 5 women). The guide included questions about their thoughts or experiences of stopping driving with respect to mobility, personal impact, impact on others, engagement with life, and finances. Impacts discussed fell into four categories: 1) lifestyle (e.g., difficulty attending leisure activities, learning to use the public transit system), 2) social (e.g., feeling dependent, isolated, or lonely), 3) identity (e.g., loss of self-esteem), and 4) emotional (e.g., sadness). Former drivers used several methods to cope with driving cessation, including: 1) resisting (e.g., attempting to have a revoked licence reinstated), 2) accepting, and adapting to, their non-driver status, and 3) adopting a positive perspective (e.g., identifying benefits of stopping driving such as relief from the stress of driving). Although the impacts of stopping driving were significant, there were few discrepancies between anticipated impacts and experienced impacts. This information could assist with developing interventions to ease the transition to former-driver status.

##### **FRONTOTEMPORAL DEMENTIA AND DRIVING: A LITERATURE REVIEW**

K.M. Turk, S. Wang, E. Dugan, *Gerontology, University of Massachusetts Boston, Boston, Massachusetts*

Frontotemporal dementia (FTD) is a progressive neurodegenerative condition affecting the frontal and temporal lobes. FTD may cause behavioral issues such as antisocial behavior, agitation, irritability, disinhibition, executive dysfunction, and poor social graces. There is a growing body of research on Alzheimer's disease and driving, but the less common dementias are not well studied. A literature search was undertaken to determine what is known about FTD and driving. A study was included if it met the following criteria: published from 1992-2012, published in English, research involving human subjects, included both FTD and driving data. The search strategy included searching the electronic databases: EBSCOhost, PubMed, Google Scholar, Proquest, Web

of Knowledge, and Publishing Connect. Search terms included: Frontotemporal dementia and driving, Frontotemporal dementia and driving accidents, Driving Cessation and Frontotemporal dementia, Frontotemporal dementia and automobile crashes, Frontotemporal dementia and crashes, Frontotemporal dementia and automobile, Frontotemporal dementia and car, and Neurodegenerative diseases and driving. Three hundred fifty-seven abstracts were reviewed, however only four articles satisfied the inclusion criteria. Results showed that drivers with FTD had more problems than control groups and fitness to drive should be questioned. Specific driving issues were related to antisocial behaviors common among people with FTD. Some examples included: hit and run car accidents, running red lights, speeding infractions, and lack of ability to recognize pedestrians at intersections. Medication to manage the behaviors may also impair driving in FTD patients. This literature review has identified a major gap in research and the need for research on FTD and driving.

### **DEPRESSIVE SYMPTOMS, ALCOHOL INTAKE, AND DRIVING: FINDINGS FROM THE HRS**

M. Devine, E. Dugan, *Gerontology, University of Massachusetts Boston, Boston, Massachusetts*

By 2030 the number of older drivers is expected to double making older driver safety a priority. Baby boomers are recognized to have more awareness of and openness to mental health treatment than previous generations. In addition, the consumption of alcohol and recreational drugs among this cohort is higher compared to previous cohorts. The aim of this research was to investigate if alcohol consumption or depressive symptoms had any association with current driving status of older adults. This paper used data from the 2010 wave of the Health and Retirement Study (HRS). The HRS is a nationally representative longitudinal survey of community dwelling adults in the United States. The analytic sample was restricted to adults age 65 and older who answered all of the questions regarding driving status in the 2010 wave of the HRS survey (N=1775). Descriptive, bi-variate, and logistic regression analysis were conducted. Expected demographic factors (age, gender, income, race/ethnicity, health status, vision, and marital status) were related to driving cessation. Older persons that do not drink had an increased risk for driving cessation compared to those that drink moderately ( $p=.06$ ). Research has shown that people who drink in moderation are different from non-drinkers or heavy drinkers in ways that could positively influence health and disease. These findings show that the benefits gained from moderate drinking may allow these persons to continue to drive longer than persons that do not drink at all. No association between driving status and depressive symptoms was observed.

### **STATE POLICIES TO ENHANCE OLDER DRIVER SAFETY: A SYSTEMATIC REVIEW**

E. Dugan, K. Barton, C. Coyle, C. Lee, *Gerontology Dept, University of Massachusetts Boston, Boston, Massachusetts*

The purpose of this study was to conduct a systematic review of the senior transportation literature on policies concerning older driver licensing/renewal and medical reporting procedures. A study was included in the systematic review if it met the following criteria: published in English; conducted in the United States; published between 1991-June 2011; included data on human subjects aged 65 and older; included information on at least one policy (license renewal/medical reporting) related to older drivers; included a transportation related outcome variable (e.g., crash, fatality, renewal). State reports and documentation were included. A total of 26 studies were included in the present analysis. The quality of articles was rated using a modified Downs & Black checklist. A data abstraction form was used to collect data from included articles. Results showed that in-person license renewal requirements, especially for the drivers age 85 and older, was associated with lower fatality rates (RR 0.83). Two studies found that vision screening resulted in motor vehicle accident risk reduction (0.83, 0.93). Medical reporting procedures,

generally aimed at identifying the most medically at-risk drivers, were effective at forcing reported drivers to cease driving. Restricted licenses (e.g., no night or highway driving) had mixed results. States have employed a variety of policies to maximize older driver safety. Policy-makers should note strong evidence supporting in-person license renewal requirements and medical reporting procedures. Restricted licensing may be another promising policy to consider. Research on the cost implications of different policy options is needed.

### **WHO KEEPS DRIVING & HOW COMMON ARE PSYCHIATRIC DISTURBANCES? FINDINGS FROM THE ADAMS STUDY**

S. Wang, C. Lee, K.M. Turk, L.M. Richardson, E. Dugan, *Gerontology, University of Massachusetts Boston, Boston, Massachusetts*

We investigated factors that are related with current driving status. In addition, we explored the extent to which psychiatric and behavioral disturbances were reported by current drivers. The Aging, Demographics, and Memory Study (ADAMS) is an ancillary study to the Health and Retirement Study. ADAMS data (Wave A) were merged with selected variables from the 2002 wave of HRS in this research. The analytic sample included N=847 adults age 70 or older. Descriptive, bivariate and multivariate statistics were conducted. Results showed that 44% were current drivers; mean age was 81.59(SD 7.10); more than half of the sample was female (58.5%). Results from the ADAMS neuropsychiatric inventory revealed several alarming symptoms present in current drivers: delusions (n=4), hallucinations (n=3), anxiety (n=22), disinhibition (n=22), emotional lability (n=29). Logistic regression to determine factors associated with current driving status (yes) identified: younger age, male gender, higher income, better vision, less ADL difficulties, excellent health, higher cognition, and fewer children (pseudo R-square =0.507,  $p=.001$ ). When older drivers cease driving the strong preference is for family and friends to provide rides. We found that those with fewer children kept on driving, perhaps due to this relative lack of alternatives. That any psychiatric disturbances were reported by current drivers is concerning.

### **THE EVIDENCE SUPPORTING THE USE OF CLINICAL ASSESSMENT AND PERFORMANCE-BASED ASSESSMENTS FOR DETERMINING DRIVING COMPETENCE AND DRIVING CESSATION FOR OLDER ADULTS**

A. Dickerson<sup>1</sup>, D. Lieberman<sup>2</sup>, M. Arbesman<sup>2</sup>, 1. *Occupational Therapy, East Carolina University, Greenville, North Carolina*, 2. *American Occupational Therapy Association, Bethesda, Maryland*

This poster will highlight the results of a comprehensive literature review for evidence of clinical assessments tools that include physical, visual, and cognitive function as well as the performance based assessments of on-road testing and simulation for determining fitness to drive for older adults. A complete search of all appropriate venues was done using older adults, driving, fitness-to-drive, and related terminology. Over 200 abstracts were reviewed with over 86 peer-reviewed manuscripts reviewed that met the initial criteria. The outcome of the study was identified as a behind-the-wheel assessment or driving cessation. Although descriptive studies were not included, cross sectional retrospective and prospective studies were analyzed. Fifty-six studies were described using a table format. This poster will highlight the themes identified in the comprehensive literature review: 1) no one assessment appears to have the adequate evidence to be used alone as the determinant of fitness to drive, 2) assessments tools must address the issues of sensitivity and specificity, 3) groups of assessment tools are showing promise for identifying criteria for fitness to drive, and 4) terminology of research in the area of driving and the use of the outcome of the driving evaluation need further research.

## SOCIAL SIDE OF HEALTH

## SOCIAL ISOLATION AND METABOLIC SYNDROME IN OLDER CAREGIVERS AND NON-CAREGIVERS

A. Hemmesch<sup>1</sup>, L. Fredman<sup>1</sup>, T. Heeren<sup>2,1</sup>, S.O. Stuver<sup>1</sup>, *1. Epidemiology, Boston Univ, Boston, Massachusetts, 2. Boston University, Department of Biostatistics, Boston, Massachusetts*

Social engagement is associated with reduced risk of cardiovascular disease (CVD) and mortality, and may buffer the adverse health effects of stress. We examined whether social isolation, measured by the 6-item Lubben Social Network Scale, was associated with having a greater number of metabolic syndrome components, which have been shown to precede CVD and diabetes. The sample included 229 older adults (mean age = 73.8 years); 14% were socially isolated, 69% were female, and 40% were caregivers to a relative or friend with Alzheimer's Disease or Parkinson's Disease. Number of metabolic syndrome components was calculated as the sum of five indicators that comprise the NCEP-ATP III criteria used to measure metabolic syndrome: high waist circumference; high levels of blood pressure, blood glucose, and triglycerides; and low HDL cholesterol (mean number of components = 1.79). In multivariate linear regression analyses controlling for age, marital status, caregiving status, and perceived stress, social isolation was associated with more metabolic syndrome components ( $b = 0.46$ ,  $p = 0.06$ ). Exploratory analyses, adjusting for covariates, revealed that social isolation was associated with significantly more metabolic syndrome components among caregivers ( $b = 1.34$ ,  $p = 0.04$ ), but not non-caregivers ( $b = 0.29$ ,  $p = 0.26$ ). These cross-sectional results suggest that social isolation may contribute to poorer health, and that this effect may be more pronounced for caregivers perhaps because it is an additional source of stress. Longitudinal analyses are needed to evaluate the impact of social isolation on metabolic syndrome over time, and whether this association continues to differ between caregivers and non-caregivers.

## THE INFLUENCE OF SOCIAL NETWORKS AND SOCIAL SUPPORT ON HEALTH: DIFFERENTIAL PATHWAYS FOR OLDER KOREAN-AMERICAN ADULTS AND NON-HISPANIC WHITES

H. Jeon, *Social Work, Boston College, Newton, Massachusetts*

The importance of social networks and social supports for maintaining health has been widely recognized by researchers over the past few decades. In addition, research has indicated that social networks and social supports are especially important for older adults, as they are more exposed to social loss than younger generations and as a result suffer increasingly from depression. Despite the well-documented importance of social networks and social supports on health, the process leading to positive outcomes on health is not yet well understood. This study will examine the pathways for different constellations of social networks (family networks vs. friend networks) and social supports (emotional supports vs. tangible supports) which lead to health outcomes. In addition, the study will examine whether these pathways differ between older Korean-American immigrants and white non-Hispanic populations. This analysis is based on the data from the "Korean-American Elderly: Social Supports and Long-Term Care" study conducted in 1994. The data ( $n = 424$ ) includes non-Hispanic White Americans ( $n = 201$ ) and Korean immigrant elders ( $n = 223$ ), aged 65 and older and residing in Southern California. Regression analysis revealed that the types of social networks and social supports effecting older adults' health were different between the two groups. The identification of these pathways that affect the health of older Korean immigrants and non-Hispanic White Americans will help design a much-needed and effective social intervention program for these populations.

## THE ASSOCIATION OF SOCIOECONOMIC STATUS AND LONELINESS AMONG OLDER ADULTS

B.R. Haimowitz, E. Dugan, *Gerontology, UMass Boston, Boston, Massachusetts*

This study examines the relationship between socioeconomic status (SES) and loneliness among older adults using multivariate analysis to identify the determinants of loneliness in a nationally representative sample of the United States population 50 years of age and older. A filtration model is used with 5856 respondents from the 2006 Health and Retirement data to test the relative impacts of socioeconomic factors (education, occupation, income and wealth) as predictors of loneliness after controlling for the mediating effects of demographics, health and social networks. The findings show that socioeconomic factors which are predictive of loneliness on a bivariate basis such as education and occupation still remain predictive of loneliness even when distal, stressor and proximate factors are taken into account. After controlling for the other variables in the logistic regression model, individuals with greater formal education and who worked in white-collar occupations have decreased odds of loneliness. The odds ratio for education ( $OR = 0.95$ ) suggests that for each additional year of education that a person has completed, the odds of loneliness decreased by 5%. Furthermore, an odds ratio for white-collar workers ( $OR = 0.80$ ) suggests that these type of workers have 80% the odds of loneliness compared to blue-collar workers. SES which is acquired earlier in the life course is associated with loneliness in later life.

## PATTERNS OF EMOTIONAL SUPPORT SOURCES AND RELATIONSHIP TO INADEQUATE SUPPORT AND DEPRESSIVE SYMPTOMS

T. Killian, M. Turner, *Human Development and Family Sciences, University of Arkansas, Fayetteville, Arkansas*

Research has found that emotional support promotes successful aging in mid and late life. It is likely that not all networks of emotional support are equally effective. This study captures the complexity of these networks by examining patterns in sources of emotional support. It is important to understand patterns in emotional support and how they are related to successful aging measured here as the level of depressive symptoms and perceptions of inadequate emotional support. Using data from 3,199 aged 40+ participants from the National Health and Nutrition Examination Study (NHANES), we used Latent Class Analysis to identify six patterns in sources of emotional support. Descriptive labels characterizing those patterns include: (1) Mostly Spouses, (2) Spouses/Children, (3) Mostly Parents, (4) Siblings, (5) Mostly Friends, and (6) Diverse. Controlling for socio-demographic characteristics, multinomial logistic regression examined how depressive symptomatology and perceptions of inadequate emotional support varied across latent classes. The highest probability of membership was "Mostly Spouses" so it was used as the reference class. Perceptions of needing more support were higher across all five classes compared to spousal support. Symptomatology was related to a higher probability of membership in the "Spouses/Children" and "Diverse" classes, a lower probability of membership in the "Siblings" and "Mostly Friends" classes, and not related to the "Mostly Parents" class. The findings suggest, when compared with spousal support, those whose major source of emotional support derives from spouses/children and diverse express higher levels of depressive symptomatology whereas those dependent on siblings and friends reported fewer depressive symptoms.

## AGE STEREOTYPES, DIABETES MYTHS, AND MARITAL RELATIONSHIPS: HOW POSITIVITY INFLUENCES MANAGEMENT OF A CHRONIC DISEASE

J.L. Atkinson, *Georgia State University, Atlanta, Georgia*

Age stereotypes have been found to have a significant impact on one's own health. Past research clearly shows a link between self-stereotyping and physiological health, such that negative stereotypes of age

may create cardiovascular stress and positive stereotypes of age may improve one's recovery from a health crisis. This interview project focuses on these issues within a married, diabetic population. Specifically, this project sought to understand the relationships among beliefs about aging, beliefs about diabetes, diabetes maintenance strategies, and marital social support. Ten couples were interviewed as a couple and then separately, resulting in 30 total interviews. Individuals with more positive beliefs about aging were either in better glycemic control or were more supportive of their spouse's maintenance strategies. Marriage longevity and participant age noticeably changed how the participants viewed the diagnosis of this chronic disease. Older participants who were married longer (i.e., 40+ years) saw the diagnosis as an important issue for both partners and reacted as a team. Younger participants, married for less time, were defensive about the diagnosis and blamed the non-diabetic partner for creating a non-supportive environment. Results are discussed in terms of age stereotypes about health, locus of control, and social support networks.

### THE EFFECT OF SOCIAL STRESS ON HEALTH AND HAPPINESS AMONG KOREAN BABY BOOMERS: A FOCUS ON GENDER DIFFERENCES

G. Han<sup>1</sup>, J. Son<sup>2</sup>, 1. *Seoul National University, Seoul, Republic of Korea*, 2. *Institute on Aging, Seoul National University, Seoul, Republic of Korea*

Social stress has been identified as a critical factor associated with health and happiness. Although many researchers have recently tried to prove whether this assumption is still tenable or not, they have failed to reach an agreement about the effect of social stress on men's and women's health and happiness. This study examines how social stress is associated with health and happiness of Korean baby boomers focused on gender differences. The data were collected from 3182 adults (1839 men and 1343 women) at the age of 50 to 58. In this survey, social stress were evaluated in two dimensions: job stress and marital conflict. The major findings are as follows. First, there are gender differences in social stress, health and happiness. Second, both job stress and marital conflict have negative effects on health and happiness. Third, the effect of marital conflict on health turned out to be different depending on gender. For men, marital conflict has more important impact on health than women. But there were not significant differences in the effect of social stress on happiness according to the gender. The result of this study suggest that it is important to recognize both gender differences and gender similarities in order to integrate theory and research into a coherent picture of "gendered" reality. Implications of these findings are discussed further.

## SESSION 705 (POSTER)

### ASSESSMENT 2

#### IS THE FIVE-TIMES-SIT-TO-STAND TEST A MEASURE OF BALANCE OR STRENGTH IN OLDER ADULTS?

A. Goldberg<sup>1,2</sup>, S. Talley<sup>1</sup>, 1. *Department of Health Care Sciences, Program in Physical Therapy, Mobility Research Laboratory, Wayne State University, Detroit, Michigan*, 2. *Wayne State University, Institute of Gerontology, Detroit, Michigan*

Introduction The five-times-sit-to-stand test (FTSST) is used to evaluate physical performance in older adults. Some studies have shown that FTSST is a measure of lower extremity strength, while others have suggested that FTSST is a measure of balance capabilities in older adults. The objective of this study was to determine if the FTSST is a valid measure of strength or balance in older adults. Methods Forty-one adults (mean age 68 years) underwent balance and lower extremity strength assessments. Balance tests included the 4-square step test and the maximum step length (MSL) test, valid balance measures in older adults. Hand-held dynamometry was used to assess strength of hip, knee and

ankle musculature. FTSST was the time to raise and lower oneself from a chair rapidly 5 times. Pearson's correlation coefficient and stepwise multiple regression determined associations between FTSST and strength and balance. Statistical significance was set at  $p < 0.05$ . Results FTSST was associated with the 4-square step test ( $r = 0.49$ ) and MSL ( $r = -0.46$ ), both  $p < 0.01$ . FTSST and strength associations were: right hip flexors  $r = -0.33$  ( $p = 0.04$ ); right knee extensors  $r = -0.09$  ( $p = 0.58$ ); right ankle dorsiflexors  $r = -0.22$  ( $p = 0.18$ ). Four-square step test explained 24% and MSL 7.7% of the variance in FTSST performance. Strength values did not explain any added variance in FTSST performance. Conclusion Balance tests explained 31.7% of the variance in FTSST performance, while none of the strength measures explained a significant portion of the variance in FTSST performance. The FTSST appears to be a valid measure of balance in older adults.

#### GENDER DIFFERENCES IN TRAJECTORIES OF LOWER-EXTREMITY PERFORMANCE IN OLDER ADULTS: RESULTS FROM A 12-YEAR LONGITUDINAL STUDY

A. Botoseneanu, H. Allore, E.A. Gahbauer, T.M. Gill, *Yale University, New Haven, Connecticut*

Background. Despite the importance of maintaining independent functioning among older adults, little is known about the gender-specific natural course of lower-extremity performance (LEP) in this age group. Methods. We evaluated longitudinal data from 754 initially non-disabled adults age 70 or older from the Precipitating Events Project (PEP). LEP was assessed every 18 months for 12 years using a modified version of the Short Physical Performance Battery (SPPB). Hierarchical linear models estimated the intra-individual trajectory of LEP and differences in trajectory intercept and slope between women and men. Results. LEP declined over 12 years following a non-linear trajectory. The rate of decline in LEP was slower in women than men, with no differences observed in LEP scores at baseline. When gender differences in trajectories were evaluated according to baseline LEP status, similar slope differences favorable to women were observed, with no differences in intercept in the high (SPPB 10-12) and intermediate (SPPB 7-9) LEP groups. Among participants with low LEP at baseline (SPPB 6 or less), no gender differences in the rate of decline over time were observed, but men had a higher starting LEP score than women. Analysis by length-of-survival showed similar LEP trajectory differences between men and women. However, men and women who died during the study had lower starting LEP scores and faster rates of decline, respectively, compared with those alive after 12 years. Conclusions. Female disadvantage in old-age mobility limitations and disability notwithstanding, older women seem to preserve lower-extremity functioning better than men.

#### COMPREHENSIVE PREOPERATIVE ASSESSMENT FOR OLDER ADULTS: DEVELOPING A CLINICAL PATHWAY

R.S. Browne, J. Mohler, K. D'Huyvetter, M. Fain, *University of Arizona, Arizona Center on Aging, Tucson, Arizona*

As the world population continues to age, older adults are facing surgical disease later in life, and with greater co-morbidity. Over time, minimally invasive surgical and anesthetic approaches have improved surgical outcomes, so that currently more than one-third of all US surgical patients are over the age of 65 years. Despite these advances in techniques, older adults remain with higher perioperative morbidity and mortality when compared to younger cohorts. In addition to optimizing the treatment of known medical morbidities, older adults facing surgery also require comprehensive geriatric assessment, to identify and manage previously unrecognized geriatric syndromes which could complicate recovery (e.g., depression, dementia, polypharmacy, malnutrition). Further, older adults need an assessment of functional status, as low function is associated with poor postoperative outcomes. Lastly, social support systems need to be reviewed and in place for the recovery and rehabilitative periods. The optimization strategies outlined above

require both interprofessional coordination-of-care and adequate lead time. Key elements of a protocol-driven geriatric surgical clinical pathway include: 1. Evaluate existing preoperative system; Perform a needs assessment; Review geriatric surgical data. 2. Identify stakeholders; Determine their drivers; Gain their “buy-in”; Meet regularly. 3. Develop a communication flow – EHR, paper charting, operative passport. 4. Select or Develop an evidence-based Comprehensive Geriatric Assessment tool and strategy (e.g., functional status, frailty, dementia, depression screening, polypharmacy, etc). 5. Identify a clinical model and Create a business plan for reimbursement. 6. Identify clinic space. 7. Confirm model and Acquire administrative approval. 8. Launch. 9. Measure outcomes and Refine model.

### IN-HOME ACCELEROMETRY IN ELDERLY: A NEW MEASURE OF FUNCTION

J. Mohler<sup>1</sup>, K. D’Huyvetter<sup>1</sup>, B. Najafi<sup>2</sup>, M. Fain<sup>1</sup>, *1. University of Arizona, Center on Aging, Tucson, Arizona, 2. University of Arizona, College of Medicine, Tucson, Arizona*

**Background/Rationale:** As life span increases, the number of U.S. elders will rise, producing unprecedented need for effective and low cost monitoring of home-dwelling elders. Remote blood pressure, glucose, peak-flow, pulse-oximetry and weight monitoring have become increasingly common, but we do not yet have a widely-used measure of activity with which to accurately and sensitively measure physical activity/functioning. New clinical and research tools are needed to accurately quantify gross activity patterns, and postural components and transitions predictive of risk of frailty, thus translating into earlier diagnosis, better targeted interventions, and more precise measurement of change in functional parameters. **Objectives:** To test the efficacy of tri-axial accelerometric activity monitoring in identifying precise early indicators of physical activity/functioning as related to frailty. **Methods:** We have begun a pilot study to monitor three equal groups (n=21) of aged 65+ non-frail, pre-frail, and frail (stratified using Fried’s phenotypic criteria) measuring physical performance and accelerometry for 24 consecutive hours in the home environment. We believe that pre-frail/frail subjects will demonstrate: 1) shorter standing duration, walking duration, limited total number of steps, and high inter-cycle gait variability; 2) greater postural transition duration of chair sit-to-stand; and 3) less organized activity as compared to non-frail controls. Therefore the fluctuation of day to day activity will be high, and its time series like a random noise pattern rather than fractal, compared to normal controls. **Conclusion:** In-home accelerometry may prove a valuable and unobtrusive tool in measuring frailty-related function. Study recruitment is underway, and results will be available Summer 2012.

### EVALUATION OF LOWER-LIMB MUSCLE FUNCTION USING A SPECIALIZED WEIGHT SCALE

T. Tsuji<sup>1</sup>, N. Kitano<sup>1</sup>, Y. Soma<sup>1</sup>, K. Tsunoda<sup>1</sup>, T. Miyama<sup>2</sup>, T. Shiokawa<sup>2</sup>, T. Okura<sup>3</sup>, *1. Doctoral Program in Physical Education, Health and Sport Sciences, University of Tsukuba, Tsukuba, Ibaraki, Japan, 2. Tanita Corporation, Itabashi, Tokyo, Japan, 3. Faculty of Health and Sport Sciences, University of Tsukuba, Tsukuba, Ibaraki, Japan*

The vertical ground reaction force (GRF) parameters in a sit-to-stand (STS) movement are useful for measuring lower-limb muscle function in older adults. We developed a specialized weight scale (BM-101, TANITA, Japan) for evaluating the peak GRF in a STS movement. In this study, we examined the relationship between the parameter obtained from the weight scale and participants’ mobility and history of falls. We performed cross-sectional analyses on 290 community-dwelling older adults, which included 143 men and 147 women aged 65-86 years (73.7 ± 5.0 years). Each participant was asked to stand up quickly from a sitting position while we measured the peak GRF per body weight parameter (kgf/kg). This parameter was lower in subjects reporting falls (1.34 ± 0.12), compared with those reporting no falls (1.40 ± 0.13) (P = 0.02, Cohen’s d = 0.52). Participants with limited mobility (difficulty walk-

ing one-quarter mile and/or climbing 10 steps) displayed a lower peak (1.29 ± 0.09) than those with no mobility limitation (1.42 ± 0.12) (P < 0.01, d = 1.20). We analyzed the data by ANCOVA, adjusting for age, gender, medication use and pain in the legs and/or lower back. These results suggest that the peak GRF in a STS movement measured by the weight scale can reflect a decline in lower-limb muscle function in older adults with a history of falls or mobility limitation. Use of these scales incorporating this measurement system may help simplify evaluation of lower-limb muscle function in a clinical setting of nursing-care prevention.

### PREOPERATIVE AMERICAN SOCIETY OF ANESTHESIOLOGISTS (ASA) SCORE PREDICTS FUNCTIONAL RECOVERY FOLLOWING HIP-FRACTURE SURGERY

L. Chen<sup>1,2</sup>, Y. Huang<sup>1,3</sup>, M. Tseng<sup>1,4</sup>, J. Liang<sup>5</sup>, M. Chen<sup>1</sup>, H. Cheng<sup>6</sup>, C. Wu<sup>6</sup>, Y.L. Shyu<sup>1</sup>, *1. Chang Gung University, Taoyuan, Taiwan, 2. Yuanpei University, Hsinchu, Taiwan, 3. Chang Gung University of Science and Technology, Taoyuan, Taiwan, 4. Meiho University, Pingtung, Taiwan, 5. University of Michigan, Ann Arbor, Michigan, 6. Chang Gung Memorial Hospital, Taoyuan, Taiwan*

**Introduction and Hypothesis.** Little is known about the predictive ability of ASA on patient outcomes following hip fracture in Asian countries. Therefore, this study explored the influence of preoperative ASA score on trajectories of recovery in physical functioning and health outcomes for elderly hip-fractured patients in Taiwan during the first year following postoperative discharge. **Methods.** Mortality, service utilization, activities of daily living (ADL) measured by the Chinese Barthel Index and health related quality of life measured by Medical Outcomes Study Short Form-36 were compared between hip fractured patients with ASA III (n=111, 48.3%) and ASA I-II (n=119, 51.7%). Generalized estimating equations (GEE) approach was used to analyze the data obtained from 230 elderly patients with hip fracture. **Results.** During the first year following hip-fracture surgery, patients with ASA I-II had significantly fewer emergency room visits and rehospitalization, better ADL (beta=4.90, p=.045) and better physical health (beta=5.78, p=.02) than patients with ASA scores III. **Conclusion.** ASA score can predict recovery and service utilization for hip fractured patients during first year following surgery. Interventions for hip fractured patients with high ASA can be developed.

### HEARING LOSS AND GAIT SPEED AMONG OLDER ADULTS IN THE UNITED STATES

L. Li<sup>1,2</sup>, E.M. Simonsick<sup>3</sup>, L. Ferrucci<sup>3</sup>, F.R. Lin<sup>1,2,4</sup>, *1. Johns Hopkins Medical Institutions, Baltimore, Maryland, 2. Johns Hopkins School of Medicine, Baltimore, Maryland, 3. National Institute on Aging, Baltimore, Maryland, 4. Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland*

**Background:** Gait speed is an important predictor of health outcomes and survival in older adults. We investigated whether hearing loss is independently associated with gait speed in a nationally-representative sample of older adults. **Methods:** We analyzed cross-sectional data from the 1999-2002 cycles of the National Health and Nutritional Examination Survey during which participants 50-69 years (n = 1180) underwent assessment of hearing and gait speed. Hearing was defined by a pure tone average of hearing thresholds at 0.5-4 kHz tones in the better-hearing ear. Gait speed was obtained in a timed 20-foot walk. Linear and logistic regression models were used to examine the association between hearing loss and gait speed while adjusting for demographic and cardiovascular risk factors. Analyses incorporated sampling weights to yield results generalizable to the U.S. population. **Results:** In a model adjusted for demographic and cardiovascular risk factors, a 25 dB hearing loss was associated with slower gait speed (-0.04 m/s per 25 dB HL [95% CI: -0.07 – -0.01]) and a nearly two-fold increased odds of having a gait speed < 1.0 m/s (OR = 1.9, 95% CI: 1.3 – 2.8). The reduction

in gait speed associated with a 25 dB hearing loss was equivalent to that associated with an age difference of nearly 10 years. Conclusions: Greater hearing loss is independently associated with slower gait speed. Further studies are needed to examine the basis of this observed association.

#### **FRAILTY ASSESSMENT IN THE GERIATRIC CLINIC**

T. Hornick<sup>1,2</sup>, H. Kim<sup>2</sup>, D.H. Canaday<sup>2,1</sup>, C.J. Burant<sup>2,1</sup>, P. Higgins<sup>2,1</sup>, *1. LSCVAMC, Cleveland, Ohio, 2. CWRU, Cleveland, Ohio*

**Background/Purpose:** Frailty is a common phenomenon in the geriatric clinic. This study: (1) assessed the feasibility of administering two frailty indices in an outpatient clinic (Fried, 2001; Gill, 2002); (2) compared classifications of frailty screening; and (3) created parsimonious indices from 2-criteria combinations and analyzed agreement with Fried, the more comprehensive and established frailty index. **Methodology:** Assessment was completed on 164 veterans (mean age = 83.7, 57% black) enrolled in a geriatric clinic. Each participant completed both indices during the same clinic visit. The indices' component criteria, which are well known to gerontological clinicians, were administered in a standard order and scoring was identical to original indices. **Results:** The 5-item Fried required 15-20 minutes to complete, the 2-item Gill less than two minutes. Of the 164 participants assessed, 74 were determined to be frail by one of the frailty indices. Of the 74, Fried index identified 57, the Gill index 51, and 34 participants were determined to be frail by both indices. Correlations between the indices were Spearman=0.58 ( $p < 0.001$ ), and kappa =0.25, ( $p < 0.001$ ). There was no relationship between race and frailty. Twenty 2-criteria indices were created. Grip strength + 15-ft gait speed had the strongest agreement with Fried (kappa=.60,  $p=.001$ ). **Conclusion:** The different results from the frailty indices are likely due to differences in component tests and methods. In the clinical setting, a simple assessment of patient's grip strength and gait speed may be a practical and rapid assessment to determine if further investigation of frailty is warranted.

#### **THE IDENTIFICATION OF FRAIL OLDER ADULTS IN PRIMARY CARE: COMPARING THE ACCURACY OF 5 SIMPLE INSTRUMENTS**

E.O. Hoogendijk<sup>1</sup>, H. van der Horst<sup>1</sup>, D.J. Deeg<sup>2</sup>, D. Frijters<sup>1</sup>, D. Jansen<sup>1</sup>, G. Nijpels<sup>1</sup>, H. van Hout<sup>1</sup>, *1. Department of General Practice & Elderly Care Medicine, EMGO Institute for Health and Care Research, VU University Medical Center, Amsterdam, Netherlands, 2. Department of Epidemiology & Biostatistics, EMGO Institute for Health and Care Research, VU University Medical Center, Amsterdam, Netherlands*

Many identification instruments exist to identify frail older adults who may benefit from geriatric interventions. Most of those instruments are time-consuming and difficult to use in primary care. To select a simple, but valid instrument to identify frail older adults in primary care, we compared: the opinion of the general practitioner, prescription of multiple medications, the Groningen Frailty Indicator (GFI), PRISMA-7, and a subjective general health estimate by the older adult. Fried's frailty criteria and a clinical judgment by a multidisciplinary expert panel were used as reference standards. Data were used from the cross-sectional Dutch Identification of Frail Elderly Study and consisted of 102 people aged 65 and over from a primary care practice in Amsterdam. Accuracy of the different instruments was estimated by the area under the ROC curve. The agreement between the instruments and the reference standards was determined by kappa. The accuracy of the instruments ranged from poor (AUC = 0.64) to good (AUC = 0.85), irrespective of the reference standard used. The results showed that PRISMA-7 was the best of the five instruments with good accuracy and substantial agreement.

#### **AN INTEGRATIVE MODEL OF FRAILTY: METHODOLOGICAL PERSPECTIVES AND CHALLENGES**

O. Zaslavsky<sup>1</sup>, B.B. Cochrane<sup>1</sup>, H.J. Thompson<sup>1</sup>, N.F. Woods<sup>1</sup>, J.R. Herting<sup>1</sup>, A.Z. LaCroix<sup>2</sup>, *1. University of Washington, Seattle, Washington, 2. Fred Hutchinson Cancer Reserach Institute, Seattle, Washington*

Frailty is an emerging geriatric syndrome that refers to a state of increased vulnerability to adverse events. Despite its long history in research and publications, mechanisms of frailty development are still poorly understood. In this presentation we will describe a number of conceptual models that have been used to explain the dynamic nature of frailty. We also illustrate an integrative pathophysiological model of frailty, taking into consideration the large body of studies regarding predictors, indicators, and outcomes of frailty. The model addresses cellular (e.g., oxidative damage, telomere length) and systemic (e.g., endocrine, inflammatory, coagulatory and metabolic deficiencies) mechanisms of frailty, moderating factors (e.g., ethnicity, life style, co-morbidities) and outcomes (e.g., morbidity, disability). Of note, based on a synthesis of studies to date and in addition to the "conventional" Fried et al. (2001) criteria, we suggest including indicators of neurosensory loss (i.e., cognition and sensory decline) in the operational definition of frailty. Finally, we will identify the weaknesses of traditional epidemiological approaches for studying frailty and propose areas of inquiry for physiologic research. Specifically, we claim that to better understand etiologic processes in the development of frailty, it is important to extend uni-level analyses to more comprehensive multilevel models. Using this approach, we can explicitly model the complex structural and longitudinal dynamics involved in the pathophysiology of frailty. In summary, the results of such analyses are likely to elucidate the heterogeneous nature of frailty and its development and identify directions for future intervention.

#### **DEVELOPMENT OF A WORD RECOGNITION INSTRUMENT TO ASSESS HEALTH LITERACY IN DENTISTRY AMONG THE ELDERLY**

A.R. Mohammad, *Geriatric Dentistry Program, The Ohio State University, Columbus, Ohio*

According to the American Dental Association, health literacy in dentistry is defined as the "degree to which individuals have the capacity to obtain, process, and understand basic health information and services needed to make appropriate oral health decisions." Nearly 9 out of 10 adults have difficulty using the basic health information that is routinely available in our health care facilities. Health literacy is therefore necessary for patients adherence to medical instruments including consent forms, verbal instructions on drug labels, and for increased potential in positive health outcome. Health literacy in dentistry has received little attention beyond the readability of dental education materials. Furthermore, the growing geriatric population has focused the attention on the need for more efforts in health literacy in dentistry. The purpose of this study is to develop and assess an oral health literacy instrument among the elderly. **Method:** The instrument developed was based on the rapid estimate of adult literacy in medicine (REALM - SF), which is a word recognition instrument used to test health literacy in medicine. The new instrument, Rapid Estimate of Adult Literacy in Dentistry (REALD - SF), consist of 30 common dental words with varying degrees of difficulty (easy, moderate, difficult). A test was administered to 182 english-speaking elderly residing in a local nursing home in the Columbus, Ohio area. **Results:** 98% +/- 0.07 of the participating residents read the easy level correctly, 83% +/- 0.23 read the moderate level correctly and finally 74% +/-0.37 read the difficult level correctly. **Conclusion:** This study presented an effective instrument to measure health literacy among the elderly. Furthermore, the results indicate a significantly higher level of understanding of oral health literacy among this sample population.

## **INTEGRATION OF GERIATRIC MENTAL HEALTH SCREENING INTO A PRIMARY CARE PRACTICE: A PATIENT SATISFACTION SURVEY**

S. Samuels, R. Breckman, C. Snow, E. Woods, R. Goralewicz, A. Stern, C. Reid, R. Adelman, *Division of Geriatrics and Gerontology, Weill Cornell Medical College, New York, New York*

**BACKGROUND:** Depression and anxiety can have serious ramifications in older adults. Co-location of mental health screening, assessment, and treatment in the primary care physician's office has been shown to reduce stigma, improve access, and increase coordination of care between mental health and primary care teams. **PURPOSE:** To evaluate older patients' acceptance of and satisfaction with screening for depression and anxiety in a primary care geriatrics setting. **Methods:** The study was conducted at a geriatric primary care practice affiliated with a large teaching hospital in NYC from July 2009 to January 2010. Nine attending physicians screened eligible patients for depression and anxiety in specified practice sessions as part of usual care. Eligible patients (N=106) were asked to participate in a post-screening survey and interview to assess their perceptions on the screening experience. The responses were quantitatively and qualitatively analyzed. **RESULTS:** Most patients (88.6%) assessed the length of the mental health screening to be appropriate. A majority of patients thought the screening questions were acceptable (73.4%) and not at all difficult (81.9%). Most participants did not find the questions to be stressful (84.9%) or intrusive (91.5%); a majority of patients were not at all embarrassed (93.4%), upset (93.4%), or uncomfortable (89.6%) during the screening process. When asked about their opinions regarding frequency of screening, most patients (72.4%) desired screening for depression and anxiety at least as often as yearly visits. **CONCLUSIONS:** Results demonstrate strong patient support for the integration of depression and anxiety screening in a primary care geriatrics practice.

## **RELIABILITY AND SPECIFICITY OF SWEAT MEASUREMENT IN OLDER ADULTS**

B.J. Holtzclaw, *University of Oklahoma HSC, Oklahoma City, Oklahoma*

Precision of instruments to measure sweating activity as a variable in studies of fever, exercise, hyperhidrosis, or night sweats, depends on requirements to determine body sweat distribution, circadianicity, amount, consistency, or contents. In older adults, factors dictating selection of measurement method include mechanisms underlying sweat production/secretion, adrenergic and cholinergic processes, and possible inferential relationships to research questions. Mechanisms underlying sweat production and secretion and specific relationships of sweat to the research question are relevant when inferential questions or correlates are proposed. **Purpose:** This systematic survey of sweat measurement methods was designed to select measurement approaches for a planned study. **Study aims were to:** 1) Categorize capabilities of extant techniques to measure sweating activity. 2) Compare/contrast usability, indications for, and limitations of sweat measurement techniques. **Method(s):** Investigators examined existing or historically documented sweat measurement techniques from scientific literature, instrument vendors, and reports. **Results:** Measurements included sweating intensity, amount, ion concentrations, and excitation frequency. Data on specifications, capacities, and appropriate indications for use are shown. **Discussion:** Galvanic responses; electrodermal conductance measurements, and starch-iodine mapping of distribution lack needed precision and reliability for planned study. Influence of configuration, excitation frequency, type of electrodes and signal extraction, create measurement error. Skin conductance levels vary with filling of sweat ducts and reabsorption not sweat production or evaporation. Despite, advances in electrodermal measurement, relationships of electrical measurements to sweat activity lack full validation. Selected final study instrument uses parameters from skin conductance curves, calibrated to measure the sweat quantity or levels of sweat activity.

## **RELOCATION TRANSITION: A MIXED RESEARCH INTEGRATIVE REVIEW**

S.M. Gilbert, *Medical University of South Carolina, Charleston, South Carolina*

The purpose of this review is to determine how relocation transitions of older adults are measured in the literature. PubMed, CINAHL, and PsycInfo databases were queried using the key words relocation, transitions, and older adults. Fourteen articles were retained for this assessment. Two quantitative studies measured relocation from the older adult's perspective. The remaining studies, qualitative in design, revealed autonomy, decision making, social support, and physical health declines as persistent themes in older adults' relocation transition experiences. While qualitative studies describe the processes of these experiences, there remains only one measurement instrument, Rossen and Gruber's (2007) Relocation Self-Efficacy Scale that provides health care professionals with a means to determine an older adult's ability to transition to a new living environment.

## **CORRELATION BETWEEN SEVERITY OF HEARING LOSS AND SELF-REPORTED PARTICIPATION RESTRICTIONS (HEARING HANDICAP) IN LONG TERM INSTITUTIONALIZED OLDER PEOPLE**

S. Ribeiro<sup>1,2</sup>, A.G. Bó s<sup>1</sup>, C.C. Soldera<sup>1,2</sup>, M. Cardoso<sup>2</sup>, I.H. Menegotto<sup>2</sup>, I. PUCRS, *Porto Alegre, RS, Brazil*, 2. UFCSPA, *Porto Alegre, RS, Brazil*

Hearing loss due to aging (presbycusis) is often present in the elderly population, accompanied by restrictions on social participation (auditory handicap). **Objectives:** to verify the possible correlation between the responses obtained using "The Hearing Handicap Inventory for the Elderly – HHIE" questionnaire and the hearing thresholds measured in a group of institutionalized elderly. **Methodology:** the sample consisted of people resident of a long-term institution for the elderly. We analyzed the results from the HHIE questionnaire and an audiometric evaluation. The study included 41 individuals, of which 30 were females, aged between 63 and 92 years old. All participants presented some degree of hearing loss, 34.2 % presented hearing handicap. The correlation between handicap and hearing level (dB) as 0.17 (p=0.14). Therefore, the higher the hearing loss higher was the HHIE, but it was not significant. We hypothesize that nursing home residents with mild hearing loss perceive more intensely their hearing handicap than those with more severe loss. Nursing home residents with severe hearing loss would restrict their daily life activities and social participation, not perceiving the hearing handicap.

## **ASSESSMENT OF OVERNIGHT CHANGES IN HYDRATION STATUS AND ORTHOSTATIC BLOOD PRESSURE IN OLDER ADULTS**

M.C. Schlairet, M.J. Benton, *College of Nursing, Valdosta State University, Valdosta, Georgia*

Overnight changes in hydration may be linked to fall risk in the elderly due to blood volume and orthostatic blood pressure changes. Bio-electrical impedance analysis (BIA) is an accurate measure of hydration that can assess changes in extracellular fluid that contributes to blood volume. This study evaluated overnight changes in hydration and blood pressure in 17 older (73.8 ± 1.5 years) community-dwelling adults who completed two BIA measurement sessions: (Day 1) between 10:00 am – 4:00 pm in a euhydrated state, and (Day 2) the following morning within 30 minutes of waking after an overnight fast (no food/fluids for 8 hours). Significant overnight decreases in body mass (-0.8 ± 0.1 kg, P < 0.001) were accompanied by losses of total body water (-0.7 ± 0.2 L, P = 0.001), extracellular water (-0.2 ± 0.1 L, P < 0.05), and intracellular (intramuscular) water (-0.3 ± 0.1 L, P < 0.001). Commensurate overnight decreases in systolic blood pressure sitting (-9.4 ± 3.8 mmHg, P < 0.05) and standing (-13.6 ± 3.7 mmHg, P < 0.01) were observed. Orthostatic changes from lying to sitting were significantly greater on

Day 2 ( $-6.9 \pm 3.2$  mmHg,  $P < 0.05$ ), while there was a trend for changes from sitting to standing ( $-6.3 \pm 3.4$  mmHg,  $P = 0.08$ ). Older adults are at increased risk for falls due to orthostatic blood pressure changes that accompany overnight changes in hydration. Muscle, which is a repository for body fluids, may contribute fluid stores overnight to minimize losses of extracellular fluids.

#### ASSESSMENT OF OVERNIGHT INTRAMUSCULAR FLUID LOSS AND STRENGTH IN COMMUNITY-DWELLING OLDER ADULTS

M.J. Benton, M.C. Schlairet, *College of Nursing, Valdosta State University, Valdosta, Georgia*

Muscle is approximately 70% water. It provides a reservoir for body fluids to maintain fluid volume overnight when transient changes in hydration status occur. The effect of nocturnal intracellular (intramuscular) fluid shifts on muscle strength has not been evaluated, although this may contribute to early morning fall risks. The current study used bioelectrical impedance analysis (BIA) to evaluate overnight changes in body composition and fluid status in 17 older ( $73.8 \pm 1.5$  years) community-dwelling adults. Measurements were taken between 10:00 am – 4:00 pm in a euhydrated state and again the following morning after an overnight fast (no food/fluids for 8 hours). Immediately following BIA, muscle strength was assessed using 30-second Arm Curl (upper body) and Chair Stand (lower body) tests. Participants were overweight (BMI  $27.16 \pm 1.2$  kg/m<sup>2</sup>), with an average of  $44.1 \pm 2.6$  kg lean mass and  $40.8 \pm 2.1\%$  body fat. The overnight fast resulted in a significant loss of intracellular (intramuscular) fluid ( $-0.3 \pm 0.1$  L,  $P = 0.01$ ) that manifested as a significant decrease in lean (muscle) mass ( $-0.8 \pm 0.2$  kg,  $P < 0.001$ ) and increase in body fat ( $0.5 \pm 0.2\%$ ,  $P = 0.02$ ). Loss of lean mass was accompanied by a significant loss of upper body strength ( $-9.1 \pm 5.6\%$ ,  $P = 0.01$ ) and a trend for loss of lower body strength ( $-5.6 \pm 10.6\%$ ,  $P = 0.10$ ). In these older adults, overnight fluid shifts resulted in loss of both muscle and strength that may pose an unappreciated risk for early morning injury.

#### ROLE OF COMPREHENSIVE GERIATRIC ASSESSMENT IN THE PREDICTION OF THE OUTCOME AMONG THE ELDERLY PATIENTS WHO UNDERGOING ELECTIVE SURGERY

K. Kim, C. Kim, *Internal Medicine, Seoul National Bundang Hospital, Seongnam-si, Republic of Korea*

Background: The proportion of elderly patients who undergoing surgery has been rapidly increased, however, the clinical indicator predicting the outcomes have been limited. We aimed to evaluate the significance of comprehensive geriatric assessment (CGA) in the elderly patients who undergoing elective surgery. Methods: We studied 141 elderly patients (age:  $78.0 \pm 6.5$ , male: 41.1%) who referred to the geriatrician for the surgical risk evaluation. CGA was performed to evaluate physical health, functional status, psychological health, and social support. The primary composite outcome of this study was in-hospital death or post-discharge institutionalization. In-hospital adverse events, such as delirium, pressure ulcer, pneumonia, and urinary tract infection, were also evaluated. The associations between CGA and in-hospital adverse events, in-hospital death, and post-discharge institutionalization were investigated. Results: There were 32 adverse outcomes (6 in-hospital deaths and 26 post-discharge institutionalizations). Compared with patients who discharged to home, patients with adverse outcome were characterized with poor nutritional status and previous stroke. However, there was no significant difference in surgical risk or anesthesia type. CGA results showed that patients with adverse outcome were associated with functional dependency and poor nutrition. Cumulative number of impairment in CGA domain was significantly associated with adverse outcome, in-hospital events, and prolonged hospital stay. In multiple logistic regression analysis, cumulative impairment in CGA was independently associated with surgical outcome in elderly patients

undergoing elective surgery (Fully-adjusted odd ratios (95% CI); 1.892 (1.318 – 2.716)). Conclusions: Preoperative CGA can identify elderly patients at greater risk for mortality, prolonged length of hospital stay, and post-discharge institutionalization.

### SESSION 710 (POSTER)

#### DISABILITY AND MOBILITY

##### THE ROLE OF GENDER IN THE RELATIONSHIP BETWEEN MOTOR FUNCTIONING AND MORTALITY

M. Ernsth-Bravell<sup>1</sup>, D. Finkel<sup>2</sup>, A.K. Dahl<sup>1,3</sup>, 1. *School of Health Sciences, Jönköping University, Institute of gerontology, Jönköping, Sweden*, 2. *Indiana University Southeast, New Albany, Indiana*, 3. *Department of Medical Epidemiology and Biostatistics, Karolinska Institutet, Stockholm, Sweden*

Basic motor functioning is not only an indicator of general physical functioning but it may also predict mortality. Motor function is however complex and different functions may play different roles in mortality. The aim of this study is to analyze relations among different types of motor function and mortality and also to examine possible gender interactions. As a part of the longitudinal Swedish Adoption/Twin Study of Aging (SATSA) twenty different assessments of motor functioning have been collected six times over a 19-year period. At baseline motor function data were available from 859 twins ranging in age from 50 to 88 years. Given the skew evident in motor functioning measured in seconds (most individuals perform well into their mid60s), performance on the 20 motor functioning tasks was categorized as without difficulty, with difficulty, or impossible. Factor analysis was used to create 3 motor factors: balance, flexibility, and fine motor skills. For the analyzes data from wave 2 was used (age from 50 – 91) due to larger variance in function than at wave 1. Cox regression survival analysis was performed with mortality (event = 1) as the outcome variable and the three motor factors as independent variables together with age and gender. In the first model age and balance turned out significant related to mortality; however, when sex was included in the model age and the interaction of gender and fine motor skills demonstrated significant relations with mortality. The analysis demonstrates that relationship between motor functioning and mortality differs significantly by gender.

##### PATTERNS OF ACTIVITY AND REST IN OLDER ADULTS AS MEASURED BY A HOME MONITORING SYSTEM

H. Lach<sup>1</sup>, R.A. Lorenz<sup>1</sup>, K. Rose<sup>2</sup>, M. Hanson<sup>3</sup>, A. Barth<sup>3</sup>, 1. *Saint Louis University, St. Louis, Missouri*, 2. *University of Virginia, Charlottesville, Virginia*, 3. *BeClose, Vienna, Virginia*

Older adults are at risk for accidents and injuries in the home environment, particularly people with dementia. Potential safety problems include falls, fires, medication mismanagement, and wandering. Home monitoring technology has the potential for increasing safety and keeping older adults independent in the community through identifying potentially unsafe behaviors before an incident occurs. This descriptive study examined pilot data collected through a wireless home monitoring system on 5 community-dwelling older adults (mean age 77.8, female =4). People had wireless sensors installed in the home to collect data on motion in the kitchen and living room, sensors to identify when the person was in bed or in a primary chair, time spent in the bathroom, and detection of opening the front and back doors. Participants were tracked over one month. Variables collected on some if not all of the participants included time in bed, getting out of bed, active and sedentary time, time in the bathroom, opening the door, and leaving the home. Computer algorithms were used to generate activity graphs for each of the participants for each type of behavior. Patterns of activity during both the day and at night emerged with ability to identify alterations in participant's regular patterns and unusual events, such as opening the door in the middle of the night, or getting up frequently at night. Implied

cations for exploring older adults' behaviors related to safety are discussed.

### **EXAMINING GENDER DIFFERENCES IN CONTRIBUTIONS OF RISK FACTORS TO DEPRESSION AMONG ELDERLY WITH STROKE-RELATED DISABILITIES DWELLING IN A COMMUNITY**

S. Moon, *social welfare, daejin university, Pocheon, Republic of Korea*

The purpose of this study was to analyze gender differences in depression for elderly who are disabled by stroke dwelling in a community. The result of this study will be a meaningful exploration that would be helpful for policy makers and social workers in developing appropriate preventive strategies, as well as in providing knowledge about the depression treatment for elderly with disabilities. This study was developed based on biological, psychosocial theory to examine gender differences in contributions of risk factors to depression among elderly with stroke-related disabilities. The results of this study showed that risk factors to depression were sociodemographics; religion, education level, economic level, activities of daily living. Daily hassles such as internal conflict, family conflict, and services provided in a community such as medical rehabilitation services and collective social activities were also risk factors to depression. The differences between men and women were level of education and economy, family conflict, and collective social activities. Therefore, effective and strategic development of social activities and programs provided by a community for different sex is necessary in order to reduce depression.

### **TRENDS IN FUNCTIONAL MOBILITY BEFORE, DURING AND AFTER DISMISSAL FROM CLINICAL-GERIATRIC SETTING**

S. Strupeit, K. Wolf-Ostermann, C. Deneke, *Life Sciences, Hamburg University of Applied Science, Hamburg, Germany*

**Introduction:** In the health sciences it seems to be indisputable that mobility refers to physical dimensions, to the movement of the human sciences as basis of the life. In medicine, nursing and other therapeutic occupations of health, there is often a lack of understanding functional mobility. **Material/Methods:** In a timeline of 6 month after the hospitalization the Barthel Index was assessed as status quo before transfer to the hospital (t1), at the time of dismissal from the clinical geriatric setting (t2) and after 6 month (t3). The survey took place in Hamburg (Germany) with 123 patients. **Results:** There is an improving of functional mobility during the clinical stay. After 6 month there is a decrease of the clinical status quo. Partly worsened than before the hospitalization. **Discussion:** There are different stages of functional mobility at different stages of the course of disease. To improve and achieve the functional mobility special interventions must take place.

### **THE PREVALENCE OF LOW CONFIDENCE WITH USING A WHEELCHAIR AND ITS RELATIONSHIP TO WHEELCHAIR SKILLS**

W.C. Miller<sup>1,2</sup>, B.M. Sakakibara<sup>1,2</sup>, P.W. Rushton<sup>3</sup>, *1. University of British Columbia, Vancouver, British Columbia, Canada, 2. Vancouver Coastal Health Research Institute, Vancouver, British Columbia, Canada, 3. Centre de recherche de l'institut universitaire de gériatrie de Montréal, Montreal, Quebec, Canada*

**Objectives:** Social Cognitive Theory suggests that confidence (self-efficacy) is an important covariate along with skill or ability in determining behavior. To date no studies have looked at confidence with wheelchair use. Here we estimate the prevalence of low confidence with using a wheelchair and examine its relationship with wheelchair skills. **Methods:** Using a cross-sectional design 96 community-living, mostly male (69%), manual wheelchair users who were 50 years or

older (mean=60 years) and used their wheelchair on a daily basis were recruited. Variables collected included the 65 item Wheelchair Use Confidence Scale (WheelCon), the 32 item performance-based Wheelchair Skills Test (WST), the 14 item Hospital Anxiety and Depression Scale (HADS) and a number of demographic and clinical variables. **Results:** The prevalence of low confidence with wheelchair use was 39% (95% CI=29-49%). Using cut-scores of 80% for both the WheelCon and WST, crosstab analyses suggest that 27% of the sample have a disproportionate balance of skill and confidence (e.g., low skill high confidence or vice versa). There is a moderately high shared variance ( $r^2=49%$ ) between confidence and skill. Having higher confidence remains significant when regressing wheelchair skill on wheelchair confidence and other important covariates. **Conclusion:** Confidence with using a manual wheelchair is a newly determined construct and its relationship with wheelchair skill has yet to be examined. Low confidence is evident in a relatively large proportion of older wheelchair users. Given our findings, in concert with existing published evidence, interventions to address wheelchair confidence and skill may lead to better mobility outcomes.

### **COMBINED PELVIC FLOOR AND VIRTUAL REALITY DANCE TRAINING CAN IMPROVE DUAL-TASK GAIT IN WOMEN WITH MIXED URINARY INCONTINENCE**

S. Fraser<sup>1,2</sup>, V. Elliot<sup>3,1</sup>, J. Chaumillon<sup>3,1</sup>, M. Lussier<sup>2,1</sup>, E.D. de Bruin<sup>4</sup>, L. Bherer<sup>1,2</sup>, C. Dumoulin<sup>3,1</sup>, *1. Centre de recherche de l'Institut de gériatrie de Montréal, Montreal, Quebec, Canada, 2. Université du Québec à Montréal, Montreal, Quebec, Canada, 3. University of Montreal, Montreal, Quebec, Canada, 4. Institute of Human Movement Sciences and Sport, Zurich, Switzerland*

Recent research suggests that women with mixed urinary incontinence demonstrate poorer executive functioning (EF) than women with stress urinary incontinence or continent women. Poorer EF has been associated with dual-task walking deficits and an increase in fall risk. While pelvic floor training has been successful in reducing involuntary leaks, we questioned if dance training that included executive control would improve outcomes in women with mixed urinary incontinence. Twenty-three women (Mage = 70.5 yrs) completed 12 weeks of combined pelvic floor and virtual reality dance training. Participants were measured on their ability to walk and complete a 2-back task on three separate occasions (Pre1, Pre2, Post-test). To assess test-retest improvements we included a two week 'no training' period (from Pre1 to Pre2). The combined training occurred between Pre2 and Post. We computed dual-task cost scores (DTCs) for each participant (i.e., 2back alone - 2back+walking). For all participants, walking DTCs were unchanged overtime but 2-back DTCs diminished significantly from Pre2 to Post ( $p = .022$ ). When we examined those who benefited from training and improved their pad test from Pre2 to Post ( $n = 13$ ) and those who did not improve ( $n = 10$ ), we found that improvers had poorer scores at Pre1 in the executive Stroop task than the non-improvers ( $p = .019$ ). Interestingly, only those that improved on their pad test demonstrated improvements in 2-back performance over time ( $p = .026$ ). Overall, results suggest that combined training can benefit individuals with mixed urinary incontinence and improve cognitive performance during dual-task walking.

### **TOILETING DISABILITIES IN OLDER PEOPLE LIVING IN RESIDENTIAL CARE FACILITIES**

K.M. Talley, J. Wyman, *School of Nursing, University of Minnesota, Minneapolis, Minnesota*

Understanding risk factors for toileting disabilities in older adults living in residential care facilities will help design prevention programs

to delay nursing home relocation. The purpose of this study was to identify risk factors associated with toileting disabilities in this population. A subsample of 2,395 adults age 65 years or older, without dementia, and with the potential to benefit from behavioral interventions for urinary incontinence, and physical activity was created from the 2010 National Survey of Residential Care Facilities (a nationally representative cross-sectional sample of 8094 participants). The disablement process model provided the conceptual framework and predictors were classified as pathologies, impairments, disabilities, intra- and extra-individual factors. Toileting disability was measured as “does the resident currently receive any assistance using the bathroom?” Logistic regression was used to identify independent predictors of toileting disabilities. Variables with  $p < .05$  in univariate models were included in the final multivariate model. Residents were mostly white women age 85 years and older. Sixteen percent had toileting disabilities. Independent predictors (odds ratio, 95% confidence intervals reported) of toileting disabilities included; living in a for profit facility (1.54, 1.07-2.22); having kidney disease (1.99, 1.06-3.70), bowel incontinence (3.21, 1.91-5.39), urinary incontinence (2.33, 1.63-3.33); an increased number of physical impairments (.82, .71-.95); not going outside (.29, .16-.52); needing assistance with bathing (2.13, 1.11-4.08), dressing (6.26, 4.20-9.34), and transferring (8.41, 5.56-12.71). Prevention efforts should include treatments for incontinence, physical activity programs targeting impairments with walking, standing, sitting, stooping, reaching, and grasping, and therapy to improve dressing and transferring skills.

#### PREVALENCE OF METABOLIC SYNDROME AND ITS ASSOCIATION WITH PHYSICAL PERFORMANCE, DISABILITY AND SUBJECTIVE WELL-BEING AMONG LIFESTYLE INTERVENTIONS AND INDEPENDENCE FOR ELDERLY (LIFE) STUDY PARTICIPANTS

A. Botosaneanu<sup>1</sup>, W.T. Ambrosius<sup>2</sup>, N. de Rekeneire<sup>1</sup>, B. Goodpaster<sup>4</sup>, B. Nicklas<sup>2</sup>, T. Church<sup>3</sup>, T.M. Gill<sup>1</sup>, 1. *Yale University, New Haven, Connecticut*, 2. *Wake Forest University, Winston-Salem, North Carolina*, 3. *Pennington Biomedical Research Center, Baton Rouge, Louisiana*, 4. *University of Pittsburgh, Pittsburgh, Pennsylvania*

**Background.** Maintaining physical independence and reducing disability among older adults is of great clinical and public health importance. Despite the increase in obesity and related metabolic dysfunction in this age group, the association between metabolic syndrome (MetS) and physical performance, disability, and subjective well-being in older adults with functional limitations has not been evaluated. **Methods.** We used data from 1,635 adults aged 70-89 years old with functional limitations [summary score  $< 10$  on the short physical performance battery (SPPB)] from the LIFE Study, to assess differences in physical performance (400m walk time, grip strength, and SPPB score), disability (composite 19-item score), and self-rated health (SRH), between those with and without MetS at baseline. MetS was defined according to 2009 IDF/NHLBI criteria. Analyses were performed for the overall sample and subsequently stratified according to diabetes status. **Results.** The prevalence of MetS was 29.9% in the overall sample, and 48.8% and 23.5% among diabetics and non-diabetics, respectively. In the overall sample and the diabetic and non-diabetic subgroups, no significant differences were found in 400m walk time, grip strength, SPPB score, or disability score between participants with and without MetS. In contrast, self-reported ratings of overall health status were better (lower) in participants without MetS compared with those with MetS (adjusted means 2.73 and 2.82;  $p$ -value = 0.033); the ratings did not differ significantly in the two diabetes subgroups. **Conclusion.** In older adults with functional limitations, MetS status is associated with higher ratings of subjective well-being, but not with physical performance or disability.

#### USUAL GAIT SPEED, SELF-RATED HEALTH, AND FUNCTIONAL DEPENDENCE IN OLDER JAPANESE WOMEN

S. Seino<sup>1,2</sup>, N. Yabushita<sup>1</sup>, M. Kim<sup>3</sup>, M. Nemoto<sup>1</sup>, S. Jung<sup>1</sup>, Y. Osuka<sup>1</sup>, Y. Okubo<sup>1</sup>, K. Tanaka<sup>1</sup>, 1. *Graduate School of Comprehensive Human Sciences, University of Tsukuba, Tsukuba, Japan*, 2. *The Japan Society for the Promotion of Science, Chiyoda, Japan*, 3. *The Research Team for Promotion Independence of the Elderly, Tokyo Metropolitan Geriatric Hospital and Institute of Gerontology, Itabashi, Japan*

**Background:** Although usual gait speed (UGS) and self-rated health (SRH) are considered useful indicators of overall well-being, it is unclear whether slow-UGS and poor-SRH have an additive effect on functional dependence. The purpose of this study was to evaluate an additive effect of a slow-UGS and poor-SRH on functional dependence. **Methods:** We conducted a cross-sectional analysis on data from 736 older Japanese women, aged 65-95 years ( $74.3 \pm 5.9$  yr). Trained testers measured participants' UGS. Participants were categorized their UGS as fast or slow using the established 1.0 m/s cut-off point. SRH and functional dependence were assessed using commonly used questionnaires. We classified participants into four groups: fast-UGS/good-SRH, fast-UGS/poor-SRH, slow-UGS/good-SRH, and slow-UGS/poor-SRH. Using multiple logistic regression analyses and adjusting for potential confounders, we analyzed whether slow-UGS/poor-SRH had an additive effect on functional dependence. **Results:** There were 60 (8.2%) functionally-dependent participants. The crude prevalence of functional dependence were 3.8%, 7.4%, 18.7%, and 25.0% in the fast-UGS/good-SRH, fast-UGS/poor-SRH, slow-UGS/good-SRH, and slow-UGS/poor-SRH groups, respectively. Compared with the fast-UGS/good-SRH group, the adjusted odds ratios (95% confidence intervals) for functional dependence were 1.7 (0.6-4.4) in the fast-UGS/poor-SRH group, 3.2 (1.6-6.7) in the slow-UGS/good-SRH, and 4.4 (1.8-10.8) in the slow-UGS/poor-SRH group. A significant slow-UGS  $\times$  poor-SRH interaction was detected ( $P < 0.001$ ). **Conclusion:** The concomitant presence of a UGS  $< 1.0$  m/s and poor-SRH had a significant additive effect on functional dependence in older Japanese women. These two measures may capture different information in terms of functional dependence.

#### THE INFLUENCES OF COMORBIDITIES TO THE ELDERLY WITH HIP FRACTURE IN TAIWAN

Y. Huang<sup>1,2</sup>, H. Cheng<sup>1</sup>, Y.L. Shyu<sup>1</sup>, 1. *Chang-Gung University of Science and Technology, Taoyuan, Taiwan*, 2. *Chang-Gung University, Taoyuan, Taiwan*

**Objectives.** Hip fracture impacts functional abilities of the elderly with high morbidity and mortality, and comorbidities usually derogated their recovery. The aim of this study is to examine the influences of comorbidities to the recovery of elderly with hip fracture in Taiwan. **Data and Methods** The secondary data of 291 elders with hip fracture from three previous longitudinal observational studies (99, 110, 82, respectively) in Taiwan was analyzed by generalized estimating equation approach. Outcomes were measured by the Chinese Barthel Index (as activities of daily life; ADLs) and Short Form-36 Taiwan version (as quality of life; QoL). Data was examined if the comorbidities influenced the mortality, readmission rate, ADLs and QoL during the first 12 months after their discharge. **Results** After controlling the covariates, hip-fractured elders with dementia ( $N = 7$ , 2.4%), diabetes ( $N = 76$ , 26.1%) or stroke ( $N = 33$ , 11.3%) had significantly worse ADLs and QoL than those without. Elders who with cardiovascular disease ( $N = 160$ , 55%), parkinsonism ( $N = 10$ , 3.4%), renal disease ( $N = 28$ , 9.6%), liver disease ( $N = 11$ , 3.8%) or respiratory disease ( $N = 25$ , 8.6%), were slightly worse in outcomes but not significantly different. Moreover, elders with dementia had significantly higher mortality in the first three months; and elders with respiratory disease, stroke or diabetes had significantly higher readmission rates in the first three months. **Conclusions** Comorbidities negatively influenced the outcomes of elderly.

erly with hip fracture. The results could be the references for developing interventions for hip-fractured elders with comorbidities.

### **EFFECTS OF HOME-BASED PHYSICAL REHABILITATION PROGRAM ON PHYSICAL DISABILITY AFTER HIP FRACTURE**

J. Edgren<sup>1</sup>, A. Salpakoski<sup>1</sup>, T. Rantanen<sup>1</sup>, A. Heinonen<sup>2</sup>, M. Kallinen<sup>3</sup>, S. Sipilä<sup>1</sup>, *1. Gerontology Research Center, Department of Health Sciences, University of Jyväskylä, Jyväskylä, Finland, 2. Department of Health Sciences, University of Jyväskylä, Jyväskylä, Finland, 3. Department of Physical and Rehabilitation Medicine, Central Finland Central Hospital, Jyväskylä, Finland*

Only half of the hip fracture patients will regain the pre fracture level of their physical functional capacity. This secondary analysis investigated the effects of multifaceted home-based rehabilitation program on physical disability among older hip fracture patients. Population-based sample of over 60-year-old community-dwelling men and women operated for hip fracture (n=81, mean age 79 years, 78 % were women) participated in this study (ISRCTN53680197) and were randomly assigned into control (Standard Care) and intervention groups on average 6 weeks after discharged to home. The year-long intervention included modification of environmental hazards, guidance for safe walking, non-pharmacological pain management, progressive home exercise program, physical activity counseling and Standard Care. Assessment took place at baseline, and three, six and 12 months thereafter. Physical disability was assessed by a questionnaire containing 14 questions on perceived difficulty in basic (ADL) and instrumental activities of daily living (IADL). Two sum scores were composed: ADL score (range 0–6) and IADL score (range 0–8). A higher score indicated more difficulties. At the baseline the mean ADL score was 2.7(SD=1.9) in the intervention group and 2.7(2.1) in control group. Respective values for IADL were 4.1(2.5) and 3.8(2.2). After one year physical disability had reduced in both groups but the change did not differ between groups (group\*time p=0.898 for ADL and 0.764 for IADL). The intervention was equally effective for rehabilitation of ADL and IADL disabilities as the Standard Care. There is need for more sensitive disability scales to conquer the floor/ceiling effect.

### **THE ASSOCIATION OF AN AMBULATORY SYMPTOM INVENTORY WITH COMMUNITY MOBILITY IN LATE LIFE**

R.M. Allman<sup>1,2</sup>, R. Kennedy<sup>2</sup>, C.J. Brown<sup>2</sup>, R. Hearld<sup>2</sup>, Y. Yuan<sup>2</sup>, P. Sawyer<sup>2</sup>, *1. UAB Center for Aging, Birmingham/Atlanta GRECC, Birmingham, Alabama, 2. University of Alabama at Birmingham (UAB), Birmingham, Alabama*

Purpose: To develop a measure of symptoms hypothesized to impact ambulation, the Ambulatory Symptom Inventory (ASI), and evaluate the association of ASI with life-space mobility in late life. Methods: We recruited community-dwelling older adults aged 75 years and older between 2010 and 2011 for the UAB Study of Aging II. Baseline assessments included age, sex, race, symptoms, life-space mobility, and an in-home gait speed. Ten symptoms (problems with balance, lack of energy, pain, shortness of breath when walking, stiffness, tired/fatigued, swelling, tingling/burning, numbness, or weakness in legs or feet) were each associated with life-space mobility (p≤0.10) and summed to develop the ASI. Multivariate linear regression was used to evaluate the association of ASI with life-space. Results: Participants (N=404; mean (SD) age = 80.1(5.3); 57% female; 35% African American) had a mean life-space = 64.9 (24.9). The mean ASI=3.9 (2.8); mean gait speed=0.5 m/sec (0.3). The symptom prevalences ranged from 23.5% for shortness of breath with walking to 65.1% for pain. The ASI correlated with both life-space mobility and gait speed (r=-0.326 and r=-0.323, respectively, p< 0.001). ASI was significantly and independently associated

with life-space in a multivariate model adjusting for age, sex, race, and gait speed. The association of ASI with life-space was stronger with life-space <60. Conclusions: Symptoms hypothesized to impact ambulation were common among community-dwelling older adults in late life, and the ASI was significantly and independently with life-space mobility.

### **ARE WOMEN MORE AT RISK FOR FALLS RELATED TO CHRONIC MUSCULOSKELETAL PAIN THAN MEN? FINDINGS FROM THE MOBILIZE BOSTON STUDY**

S.G. Leveille<sup>1,2,3</sup>, L. Shi<sup>1</sup>, R. Jones<sup>3,4</sup>, J. Hausdorff<sup>2,3,7</sup>, R.H. Shmerling<sup>2,3</sup>, J.M. Guralnik<sup>5</sup>, J.F. Bean<sup>3,6</sup>, *1. Nursing, CNHS, Univ Mass Boston, Dorchester, Massachusetts, 2. Beth Israel Deaconess Medical Center, Boston, Massachusetts, 3. Harvard Medical School, Boston, Massachusetts, 4. Hebrew SeniorLife, Boston, Massachusetts, 5. University of Maryland, Baltimore, Maryland, 6. Spaulding Rehabilitation Hospital, Boston, Massachusetts, 7. Tel-Aviv Sourasky Medical Center, Tel-Aviv, Israel*

We previously reported that chronic pain contributes to falls in older adults. Women are more likely than men to have chronic pain and older women are also more at risk for injuries from falls. The purpose of this study is to determine whether women are more at risk for falls related to chronic musculoskeletal pain. We studied 276 men and 473 women aged >70y in the population-based MOBILIZE Boston Study. Participants returned monthly fall calendars over 18 months. Baseline visits collected information on fall risk factors, joint pain (hands/wrists, shoulders, back, hips, knees and feet), pain severity and pain interference with activities (Brief Pain Inventory). We used multivariable negative binomial models to determine rate ratios (RR) for falls in women and men; covariates included sociodemographics, fall risk factors, medications, gait speed, physical activity and chronic conditions. 45% of women and 32% of men reported pain in >1 joint sites. Women who had >1 pain sites had a nearly two-fold increased risk for falls (adj. RR=1.82, 95%CI 1.34-2.47) compared to their peers with no pain. In men, there was no increase in fall risk related to having >1 pain sites (adj. RR=1.18, 95%CI 0.73-1.91). Similar sex differences in fall risk were observed according to all pain measures (location, severity and interference with activities). In conclusion, women who have chronic pain have an increased risk for falls that is not observed in men. Greater attention to prevention and management of chronic pain especially in women could have important benefits for fall prevention.

### **ASIAN EXERCISES FOR AGING AMERICANS: ACTIVE LIFESTYLE LEADS TO ACTUALIZED LIFESPAN**

S.L. Loftus, *Neurology, Beth Israel NY, New York, New York*

Avoiding falls and maintaining activity are essential to successful aging. Qi Gong (exercise from China) and Yoga (exercise from India) have been investigated to improve postural stability/balance and decrease falls in a population aging with disability. Qi Gong is energy exercise, the cultivation of balanced energy. Yoga is an attitude toward being, an attitude adjustment for personal order. Preventing falls requires ethereal and empirical exercise experiences to ameliorate falling and fear of falling. The Berg Balance Scale, Pull Test, Fall Risk Profile, Mini-Mental State Exam and Quality of Life Scores were documented pre and post intervention with Asian exercises. Pre and post results were compared in this 55 year old and older population, with progressive disability. Initial findings indicate Qi Gong is beneficial for compensating to environmental perturbations while Yoga may be less so. Statistical analysis suggests clinical usefulness of Qi Gong, while further study of Yoga is recommended.

## DISABILITY AND MOBILITY 2

## SYNCOPE IN YOUTH AS A MODERATOR OF THE RELATIONSHIPS BETWEEN RECENT SYNCOPE AND HEALTH OUTCOMES

B. King-Kallimanis<sup>1</sup>, R.R. Romero-Ortuno<sup>2</sup>, D. O'Shea<sup>3</sup>, R. Kenny<sup>1,2</sup>, 1. *The Irish Longitudinal Study on Ageing, Trinity College Dublin, Dublin, Ireland*, 2. *St James Hospital, Dublin, Ireland*, 3. *St Vincent's University Hospital, Dublin, Ireland*

Syncope is a common condition which peaks in prevalence during mid-teenage years, with another peak around the age of 65. Vasovagal syncope is considered a benign condition with respect to mortality; however, less is known about the effect of vasovagal syncope on other health outcomes. The main purpose of this study was to examine whether syncope in youth affects the relationship between recent syncope and health outcomes including quality-of-life (QoL), depression, anxiety, fear of falling, self-reported health and disabilities. Data are from a population based sample (the Irish Longitudinal Study on Ageing) of community dwelling adults aged 50 and older (N=5,654). Participants were asked whether they had ever fainted, and those who had were asked to recall whether they had fainted in their youth and to report the number of faints in the past 12 months. The results suggested that syncope in youth moderated the relationships between recent syncope and QoL, depression, anxiety, fear of falling, self-reported health and activities of daily living. Participants who had fainted in youth, and fainted multiple times recently did not report significantly worse depression than participants who had never fainted. However, those who did not faint in youth, and had fainted multiple times recently and those who had fainted in youth and had only one faint recently had significantly worse depression. These results suggest that the effects of life time syncope may not be benign. When designing interventions to improve health outcomes, syncope history and number of recent faints need to be considered.

## TRANSPORTATION OPTION USE AMONG OLDER ACTIVE DRIVERS

R. Marottoli<sup>1,2</sup>, K. Araujo<sup>1</sup>, P. Peduzzi<sup>1</sup>, 1. *Internal Medicine, Yale University School of Medicine, New Haven, Connecticut*, 2. *VA Connecticut, West Haven, Connecticut*

Background: Much of the focus on transportation option use has been among people who no longer drive. However, the use of these options by active drivers is less well known. Methods: Participants were active drivers age 70 years and older recruited from medical clinics and community sources who were followed prospectively for two years. Participants were contacted every six months with questions on driving status and use of transportation options, including option type and frequency. Results: The 615 drivers had a mean age of 78.8 (SD=4.9) years, 12% were women, mean MMSE score was 27.4 (±2.1) points, drove an average of 129.2 (± 108.6) miles per week, and 72% drove daily. Over the course of two years of follow-up, 96% used some form of transportation besides driving. The most common types were: car passenger 95%, plane 43%, train 31%, bus 26%, limousine 13%, and taxi 13%. The most common providers of these services were transportation companies, spouse, children, and friends. Conclusion: In a high functioning cohort of older active drivers followed prospectively for 2 years, use of transportations option other than driving was common with a wide array of choices reflecting a variety of trip purposes, including distant travel. While driving remains the primary mode of transportation, many older drivers use other means to provide out-of-home mobility.

## A STIFF PRICE TO PAY: DOES JOINT STIFFNESS PREDICT DISABILITY IN AN OLDER POPULATION?

M. Thakral<sup>1</sup>, L. Shi<sup>1</sup>, R.H. Shmerling<sup>2,3</sup>, J.F. Bean<sup>2,4</sup>, S.G. Leveille<sup>1,2,3</sup>, 1. *College of Nursing and Health Sciences, University of MA, Boston, Boston, Massachusetts*, 2. *Harvard Medical School, Boston, Massachusetts*, 3. *Beth Israel Deaconess Medical Center, Boston, Massachusetts*, 4. *Spaulding Rehabilitation Hospital, Boston, Massachusetts*

The purpose of this study is to determine whether joint stiffness contributes to incident or worsening disability in community-living older adults. In the population-based MOBILIZE Boston Study, 681 persons aged ≥70 years were assessed at baseline and 18 months for joint stiffness, physical function, and a number of health measures. Morning joint stiffness (on most days in the past month) in the arms, back, hips and knees was categorized according to no sites, 1 site, and 2 or more sites. Self-reported mobility difficulty was defined as difficulty walking ¼ mile or climbing stairs without assistance. Multivariable Poisson regression was used to determine the relationship between baseline stiffness and development of mobility difficulty at 18 months. Joint stiffness in 1 site was reported by 26% of participants, and ≥2 sites, by 27% at baseline. Factors associated with stiffness at baseline included obesity, low income, female gender, mobility aids, depression, peripheral arterial disease, spinal stenosis or disc disease, and pain severity. Multisite stiffness predicted onset of mobility difficulty among those without mobility difficulty initially (for ≥2 sites, adj.RR=1.86, CI 1.05-3.28). After further adjustment for pain severity, neither stiffness nor pain was associated with incident difficulty, and there was no significant interaction between stiffness and pain. Among those who had mild difficulty at baseline, stiffness was not associated with worsening mobility at 18 months. These findings suggest that multisite stiffness is an important health indicator. Further research is needed to understand the influence of stiffness and pain on risk for disability in older adults.

## SESSION 720 (POSTER)

## EDUCATION AND EVALUATION

## VENOUS THROMBOEMBOLISM KNOWLEDGE AND SATISFACTION OF OLDER HIP FRACTURE PATIENTS AND CAREGIVERS

J. Lee<sup>1</sup>, D. Drake<sup>2,1</sup>, J. Donaldson<sup>2</sup>, V. Kennedy<sup>1</sup>, 1. *Nursing Science, University of California Irvine, Irvine, California*, 2. *Mission Hospital, Mission Viejo, California*

Background: The risk of venous thromboembolism (VTE) is highest in older adult patients undergoing hip fracture surgery. These patients are expected to receive extended VTE prophylaxis using anticoagulants after hospital discharge. The purpose of the study was to identify older adult patients and family caregivers' knowledge of VTE prevention and satisfaction with education on anticoagulation during hospitalization. Methods: We conducted surveys on older adult hip-fractured patients (≥65 years) and their family caregivers immediately before discharge from a community hospital over one year. Results: A total of 24 patients and 15 caregivers participated in the study. The VTE knowledge score was 62.1% for patients and 64.8% for caregivers. The satisfaction with care and education was 3.6 out of 5 among patients and 3.5 out of 5 among caregivers. Both patients and family caregivers reported that they need to know more about the medication (e.g. anticoagulants) and the side effects. Overall satisfaction among patients/caregivers who scored 80% or higher on VTE risk factor questions was significantly higher than among those who scored lower than 80% (p<0.05). Most hip-fractured patients (73%) reported being discharged to a skilled nursing home for rehabilitation. Conclusions/Implications: The results of the study show that hip-fractured older adult patients and family caregivers needed more education about the prevention of VTE in the transition period. Focused discharge education including during transition

from acute care to home or long-term care should be considered in the development of a hip fracture program for older adults.

### **MULTIPLE TEACHING METHODS ACTIVATE GERIATRICS TEACHERS' & FAMILY MEDICINE RESIDENTS' LEARNING**

D.L. Brown, S. Denson, K. Denson, D. Lillich, D. Simpson, Y. Thaker, E.H. Duthie, *Educational Services, Medical College of Wisconsin, Milwaukee, Wisconsin*

Background Medical education and residency programs face two major paradigm shifts: the transition to "active learning" consistent with lifelong learning per health care professions accreditation standards, and changing faculty behavior to provide this instruction based on science of learning principles. Methods Academic half-day sessions for Family Medicine residents (n=59) or "Coordinated/Core Units in Residency Education" (CURE) build evidence-based clinical skills within a classroom environment. In 2011-12 CURE curricula combined geriatrics with patient-centered medical home (PCMH). A multi-disciplinary collaborative (e.g., MD, PhD, MSW, trainees) labeled Geriatrics Education Team (GET) designed the curriculum. Session #1 was lecture-dominated resulting in disheartening results for GET members regarding overall learning (5.4) despite strong overall effectiveness of teachers (6.1) [Likert scale 7=Excellent to 1=Poor]. Review of results generated opportunity to activate teachers to use teaching methods associated with deep and sustained learning in subsequent sessions (e.g., functional assessment, housing, palliative care, dementia). New teaching methods were incorporated with coaching from educational experts. Results Teaching methods included standardized patients, vision impaired glasses, activities using assistive devices, role plays, video triggers and team quizzes. Teaching sessions resulted in increased overall learning (5.9) while retaining overall teaching effectiveness (6.1). Research tells us that immediately after a change in behavior performance ratings decline, adjust and then peak once again. Results here immediately increased and/or remained constant. Conclusion Use of disheartening baseline resident evaluation data can be used to change Geriatrics teachers' behaviors resulting in use of methods associated with activating deep learning while retaining overall teaching effectiveness ratings.

### **EFFECT OF A 1-WEEK REQUIRED CLINICAL ROTATION IN GERIATRIC MEDICINE ON MEDICAL STUDENTS' ATTITUDE**

K.L. Young<sup>1</sup>, J.A. Larson<sup>1</sup>, S.K. Ostwald<sup>2</sup>, K. Murphy<sup>2</sup>, C. Dyer<sup>1</sup>, 1. *Internal Medicine, Division of Geriatric and Palliative Medicine, UT Health-Medical School, Houston, Texas, 2. UT Health-School of Nursing, Houston, Texas*

Background: The U.S. Census Bureau asserts that during the period from 2010 to 2020, there will be rapid increases in the elderly population due to the aging of the Baby Boom Population. With this increase, it is important that medical students complete geriatric rotations. Existing research demonstrates that attitudes and stereotypes held by students can influence educational and clinical outcomes. The purpose of this study is to assess the impact of a 1-week required clinical rotation on third-year medical students' attitudes towards older adults. Methods: A pre-post design was used in which 520 third-year medical students completed the UCLA Geriatric Attitudes Scale as part of a geriatrics rotation at the University of Texas Houston Medical School through the D.W. Reynolds Foundation. Key components of the clerkship included orientation, a vignette, journaling, one-on-one training and observed learning. Results: Descriptive statistics and a paired T-test procedure were performed. Results indicate significant positive effects on students' attitude from pre(M=3.467, SD=0.384) to post test (M=3.501, SD=0.435). The paired t test demonstrated significantly more positive attitudes on the posttest t(321)= -2.330, p<0.021. Conclusion: Medical students had improved, more positive attitudes regarding the

elderly patient. An intense 1-week clerkship can provide enough learning to alter attitudes and influence care.

### **INTEGRATING GERONTOLOGY IN A NURSING FUNDAMENTALS CURRICULUM**

D. Mize, C. Hagen, *Nursing, George Fox University, Newberg, Oregon*

New nurses will care for older adults more than any other patient population. Curriculum in pre-licensure nursing education does not always provide a clear synthesis of gerontological content related to topics of basic care and comfort for older adults. The primary purpose of this study was to examine whether the intentional integration of gerontological topics into the foundational nursing courses would impact assessment of the student's basic mastery of the fundamental principles for nursing practice. A descriptive approach included the comparison of standardized testing results from a 60-item RN Fundamentals proctored assessment that measuring concepts of foundations of practice, basic nursing care, support of psychosocial needs, support of physiological needs, and health assessment) between two groups of nursing students. One group completed their first semester nursing courses designed with basic foundational concepts of nursing in the curriculum. Another group completed their first semester nursing courses with integrated gerontological nursing content into the same first semester nursing courses. The competencies are aligned with the Recommended Baccalaureate Competencies and Curricular Guidelines for the Nursing care of Older Adults (AACN, 2010) and QSEN - Quality & Safety Education for Nurses (2007). Students completing integrated gerontological nursing content (N=39) scored significantly higher on the RN Fundamentals assessment than students completing basic foundational concepts (N=38) at p<. 01. For the subcategory of basic care and comfort, students completing integrated gerontological nursing content scored significantly higher on 14 test questions at p<. 01. The findings suggest intentionally integrating gerontological nursing content improves mastery of fundamental principles.

### **A TOOL FOR AUDIT OF HOSPITAL CHARTING OF FUNCTIONAL AND COGNITIVE STATUS BY YEAR 4 (Y4) MEDICAL STUDENTS-A PILOT STUDY**

J.E. Agens<sup>1</sup>, J.S. Appelbaum<sup>3</sup>, S. Baker<sup>1</sup>, K. Brummel-Smith<sup>1</sup>, E. Friedman<sup>4</sup>, M.A. Kutner<sup>1</sup>, S.L. Harrison<sup>2</sup>, 1. *Geriatrics, Florida State University College of Medicine, Tallahassee, Florida, 2. Florida State University College of Medicine Department of Family Medicine and Rural Health, Tallahassee, Florida, 3. Florida State University College of Medicine Department of Clinical Sciences, Tallahassee, Florida, 4. Florida State University, Tallahassee, Florida*

Background and Methods: At Florida State University College of Medicine, fourth year medical students (Y4) demonstrate competency in functional and cognitive assessment of patients in the required Primary Care Geriatrics Clerkship (PCG) using shadow chart written exercises and case presentations. We found little on clinical hospital charting outcomes in geriatric patients in the medical student education literature. We wished to measure charting of cognitive (level of consciousness, cognition) and functional (ADL and IADL) assessment on Y4 required rotations that occur both before and after PCG. We designed a tool to abstract charts targeting any mention of functional or cognitive evaluation. Subjects were consenting students on other required Y4 clerkships. Trained assistants have abstracted, on average, five charts per student in patients over 65 years old. The chart tool has questions asking if there was any functional or cognitive evaluation and examples to circle as well as the source(s). Only students who have not yet had PCG have had chart abstracting at the time of this abstract. Results: 30% of the charts were scored by both assistants yielding concurrence on 85%. Six percent of the charts had no mention of cognitive evaluation by the student. Most (90%) had some mention of cognitive status by both the student and others writing in the chart. Frequently (52%), these were just cursory statements like 'alert and oriented X3' (40%).

Many charts (47%) made no mention of functional evaluation. Conclusion: Baseline charting performance was low for Y4 students. This indicates need for the PCG clerkship.

### **PREVENTING FALLS: AN EDUCATIONAL WORKSHOP TAUGHT BY GERIATRIC FELLOWS**

J. Culbertson<sup>1</sup>, S. Ahmed<sup>1</sup>, K. Agarwal<sup>1</sup>, Z. Tan<sup>2</sup>, L. Granville<sup>3</sup>, H. Atkinson<sup>4</sup>,  
1. *Baylor College of Medicine, Houston, Texas*, 2. *University of California at Los Angeles, Los Angeles, California*, 3. *Florida State University, Tallahassee, Florida*, 4. *Wake Forest University, Winston-Salem, North Carolina*

Medical students often receive didactic material in lecture form despite recent emphasis on a competency-based curriculum. Additionally, the training of Geriatric Fellows requires curricular elements related to teaching and interaction with learners in an academic setting. Medical students assigned to the Core Internal Medicine Clerkship were randomized into groups based on clerkship site. The experimental group participated in an interactive, competency-based falls workshop taught by geriatrics fellows, designed to give students a hands-on experience in the assessment and interventions of falls. Control students attended a lecture by a faculty teacher based on identical goals and objectives. Both groups completed a knowledge and attitudes assessment survey immediately after the 50-minute workshop or lecture, and then again during the tenth week of the Core Clerkship. Workshop participants (n=15) self-reported knowledge of the components of the falls assessment, ability to administer a Get-Up-and-Go Test, and confidence in their ability to describe the components of gait disorders was increased to a greater extent than in students receiving the control lecture (n=13). Students rated the impact of the workshop highly, and subjective comments suggest that students enjoyed the interaction with Geriatric Fellows. The workshop group were more likely to report that they used a falls assessment during their clinical clerkship. When measured by objective testing, workshop students demonstrated greater knowledge retention at 10-weeks compared with students who received a standard lecture. Geriatric Fellows reported positive experiences and increased confidence in teaching in the small group setting.

### **THE AZ-GEC GOES INTERPROFESSIONAL: OUR FRAMEWORK, STRATEGIES & CHALLENGES**

J. Mohler<sup>1</sup>, K. D'Huyvetter<sup>1</sup>, L. O'Neill<sup>1</sup>, J.K. Lee<sup>2</sup>, T. Kennedy<sup>3</sup>, C. Keller<sup>4</sup>, C. Howe<sup>1</sup>, M. Fain<sup>1</sup>,  
1. *University of Arizona, Arizona Center on Aging, Tucson, Arizona*, 2. *University of Arizona College of Pharmacy, Tucson, Arizona*, 3. *Arizona State University School of Social Work, Phoenix, Arizona*, 4. *Arizona State University Harford Center of Geriatric Nursing Excellence and the Center for Healthy Outcomes in Aging, Comprehensive Geriatric Nursing Education Center, Phoenix, Arizona*

Background/Rationale: The Arizona Geriatric Education Center (AZ-GEC) is a HRSA-funded statewide consortium, providing geriatric education and training since 2007. HRSA recently mandated that all newly funded GECs (2010) adopt interprofessional (IP) models of education, training, and clinical care. Objectives: We sought to systematically "inter-professionalize" Arizona GEC faculty and projects, using a collaborative team process involving a faculty core consisting of pharmacists, nurses, public health professionals, physicians, naturopaths, gerontologists, social workers, and health informationist and communication experts. Methods: Explicit and deliberate faculty communication and team building processes and IP didactic content expertise were developed. We built a cohesive faculty, who could then integrate both IP methods and geriatric content. Working together we: 1) Developed curricula and educational products; 2) Coordinated and planned practical experiences; and 3) Team taught IP health trainees and practitioners to provide quality geriatric care. Additionally, an IP Advisory Board was formed to engage and disseminate AZ-GEC programs and products throughout the communities statewide. Conclusions: Collaboratively,

our AZ-GEC faculty has overcome barriers to teamwork; integrated professional roles and responsibilities. Because we are committed to building IP clinical training sites that incorporate innovative models of team-based geriatric care, we have developed a new: Acute Care of Elders (ACE) Unit, Primary Care at Home Program, Geriatric ED Unit, and a Gero-Ortho Hip Fracture service. Our new IP editorial board reviews all AZ-GEC products, including our statewide Arizona Geriatrics Society Journal. Since 2010 our IP AZ-GEC faculty team has successfully provided IP geriatric education to over 4200 learners across our state.

### **USE OF A CLINICAL VIGNETTE TO BRIDGE EXPERIENTIAL DIFFERENCES ON A GERIATRIC AND PALLIATIVE CLINICAL ROTATION**

J.A. Larson, K.L. Young, S. Pearce, G. Varas, S.K. Ostwald, K. Murphy, C. Dyer, *The University of Texas Health Science Center at Houston (UTHealth), Houston, Texas*

Background: In 2009, a geriatric and palliative clinical rotation was established at The University of Texas Health Science Center at Houston Medical School through the D.W. Reynolds Foundation. The rotation's clinical sites include outpatient geriatric clinics, inpatient geriatric care through an ACE unit, inpatient palliative care, geriatric house calls and palliative house calls. Focus group data suggested the need to standardize the rotation experience across sites. To accomplish this goal, a clinical vignette originally developed by Amy L Holthouser, MD was revised with permission. The revised version contains both geriatric and palliative core principles. Methods: During 2010, the standardized clinical vignette was introduced into the clerkship. A brief vignette quiz was developed to assess the impact of the vignette on students' knowledge of core geriatric and palliative principles. A total of 150 third year students completed the vignette quiz. A simple pretest-posttest design was used. Results: A dependent T-test procedure was performed. Results indicate significant improvement on students' score from pre to post  $t(149) = (-10.98, p < .0001)$ . Conclusion: The vignette quiz demonstrated significant improvement from pre to post. The progressive clinical vignette is an valuable component that can assist standardizing a mixed geriatric and palliative rotation ensuring all students receive core principles regardless of site location.

### **INNOVATIVE INTERACTIVE GERIATRIC CURRICULUM IN FAMILY MEDICINE**

J. Kuester, S. Denson, N. Havas, K. Denson, E.H. Duthie, D. Lillich, D.L. Brown, *Medicine, Medical College of Wisconsin, Milwaukee, Wisconsin*

Background: Increasingly integrated geriatrics healthcare delivery requires proficiency in a multidisciplinary team approach not normally stressed in physician training. To meet this urgent need, MCW's Family and Community Medicine Residency Program sought to design a new geriatrics curriculum aligned with key Patient Centered Medical Home (PCMH) principles. However, specialty specific teachers often lack depth of expertise in geriatrics and/or education. To bridge these curriculum design gaps we formed a multidisciplinary Geriatric Education Team (GET) and sought to identify key parameters that support team-based curriculum design. Methods: Multidisciplinary GET curriculum design members were selected to provide complementary expertise areas: Geriatricians, Family Medicine teachers, social workers, medical educators, and trainees. GET members met monthly to identify topics based on curricular and practice deficits identified by the Family Medicine faculty and residents with Geriatricians, nursing, social work providing content expertise and cross-discipline training in integrated healthcare. Results: GET members identified key features associated with design success including ability to: designate leaders; respect/value each member's unique expertise; bridge discipline specific language gaps; maintain focus on trainee audience and their role (family medicine residents); take educational risks. 36 residents completed a 15 hour Geriatrics/PCMH curriculum during AY 2011-12, uti-

lizing interactive modalities including standardized patients, role playing, and small group discussions. Learner ratings showed that core educational competencies were met (average 3.37 on 4 point scale, 4=strongly agree) and that session quality was high, averaging 6.1 (7 point Likert, 7=excellent). Conclusions: A multidisciplinary GET approach yields a tailored, active, and integrative curriculum with high learner satisfaction.

#### **AN INNOVATIVE APPROACH TO TEACHING HEALTH LITERACY USING STANDARDIZED PATIENTS**

C.L. Clarke<sup>1</sup>, S.G. Lowman<sup>3</sup>, D.A. DeWalt<sup>2</sup>, J. Busby-Whitehead<sup>1</sup>, E. Roberts<sup>1</sup>, 1. *University of North Carolina Division of Geriatrics Center for Aging and Health/Carolina Geriatric Education Center, Chapel Hill, North Carolina*, 2. *University of North Carolina Internal Medicine and Epidemiology, Chapel Hill, North Carolina*, 3. *Duke University Center for Palliative Care, Durham, North Carolina*

**BACKGROUND:** Research documents older adults as especially vulnerable to low health literacy leading to poor health outcomes. Authentic training can ameliorate low literacy and improve quality of care. **PURPOSE:** To develop an interactive health literacy curriculum for interdisciplinary teams of health professionals using standardized patients. **METHODS:** The Teach Back method addresses low health literacy by limiting patient education to 3 salient points at most. The patient must then teach-back, or repeat to demonstrate understanding. Physicians, nurses, physical therapists, and pharmacists practiced Teach Back in a 6-hour session during the Faculty Development Program in Health Literacy, Practice Improvement and Aging program. Background on the Teach Back method included video demonstrations, and research evidence showing the correlation between low health literacy and poor outcomes. Small groups of Learners were videotaped as rotating through three case scenarios. Specially trained older adult volunteer actors (Standardized Patients) demonstrated incomplete understanding during the encounter prompting Teach Back. Learners received feedback from Health Literacy experts, classmates and the standardized patient. **OUTCOMES:** Pre-test post-test analysis showed growth in Learners' knowledge and application of health literacy concepts. Learners acquired new assessment and intervention strategies. These skills will be applied in clinical and teaching encounters as well as being used as a means to systemic practice improvement. **CONCLUSION:** This curriculum provides a fully interactive learning environment wherein standardized patients simulate clinical encounters to teach faculty learners about health literacy, in particular, the "Teach Back" method. These sessions may be replicated in other settings and with other disciplines.

#### **COMPARISON OF MODELS FOR INTERPROFESSIONAL EDUCATION (IPE) IN GERIATRICS**

G.A. Hudgins, *Pharmacy Practice, University of Montana, Missoula, Montana*

Upon the recommendation of the Institute of Medicine and many other organizations, interprofessional education (IPE) is a goal for health professions educators in all disciplines. Many educational accrediting agencies are now requiring activity in this area. Perhaps more easily accomplished in some environments than others, those programs located in largely rural areas without an academic medical center have more difficulty in achieving IPE for their students. With the support of the Montana Geriatric Education Center at the University of Montana, interdisciplinary student training around the activity of geriatric health screening is providing IPE opportunities for pharmacy, nursing, medicine, physical therapy, social work, speech pathology, and audiology students from four individual academic institutions in Montana. In a typical year, approximately 40 pharmacy students, 20 nursing students, 10 social work students, and smaller numbers of students from other disciplines are involved in over 50 screening events throughout the state. Under faculty supervision, teams of students work together to provide a variety of screenings for older individuals in rural communities, including

counseling on the results of the tests and follow up of abnormal results. Since each discipline utilizes a different format and schedule for clinical training, no one approach to IPE works for all the disciplines involved. Various approaches utilized by pharmacy, two different nursing programs, physical therapy, and social work will be described and compared. Evaluation results from surveys of faculty and students will be included.

### **SESSION 725 (POSTER)**

#### **ENDOCRINOLOGY AND METABOLISM**

##### **EXPECTED LIFE-YEARS SAVED BY PREVENTING END-STAGE RENAL DISEASE IN THE ELDERLY WITH DIABETES**

D. Yang<sup>1,2</sup>, L. Lee<sup>3,4</sup>, C. Hsu<sup>5</sup>, Y. Chang<sup>3</sup>, M. Wang<sup>6</sup>, W. Lin<sup>6,7</sup>, C. Chang<sup>1,2</sup>, J. Wang<sup>4,6,8</sup>, 1. *Division of Geriatrics and Gerontology, Department of Internal Medicine, National Cheng Kung University Hospital, College of Medicine, National Cheng Kung University, Tainan, Taiwan*, 2. *Institute of Gerontology, College of Medicine, National Cheng Kung University, Tainan, Taiwan*, 3. *Division of Environmental Health and Occupational Medicine, National Health Research Institutes, Zhunan, Taiwan*, 4. *Institute of Occupational Medicine and Industrial Hygiene, College of Public Health, National Taiwan University, Taipei, Taiwan*, 5. *Institute of Population Health Sciences, National Health Research Institutes, Zhunan, Taiwan*, 6. *Department of Internal Medicine, National Cheng Kung University Hospital, College of Medicine, National Cheng Kung University, Tainan, Taiwan*, 7. *Institute of Clinical Medicine, College of Medicine, National Cheng Kung University, Tainan, Taiwan*, 8. *Department of Public Health, College of Medicine, National Cheng Kung University, Tainan, Taiwan*

**BACKGROUND-** The incidence and prevalence of diabetes in the elderly keep increasing, and diabetes-related complications contributed to high morbidity and mortality. We estimated the expected life-years (LY) saved from successful prevention of end-stage renal disease (ESRD) in the elderly with diabetes. **METHODS-** We used the National Health Insurance Research Database to conduct a population-based cohort study in Taiwan. We identified all new ESRD cases aged over 65 receiving maintenance hemodialysis (N=24,243) from the registry files of catastrophic illnesses from July 1, 1997 to December 31, 2005. We then retrospectively searched the database if there was a diagnosis of diabetes in these new cases. Incidence rates and cumulative incidence rates of ESRD were calculated. After excluding cases with malignancy (N=3,423), we followed the survival of new cases through the end of 2006. The survival function for an age- and sex-matched reference population was generated using the Monte Carlo method from the life table of the general population. We further estimated the expected LY saved from successful prevention of ESRD in the elderly with diabetes. **RESULTS-** The cumulative incidence rates of requiring hemodialysis were 0.078 and 0.099 for the elderly males and females with diabetes, respectively. There were 5,430.1 LY and 10,177 LY could be saved by successful prevention of ESRD in the elderly males and females with diabetes in a year, respectively. **CONCLUSIONS-** The LY saved by successful prevention of ESRD in the elderly with diabetes in a year are substantial and deserve special attention, especially in the elderly females.

## THE ASSOCIATION BETWEEN BODY COMPOSITION AND 24-HOUR GLUCOSE RHYTHMS IN AN AGING POPULATION WITHOUT DIABETES

C. Wijsman<sup>1</sup>, A.J. de Craen<sup>1</sup>, R. Westendorp<sup>1</sup>, F. Van der Ouderaa<sup>1</sup>, E. Verhagen<sup>2</sup>, S. Mooijaart<sup>1</sup>, *1. Leiden University Medical Center, Leiden, Netherlands, 2. VU Medical Center, Amsterdam, Netherlands*

**Background.** The metabolic consequences of sedentary lifestyle are increased body weight, metabolic syndrome and increased prevalence of diabetes. Increasing age is associated with higher blood glucose levels and glucose variability. We now are performing a randomized controlled trial to study the effects of a lifestyle intervention on physical activity and metabolic health in sedentary older adults without diabetes. **Methods.** From this ongoing trial, we report baseline characteristics of 190 participants. We have studied the association between body composition and parameters of 24-hour glucose rhythms obtained by continuous glucose monitoring. **Results.** Sixty percent of participants was male. Mean age of participants was  $64.9 \pm 2.8$  years. Mean body mass index was  $29.2 \pm 3.5$  kg/m<sup>2</sup> in males, and  $28.7 \pm 5.0$  kg/m<sup>2</sup> in females. Mean capillary fasting glucose levels were  $5.6 \pm 0.8$  mmol/L in males, and  $5.0 \pm 0.6$  mmol/L in females. Overall mean glucose levels were higher in males than females (mean + standard error:  $5.7 \pm 0.06$  vs  $5.3 \pm 0.06$  mmol/L,  $p < 0.001$ ), as were all other measures of continuous glucose monitoring (all  $p < 0.05$ ). Body mass index, waist circumference and fat percentage were highly significantly associated with overall mean glucose levels, both diurnal and nocturnal (all  $p < 0.05$ ), but less outspoken with parameters of glucose variability. **Conclusions.** In these preliminary data in older sedentary adults without diabetes, body composition is strongly associated with parameters of 24-hour glucose rhythms.

## SESSION 730 (POSTER)

### EPIDEMIOLOGY

#### PREDICTORS OF AGE AT ONSET OF DEMENTIA AMONG OLDEST OLD AMERICANS

R. Basu, *Scott & White Healthcare, Temple, Texas*

**Background:** Trajectory of Alzheimer's disease in the U.S. population imposes a substantial burden on the country's health care system. The primary objective of this study is to examine socioeconomic and lifestyle related factors across lifespan on the age at onset of dementia, including Alzheimer's disease (AD) in the U.S. population. **Method:** The Aging Demographics and Memory Study (ADAMS) data were used to examine factors associated with the age of onset of AD and other dementia. The ADAMS is a cross-sectional supplemental sample of individuals age 70 or older selected from the Health and Retirement Study. The age at onset of dementia was estimated if respondents meet DSM criteria based on review of the chronological history of cognitive and functional symptoms. A list of lifestyle, socioeconomic, and health related factors including birth year, education, physical exercise, and childhood socioeconomic status was regressed on the outcome variable of onset age of dementia. **Results:** An earlier year of birth, being women, having stroke, and Apolipoprotein-E4 gene were associated with lower onset age, while regular exercise, being Hispanic have positive impact on delaying the age of onset. Low paternal education had a significant impact on the earlier age of dementia onset. **Conclusion:** Modifiable lifestyle factors can delay the onset of dementia, however, Americans with less educated fathers have the lower age of onset. Public health impact of delaying the onset is tremendous as it would lower the prevalence rate and consequently social and economic burdens of the disease

#### IMPACT OF CAREGIVING TRANSITIONS ON PERCEIVED STRESS IN 990 OLDER WOMEN IN CAREGIVER-SOF

J. Lyons<sup>1</sup>, K. Ensrud<sup>2</sup>, T.A. Hillier<sup>3</sup>, L. Fredman<sup>1</sup>, *1. Epidemiology, Boston Univ, Boston, Massachusetts, 2. University of Minnesota, Minneapolis, Minnesota, 3. Kaiser Permanente Center for Health Research, Portland, Oregon*

While caregiving can be stressful and can vary in intensity over time, the relationship between transitions in caregiving intensity and stress remains unclear. We evaluated the effect of transitions into and out of caregiving, and between caregiving intensity levels, on Perceived Stress Scale (PSS) scores following the transition among 990 women from the Caregiver-Study of Osteoporotic Fractures who participated in up to five interviews over nine years. Caregivers were defined as those who assisted someone with one or more basic or instrumental activities of daily living (ADL/IADLs). Caregivers were categorized as high- or low-intensity based on the sample-based median number of ADL/IADL tasks caregivers provided (1 and 4, respectively). Analyses were performed on participants with data on caregiving and PSS at two consecutive interviews, resulting in a total of 2673 transitions. At baseline, participants were aged 81.2 years (sd=3.7), 66% were non-caregivers, 17% were high-intensity caregivers, and 17% were low-intensity caregivers. Among participants whose caregiving intensity level remained constant over two interviews, high-intensity caregivers reported the highest stress, adjusted for confounders (m=19.06, sd=0.50), followed by low-intensity caregivers (m=16.83, sd=0.56) and non-caregivers (m=15.80, sd=0.21) ( $p < 0.01$ ). Those who ceased caregiving reported similar stress levels as continuous non-caregivers, except for non-caregivers who provided care for a brief period during the interval ( $p = 0.06$ ). Non-caregivers who transitioned into either high- or low-intensity caregiving reported similar stress levels as each continuous caregiving group, respectively. Results suggest that caregiving intensity, rather than caregiving itself, influences caregivers' stress level and that high stress persists among high-intensity caregivers.

#### ASSOCIATION OF SUBCLINICAL CEREBROVASCULAR DISEASE WITH RATE OF DECLINE IN GAIT PERFORMANCE

S. Wu<sup>1</sup>, C. Hirsch<sup>1</sup>, B. Durbin-Johnson<sup>1</sup>, P. Buzkova<sup>3</sup>, K. Patel<sup>2</sup>, J. Xia<sup>1</sup>, *1. Internal Medicine, University of California Davis Health System, Sacramento, California, 2. National Institute on Aging, Bethesda, Maryland, 3. University of Washington, Seattle, Washington*

**Background:** Data from the Cardiovascular Health Study (CHS), a population-based cohort study of persons  $\geq$  age 65, have shown that faster rate of decline in gait performance predicts higher risk of mortality and disability. Little is known about how age-related factors contribute to the rate of decline in gait performance. **Methods:** Using data from the CHS, subjects without a history of stroke comprised a primary analysis population of 3038 subjects (mean age 74). We used sequential directed acyclic graphs and multivariable analyses to examine the independent contributions of subclinical cardiovascular disease (SCVD), CVD risk factors, and other subject characteristics to the rate of decline in gait speed and stride length assessed over 6 years. Scores on the Digit Symbol Substitution test (DSST), which have been correlated with cerebral white matter ischemia, were included as a proxy for subclinical cerebrovascular disease. Subset analyses were conducted on 1579 subjects with data on MRI white matter grade (WMG), and compared to results using the DSST. **Results:** In addition to age, sex, and baseline gait performance, DSST and composite SCVD were independently associated in the expected directions with the rate of decline of gait speed and stride length ( $p < 0.001$  and  $p = 0.029$  respectively). In subset analyses, substituting WMG for DSST yielded similar results ( $p < 0.001$ ). **Conclusion:** Subclinical cerebrovascular disease is associated with performance decline in gait speed and stride length in older persons.

## **SABE STUDY: HEALTH, WELLNESS AND AGING. COMPARATIVE STUDY OF JALISCO AND COLIMA STATE, MEXICO**

E. Arlas-Merino, J. Cueva Contreras, N.M. Mendoza-Ruvalcaba, M.J. Arias-Merino, R. Meda Lara, G. Martinez Saldaña, *Salud Pública, Universidad de Guadalajara, Zapopan, Jalisco, Mexico*

**Introduction:** In Mexico for meeting the challenges of aging on health SABE Study is proposed as an interinstitutional project by PHAO and the Federal Ministry of Health. The SABE Study was carried on in Colima through the CASOENAC project sponsored by FONCICYT-92076, and in Jalisco through the funding of COETCYJAL-University of Guadalajara, Jalisco Health Secretariat COESAEN. The following analysis compares data from Jalisco and Colima, both located at western in Mexico. **Methods:** Both were cross-sectional studies, participants: n=1562 in Jalisco n=1222 in Colima, community-dwelling elders 60 and older. Using SABE-survey data were analyzed: socio-demographic characteristics, cognitive and physical function, depression, chronic diseases, nutritional status, and access to health services. Data were captured simultaneously by using minicomputers. Analysis was performed on SPSS program. **Results:** Data compares Jalisco/Colima states. Mean ages were 72.5±8.41/72.1±8.52, women 63.7%/62%, for both 16.3% were illiterate. Living alone 11.5%/15.2% (p=0.000). Most (93.5% / 94.3%) have been married in his life, were married only 56.8% /61.1% (p=0.009). Most were Catholic (94.4%/92.5%). Cognitive impairment was found in 16.5%/17.5% and depression symptoms 25%/28.3%. The perception of health was good to excellent in 36.9%/32.7%. The most frequent diseases were: hypertension 51.2%/49.2%, diabetes mellitus 27.6%/28.3%, and arthritis 20.1%/17.2%. It was found urinary incontinence in 22.0%/20.6%, during the last year 35.0% has suffered falls. **Conclusion** Data from the two States are very similar in both socio-demographic as health, except for living alone and marital status. The results show health problems that represent several challenges at health services and, family and personal care.

## **THE RELATIONSHIP BETWEEN PROTON PUMP INHIBITOR ADHERENCE AND FRACTURE RISK IN THE ELDERLY**

J. Ding<sup>1</sup>, D.A. Heller<sup>1,2</sup>, F. Ahern<sup>2</sup>, T. Brown<sup>3</sup>, *1. Magellan Health Services, Harrisburg, Pennsylvania, 2. Penn State University, University Park, Pennsylvania, 3. Pennsylvania Department of Aging, Harrisburg, Pennsylvania*

Results of several recent studies suggest that long-term use of proton pump inhibitors (PPIs) may be associated with an increased risk of fracture. However, no prior studies have examined the role of medication adherence in this association. The goal of this study was to examine the relationship between medication adherence and fracture risk among elderly PPI users. The study cohort included 6,833 community-dwelling new PPI users, without history of fracture, who were enrolled in Pennsylvania's Pharmaceutical Assistance Contract for the Elderly (PACE) Program. Proportion of Days Covered (PDC) was computed to measure adherence based on prescription refill patterns. Time-dependent Cox proportional hazards models were used to examine the relationship between PPI adherence and hospitalization for fracture while controlling for demographics, comorbidity, and average adherence across other drug classes. During 20,291 person-years of follow-up, 571 fracture-related hospitalizations occurred. Relative to the lowest PPI adherence level (PDC<0.4), the fracture hazard ratios (HRs) associated with higher adherence (PDC: >0.9, 0.8-0.9, 0.6-0.8, and 0.4-0.6) were 1.15 (P=0.33), 1.50 (P=0.0009), 1.46 (P=0.0025), and 1.41 (P=0.015), respectively. In addition, PPI therapy discontinuation appeared to be protective (HR=0.63, P<0.0001), and among non-persistent users, resuming therapy was associated with increased risk (HR=2.63, P=0.002). These results provide further evidence that long-term PPI use is associated with increased fracture risk in the elderly, and that risk varies by adherence level. The findings highlight the need for clinicians to periodically

re-assess their elderly patients' individualized needs for ongoing PPI therapy, while weighing the potential risks and benefits of long-term PPI use.

## **PHYSICAL ACTIVITY AND BONE HEALTH IN US OLDER ADULTS: NHANES 2007-2008**

E. Grubert<sup>1</sup>, L. Gensburg<sup>1</sup>, L.N. Borrell<sup>2</sup>, *1. University at Albany, SUNY, School of Public Health, Rensselaer, New York, 2. Department of Health Sciences Graduate Program in Public Health Lehman College, CUNY, Bronx, New York*

**Objective:** As the US older adult population increases, the need to identify factors contributing to racial/ethnic difference in bone mineral density (BMD) is imperative. Thus, this study aims to determine whether current physical activity (PA) is related to BMD before and after controlling for age, race/ethnicity, gender, body mass index, poverty-income ratio, smoking, and current osteoporosis treatment. **Methods:** We used data from the National Health and Nutrition Examination Survey 2007-2008 (NHANES) for this study. Out of 1656 NHANES participants with femoral BMD using x-ray bone densitometer, participants ≥60 years old who self-reported their race/ethnicity as black, white or Hispanics and without missing data on selected covariates were included in the analyses (n=1353). Current levels of PA were obtained by self-report and metabolic equivalents (METs) categories were calculated using the Global Physical Activity Questionnaire Analysis Guide. Linear regression models were used to examine the strength of the association between PA and BMD. **Results:** On average, there was a 0.05 kcal/kg difference in BMD between those in the high MET PA category and those in the low MET category (b=0.049, p=0.002). However, after adjusting for age, race/ethnicity, gender, body mass index, poverty-income ratio, smoking, and current osteoporosis treatment, this association was no longer statistically significant. **Conclusions:** Most studies evaluating current PA and BMD have been done among younger adults with the few among older adults yielding mixed findings. Thus, more studies, especially longitudinal, are needed to further our understanding of the effect of PA on BMD among older adults.

## **GERONTOLOGICAL ASSESSMENT IN OLDER ADULTS IN A DAY CENTER. TECOMAN, COLIMA, MEXICO**

M.J. Arias-Merino<sup>1</sup>, E. Arias Merino<sup>1</sup>, N.M. Mendoza-Ruvalcaba<sup>1</sup>, J. Cueva Contreras<sup>1</sup>, M. Vazquez Arias<sup>1</sup>, R. Meda Lara<sup>1</sup>, G. Ramí rez Patiñ o<sup>2</sup>, *1. Salud Pública, Universidad de Guadalajara, Zapopan, Jalisco, Mexico, 2. Secretaría de Salud Colima, Colima, Colima, Mexico*

In the framework of the Socio-demographic Change and Active Ageing (CASOENAC, FONCICYT 94670) and in order to achieve better strategies and procedures for providing care to the elderly within the Day Center located in Tecoman, Colima, we performed an analysis of the situation of the quality of life of the beneficiaries of the Centre, identification of risk groups and health care needs. **Method:** Gerontological assessment of all center beneficiaries, including Self-report of sociodemographic and health characteristics and cognitive, emotional, functional, nutritional, social areas and quality of life. **Results:** Participants 197 persons, age 71.1 ± 8.3 years (Rank=60 - 98), women 59.4%, married 41.3%, education 2.9 ± 3.2 years, 87.3% catholic, economic pension 25.8%. Depression 46%, anxiety 52%, low dependence for Basic Activities of Daily Living (3.6%), high dependence for Instrumental Activities of Daily Living (62.9%). Cognitive intact state 80.1%, risk of falls 67.7%, high risk of falls 13.1%. Chronic - degenerative diseases: musculoskeletal 63.7%, hypertension 47.5%; diabetes 34 %, obesity 26 %. The key components of their quality of life are mainly health, good social and family relationships and to tend for themselves. **Conclusions:** The elderly present potentials recounted to having a cognitive intact condition, being autonomous in activities of self-care and in labors that allow them to live in community, in general they have functional families that serve as a support to continue with a process of aging with

well-being. In spite of their problems, they have a satisfactory perception of their health and of the life in general.

#### **ADHERENCE TO ICU BEST PRACTICE GUIDELINES IN OLDER ADULTS**

N. Capogna<sup>1</sup>, I.H. Zuckerman<sup>1</sup>, C.S. Franey<sup>1</sup>, C.M. Lilly<sup>2</sup>, O. Badawi<sup>3</sup>, S.K. Dutcher<sup>1</sup>, M. Al-Jawadi<sup>1</sup>, G.B. Rattinger<sup>1</sup>, *1. University of Maryland School of Pharmacy-Pharmaceutical Health Services Research, Baltimore, Maryland, 2. University of Massachusetts Medical School, Worcester, Massachusetts, 3. Phillips Healthcare, Baltimore, Maryland*

Intensive Care Unit (ICU) best practice guidelines are currently implemented to prevent ICU acquired conditions. Reports have suggested variability in adherence, but relationships between adherence rates and age has yet to be determined. Our objective was to describe the relationship between age and adherence to ICU guidelines for stress ulcer prophylaxis (SUP), venous thromboembolism prevention (VTEP) and beta blocker utilization (BBU) after myocardial infarction. This retrospective cross-sectional study examined patients' electronic medical records representing 271 ICUs in 188 hospitals during 2008. Using specific criteria for each guideline, adherence rates were calculated overall and stratified by age: <65, 65-74, 75-84 and ≥85 years. Bivariable and multivariable analyses determined the relationship between age and receipt of ICU best practice guidelines, adjusted for potential confounders. Among the 169,321 admissions, mean age was 62.9 years with females comprising 45.7%. Overall adherence to the three treatment guidelines was high (92.6% SUP, 88.2% VTEP and 76.2% BBU). In the bivariable analyses, compared to ICU patients ≥85 years old, patients <65 years were more likely to receive SUP (91.1% vs. 93.1%,  $p < 0.01$ ) and BBU (74.3% vs. 78.6%,  $p < 0.01$ ), and less likely to receive VTEP (89.6% vs. 87.4%,  $p < 0.01$ ). Multivariable models revealed small differences in adherence by age. There is little variability in adherence to these guidelines by age, suggesting older adults are receiving best practice treatments at similar rates as younger patients. Understanding patterns between age and guideline adherence is an initial step in determining whether outcomes associated with ICU guidelines vary by age.

#### **THE INTERFACE BETWEEN THE SOCIOECONOMIC AND THE EFFECTS OF STRUCTURAL FACTORS ON THE BRAZILIAN ELDERLY HEALTH**

D. Mori<sup>1</sup>, H. Sumii<sup>1</sup>, K. Hamaguchi<sup>2</sup>, C. Rim<sup>3</sup>, S. Hyeon-Kyu<sup>4</sup>, *1. Human Welfare, Prefectural University of Hiroshima, Mihara, Hiroshima, Japan, 2. Mogi das Cruzes University, Mogi das Cruzes, SP, Brazil, 3. HanNam University, Daejeon, Democratic People's Republic of Korea, 4. Kyoei University, Kasurake, Saitama, Japan*

The Brazilian elderly population will expect to increase from 11.3% (2011) to 49% (2050) and, according to the World Bank (2011), life expectancy is highly correlated with an important social inequality in terms of income, even reporting acceleration in poverty reduction by inclusion of public policies. Evidences shows that life expectancy in developed countries is dramatically improved where income differences are smaller and societies are more socially equable. The purpose of this study is to estimate the association between the socioeconomic situation of Brazilian Elderly and Health Conditions Indicators, Access and Transference of Income from Social Programs, Socioeconomic Indicators and Cover Indicators. The main source of data was the 2008 National Sample Household Survey from the database of the Brazilian Institute of Geography and Statistics (IBGE) and Informatics Department of Unified Health System (SUS). The results demonstrated that Brazil is moving into a fundamentally different demographic context, within increasingly mature population and extra burden on the Public Health System. In order to revise for the future of the National Health Policy for the Elderly implemented in 1999 and respond appropriately to the demands of the sharply aging society within all healthcare service available nowadays, it is essential to estimate the influential factors of the parameters

and use all the possible strategies for more healthy, egalitarian and cohesive society.

#### **TIME-TREND UTILIZATION OF STATINS IN COMMUNITY-DWELLING OLDER ADULTS**

W. Lo-Ciganic<sup>1</sup>, R. Boudreau<sup>1</sup>, J.C. Zgibor<sup>1</sup>, J.M. Donohue<sup>1</sup>, S. Gray<sup>3</sup>, A.B. Newman<sup>1</sup>, E.M. Simonsick<sup>4</sup>, J.T. Hanlon<sup>1,2</sup>, *1. University of Pittsburgh, Pittsburgh, Pennsylvania, 2. VA, Pittsburgh, Pennsylvania, 3. University of Washington, Seattle, Washington, 4. NIA Intramural Research Program, Baltimore, Maryland*

This study describes the temporal patterns of statin use from 1997 to 2008 and examines whether statin use changed after the release of the National Cholesterol Education Program Adult Treatment Panel (NCEP ATP) III guidelines and results from the Prospective Study of Pravastatin in the Elderly at Risk (PROSPER) in 2002. We used data from 3055 participants (41% black, 51% female; age 70+) in the 1997 Health, Aging and Body Composition Study interview and categorized them into four exclusive subgroups: 1) any coronary heart disease (CHD); 2) diabetes only (CHD risk equivalent); 3) without CHD or diabetes and with ≥ 2 CHD risk factors; or 4) without CHD or diabetes and with < 2 CHD risk factors. Statin use increased from 12.9% in 1997 to 24.8% in 2002 with the greatest use (47.4%) in those with CHD. Between 2003 and 2008 statin use continued to increase from 27.6% to 39.1% with the greatest use (64.5%) in those with CHD. Using an interrupted time series analysis with generalized estimating equations to examine yearly level and trend changes in statin use adjusting for demographic, socioeconomic health status, and access to health care, we found that publication of the NCEP ATP III guidelines and PROSPER findings did not appear to increase statin utilization patterns among elders (increase in use per-year after/before 2002: adjusted ratio of odds ratio 0.90; 95% C.I. 0.87-0.93). The guidelines/evidence-based data may influence statin use gradually over time among elders. Potential underuse of statins was observed among those with CHD/diabetes.

#### **UP-TO-DATE LONG-TERM SURVIVAL OF OLDER ADULT PATIENTS WITH LUNG CANCER: PERIOD ANALYSIS OF 2000-2008**

Y. Tang, G.S. Smith, *University of Maryland Baltimore, Baltimore, Maryland*

Objective: Up-to-date estimates of long-term survival are important for the evaluation of lung cancer treatment programs. This study aims to estimate current relative survival ratios (RSS) and to identify most recent trend in long-term relative survival of geriatric lung cancer patients, using period analysis. Methods: SEER cancer registry data were used to identify newly diagnosed lung cancer patients between 1973 and 2008. Patient's vital status (dead or alive) and follow-up time between diagnosis and death or censoring date of December 31, 2008, were recorded. Period analysis was employed to calculate observed long-term survival proportion for three 3-year intervals during 2000-2008. Population mortality data in the United States was applied to the cancer population to calculate the expected number of deaths from all causes. RSR was calculated as the ratio of the observed to the expected survival proportions. Results: During 2000-2008, 5-year RSR increased from 28.2% (95%CI, 27.6%-28.8%) to 38.6% (95%CI, 38.0%-39.2%) among those 65+, compared to a much larger increase from 29.8% (95%CI: 27.1%-32.5%) to 51.2% (95%CI, 42.6%-48.2%) among those 44 years of age or younger. Similarly, 10-year RSR increased from 20.7% to 29.5%, 26.7% to 45.8%, and 22.8% to 34.8% among those 65+, <=44, and 45-64, respectively. 15-year RSR increased from 14.5% to 22.0%, 24.9% to 44.1%, and 18.3% to 29.6% among those 65+, <=44, and 45-64, respectively. Conclusion: Despite improvements in long-term survival of lung cancer during 2000-2008, survival is much reduced in the elderly compared to younger patients, even when adjusting for other causes of death.

## NEIGHBORHOOD PSYCHOSOCIAL HAZARDS AND FUNCTIONAL IMPAIRMENT: THE BALTIMORE MEMORY STUDY

A. Kress, T. Glass, B.S. Schwartz, *Epidemiology, Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland*

Population aging will produce an epidemic of functional disability this century in the US and worldwide. The identification of modifiable risk factors for functional limitations is essential given the increasing number of older adults. This study examined the association between neighborhood psychosocial hazards (NPH) and functional impairment in the Baltimore Memory Study (BMS), a cohort of 1140 community-dwelling adults aged 50-70 years from 65 contiguous neighborhoods in Baltimore, MD. Data collected during the baseline visit, 2001-2002, were used to evaluate the hypothesis that residents of neighborhoods high in psychosocial hazards would have increased odds of functional limitations. Functional impairment was measured with a standard index of ability to perform instrumental activities of daily living (IADL). Multilevel logistic regression models were used to evaluate neighborhood and individual risk factors while taking account of the clustering of persons within neighborhoods. Eleven percent of the cohort reported 1 or more IADL limitations at baseline. The prevalence of disability increased with increasing NPH from 4.7% among residents of neighborhoods in the lowest NPH quartile to 17% among residents of neighborhoods in the highest quartile of NPH. After adjusting for individual-level confounders, NPH was associated with functional impairment. Residence in a neighborhood in the highest quartile of NPH was associated with a 2-fold increased odds of IADL disability after controlling for individual-level risk factors. Residential neighborhoods represent an understudied and potentially important target of interventions that may play a role in late-life disability risk.

## PREVALENCE OF CHRONIC HEALTH CONDITIONS IN THE US SENIORS: A POPULATION-BASED STUDY

J. Finkelstein, E. Cha, *Johns Hopkins University, Baltimore, Maryland*

**Background:** Due to increased life expectancy, seniors are the fastest growing segment of the population. Seniors often suffer from a wide range of chronic conditions however limited data exist on the population-based prevalence of chronic conditions in the US seniors. **Methods:** Based on the National Health Interview Survey (NHIS) for the year 2010, the distribution of chronic conditions and morbidity was analyzed. Morbidity included emergency room (ER) visits and number of sick days in bed. The results were stratified for each condition by gender and race. Each disease was defined by the following question: 'Have you ever been told by a doctor or other health professional that you had \_\_\_\_?' Subjects who answered "Yes" to these questions were included, and those who "Refused" or answered "Not ascertained" or "Don't know" were excluded from the analyses. **Results:** The Sample Adult File from the year 2010 consisted of 5,450 subjects who were 65 or older. The conditions with highest prevalence in this population were: hypertension (61.7%), arthritis (51.3%), heart diseases (30.0%), cancer (23.5%), diabetes (23.5%), lung disease (17.2%), ulcer (10.3%), stroke (8.2%), and kidney disease (4.0%). Common comorbid conditions included: hypertension and diabetes (18.6%); hypertension and heart diseases (15.8%); hypertension and stroke (6.4%); and kidney disease (KD) and hypertension (3.3%). The highest number of ER visits and sick days in bed were observed in subjects with KD. During the past 12 months, 36.3% of subjects with KD visited ER 1-3 times and 8.6% visited more than 3 times. Patients with KD spent 26.5 days in bed during the past year compared to 14.1 days for heart diseases and 7.6 days for hypertension. Among the KD patients, males spent about 4 more days in bed than females, and the Hispanics visited ER most frequently than White, African Americans and Asians. **Conclusion:** Chronic conditions are highly preva-

lent in the US seniors. Seniors with chronic kidney disease demonstrated the highest morbidity.

## PREVALENCE AND PATTERNS OF MULTIMORBIDITY IN THE ONTARIO HOME CARE SYSTEM

J.J. Armstrong, M. Zhu, J. Hirdes, P. Stolee, *Health Studies and Gerontology, University of Waterloo, Waterloo, Ontario, Canada*

Driven by the high prevalence of multiple chronic diseases, the aging population, and the rise of health care costs, there is a mounting interest in the study of multimorbidity. Multimorbidity is the coexistence of multiple chronic diseases and has been shown to be associated with negative health outcomes and increased health care service utilization. The prevalence of multimorbidity has been reported to range between 55 to 98% yet little research has focused on developing our understanding of concurrent multiple chronic diseases in aging bodies and the resulting common patterns. With clinical and administrative data growing rapidly through the everyday use of information systems, investigations into frequent patterns of chronic diseases can be conducted through the application of novel data mining techniques. Association rule mining (ARM) can be applied to health information from older adults to discover the prevalence of multimorbidity and the most common patterns of chronic diseases within an aging patient population. **METHODS:** ARM was performed using the *arules* package in R on clinical assessment data from long-stay (>60 days) homecare clients in Ontario using the provincially mandated RAI-HC data system (N=1.6 million; year range = 2005-2010). **RESULTS:** The prevalence of multimorbidity (2 or more concurrent diseases) for those over the age of 65 was 86%. The ARM analysis resulted in identifying the top 10 combinations of chronic diseases. **CONCLUSION:** Our findings illustrate that multimorbidity is prevalent in the Ontario home care population and that common patterns of chronic diseases can be identified through the application of novel quantitative techniques.

## TWO MEASURES OF CHANGE IN SELF-RATED HEALTH AND THEIR PREDICTIVE VALUE FOR MORTALITY IN OLDER ADULTS

H. Galenkamp<sup>1</sup>, A.W. Braam<sup>2,1</sup>, M. Huisman<sup>1,3</sup>, D.J. Deeg<sup>1</sup>, *1. VU University Medical Center, Amsterdam, Netherlands, 2. Altrecht Mental Health Care, Utrecht, Netherlands, 3. VU University, Amsterdam, Netherlands*

**Introduction:** Studies have shown improved predictive value of self-rated health (SRH) for mortality after taking into account the dynamics of SRH. A prospective change measure of SRH (i.e. the difference between subsequent waves) is relatively expensive and may not take into account possible response shifts between waves. Therefore, the current study examines whether it is preferable to use a retrospective change measure (i.e. based on a then-test). **Methods:** Data come from two waves of the Longitudinal Aging Study Amsterdam (T1: 2001-2003 and T2: 2005-2006, N=1894). Self-rated health was assessed at T2 and mortality was followed until September 1st, 2011. SRH change between T1 and T2 was defined as prospective change; the difference between SRH measured with the then-test at T2 (asking for a renewed judgement of one's health at T1) and SRH at T2 as retrospective change. Mortality was predicted using Cox Proportional Hazards analyses. **Results:** Having poor SRH at T2 (adjusted OR=2.72) and prospectively declined SRH (adjusted OR=1.38) significantly predicted five-year mortality in the total sample. Further analysis revealed that prospectively declined SRH was associated with higher mortality risk only in respondents with good health (no depression, good SRH, few diseases or functional limitations), but not in those with poorer health. **Discussion:** This study confirmed that taking into account changes in SRH may add to the predictive value of baseline SRH for mortality in older

adults; in particular declined SRH in otherwise healthy subgroups was associated with higher mortality risk. Contrary to our hypothesis, the prospective measure performed better than the retrospective measure of change in SRH.

#### **INEQUALITY IN OSTEOPOROSIS DRUG TREATMENT IN SWEDEN – A NATIONWIDE STUDY OF OVER 600,000 MEN AND WOMEN AGED 75 TO 89 YEARS OLD**

J.W. Wastesson<sup>1</sup>, G. Ringbäck Weitoft<sup>2</sup>, M.G. Parker<sup>1</sup>, K. Johnell<sup>1</sup>, *1. Aging Research Center, Karolinska Institutet & Stockholm University, Stockholm, Sweden, 2. National Board of Health and Welfare, Stockholm, Sweden*

Osteoporosis and osteoporotic fractures are major geriatric public health problems. Drug treatment for osteoporosis has been found to be effective for fracture prevention. However, there are indications that osteoporosis drug treatment is unequally distributed in the population. We aimed to investigate educational differences in osteoporosis drug treatment in Swedish men and women aged 75-89 year old. By record-linkage of The Swedish Prescribed Drug Register, The Swedish Patient Register and The Swedish Education Register, we obtained information on filling of prescriptions for osteoporosis drugs (bisphosphonates, calcium/vitamin D combinations and selective estrogen receptor modulators (SERMs)) from July to October 2005, osteoporotic fractures from 1998 to 2004 and educational level for 645,429 people aged 75-89 years. Higher education was associated with use of osteoporosis drugs in both men and women, after adjustment for age, osteoporotic fractures and number of other drugs (used as a proxy for overall co-morbidity). Among those who had sustained a fracture (n=57,613), educational differences in osteoporosis drug treatment were larger for women than for men. Further, men were less likely to receive osteoporosis drug treatment after fractures. In Sweden, a country with presumably equal access to health care, the uptake of osteoporosis drug therapy seems to be unequally distributed in the elderly population.

#### **AN ACTIVE LIFESTYLE POSTPONES DEMENTIA ONSET BY MORE THAN ONE YEAR IN VERY OLD ADULTS**

H. Wang, S. Paillardborg, W. Xu, B. Winblad, L. Fratiglioni, *Karolinska Institutet, Stockholm, Sweden*

**OBJECTIVE:** To test the hypothesis that an active lifestyle delays age at dementia onset. **METHODS:** This study included 388 incident dementia cases (DSM-III-R criteria) that developed over a 9-year follow-up period among 1375 baseline dementia-free community dwellers with good cognitive function (MMSE>23) (mean age=81.2). An active lifestyle was defined as participation in mental, physical, or social activity. We used linear regression models to estimate influence of baseline active lifestyle on age at onset of incident dementia and general linear models to estimate mean age at dementia onset. **RESULTS:** Age at onset of dementia was significantly older in persons who had higher levels of participation in mental, physical, or social activity ( $\beta$ : 0.18, 0.29 and 0.23 respectively,  $p < 0.001$  for all the activities) independent of education, medical condition, functional status, and other confounders. When the three types of activities were integrated into an index, we found that the broader the spectrum of participation in the activities, the later the onset of disease ( $\beta=0.93$ ,  $p=0.01$  for participating in 2 activities, and  $\beta=1.42$ ,  $p<0.001$  for 3 activities). There were 17 months difference in mean age at dementia onset between the inactive group and the most active group. **CONCLUSION:** An active lifestyle operates as a protective factor for dementia by delaying the clinical onset of the disease. These findings highlight the relevance of encouraging old adults to have active lifestyles, which could have a great impact on public health.

## **SESSION 735 (POSTER)**

### **FALLS AND FALL PREVENTION**

#### **THE IMPACT OF APPLYING A SUSTAINABILITY MODEL TO FALL GUIDELINE IMPLEMENTATION: A LONGITUDINAL STUDY**

J. Ploeg<sup>1</sup>, S. Ireland<sup>1</sup>, K. Cziraki<sup>2</sup>, B. Davies<sup>3</sup>, K. Higuchi<sup>3</sup>, M. Murray<sup>3</sup>, N. Fram<sup>1</sup>, H. Kirkpatrick<sup>1</sup>, *1. School of Nursing, McMaster University, Hamilton, Ontario, Canada, 2. Grand River Hospital, Cambridge, Ontario, Canada, 3. University of Ottawa, Ottawa, Ontario, Canada*

**Background:** The challenges in reducing falls rates and serious falls in acute care settings are well known. The challenges of sustaining the implementation of practice guidelines such as falls prevention are also acknowledged. The purpose of this study was to examine the impact of an implementation process guided by the National Health Services Sustainability Model to support sustainability of a falls prevention practice guideline in acute care community hospitals. **Methods:** A longitudinal mixed methods study was conducted in three acute care hospitals in Ontario, Canada. Quantitative data on number of falls and serious injurious falls were collected quarterly over two years pre and post guideline implementation. Qualitative data on staff perceptions about facilitators and barriers to sustaining the falls guideline were collected using 22 in-depth face-to-face individual interviews and 14 focus groups. A total of 82 participants included administrators, managers, clinical leaders, point of care providers and support staff and volunteers. **Results:** At the three study sites, overall mean quarterly fall rates per 1000 patient days were reduced by 3% and the number of quarterly serious injurious falls was reduced by 26%. The reduction in serious injurious falls produced an estimated annual savings of \$73,668 per site. Qualitative data analysis revealed that sustainability factors such as leadership, processes of care and organizational factors acted as facilitators or barriers to sustained guideline use. **Conclusion:** Findings suggest that the application of a sustainability model to the implementation of a falls prevention practice guideline may have value in impacting falls related outcomes.

#### **PSYCHOLOGICAL IMPAIRMENTS AS RISK FACTORS FOR FALLS**

M. Davalos-Bichara, J.P. Carey, Y. Agrawal, *Johns Hopkins University School of Medicine, Baltimore, Maryland*

**Background** Fear of falling has been associated with fall risk; however, little is known about the genesis or pathologic underpinning of this psychological impairment. Our objective is to determine how psychological factors such as fear of falling, depression, and executive function impairment play a role in influencing fall risk. We aim to determine if these psychological measures reflect objective physical deficits that increase fall risk or if they are independent risk factors for falls. **Methods** Community-dwelling participants age  $\geq 70$  years of age gave demographic data, a clinical history, physical activity level and history of falls. Fear of falling was measured with the Falls Efficacy Scale-International (FES-I), depression with the 15-item Geriatric Depression Scale (GDS-15), and executive function with the Trail Making Test (TMT). Physical exam included comprehensive vision, balance and gait (including inner ear balance or vestibular) testing, and sensorimotor testing (lower extremity sensation with 10-g monofilament, and grip strength with dynamometer). **Results** Mean FES-I score was 5.3, indicating high fear-of-falling, and GDS-15 was 10.5 indicating severe depression. High fear-of-falling was significantly associated with a greater risk of depression ( $p < 0.01$ ). Associations between physical measures (balance function, visual acuity, sensorimotor function) and FES-I, GDS-15 and TMT scores will be assessed in bivariate and multivariate analyses. The role of physical activity as a mediating variable between psychological impairment and fall risk will be explored. **Conclusions** Psychological

impairments may be important contributors to fall risk that need to be addressed in fall risk reduction interventions.

### ASSESSING EFFECTIVENESS OF EXERGAMES ON FALL PREVENTION IN ELDERLY ADULTS IN LOS ANGELES COUNTY PUBLIC HOUSING SITES

J. Ma, *UCLA, Los Angeles, California*

Beginning in January 2012, UCLA students initiated a fall prevention program at public housing sites of the Los Angeles County Community Development Commission. The Palms Apartments in West Hollywood have 127 housing sites, with over 80% of residents over the age of 60. 65% of the residents are Russian speaking, 29% are English speaking, and 6% are Spanish speaking. The Fall Prevention curriculum, based on CDC and NCOA materials, is broken down into three sections: 1) Medical Assessment of Fall Risk, 2) Strengthening Exercises, 3) Home Modifications to Reduce Fall Risk. Following the seminar, residents are invited to participate in Xbox Kinect Exergames. Among older adults, exercise adherence is perceived as a challenge, yet video-game playing is increasingly popular among this group. The Microsoft Xbox 360 Kinect is an Exergaming system that utilizes infrared real-time depth sensing cameras and skeletal tracking, such that it does not require any controllers to use. It has been suggested that Kinect participation can enhance physical and cognitive abilities of older adults. The goal of the intervention is to reduce fall risk and to increase balance confidence in at risk elderly. The intervention is evaluated based on pre and post program surveys with both qualitative and quantitative assessments. This study measures whether Exergames are a viable tool to encourage older adults to engage in physical activity. Additionally, it assesses whether regular participation in Exergames is an effective supplement to fall prevention presentations in increasing balance confidence.

### CLINICAL AND BUSINESS IMPLICATIONS OF A FALL SCREENING AND EXERCISE PROGRAM IN ASSISTED LIVING

G. Sloves, *Fox Rehabilitation, Cherry Hill, New Jersey*

Falls are a major health problem in the elderly community, increasing the risk of mortality, morbidity, disability and frailty as well as increasing medical costs. The purpose of this novel evidence-based program is to: provide comprehensive fall risk assessments and progressive group exercise classes to reduce the incidence of falls in assisted living residents; provide independent seniors residing in the community with no-cost progressive exercise classes; provide assisted living corporations with showcase programming to promote facility as a community resource center. All residents in 20 assisted living communities (2,000+ residents, ages 55 - 100 years) participated in a fall risk assessment, upon move into community, quarterly, at functional decline or post fall. Assessment includes fall history, strength testing (30 Sec Chair Stand), gait testing (Timed Up and Go) and balance testing (Functional Reach). 1700 high fall risk residents received an interdisciplinary improvement plan including physician/nurse system review, medication review, occupational, physical, or speech therapy, environmental hazards assessment, caregiver education, change in toileting routine, or use of DME. 300 low to moderate fall risk residents participated in customized, 12 week dynamic and progressive group exercise classes, designed by physical therapists and lead by exercise physiologists, 2x/wk for 60 minutes per session. This innovative collaborative project resulted in fall reductions up to 43% in one year. Resident impairments and function also significantly improved: Sit-Stand by 2.6 repetitions, TUG by 3.6 seconds, FR by 1.6 inches. Independent community seniors also attended exercise classes, thus increasing the viability of the facility as a community resource center for seniors.

### ZOLPIDEM USE AND RISK OF FALLS IN OLDER MEN

S. Diem<sup>1</sup>, S.K. Ewing<sup>2</sup>, K.L. Stone<sup>3</sup>, S. Ancoli-Israel<sup>4</sup>, S. Redline<sup>5</sup>, K. Ensrud<sup>1,6</sup>, 1. *University of Minnesota, Minneapolis, Minnesota*, 2. *University of California, San Francisco, California*, 3. *California Pacific Medical Center, San Francisco, California*, 4. *University of California, San Diego, California*, 5. *Brigham and Women's Hospital, Boston, Massachusetts*, 6. *Veterans Affairs Medical Center, Minneapolis, Minnesota*

Limited data is available about the safety of zolpidem in older patients, in particular regarding risk of adverse outcomes including falls and fractures. To test the hypothesis that zolpidem use is associated with increased risk of falling, we compared risk of any ( $\geq 1$ ) and recurrent ( $\geq 2$ ) falls in zolpidem users vs. non-users in the MrOS study, a prospective cohort study of community dwelling men  $\geq 65$  years old. Between 2007-09, 4471 men (mean age 79.5 $\pm$ 5.3 yr) attended a clinic visit and completed a medication inventory; of these, 197 men taking benzodiazepines were excluded from the analyses. Of the remaining 4274 men, 81 reported zolpidem use in the previous 30 days. During the subsequent 1 year follow-up period, men were contacted every 4 months about falls. In age-adjusted models, zolpidem use was associated with increased risk of 1+ [RR 1.47 (1.16, 1.87)] and 2+ [RR 1.45 (0.99, 2.12)] falls. Further adjusting for health status, IADL impairment, walk speed, and Geriatric Depression Scale (GDS) had little effect on 1+ falls [RR 1.41 (1.09, 1.83)], but 2+ falls was no longer statistically significant [RR 1.37 (0.89, 2.11)], likely due to low power. Because prior history of falling is a strong predictor of subsequent falls, we also performed analyses in which we excluded men with a history of falling in the previous year; results were similar in these analyses. Future RCTs evaluating efficacy of non-anxiolytic, non-benzodiazepine sedative hypnotics in treating insomnia in older adults should include incident falls as a safety endpoint.

### THE TEMPORAL AND SPATIAL NATURE OF FALLS IN ACUTE MENTAL HEALTH SETTINGS IN THE UNITED KINGDOM

C. Victor<sup>1</sup>, C. Simpson<sup>2</sup>, V. Narayanan<sup>3</sup>, A. Dickinson<sup>2</sup>, C. Griffiths<sup>3</sup>, D. Humphrey<sup>3</sup>, 1. *Brunel University, Uxbridge, United Kingdom*, 2. *University of Hertfordshire, Hatfield, United Kingdom*, 3. *Oxford Health NHS Foundation Trust, Oxford, United Kingdom*

Introduction Falls are the most commonly reported patient-safety incident in mental health settings for older people with approximately 36,000 falls reported from these settings per year. Risk of falling is exacerbated by mental health problems, such as impaired mental status due to dementia and depression, and their treatments. However, we have very little understanding of either the context or best way to prevent falls in these settings. This paper will present phase 1 findings from a mixed-methods exploratory case study. Methods Methods included retrospective analysis of reported falls for a 12 month period, non-participatory observation (300+ hours), focus-groups with staff (n=5) and interviews with senior managers (n=6). Findings We will use the data to explore the temporal and spatial nature of falls within 5 acute mental health settings. We found falls were not evenly distributed across the course of the day, with peaks occurring in the morning, and early afternoon. Staff reflections on this data during focus group discussions, and our observations of the temporally-determined flow of activity and use of space by staff, patients and visitors to the ward have enabled us to understand some of the patterns and possible factors that contribute to falls in these settings. Conclusions Use of routinely collected data, enhanced by staff reflection and observation can aid understanding of factors contributing to falls in acute mental health settings. Data of this nature could be used by organisations seeking to manage risk, improve patient safety, and develop appropriate interventions.

## AN ANALYTICAL REVIEW OF LOCAL AND NATIONAL FALL POLICY AND GUIDELINES IN ENGLAND AND WALES

C. Victor<sup>1</sup>, V. Narayanan<sup>3</sup>, C. Simpson<sup>2</sup>, A. Dickinson<sup>2</sup>, C. Griffiths<sup>3</sup>, D. Humphrey<sup>3</sup>, 1. Brunel University, Uxbridge, United Kingdom, 2. University of Hertfordshire, Hatfield, United Kingdom, 3. Oxford Health NHS Foundation Trust, Oxford, United Kingdom

**Background** There is an urgent need to improve the care of older people at risk of or who experience falls in mental health settings. Falls are the most frequently reported patient safety incident. NICE Guidelines recommends the use of multidisciplinary fall risk assessment during individualised treatment and in prevention care plans for older people at risk of falls (NICE, 2004). This poster outlines work underway to explore the policy guidance issued by NHS Mental Health Trusts in England and Health Boards in Wales. **Methods** We requested fall policies and other relevant documentation from NHS mental health trusts in England (56) and healthcare boards in Wales (6). Policies are being subjected to a quantitative content analysis to explore guidance given to clinical staff and managers. **Findings** We obtained falls policies from 42 mental health trusts in England, and 2 from healthcare boards in Wales. 30 policies were publically available on the internet. 1 Trust told us they did not have a fall-prevention strategy. 1 was currently reviewing their policy. Analysis of fall risk assessment tools show variation in the number of risk-variables included. Few Trusts used validated tools such as STRATIFY, FRASE, MORSE, and MHOA, others used customised falls risk assessment tools. **Conclusions** A wide variety of screening and assessment tools are in use, however, the most commonly used are those developed by individual Trusts, or which focus solely on the external environment, with no screening/assessment of individual patients. Use of invalidated tools raises questions of reliability and effectiveness.

## RELATIONSHIPS BETWEEN SELF-ESTIMATION OF STEPPING-OVER ABILITY AND FALLS IN OLDER ADULTS

R. Sakurai<sup>1,2</sup>, Y. Fujiwara<sup>1</sup>, M. Ishihara<sup>2</sup>, K. Imanaka<sup>2</sup>, 1. Tokyo Metropolitan Institute of Gerontology, Itabashiku, Tokyo, Japan, 2. Tokyo Metropolitan University, Tokyo, Japan

In old adults, tripping over an obstacle during a walk is a major cause of falls. Making a trip during a walk may result from possible inaccurate self-estimation of likely age-related impairment in stepping-over ability. We examined the accuracy of self-estimation of stepping-over ability using a stepping-over test (SOT) in old adults (343 young-old and 151 old-old adults, with 71 young adults as a control group), with an inquiry about their experience of falls for a year prior to this study. Participants were assigned to either faller or non-faller group. In the SOT, a horizontal bar was presented at 7 m distance in front of the participants and the height of the bar was continuously manipulated in a descending/ascending direction. The participants then verbally reported their estimation of maximum height (estimated height, EH) of the bar at which they believed to successfully clear. They subsequently performed trials of SOT motor action initially at the EH until their highest clearable bar height (actual height, AH) was determined. Our results showed that 39 young-old (11.4%) and 49 old-old adults (32.5%) failed to clear the bar at the EH, whereas all the young adults succeeded. This indicated that old adults tended to overestimate the stepping over ability more than did the young adults. Furthermore, the occurrence rate of overestimation was almost twice larger for the fallers (28%) than that for the non-fallers (16%,  $P = 0.017$ ), suggesting that self-overestimation of stepping over ability appeared with aging and may have increased falls.

## SYSTEMIC CAUSES OF FALLS IN STROKE SURVIVORS

M. Madady<sup>1</sup>, A.A. Zecevic<sup>1</sup>, A. Salmoni<sup>1</sup>, B. Young<sup>2</sup>, E. Britt<sup>3</sup>, 1. University of Western Ontario, London, Ontario, Canada, 2. London Health Sciences Centre, London, Ontario, Canada, 3. St. Joseph's Health Care, London, Ontario, Canada

According to WHO 15 million people worldwide and almost a million North Americans suffer a stroke every year. While information

about the incidence and risk factors of falling among stroke survivors is available, considerably less is known about the actual causes of falls and the circumstances surrounding these adverse events. The purpose of this project was to identify systemic causes of falls in stroke survivors as they transition from acute care to rehabilitation hospital, and to community or long-term care. A total of 30 stroke survivors were followed-up for six months post stroke. Their first fall at each stage of the care continuum was investigated using Systemic Falls Investigative Method (SFIM). Comprehensive data were collected through multiple interviews, document reviews, environmental scans, re-creation of events and was entered into the SFIM Database. The database produced falls reports that contained information about the faller, the fall, a descriptive summary of the occurrence, chronological sequence of events, a summary table of acts/decisions and contributing factors, and conclusions. The guiding framework in data reduction and analysis was the Swiss Cheese Model of Accident Causation. Summary tables from all falls reports were organized using NVIVO and coded to identify dominant themes. Results indicate that person-related factors combine with behavioural, situational and broader organizational and healthcare system influences as contributors to falls. When considering falls prevention programs in post-stroke rehabilitation and community re-integration, it is important to address stroke-specific causes, but also challenge system-wide contributors that affect stroke survivor's safety.

## FACTORS RELATED TO FALLS AND FRACTURES IN A LARGE SAMPLE OF ELDERLY PEOPLE FROM SOUTHERN BRAZIL

I.C. Caberlon<sup>1,2</sup>, A.G. Bósi<sup>1</sup>, 1. Institute of Geriatrics and Gerontology, Pontifical Catholic University of Rio Grande do Sul, Porto Alegre, RS, Brazil, 2. ULBRA, Canoas, RS, Brazil

Falls and fractures in the elderly represent a significant public-health problem. The present study aimed to investigate falls and fractures in the elderly (60 years and over) residents in the State of Rio Grande do Sul, Brazil. We collected information from charts of elderly patients presenting falls from four units of Urgency and Emergency. The final sample of 6,556 elderly assisted by falls, 4,664(71%) women and 1,892(29%) men, 26.8% occurred in winter followed by autumn with 24.5%. More than half of visits happened up to 6 hours after the fall. Fracture were more frequent on women, 31% of falls had fractures, 32% of the women and 28% of the men ( $p < 0.0001$ ). Average age of fractured people was significantly higher than people who did not fractured. Fractures of the upper-limbs were the most frequently recorded with 978 fractures, followed by fractures of the lower limbs with 620 fractures. Winter had the highest number of confirmed fractures within 34% of falls ( $p = 0.0002$ ), while the lowest percentage was the spring within 28% of falls. Age, sex, and winter were the significant risk factors for falls. A person one year older is 2.2% more likely to fracture when falling. The chances of women fracture after a fall are 15% higher than men the same age. This survey results point to the need for further epidemiological and clinical studies that can clarify issues related to other approaches to risk factors for falls and fractures.

## MULTIDISCIPLINARY FALLS RISK MANAGEMENT: TRAINING PROGRAMS TO TRANSLATE RESEARCH TO PRACTICE

T. Shubert, C.L. Clarke, E. Roberts, E. Schneider, J. Busby-Whitehead, Center for Aging and Health, UNC Chapel Hill, Chapel Hill, North Carolina

Falls risk management practices have been developed, tested and proven effective in research settings, however translation from research to clinical practice has been limited. This pilot study developed and tested a team-based curriculum, based on the tenants of implementation science, to facilitate practice change. The curriculum was taught over two sessions to facilities and agencies representing the continuum of care (wellness centers, continuing care retirement communities, home

health agencies, hospital-based systems). Each participating facility sent a minimum of three representatives from different disciplines to attend. Session 1 reviewed risk factors, screening and assessment tools and interventions. During the session, dedicated time was spent assisting each team to assess their own practices and to identify gaps in falls risk management. At the end of session 1 each team developed an implementation plan with a timeline for execution; Session 2 introduced outcome measures and then participants presented the results of their implementation plan. Forty participants from 7 different facilities have completed the curriculum. Baseline and post-test measures show significant changes in knowledge of falls risk ( $p < .05$ ). A follow-up implementation survey at 6 weeks collected qualitative data on the implementation process. To date five teams have reported partial or full implementation of at least one evidence-based falls risk management practice including integrating falls risk screening into annual medical visits and wellness screenings, implementing evidence-based exercises programs for home exercises and in restorative care, medication management programs, patient education programs, and developing communication protocols between all disciplines to improve risk management.

### **MANAGING FALLS IN THE OLDER ADULT POPULATION: OUTCOMES FROM AN INTERPROFESSIONAL FALLS MANAGEMENT COURSE**

J. Dauenhauer, S. Glose, D. Fromm Faria, K. Heffernan, *College at Brockport, Brockport, New York*

This presentation will describe the outcomes from an interprofessional evidence-based falls management course for undergraduate and graduate students. The 3-credit elective course was developed by a gerontological social work and nursing faculty member in partnership with a community-based case management organization that serves older adults. Creation of the course was in response to a mandate by the Health Resources and Services Administration, funding source for federal Geriatric Education Centers, to train interprofessional students using an evidence-based approach. A total of twelve students (6 in summer 2011 and 6 in summer 2012) completed the course which included 20 hours of classroom training followed by delivery of the Matter of Balance program to 40 community-dwelling older adults at four different locations. Presenters will describe results including 1) student outcomes from a pre/post falls knowledge test, 2) qualitative data from student evaluations, and 3) Findings from a falls risk assessment administered by students to community-dwelling older adult participants. Opportunities and challenges associated with course delivery will also be described.

### **PSYCHOMETRIC TESTING OF FALLS AND FALL-RELATED INJURIES QUESTIONNAIRES**

J. Kehinde, G.A. Pepper, *University of Utah College of Nursing, Salt Lake City, Utah*

Background: Although instruments identifying individual-related risk factors such as motor impairment, behavioral disturbances, and inability to discern or avoid hazards are frequently used, older adults living in NHs continue to fall. Clinicians need a rigorously developed and tested instrument to identify the impact of organizational factors such as quality monitoring, adequate staffing, NH policies, environmental and process-related issues on fall rates for appropriate interventions. Purpose: The purpose of this study is to further validate the psychometric properties of the previously piloted FFIQ in a larger sample of DONs. Methods: Using a correlational design, a survey of DONs will be conducted in 300 eligible NHs in California, Texas, and Utah using proportionate stratified (by NH characteristics) sampling. The FFIQ, a theory-driven instrument that measures the perceptions of DONs about the impact of quality monitoring, adequate staffing, NHs policies, NH environment, and process issues on falls will be used for this study. Descriptive statistics, exploratory factor analyses, test-retest and internal consistency reliability analyses will be conducted. Results: We expect

measures of the FFIQ to be efficient (require less than 20 minutes to complete) and to demonstrate acceptable-to-high reliability (test-retest and internal consistency) and construct validity. Implications: The theory-driven FFIQ would provide a valid measure of the impact of staffing, clinical and administrative policies, quality monitoring, staff education, process-related and environmental issues on NH falls for targeted interventions.

### **TREATMENT EFFECTS OF MULTI-COMPONENT FALL PREVENTION PROGRAMS FOR COMMUNITY-DWELLING OLDER ADULTS**

P. Chang, *School of Occupational Therapy, Texas Woman's University, Houston, Texas*

Background: Falls are the leading cause of acute hospitalization among community-dwelling older adults in the United States, especially those 75 years of age and older. As a result of falls, the elderly experience various degrees of functional decline which requires extensive medical care. Previous studies have examined treatment effects from different fall prevention strategies, however, it is not clear which multi-component approach is more effective than other approaches in preventing falls. Methods: A pilot study was conducted using pre- and post-test comparison design. Participants were older adults 75 years of age or older who reside in the community and have had at least one fall in the past year. After initial screening by the MMSE (score  $\geq 24$ ), participants met once a week, 50 minutes each session for 6 weeks to perform exercise programs followed by safety education. The outcome measurements included function, balance, walking endurance, and health-related quality of life. Results: 6 participants from 2 senior centers completed this pilot study. The mean age of these 6 participants (5 female and 1 male) is 80.8 ( $\pm 5.6$ ), and the mean MMSE score is 27 ( $\pm 1.8$ ). Preliminary data showed significant improvement in standing balance (Berg Balance Scale changed from 37.25 to 47.25) and walking endurance (6-minute Walk distance changed from 699 ft to 959 ft). These 6 participants also demonstrated some improvement in functional independence and psychological function. Conclusions: Strengthening and balance exercise programs have significant treatment effects on improving balance and walking endurance for older adults aged 75 and older.

### **FALLS RISK MANAGEMENT AND ELECTRONIC MEDICAL RECORDS: INNOVATION TO SUPPORT PRACTICE CHANGE**

L. Schrodt<sup>3</sup>, R. Weaver<sup>2</sup>, C.L. Clarke<sup>1</sup>, R. McWilliams<sup>2</sup>, J. Busby-Whitehead<sup>1</sup>, T. Shubert<sup>1</sup>, *1. Center for Aging and Health, UNC Chapel Hill, Chapel Hill, North Carolina, 2. Mountain Area Health Education Center, Asheville, North Carolina, 3. Western North Carolina University, Cullowhee, North Carolina*

In the western region of North Carolina 9 of 16 counties have 20% or more of the population over age 65. Older adult falls are the leading reason for emergency room visits and accidental deaths in this region. A survey of primary care physician practices indicated evidence-based falls risk management practices were not a routine part of older adult office visits. To increase the reach of clinical practice guidelines to prevent falls, a project was conducted to integrate falls risk screening, assessment, and intervention fields into the practice's electronic medical record (EMR). To enhance adoption, the EMR fields were created per Medicare's Physician Quality Reporting System, using falls risk assessment and plan of care as quality indicators. A brief training was created, and individual meetings with practice managers insured all staff and clinicians understood the new EMR fields. Eleven practices agreed to participate and five received the intervention. Baseline measures reveal that of the 5 practices serving 5000 Medicare patients, there was no consistent implementation of falls risk management practices amongst providers. After the EMR and training interventions, preliminary data support effective practice change, with  $> 80\%$  of Medicare patients screened and assessed for falls risk per EMR. Additional data from the

remaining pilot sites will be collected and analyzed to further assess the outcomes of this innovative, systems-based approach to increase the reach, effectiveness, adoption, implementation and maintenance of falls risk screening in a physician practice.

### **FALLING SHORT: RECRUITING ELDERLY INDIVIDUALS FOR A FALL STUDY**

S.R. Parasuraman, S. Rupcic, *Healthcare Innovation and Technology Lab, New York, New York*

Despite the importance of activity indicators in predicting the risk of falls in older adults, activity data on the elderly are limited. This may result from the recruitment and sampling methods of activity-related studies and fall observations in older adults. This article addresses recruitment and sampling methodology issues and draws attention to the gap in best practices left by previous literature. It leverages a systematic review of methods used to recruit elderly subjects for fall studies, highlighting the most effective recruitment strategies across several settings. These findings are further explored in light of the challenges faced by the researchers of one fall study in 2011, particularly in recruiting from the “sweet spot” of older adults at a sufficiently high risk of falling, yet with the requisite cognitive capacity to adhere to activity protocols. The analysis suggests several tactics for improving the recruitment of older adults for activity-related studies, including: recruiting from settings where community-dwelling older adults organize; utilizing short-term activity protocols to promote involvement among institutionalized elderly; establishing eligibility criteria that are not overly exclusive of those with lower cognitive functioning, mobility restrictions, and co-morbidities; employing direct mail recruitment methods to reach community-dwelling participants; and utilizing intermediaries to recruit institutionalized elderly.

## **SESSION 740 (POSTER)**

### **FAMILY CAREGIVING**

#### **WILLINGNESS TO ENROLL IN A RCT OF HAND & TUBE FEEDING IN INDIVIDUALS WITH DEMENTIA: CAREGIVER REPORTS**

E.J. Amella<sup>1</sup>, M. Madisetti<sup>1</sup>, C.M. Spencer<sup>1</sup>, V.L. Durkalski<sup>1</sup>, M.B. Aselage<sup>2</sup>, J. Zapka<sup>1</sup>, *1. College of Nursing, Medical University of South Carolina, Charleston, South Carolina, 2. Duke University, Durham, North Carolina*

**Background:** Studies suggest that in individuals with late-stage dementia, percutaneous endoscopic gastrostomy (PEG) tubes are no better than hand feeding yet caregivers (CGs) are regularly asked to make this decision. **Purpose:** To determine feasibility of enrolling individuals with late-stage dementia (IWD) into an RCT of PEG vs. hand feeding. **Method:** As part of a feasibility study, CGs (n=24) of IWDs [mild (n=7), moderate (n=8), and severe (n=9)] either living in the community (n = 17) or institutionalized (n=7) were interviewed in person. **Findings:** Eight CGs would consider enrollment - 9 were “unsure”. Of all CGs, those with IWD in late-stage (n = 9) were most likely to consent (3 “yes”, 3 “unsure”). The group was diverse based on relationship, age, race and education. IWD quality of life and mealtime dysfunction were poorest among those with severe dementia, while CG burden was highest in moderate dementia. Among CG’s, 64% would “not” or would be “slightly” influenced by their physician’s recommendation; 72% reported awareness of data presented regarding feeding issues. Misconception of the research process was suggested: 64% believed their IWD would receive better care if enrolled; 68% either believed or were unsure if their IWD would be “placed” into a treatment arm that suited their health problems. **Conclusions:** CGs report willingness to enroll an IWD in this RCT, yet their provider’s recommendation was not reported as an influence. Timing of enrollment appears critical. Mis-

understanding of the research process and randomization creates challenges to informed consent.

### **GENDER SPECIFIC WEB-BASED EDUCATIONAL MODULES FOR CAREGIVERS OF PERSONS WITH ALZHEIMER’S DISEASE**

C.E. Gies<sup>1</sup>, L.L. Pierce<sup>1</sup>, V. Steiner<sup>1</sup>, D. Smolen<sup>1</sup>, S. Smith<sup>2</sup>, *1. College of Nursing, University of Toledo, Toledo, Ohio, 2. Wright State University, Dayton, Ohio*

Seventy percent of 5.3 million Americans with Alzheimer’s disease (AD) live at home, where family caregivers provide long term, complex care. Evidence in the literature suggests that men and women differ in how they approach and are affected by the experience of caregiving. Caregiver assessment can identify key problems specific to men and women. Cost effective, convenient Web-based Educational Modules (WBEMs) for AD caregivers could support caregivers and provide an efficient resource for healthcare providers in clinical settings. This evidence-based practice project, guided by Friedemann’s Framework and Stetler’s Model, identified gender differences in problems (incongruence) reported by caregivers of persons with AD. Stakeholders are persons with AD, their family caregivers and healthcare providers with Internet access. Gender specific WBEMs were developed to help caregivers cope with these problems. Four male and six female caregivers completed a web-based adaptation of the Carer’s Needs Assessment for Dementia instrument. Assessment results and evidence-based literature were compared to determine key gender differences in caregiving problems. Two male and two female WBEMs were then developed and evaluated for utility, feasibility and functionality by a second group of male (n=6) and female (n=6) caregivers using a Caregiver Evaluation Questionnaire. Both evaluator groups agreed that the WBEMs were well designed with clear, credible, informative content. Suggestions for larger font size and navigation directions will be incorporated in module revisions. WBEMs have potential to re-establish congruence/well-being for caregivers of persons with AD and be adapted for use by healthcare providers and caregivers of persons with other chronic illnesses.

### **FACTORS ASSOCIATED WITH QUALITY OF LIFE OF RURAL WOMEN CAREGIVERS OF PERSONS WITH ADVANCED CANCER**

W.D. Duggeby<sup>1</sup>, A. Williams<sup>2</sup>, H. O’Rourke<sup>1</sup>, S. Ghosh<sup>1</sup>, *1. Nursing, University of Alberta, Edmonton, Alberta, Canada, 2. McMaster University, Hamilton, Ontario, Canada*

**Research Aim;** To examine factors associated with health-related quality of life in rural women caregivers of persons with advanced cancer. **Sample:** 122 rural women, mean age 59.0 (SD=11.5) who had been caregiving on average 38 months (SD 77.3). **Study Design and Methods;** Correlation cross-sectional design was used. Six hundred surveys were mailed out through the Alberta and Saskatchewan Cancer Registry. Participants were asked to complete a demographic form, the Herth Hope Index (HHI), the General Self-Efficacy Scale (GSES), the Non Death Revised Grief Inventory (NDREGI) and the SF 12. **Data Analysis:** Variables significant at the p<0.10 level in the univariate analysis were entered in the multivariate generalized linear model to determine significant factors associated with health-related quality of life as measured by SF12. **Results:** The SF 12 mean physical health summary score was 43.3 (SD= 4.63) and the mean mental health summary score was 45.2 (SD 5.99). The factors associated with physical quality of life were self-efficacy (GSES) (p=0.003) and guilt (NDRGEI Subscale) (p=0.035). Self efficacy (GSES) was a significant factor for the SF12 mental health-related quality of life summary score (p=0.004). **Discussion/Conclusion:** Compared to United States population norms, study participants scored below the 25th percentile for physical health summary score and close to the 25th percentile for mental health summary scores. This suggests that they had poor reported physical and mental health. General

self efficacy (belief they can perform difficult tasks or cope with adversity) was a significant factor for both physical and mental health.

### **FAMILY CAREGIVING FOR OLDER ADULTS: THE ROLE OF RESOURCES IN MODERATING CAREGIVER OUTCOMES**

G. McGhan, R. BeLue, J. Penrod, *Penn State University, University Park, Pennsylvania*

**Purpose:** According to the National Alliance for Caregiving (2011), 65.7 million caregivers make up 29% of the United States adult population and are found in 31% of all the households. Caregiving can result in increased morbidity and mortality for the caregiver however; recent studies have shown positive outcomes such as improved well-being. Support for family caregivers is important, yet there is a shortage of strategies to assess caregivers' needs. The purpose of this study is to examine the relationship between resources in the caregiving role and their effects on caregiver strain and satisfaction. **Methods:** The Conservation of Resources model provides the theoretical framework and accounts for both the positive and negative outcomes of caregiving. Secondary analysis of data from the 2004 National Long-Term Care Survey, Informal Caregiver Supplement was completed using OLS Regression with moderation analysis (n=1471). **Results:** Our findings of greater demands in the caregiving role resulting in higher levels of caregiver strain ( $\beta = .470, p < .001$ ) are consistent with previous research. An interesting result from this study is resources in the form of family support reduces caregiver strain ( $\beta = -.251, p < .001$ ) and positively moderates the effect of caregiver demands on strain levels ( $\beta = -.107, p < .001$ ) whereas resources in the form of personal support has a stronger relationship with satisfaction ( $\beta = .164, p < .001$ ) than with strain ( $\beta = -.087, p < .005$ ). **Conclusions:** These findings support the need to assess caregivers' perceptions of their support systems so that interventions may be tailored to address their specific resource needs.

### **FACTOR ANALYSIS ON A RESPITE NEEDS QUESTIONNAIRE FOR KOREAN FAMILY CAREGIVERS TAKING CARE OF DEMENTIA PATIENTS**

M. Song, *nursing department, Hoseo university, Asan-si, Republic of Korea*

**PURPOSE** The purpose of this study was to identify the main factors among the respite needs of Korean family caregivers taking care of dementia patients in order to develop effective respite care programs. **METHODS** The data were collected from 180 family caregivers of dementia patients who expressed a willingness to participate in the study during March through May, 2009 in community health care centers through a newly developed 23-item questionnaire for measuring the respite needs of family caregivers taking care of dementia patients. Factor analysis was conducted to identify the main factors from the respite needs questionnaire. **RESULTS** The factors with respect to the respite needs of Korean family caregivers taking care of dementia patients were classified into 6, that is, needs concerning 1) knowledge improvement and education 2) diversion and relaxation, 3) using public support systems, 4) rest and physical health management, 5) economic support, and 6) family support. **CONCLUSION** To achieve the most effective respite care for family caregivers taking care of dementia patients, the needs concerning knowledge improvement and education, diversion and relaxation, using public support systems, rest and health management, economic support, and family support should be chiefly considered.

### **CAREGIVER HEALTH OUTCOMES BASED ON ACCESS TO HEALTH CARE PROVIDER FOR THEIR CARE RECIPIENT**

C. Fowler<sup>1</sup>, M. Walia<sup>2</sup>, *1. Nursing, Old Dominion University, Norfolk, Virginia, 2. Eastern Virginia Medical School, Norfolk, Virginia*

**PROBLEM:** Many home bound older individuals do not have access to a health care provider (HCP) despite suffering from multiple chronic health problems. Their health status often impacts the health of their

caregiver. **PURPOSE:** The purpose of this study is to compare the health outcomes for caregivers of home bound older individuals based on the care recipient's access to a HCP. **EBP QUESTIONS:** Is there a significant difference between the scores on the Short Form 36 tool for those caregivers of home bound older individuals that have access to a HCP for their care recipients compared to those that do not? What are the barriers to obtaining access to a HCP? **DESIGN:** Descriptive cross sectional case control study. **METHODS:** The SF36 health assessment tool was completed by 55 caregivers (34 with access to a HCP for their care recipient and 21 without access). They were also asked specific questions about barriers to obtaining services from a HCP. **OUTCOMES:** The study showed lower mental and physical component scores on the SF 36 for caregivers that did not have access to a HCP for their care recipient, at a statistically significant level (MCS 46.36 vs. 39.28,  $p=0.47$ /PCS 50.79 vs. 41.75,  $p=0.002$ ) Also, it showed two major barriers to obtaining access, difficult transfers and behaviors. **SIGNIFICANCE:** Care recipients' access to a HCP has a positive effect on the health outcomes of caregivers. Additional research could evaluate new ways of reaching caregivers and extend the reach of HCPs to older individuals and their caregivers.

### **FROM MARGINS TO THE CENTRE: CAREGIVING FOR THE FRAIL ELDERLY IN SINGAPORE**

C.J. Bing, *Care Integrated Division, Agency for Integrated Care, Singapore, Singapore, Singapore*

Caregiving in Singapore is increasing in complexity with the ageing population and growing life expectancy compounded with a rising prevalence of more complex chronic medical and mental conditions. Caregivers face the high possibility of caregiver burnout as they are expected to meet their loved one's probable needs along the entire trajectories of illnesses while not necessary receiving timely supports. Singapore's Ministry of Health set up Agency of Integrated Care (AIC) in 2009 as the national healthcare integrator of Singapore. The mission of AIC is to achieve the best health outcomes for our patients and caregivers through right siting of services and building a well-connected health and social care system. In response to the gaps and disintegrated system of caregiver services, AIC established a caregiver framework to empower caregivers through 3 main thrusts: the "Information", "Support" and "Instrumental Skills" (ISIS) pillars. These pillars aim to provide caregivers with easily accessible and navigated information, an available robust network of support mechanisms and the right set of competency skills in managing their loved one's care needs across the different health and social care signposting. From this poster, participants will be informed on the first round of initiatives rolled out by AIC through platforms like the Internet, caregiver skills training, transitional and respite care services, designed to achieve AIC's roadmap of providing caregivers with a wide range of adequate supports that spin from early diagnosis to home care

### **PREDICTORS OF MENTAL HEALTH IN FAMILY CAREGIVERS OF THAI ELDERLY**

S. Jaratsit<sup>1,2</sup>, C. Reynolds<sup>1</sup>, R. Phatchana<sup>1</sup>, H. Stohry<sup>1</sup>, *1. Institute for Population and Social Research, Nakhornpathom, Thailand, 2. Miami University, oxford, Ohio*

The issues of family caregivers for the older adults are increasing discussed in aging societies. In Asian cultures, family members are expected to provide care for older relatives. In Thailand, many people prefer to provide care for older relatives rather than sending them to a nursing home; the caregiving situation gives many adults an opportunity to bond with their parents or older family members. Despite these benefits, family caregivers often suffer from stress due to the multiple roles required of them. This quantitative study examines significant factors affecting the mental health of 308 primary family caregivers for older adults (60+ years) in Kanchanaburi, Thailand, and explores the magnitude of stress affecting the daily lives of family caregivers. Stress

is defined in terms of mental health, which is measured using the Thai Mental Health Indicator (TMHI-15) as developed by the Thai Ministry of Public Health. Using a logistic regression analysis, six significant factors were found to affect mental health of family caregivers: work status, caregiving assistance(?), duration of caregiving, amount of services, educational level, and caring coping. Results suggest that time consumption is an important factor influencing stress of family caregivers.

## SESSION 745 (POSTER)

### FRAILITY

#### DO PSYCHOSOCIAL FACTORS MODIFY THE EFFECTS OF FRAILITY ON FUNCTIONAL DECLINE AND MORTALITY?

E.O. Hoogendijk<sup>1</sup>, H. van Hout<sup>1</sup>, H. van der Horst<sup>1</sup>, D.J. Deeg<sup>2</sup>, M. Huisman<sup>2,3</sup>, 1. Department of General Practice & Elderly Care Medicine, EMGO Institute for Health and Care Research, VU University Medical Center, Amsterdam, Netherlands, 2. Department of Epidemiology & Biostatistics, EMGO Institute for Health and Care Research, VU University Medical Center, Amsterdam, Netherlands, 3. Department of Sociology, VU University Amsterdam, Amsterdam, Netherlands

The aim of this study was to investigate whether psychosocial factors modify associations between frailty and adverse outcomes. The study sample consisted of 1188 men and women aged 65 and over participating in the two most recent waves of the Longitudinal Aging Study Amsterdam (LASA). Frailty and psychosocial factors were assessed at T1 (2005/2006). The frailty indicator was based on the frailty definition of Strawbridge. Psychosocial factors included mastery, self-efficacy, personal network size and received emotional support. Adverse outcomes included functional decline and mortality assessed at T2 (2008/2009). Results of logistic regression analyses demonstrated that frail older adults had higher odds of both functional decline and mortality. Mastery was associated with mortality and self-efficacy was associated with functional decline. No statistically significant interaction effects between frailty and psychosocial factors were found. The results of this study showed that frailty and psychosocial factors are associated with functional decline and mortality. However, it seems that psychosocial resources do not buffer against adverse outcomes in frail older adults.

#### AN IDENTIFICATION AND CARE PROGRAM FOR FRAIL OLDER PEOPLE: EXPERIENCES OF OLDER PEOPLE AND PROFESSIONALS

J. Bindels<sup>1</sup>, K. Cox<sup>1,2</sup>, G. Widdershoven<sup>3</sup>, O. van Schayck<sup>1</sup>, T. Abma<sup>3</sup>, 1. CAPHRI Research School, Maastricht University, Maastricht, Netherlands, 2. Fontys University of Applied Sciences, Eindhoven, Netherlands, 3. Medical Humanities, VU University Medical Centre., Amsterdam, Netherlands

**BACKGROUND:** Frailty is one of the largest problems that older people face, and is a risk-factor for adverse health outcomes such as disability and even death. It can put a burden on society by higher health-expenditures due to more hospitalization and an increasing demand for long term-care. In three regions in the Netherlands, programs for community-dwelling frail older people are developed, which contain the identification of frailty in older people and home-visits performed by practice nurses. A better understanding of the experiences of those involved is needed to gain insights into the results of interventions for frail older people. **METHOD:** Data were collected over an 18 months period. In-depth interviews were conducted with older people (n=23) and practice nurses (n=12). Furthermore, two focus group interviews took place with practice nurses, one with general practitioners and one with physiotherapists and occupational therapists. All data were analyzed using a Grounded Theory approach. **RESULTS:** Analysis elucidated that many community-dwelling frail older people experience lone-

liness. Older people appreciate the interaction with the practice nurses and use this interaction to share their thoughts concerning every day life. Not all practice nurses feel equipped to manage problems on the social domain of aging. Furthermore, professionals perceived problems in facilitating care for reluctant frail older persons. **CONCLUSION:** Problems on the social domain should receive more attention in the care for community-dwelling frail older people as well as in the support and education for professionals.

### FRAILITY IN COMMUNITY-DWELLING OLDER MEXICANS

E. Arias Merino<sup>1</sup>, N.M. Mendoza-Ruvalcaba<sup>1</sup>, J. Cueva Contreras<sup>1</sup>, R. Meda Lara<sup>1</sup>, M.J. Arias-Merino<sup>1</sup>, G.G. Ortiz<sup>2</sup>, 1. Salud Pública, Universidad de Guadalajara, Zapopan, Jalisco, Mexico, 2. Instituto Mexicano del Seguro Social, CIBO., Guadalajara, Jalisco, Mexico

Frailty is a geriatric syndrome that places older adults at risk for adverse health outcomes such as functional impairments, falls, multiple medical co-morbidities, hospitalization, institutionalization, and death. Objective: To describe frailty status in community-dwelling older Mexicans. Design: Data were used from the Health, Wellbeing and Aging Study (SABE) in Jalisco COETCYJAL-UGD 252008891, SSJal) and, Colima, Mexico (CASOENAC, FONCICYT 94670). Participants were 2082 non-institutionalized Mexicans 749 (36%) men and 1332 (64%) women, of 60 years and older. Measurements: Frailty was defined as: Unintentional weight loss (>3 kg in the last year), Weakness (Grip string), Slow walking (Mobility), Self-reported-exhaustion (Depressive symptoms), and Low physical activity level (Basic Activities of Daily Living). Information about socio-demographic factors, cognitive function, health conditions, depressive symptoms, functional and nutritional status, was obtained through a comprehensive gerontological assessment. Results: A total of 309 (14.8%) were frail, 915 (43.9%) pre-frail. Both exhaustion (34.4%) and slowness in walking speed (34.4%) were the most common criteria that contributed to the condition of frailty status, followed by grip strength (20.3%), low activity (11.5%) and weight loss (8.6%). Also the factors of being female, low education, malnutrition, depression, IADL, hypertension, diabetes mellitus, heart, lung and cerebral vascular disease and arthritis are related. Falls, urinary and fecal incontinence are related as well. Conclusions: Our results of frailty are higher than in other studies. Longitudinal studies are needed to establish predictors.

#### HOME SWEET HOME EU AAL TRIAL: SELECTION OF CLINICAL INDICATORS FOR FRAIL OLDER ADULTS

A. O'Hanlon<sup>1</sup>, I. Saez<sup>2</sup>, M. Vandewoude<sup>3</sup>, W. Keijsers<sup>4</sup>, P. Squillace<sup>5</sup>, 1. Netwell Centre, Dundalk Institute of Technology, Dundalk, Ireland, 2. Badalona Serveis Assistencials, Spain, Badalona, Spain, 3. ZNA (Ziekenhuis Netwerk Antwerpen), Belgium, Antwerpen, Belgium, 4. Health Information Management SA, Belgium, Antwerpen, Belgium, 5. Azienda Unità Sanitaria Locale di Latina, Latina, Italy

Ambient Assisted Living (AAL) technologies have the potential to extend independent living among older people. Home Sweet Home (HSH) is a European Commission co-funded AAL project in four European countries: Belgium, Ireland, Italy, and Spain. This project aims to specify clinical indicators for a practical and valid evaluation of frailty among older HSH participants. Participants were community based adults aged 65+ years, randomly grouped into those receiving usual-care-only and those augmenting usual care with home-based technologies. Clinical outcomes measures were chosen with respect to the following criteria: use of identical indicators across sites; relevance for an older population and for prevalent pathologies and conditions; usefulness for economical evaluation and reliability and ease of measurement. Measures had to be available in four trial site languages (Dutch, English, Italian and Spanish). All participants were successfully screened as being mild- or moderately frail using the Edmonton Frail Scale (EFS). Measures of cognitive status, handgrip strength and gait speed were suc-

cessfully included as indicators of frailty among the sample. Height, weight, unintentional weight loss, and the MNA-Short form for nutritional assessment were also successfully included, as were measures of mental health and well-being. Frailty can be understood as a composite of indicators across many domains of functioning including biological and physical, sensory and perception, psychological and social. Despite pragmatic and research challenges, HSH researchers were able to select and baseline successfully a range of clinical indicators or measures for frailty among older adults in four European trail countries.

#### COMPARISON ON FUNCTIONS BETWEEN COMMUNITY AND NURSING HOME RESIDING ELDERS IN KOREA

G. Hong<sup>1</sup>, S. Lee<sup>2</sup>, Y. Lee<sup>1</sup>, *1. Hanyang University, Seoul, Republic of Korea, 2. Bucheon College, Dept. of Nursing, Bucheon, Republic of Korea*

Frailty has been known to predict disability, institutionalization, and motility in both community and nursing home residing elders. Using the following frail indicators, the purpose of the study was to examine difference in general characteristics (age, gender, educational level, BMI, perceived health), physical (activities of daily living, grip strength, and peak flow), psychological (depression and familiarity), cognitive function, and nutritional status between community and long-term care facility residing elders in Korea. Descriptive study design was used through face-to-face interviews. Data collection was done from October, 2011 to February, 2012. Two hundred ninety-two community residing elders were recruited from K city through the public health centers, and 304 nursing home residing elders were taken from 7 long-term care facilities of more than 80 beds in several cities in Korea. Main instruments were included such as Korean version of the Modified Barthel Index, the Cornell Scale for Depression and Dementia (CSDD), familiarity scale, the Korean version of Mini-Mental Status Examination for screening dementia (MMSE-DS), and Mini Nutritional Assessment (MNA). Mean age was 77.94(SD=7.07), and the majority of the subjects was female (73.3%), and widow (66.5%). Age( $t=9.16, p<.001$ ), educational level( $\chi^2=53.37, p<.001$ ), BMI ( $t=-6.43, p<.001$ ), perceived health ( $t=-3.97, p<.001$ ), depression ( $t=-2.84, p<.01$ ), familiarity ( $t=-12.89, p<.001$ ), cognition ( $t=-20.71, p<.001$ ), and nutrition ( $t=-14.79, p<.001$ ) were statistically significant between two groups. Population based interventions that can improve all types of functions should be developed and adapted to postpone the frail process in elders.

#### DEVELOPMENT OF A BRIEF QUESTIONNAIRE FOR SCREENING FRAILTY AMONG JAPANESE OLDER ADULTS

S. Shinkai<sup>1,2</sup>, M. Nishi<sup>1,2</sup>, H. Murayama<sup>1,2</sup>, H. Yoshida<sup>1</sup>, Y. Fujiwara<sup>1</sup>, M. Kim<sup>1</sup>, H. Amano<sup>1</sup>, Y. Taniguchi<sup>1,2</sup>, *1. Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan, 2. Japan Science and Technology Agency, RISTEX, Tokyo, Japan*

Background/Purpose: We previously developed a questionnaire-based 15-items check-list (CL) for screening older persons at higher risk for functional decline. This study further examined the validity of this CL for using as a frailty index. Methods: 612 community-dwelling elderly aged 65 years and over undertook a comprehensive geriatric assessment in 2007. Using the data, we examined the temporal relationship between Fried's frailty (=external criteria) and the CL for evaluating concurrent validity. Further, 916 community-dwelling elderly aged 70 years and over who participated in the baseline survey in 2001 were followed for subsequent 5 years regarding the onset of ADL disability and mortality. Using the data, we examined the predictive validity of the CL for such adverse health outcomes. Results: The CL (range=0-15 points; cut-off point=3/4 points) successfully discriminated Fried's frailty and non-frailty at the sensitivity of 70.0% and specificity of 89.3%. Higher the CL score, higher the prevalence of frailty; the linearity was highly significant ( $p<.0001$ ). As compared with older persons who had CL scores of less than 4 points, those who had CL scores of 4 points or over showed

significantly higher risk for developing adverse outcomes. Multiple-adjusted relative risks for ADL disability at 2 and 4 years later were 4.82 (95%CI: 2.54-9.15) and 3.07 (1.59-5.94), respectively. Likewise, that for mortality during the 4-year follow-up period was 2.40 (1.67-3.43). Conclusions: The CL had good concurrent and predictive validity as frailty index. Since it comprises 15 easy-to-answer questions, it could be widely used for research on frailty and its preventive intervention.

#### EXAMINING THE EFFECTS OF PREDICTORS ON LONGITUDINAL TRAJECTORIES IN FRAILTY INDICATORS

O. Zaslavsky<sup>1</sup>, B.B. Cochrane<sup>1</sup>, J.R. Herting<sup>1</sup>, N.F. Woods<sup>1</sup>, A.Z. LaCroix<sup>2</sup>, *1. University of Washington, Seattle, Washington, 2. Fred Hutchinson Cancer Reserach Institute, Seattle, Washington*

Frailty is a common geriatric condition with a wide array of adverse consequences. Despite its long history in research and publications, mechanisms of frailty development are still poorly understood. A number of models have been proposed to objectively screen for frailty and to assess its long-term consequences in clinical and community settings. Thus far, frailty indicators have been analyzed as predictors of health outcomes, based on a baseline "snap shot" of their distributions at the lowest quintile of functioning. Such definitions yield results that are inherently linked to the timing of measures and the unique characteristics of the sample. A finer-grained description of long-term trajectories of frailty indicators will increase our ability to predict clinically relevant geriatric outcomes while overcoming constraints imposed by cross-sectional measures. We examined trajectories of change in frailty indicators by applying Latent Class Growth Modeling to a longitudinal dataset obtained from a large cohort (N~45,000) of postmenopausal, community-dwelling older women (ages 65+) participating in Women's Health Initiative over an average follow up of 7-8 years. The analysis enabled us to test pre-specified hypotheses concerning the association of baseline covariates (e.g., demographic characteristics, co-morbidities, life style, psycho-emotional factors) with different longitudinal trajectories. In summary, as the result of being data-driven and multidimensional, the trajectories and their predictors derived from these analyses reflect clinically relevant longitudinal pathways of frailty in a large ethnically and geographically diverse cohort of community dwelling older women.

#### SESSION 750 (POSTER)

##### CIVIL ENGAGEMENT; VOLUNTEER ACTIVITIES

##### GENERATIVITY MOTIVATION IN OLDER VOLUNTEERS

H. Chen, N. Morrow-Howell, *Washington University in St. Louis, Brown School of Social Work, St. Louis, Missouri*

Aim: This study seeks to advance knowledge of volunteerism among older adults by examining factors associated with a generativity motivation for volunteering. Generativity is defined as an adult's concern for the welfare of the next generation. Methods: Data are from a study of Experience Corps® (EC), a national program where older volunteers are trained and supported in working with low-reading students in public elementary schools. There were two cohorts of new EC members in the survey, one joined in the fall of 2006 and the other in fall 2007. In this study, participants' demographic information and their primary reason to join EC are analyzed. A total of 500 members were interviewed at baseline. A logistic regression model was used to identify demographic factors associated with generativity as a motive to volunteer. Findings: Results showed that 60% of participants were motivated by generativity. Generativity motivation differed by race, marital status, but not by gender and living arrangements. African American volunteers were more likely to have generativity motivation than their non-African American counterparts. Participants who were never married were less likely to report motivation. Findings also indicated that there was an interaction

effect between gender and retirement status, showing that retired females were more likely to be motivated by generativity than working females and working and retired males. Implications: In general, recruitment messages about generativity would have wide appeal. Specifically, to increase the diversity of the volunteer workforce where ethnic minorities are underrepresented, messages about generativity could be targeted toward African Americans.

#### **RETIREMENT AND VOLUNTEERING: BURN CAMP AND COMMITTED SERVICE BY FIREFIGHTERS**

S. Kolomer<sup>1</sup>, D. Dillard<sup>2</sup>, 1. *University of Georgia School of Social Work, Athens, GA*, 2. *Georgia Firefighter Burn Foundation, Atlanta, Georgia*

Background: For 20 years, the Georgia Firefighters Burn Foundation has operated a weeklong summer camp for children with burn injuries. This organization boasts an extremely high return rate of camp volunteers. Many returning volunteers are now retired from their professional lives in the fire service. The purpose of this study was to explore whether providing service at a camp for burn-injured children is an activity in which retired fire service personnel knowingly or unknowingly participate in as a means of self-care. Methodology: Ten retired firefighters were interviewed about their volunteer experiences at burn camp. These volunteers attended camp at least two times, with most participating more than 10 years. Questions were designed to elicit information about the volunteers' experiences that provided motivation to continue returning to camp now that they were retired. General themes were identified and analyzed through a grounded theory approach to assist in understanding the role that camp has played in self-care for retired firefighters. Discussion: Anecdotal evidence has long suggested that volunteering at the camp for severely burned injured children appears to be as beneficial and meaningful for the volunteers as much as it is for the children. Many of the interviewees identified that camp feels like a family and provides support and comfort. The mutual benefits and rewards of volunteering at the camp, as well as physical decline and fear of being unable to contribute on the part of the volunteers will be addressed. Organizational challenges around issues of adaptation of a changing and aging volunteer base will also be presented.

#### **MEASURING THE PERSONAL IMPACTS OF NON-TRADITIONAL VOLUNTEERISM AMONG RURAL OLDER ADULTS**

J. Crittenden, L.W. Kaye, D.C. Wihry, *Center on Aging, Bangor, Maine*

While much is known about the impacts of traditional approaches to older adult volunteerism and the personal benefits derived from such opportunities, this poster will examine the benefits derived from non-traditional civic engagement, namely volunteerism that is self-selected and self-monitored. Encore Leadership Corps (ENCORPS) is a state-wide volunteer leadership program focused on engaging older adults in the areas of development and housing (N=51 projects); staying active, connected, and engaged (N=237 projects); staying healthy (N=47 projects); and transportation and mobility (N=7 projects). One hundred and sixty members, who are between 48 and 87 years (Mean=65 yrs), are working to address community and environmental issues in their respective regions of the state. All projects carried out by ENCORPS members are self-selected and self-driven. This poster presentation will examine the personal and community-level impacts of this unique volunteer leadership initiative. Findings indicate that non-traditional volunteerism pathways can yield the same personal benefits for older adults as more traditional volunteer pathways (i.e. volunteer opportunities dictated by organizational needs rather than personal or community-level needs). Analysis of member assessments (N=62), confirm that the most salient personal benefits derived from program participation include new skills acquisition (81.1%), enhanced confidence in leadership abilities (61.1%), increased socialization (83.3%) and improvements in self-reported physical (55.7%) and emotional health (70.2%). After one year of partici-

ation, members reported both increased immersion in their local communities (56.2%) and an elevated sense of contributing to the health and well-being of those settings (74.2%).

#### **NEIGHBORHOOD INFLUENCES ON THE DECISION TO VOLUNTEER IN LATER LIFE**

S. Dury<sup>1</sup>, M. Musick<sup>2</sup>, L. De Donder<sup>1</sup>, T. Buffel<sup>1</sup>, N. De Witte<sup>3</sup>, D. Verté<sup>1</sup>, 1. *Vrije Universiteit Brussel, Brussels, Belgium*, 2. *University of Texas, Austin, Texas*, 3. *University College Ghent, Ghent, Belgium*

This contribution explores the relation between social and physical features of the neighborhood and participation in volunteering. Relatively strong evidence of the influence of place on older people's physical and mental health exists. However, the question how neighborhoods promote or hinder volunteer participation remains under-explored in social gerontology. The data for the present research are derived from the Belgian Ageing Studies, a project which uses structured questionnaires to collect information about various aspects of quality of life among older adults at the level of municipalities. Using data from Belgian elderly people (N=59,977), a multilevel logistic regression model is tested, with personal characteristics, subjective and objective neighborhood-level measures as independent variables, and volunteering as dependent variable. The results reveal that several social features (e.g. being highly involved in the neighborhood) emerged as positive predictors of volunteering. In addition, experiencing traffic unsafety demonstrates a lower rate of volunteering. The discussion highlights the potential of the local environment as promoters or barriers for volunteering.

#### **PSYCHOLOGICAL CHANGES AMONG OLDER VOLUNTEERS WHO EXPERIENCED ROLE LOSS AND CHANGED SOCIAL NETWORK**

H. Jang, E. Gonzales, *Washington University, St. Louis, Missouri*

Purpose: This study examined changes of positive and negative affect and purpose in life for older volunteers who experienced role loss—death of family members, friends, or widowhood—at the beginning and end of one academic year in the Experience Corps® (EC) program. Specifically, new volunteers were moderated to imply the interaction effect of role losses on the dependent variables. Method: Data from the EC program on 435 volunteers aged 55 and over were used. Multiple regression models estimated the changes of positive affect, negative affect, and purpose in life on volunteers who experienced role loss and new volunteers were moderated. Results: Volunteers who experienced death of family members and were in widowhood were positively associated with changes of positive affect. For new volunteers, there is positive relationship between death of a family member and change in positive affect. For experienced volunteers, there is no relationship between losing a family member and change in positive affect. Implications: This study indicates that volunteering increases positive affect for older adults who had loss of a family member or were in widowhood. Specifically, new volunteers might have much advantage in psychological changes during volunteering.

#### **MATCHING SKILLS AND VOLUNTEER ACTIVITIES AMONG OLDER VOLUNTEERS IN SOUTH KOREA**

J. Park<sup>1</sup>, H. Lee<sup>2</sup>, 1. *Han Shin University, Osan, Gyeonggi, Republic of Korea*, 2. *Kangnam University, Yong In, Gyeonggi, Republic of Korea*

PURPOSE: Older volunteers have unique characteristics and are vastly different from previous generations of volunteers (Einolf, 2008). The purpose of this investigation explored the causal relationships between matching principles and the degree to which older volunteers express satisfaction, commitment, role identification with being a volunteer and well-being in later life. METHODS: The sample consisted of 274 volunteers at agencies in South Korea. Volunteer's motivation, personality, satisfaction, commitment, role identification and well-being were collected using a 5 point Likert scale. RESULTS: Path analyses found

significant direct effects between volunteer's subjective factors and engagement factors. Sobel test found indirect effects of motivation on satisfaction ( $\beta=.043$ ,  $t=2.729$ ,  $p<.05$ ), and personality on satisfaction and role identification ( $\beta=.064$ ,  $t=3.025$ ,  $p<.05$ ) when mediated by the degree of matching skill sets, suggesting a significant mediator. The analyses of the path model support the conceptual model, with the final model producing fit indices well within the range of a good fit of the data to the model ( $X^2=9.712$ ,  $p>.05$ ,  $CFI=.991$ ,  $RMSEA=.06$ ). IMPLICATION: This investigation demonstrates that "matching skillsets" as a mediator, which is connected to motivation and personality, along with well-being, satisfaction and role identification affect a volunteer's positive well-being. A key implication in the individual level is that understanding the transitional phase of retirement and creating volunteer opportunities that match not only the level of willingness to volunteer but the skills set brought to volunteer experience. In the agency level, applying matching principle can enable agencies to decrease the turnover rate and increase the retention rate of volunteers.

### **VOLUNTEER ENGAGEMENT IN TRANSITION TO RETIREMENT**

F. Tang, E. Choi, R. Goode., *Pittsburgh, Pennsylvania*

Older adults used to take up volunteering upon leaving the workforce. However, the changing demographics and expectations for a longer work life among the current older population may affect their volunteer engagement. Late-life work during transition to retirement is composed of a sequence of shifts between work and non-work statuses. Previous studies documented that both part-time workers and non-workers were more likely to volunteer than full-time workers. Presently, older adults tend to actively engage in both paid work and volunteering concurrently. Thus it is important to understand how diverse patterns of the transition to retirement are related to volunteer engagement. Using the data from Health and Retirement Study (2000-2008), this study first identified four latent statuses in retirement transition: full-time worker, part-time worker, fully-retired, and partially-retired. Then we examined transition probabilities that divided respondents into stayers (i.e., those remaining in the same status in sequence) and movers (i.e., those shifting to other statuses over time). We applied generalized linear mixed model to examine latent status and transition probabilities in predicting volunteer engagement over time. Findings showed that work-retirement statuses were not related to volunteering; however, those with high probabilities of remaining in the same status were more likely to volunteer. This study indicated that stability in work status is important for older adults to engage in volunteer activity during the transition to retirement, while those experiencing changes in work behaviors may not consider volunteering as an option for productive engagement.

### **VOLUNTEER GUARDIANS IN THE COMMUNITY: SERVICE PIONEERS**

A.L. Jones, *School of Social Work, University of Maryland, Reisterstown, Maryland*

The growing demographic of older adults will include an increasing number of individuals living with a lack of informal surrogate decision makers/advocates. In light of the possible reductions in government funding for services, community programs could be developed to recruit and train volunteers to serve as legal guardians for incapacitated disabled and older adults, a highly responsible and unique volunteer task. This poster will illustrate themes relating to why people volunteer as guardians, and how they perform duties, with a sample of volunteer guardians ( $n = 12$ ) from an agency in an Eastern state. Data were collected using semi-structured interviews. Data analysis employed grounded theory techniques (Hood, 2007). Qualitative themes indicate a typology of guardian performance ('how I do this') ranging from active case manager to guardian functionary. These performance styles have implications for how/when guardians 'ask for help,' how they 'deal with

conflict,' what their 'training needs' are, and how the agency may use this information to offer more effective management tailored to the volunteer guardians' needs and interests. Viewed through the theoretical lens of symbolic interactionism (Blumer, 1969), guardians expressed a desire to work with one individual who they regarded as unbefriended by society, and tended to strongly advocate on their behalf as a reflection of their role as volunteers in service to the larger society ('advocate/savior'). Implications for practice, policy and future research include the development of a recruitment/training model for volunteer guardians that could be replicated by government, faith-based, and other non-profit social service agencies. Hood, J. (2007). Orthodoxy vs. power: The defining traits of grounded theory. In A Bryant & K. Charmaz (Eds.), *The Sage handbook of grounded theory*, (pp.151-164). Thousand Oaks, CA: Sage Publications, Inc. Blumer, H. (1986). *Symbolic interactionism: a perspective and method*. Berkeley, CA: The University of California Press.

### **ACTIVITY PATTERNS AND WELL-BEING OUTCOMES ASSOCIATED WITH VOLUNTEERING**

N. Morrow-Howell, Y. Lee, *Washington University in St. Louis, St. Louis, Missouri*

Aim. The aims of this study are to 1) examine the change in activity experienced by volunteers who joined the Experience Corps (EC) program and served in a high-commitment volunteer role; and 2) explore activity patterns in relation to well-being outcomes. Method: A sample of 354 older volunteers from a longitudinal study of Experience Corps (EC) was used. Level of activity in 14 areas (leisure, exercise, visiting, shopping, etc) as well as physical health, mental health, and satisfaction measures were obtained at the beginning of volunteer service and three to four years later. Latent class analyses (LCA) were conducted to identify activity patterns, and activity change measures between the pre- and posttest were created based on findings from LCA. Then, structural equation modeling (SEM) was utilized to examine how activity changes were associated with changes in wellbeing outcomes. Findings: In both pre- and posttest, EC volunteers in the study sample were classified into two groups: high-activity and low-activity group. About 17% of the sample moved from low-activity at pretest to high-activity at posttest, 7% from high-activity to low-activity, and 76% stayed in the same group. Findings from SEM showed that EC volunteers who moved from low-activity to high-activity had larger gains in physical and mental health, compared to those in other groups. Changes in activities were not significantly associated with changes in satisfaction. Implications. These findings suggest that changes in activity patterns associated with volunteering might be a mechanism through which volunteering improves well-being outcomes.

### **SESSION 755 (POSTER)**

#### **DISABILITY, FALLS, AND MOBILITY**

##### **EFFECTS OF NEW INCIDENCE AND CUMULATIVE STROKES TO TRAJECTORIES OF PHYSICAL FUNCTIONING**

H. Hsu, *Department of Health Care Administration, Asia University, Taichung, Taiwan*

Purpose: The purpose of this study was to examine the effects of new incidence and cumulative strokes to the trajectories of physical functioning. Methods: Data were from a 6-wave longitudinal panel of the Taiwanese elderly aged 60 or more between 1989 to 2007. The participants who participated during 1993 to 2007 for at least 3 waves or more were included in the analysis ( $n=1,030$ ). Physical function was measured by activities of daily living and instrumental activities of daily living. Group-based trajectory analysis was used for the modeling. Results: Five groups predicted by newly and cumulative reports of strokes among the older adults were identified: The Intact group (37.7%),

the slightly difficult group (32.5%), the moderately difficult group (13.6%), the fast declined group (9.8%), and the severely disabled group (6.3%). The new incidence and the cumulation of strokes in the follow-ups related to the physical function trajectories. Having more chronic diseases would increase physical function disabilities for the intact, the slightly difficult, and the fast declined groups. Having more depressive symptoms accompanied with more function disabilities. The moderate disabled group got more social support when they had more functional disabilities, while the slightly difficult, the fast declined, and the severely disabled groups reported less social support when they had more functional disabilities. Conclusion: New incidence of strokes affected physical function trajectories and the effect may be cumulative. The post-stroke changes of mental and social functioning accompanied with physical disabilities should be monitored.

#### **FRAIL OLDER PEOPLE'S PERSPECTIVES ON BEING TRANSFERRED BY MEANS OF ASSISTIVE DEVICES**

A. Brandt, *The National Resource Centre on Disability, Assistive Technology and Social Psychiatry, The National Board of Social Services, Århus C, Denmark*

Assistive devices such as hoists and sliding blankets are often used by carers when assisting frail older people to transfer, e.g. from bed to wheelchair. The positive effects on the carers' health are well-documented, but very little is known about the perceptions of the persons who receive the assistance. In all 208 Danish persons who received assistance for transfer were interviewed face-to-face by experienced occupational therapists using a structured interview guide, also including open questions. The participants' mean age was 78.3 years (SD 12.7), 57.2% were female, 35.6% lived in private homes and the remainder in sheltered housing or nursing homes. Most had several functional limitations and poor health. More than half of the study participants had an electrically adjustable bed and a wheelchair, and about half got assistance for transfer by means of a mobile or a ceiling mounted hoist. In contrary to many carers' perceptions the participants were satisfied with the use of assistive devices: a mean of 82% were satisfied or very satisfied. Satisfaction with electrically adjusted beds was highest, and it was lowest with turning towers. Most comments on dissatisfaction were related to wheelchairs. Main explanations of high satisfaction concerned the feeling of security, and reasons for low satisfaction were poorly fitted devices. Only 30% took part in the assistive device selection process, mostly because they did not wish to be involved; in fact 85% were satisfied with the implementation process.

#### **UNDERSTANDING SAVING AND PURCHASE PATTERNS OF CONSUMERS IN A SELF-DIRECTED CARE PROGRAM: THE OF THE WEST VIRGINIA PARTICIPANT-DIRECTED GOODS AND SERVICES PROGRAM (PDGS)**

M. Inoue<sup>1</sup>, M. Lombe<sup>1</sup>, M. Putnam<sup>2</sup>, K.J. Mahoney<sup>1</sup>, *1. Boston College, Chestnut Hill, Massachusetts, 2. Simmons College, Boston, Massachusetts*

While evaluation of Medicaid home and community-based services has been extensive, analysis of saving patterns of self-directing consumers has been limited. The present study examines saving and purchase patterns of consumers (N=279) in the Participant-Directed Goods and Services (PDGS) program, part of the West Virginia Medicaid Aged and Disabled Waiver Program. The program offers participants an option to save part of their monthly budget and spend a maximum of \$1,000 each year on equipment, services, or supplies to improve their health statuses and home safety. Our assessment indicated that saving aims and accumulations varied considerably and were influenced by program consultants. Specifically, 32% of program participants saved for items related to improvement in personal functioning, such as dental work, eyeglasses, and hearing aids; 25% saved for household appliances (e.g., washer and dryer, WHAT ELSE?); 21% saved for home modifications, this included items such as walk-in showers and hand rails. We also

found that participants with higher levels of disability were more likely to request household level items compared to personal items. Savings were spent at a variety of shopping venues, with large home improvement stores being regularly patronized. Discussion of findings includes assessing high and low savers, identifying patterns within saving and spending activities, and considering program factors in relation to saving activities. Study conclusions comment on the need to more universally evaluate saving within Medicaid HCBS self-direction programs and to place this research within the larger discourse of asset building among low-income populations.

#### **FALLS AND RESILIENCE: THE PERSPECTIVES OF OLDER KOREANS WHO HAD EXPERIENCED FALLING**

B. Hwang, J. Kang, *Pusan National University, Pusan, Republic of Korea*

Falls are painful experiences among Older Koreans. It is frequently reported that the consequences of falls and their influence on health outcomes or quality of life might be fatal. But, many older Koreans have still led healthy lives in the community even after experiencing falls. The question how older Koreans could gain resilience in their daily life after experiencing falls has not been addressed. Resilience is defined as successful adaptation or recovery of existed capacity in the middle of seriously risky situation (Luthar et al., 2000; Hardy et al., 2004). As a result, this study investigated the experiences of falls from resilience perspectives. Using a phenomenological method, individual and semi-structured interviews were conducted with 15 participants. All participants were recruited from a voluntary fall prevention program in a senior center and a public health center. Four themes emerged from data analysis: recovery of a sense of mastery; reconfirmation toward meaning of life; mobilization of supportive social network; modification of home environment. Additionally, it was discussed that the living arrangement (living with someone/living alone) and income level of participants were influential factors in gaining resilience from falls. Findings from this study have provided insights into experiences of falling for older Koreans from resilience perspectives. These insights suggest gerontological social work interventions should promote a sense of mastery in prevention of falls, facilitate supportive social networks to older Koreans who have fallen, and improvement of their dangerous home environment.

#### **AVAILABILITY OF GERIATRIC CARE FACILITIES IN THE COMMUNITY: VARIATION BY THE PROPORTION OF FOREIGN-BORN POPULATION**

S. Choi, *College of Social Work, University of Tennessee at Knoxville, Knoxville, Tennessee*

Objective. Expanding the previous immigrant health service literature, which has focused heavily on individual-level characteristics, this study examined whether the supply of geriatric care facilities in the community differ by the proportion of foreign-born population at the county level. Contextual factors, such as community-level socioeconomic compositional and resource characteristics, play a significant role in shaping individuals' health service utilization. Methods: This study analyzed the 2009 Area Recourse File and the 2005-2009 American Community Survey (ACS) at the county level (N=3,114). The five-year aggregated ACS sample is designed to facilitate meaningful analyses of smaller areas. The number of stand-alone geriatric care facilities (skilled nursing facilities (SNF), home healthcare agencies (HHA), and hospice) per 100,000 older adults (ages 65+) in each county was calculated to reflect the level of availability of such services. The percentage of foreign-born population was an independent variable. County-level compositional and socioeconomic characteristics were controlled for in the multivariate models. Results: The percentage of foreign-born to the total population ranged from 0% to 63%. The results indicate that as the proportion of foreign-born population in the county increased, the availability of geriatric care facilities decreased (SNF ( $b=-0.04$ ,  $p < .0001$ ) and HHA

( $b = -0.09, p < .0001$ ). Conclusion: These discrepancies in the availability of geriatric care facilities in the counties with high proportions of foreign-born individuals will, in turn, affect individual level service utilization among older foreign-born individuals who live in the areas with limited resources.

## SESSION 760 (POSTER)

### ECONOMICS OF AGING

#### A STUDY ON CRITICAL FACTORS INFLUENCING THE INTENTION OF SENIOR CUSTOMERS TO SHOP ONLINE

H. Wu<sup>1</sup>, H. Chang<sup>2</sup>, Y. Lan<sup>1</sup>, W. Lu<sup>1</sup>, *I. Aletheia University, Tainan City, Taiwan, 2. Marketing, Central Taiwan University of Science and Technology, Taichung City, Taiwan*

In our modern society characterized by well-developed IT infrastructure, the Internet has become a prevalent trend, and most of us have experiences shopping online. Facing our aging society, EZ66, the first portal site in Taiwan specifically targeting the senior group, was founded in 2007 to serve the senior segment in Taiwan. From the perspective of senior customers, this study focuses on analyzing critical factors influencing their tendency to shop online and provides recommendations and references for websites administrators operating similar sites to improve their website designs to attract more senior customers within limited resources. Adopting the Technology Acceptance Model, or TAM, as the research framework, this study utilizes information quality, level of trust, related knowledge and support, website design quality, usability and easiness of use as variables and Structural Equation Model, or SEM, as the research method. To fulfill the goal of this study and understand the intentions of the senior groups shopping online, this study includes the middle aged and senior group (55 years or older) who have ever participated in the ez66 learning camp in the Kaoshiung Region as the study subject. The result identifies that related knowledge and support, website design quality, and easiness of use are the critical factors influencing the tendency of the senior group to shop online. Keywords: Seniors, Information Quality, Level of Trust, Related Knowledge and Support, Website Design Quality, Usability and Easiness of Use

#### EFFECTS OF COMMON POLICY RESTRICTIONS IN LONG TERM CARE INSURANCE ON THE LIKELIHOOD OF EVER QUALIFYING FOR BENEFITS

W. Lu, G.A. Jensen, *Institute of Gerontology, Wayne State University, Detroit, Michigan*

Expenditures for long-term care are one of the largest financial risks facing most older adults today, and private long-term care insurance (LTCI) has been marketed as a strategy to reduce this risk. LTCI policies typically contain provisions that can be difficult to navigate, because they often stipulate multiple criteria a subscriber must meet in order to qualify for payment of benefits. Using data from the ongoing Health and Retirement Study, this study examines the effects of common policy restrictions, and combinations of these restrictions, on the probability that a LTCI policyholder will ever qualify for benefits. It finds that even under the least restrictive LTCI policy, the presence of an "elimination period" (a deductible measured in terms of days-receiving-care) and the usual "ADL restrictions" (that the subscriber be unable to perform two or more activities of daily living) combined together would have excluded more than 50% of the individuals who had a nursing home stay over from collecting any benefits. The probability of ever qualifying for LTCI benefits ranges from 5.1% to 38.4% among all adults ages 65 and older, depending on the policy's particular provisions. The probability varies by gender, and ranges from 10.7% to 44.5% among females, and from 8.1% to 27.2% among males, again depending on the policy's provisions. The paper concludes that the coverage restrictions

in many policies represent a significant barrier to ever receiving a LTCI reimbursement.

#### THE ELDER ECONOMIC SECURITY STANDARD INDEX FOR THE UNITED STATES: GEOGRAPHIC AND DEMOGRAPHIC ASPECTS

J.E. Mutchler, E.A. Bruce, A. Gottlieb, J. Lyu, Y. Shih, M.S. Yang, *Gerontology, UMass Boston, Boston, Massachusetts*

The Elder Economic Security Standard™ Index (Elder Index) is a newly developed measure that quantifies the income required by seniors living in the community to maintain independence and meet basic living expenses. Developed by the Gerontology Institute at the University of Massachusetts Boston, in collaboration with Wider Opportunities for Women, the Elder Index is calculated using publicly available data that is routinely generated by federal agencies. Components of the Elder Index include housing costs (including renter costs and costs for home owners with or without a mortgage), food expenses, transportation expenses, cost of health care, and miscellaneous expenses. The Elder Index is calculated for every county in the United States, providing a consistent indicator of cost of living for seniors that is unmatched in geographic detail. Using GIS and descriptive statistics, this presentation provides a national overview of the Elder Index, revealing substantial differences in cost of living faced by seniors in different areas of the country. A substantial share of seniors in every state reports income that falls below the estimated cost of living. Risk of experiencing income gaps relative to cost of living especially affects seniors who are age 75 and over, members of racial and ethnic minority groups, and single women.

#### GROWING INCOME INEQUALITY IN LATER LIFE FOR KOREAN OLDER ADULTS

J. Kong, C. Shen, *Boston College, Boston, Massachusetts*

This study investigates the long term changes in the income distribution for older adults in Korea, defined as individuals of age 55 and older. Using data from the Korean Labor and Income Panel Study (KLIPS), income inequality within 5-year cohorts were examined for ten-year period of time (1998-2009). The Gini Index of inequality showed a steady increase over time, which supported the Cumulative Advantage/Disadvantage Theory that hypothesizes inequality within-cohort increases with advancing ages. In addition, the comparison of income sources between the bottom and top income quintiles showed that 41% of family income of older adults in the bottom quintile was comprised of financial assistance from family members while 13% of their family income was made up by social insurance income. In contrast, those who are in the top quintile rely heavily on their own earnings (66%); they had a higher percentage of social insurance income (15%). This result may indicate that the retirement income of Korean older adults is mostly obtained from private sources. Public retirement system in Korea may have negligible impact on relieving the heightened later-life inequality. The Individual mobility within the income distribution was also examined by calculating the ten-year quintile transition matrix. The result showed substantial transition probability rates of less than .30, which indicates that nearly 70% of individuals had experienced transition from one income quintile to another, either upward or downward. These high mobility rates open up the need for future research examining the complex dynamics determining later-life inequality.

#### ASSET SHOCKS AND FUTURE VALUE AMONG RESPONDENTS TO THE HEALTH AND RETIREMENT SURVEY

L.H. Nitz, *Univ Hawaii at Manoa, Honolulu, Hawaii*

This study tests the hypothesis that insights or skills from holding financial or other bureaucratic occupations produce better long term asset accumulations after random shocks than the insights or skills from

craft occupations or unclassified occupations. In addition, it tests the hypothesis that college education similarly facilitates asset accumulation. We can think of the respondent's occupation and education as fixed. Their initial allocation of assets and the annual changes in assets can be seen as a random shock—as if a neutral arbiter credited or debited the respondent's bank account at the end of every year. Subjects were 4766 respondents to the Health and Retirement Survey who had non-missing data for education, year 2 occupation, initial assets, and eight years of asset changes. The accumulation process was modeled using a fixed effects (education and occupation) and random effects (initial assets, yearly changes). Denominator degrees of freedom were set to reflect the two fixed effects, subsuming the random repeated measures. SAS PROC GLIMMIX type III tests for effects showed that both occupation and education effects were significant ( $F=11.77$ ,  $p<.0001$ ;  $F23.5$ ,  $p<.0001$ , respectively). Joint effects were not significant. Least squares means for year 8 total assets were: Craft \$284,052; finance, \$552,354; other \$390,113. Least squares means for education were \$308,025 for HS or less and \$513,854 for college. Holding a financial occupation and education affect responses to financial shocks

#### **DETERMINANTS OF THE RETIREMENT ASSETS AND THE STOCK HOLDINGS WITHIN RETIREMENT ASSETS: EVIDENCE FROM THE SURVEY OF CONSUMER FINANCES AND THE HEALTH AND RETIREMENT STUDY**

T. Yang<sup>1</sup>, S. DeVaney<sup>1</sup>, Y. Cheng<sup>2</sup>, 1. *Purdue Univ, West Lafayette, Indiana*, 2. *University of Texas at Austin, Austin, Texas*

The primary objective of this study was to develop a model of the retirement assets and the stock holdings within retirement assets of 401(K) and Keogh accounts. Building upon the theory of human capital, the theory of planned behavior, and the bargaining power model, this study proposed a model suggesting that human capital, attitudes about finances, and the relative bargaining power of the spouse would influence an individual's retirement assets. Using the data from the Survey of Consumer Finances, Part 1 explored the relationship between the three proposed domains and the amount and the allocation of retirement assets. In Part 2, the relationship between the proposed domains and retirement assets were examined by utilizing variables available in the Health and Retirement Study. Those who had higher education, who had better health, saved regularly, and were more likely to take financial risk were more likely to have larger retirement assets, and were more likely to hold more stocks in the retirement assets. The results on the influence of the spouse on retirement assets and the allocation of retirement assets showed supported the bargaining power model. However, the variance explained was small. The study contributed to the literature on the human capital, health capital, and the debate among bargaining power model and shared-resource model. Educators, financial advisors, and policy makers should continue to inform workers to save for retirement when possible and to assume risk that is appropriate to their situation. Spouses should discuss how they will allocate their retirement savings.

#### **IMPACT OF TWO SOCIAL PROGRAMS -70 Y MÁS AND SEGURO POPULAR- ON THE USE OF HEALTH SERVICES FOR THE ELDERLY**

B. Manrique-Espinoza, A. Salinas-Rodríguez, S. Sosa-Rubi, M. Tellez-Rojos Solís, *Instituto Nacional de Salud Pública, Cuernavaca, Morelos, Mexico*

Seguro Popular and 70 y más are two social programs designed to reduce poverty in Mexico. The goal of Seguro Popular (SP) was to improve the financial protection of the uninsured population against excessive health expenditures, and the goal of 70 y más was to improve the living conditions of the older adults aged 70 and over in rural areas. Using a quasi-experimental prospective study, we estimated the effect of both programs on the use of health services for the elderly. The sample consists of 2191 older adults living in 516 rural communities in seven

states of Mexico. The study has two comparison groups: intervention versus control. The analysis includes the baseline measurement (2007) and the follow-up (2008). We analyzed five response variables, all of which were dichotomous: eye exam, hearing test, use of dental services and the implementation of the influenza vaccine. We used a model of differences-in-differences to estimate the effect of both programs. At baseline, in the intervention group, 41% of the older adults received outpatient care, 12% had access to eye exams, 5.8% for hearing exam, and 13% went to dental services. We found no significant effect of 70 y más on the use of outpatient services and preventive health. The Seguro Popular had significant impact on the increased use of outpatient health services (6.8%,  $p = 0.017$ ) in the eye exam (2.7%,  $p = 0.012$ ) and the application of the influenza vaccine (5.3%,  $p = 0.017$ ). It is recommended to expand the links between the two programs so that the observed effect on the use of health services will result in better overall health status of the elderly.

#### **THE LONG-TERM FINANCIAL IMPACTS OF CARING FOR AN AGING PARENT: FINDINGS FROM THE HRS, 1992-2008**

J.C. Greenfield, *Washington University in St. Louis, Saint Louis, Missouri*

With parental caregiving on the rise, a growing body of evidence suggests that not only does caregiving take a physical and emotional toll, but it can also be expensive for caregivers. However, most studies of financial impact use only cross-sectional data to examine the association between caregiving and income or assets. Using multivariate regression and latent growth curve models with data from nine waves of the Health and Retirement Survey (HRS, 1992-2008), this study examines the longitudinal effects of parental caregiving on caregivers' income and assets. We find that not only is caregiving in each wave associated with lower income in that wave, but also, an increase in caregiving duration is associated with increasingly lower wages over time. Findings from models of assets are less clear, though, with caregiving duration associated with statistically significant ( $p<.05$ ) asset decreases in only some waves. As expected, age, gender, education, and self-rated health have significant relationships with asset accumulation/decumulation over time, and in some cases have a mediating effect on the relationship between caregiving and assets. We conclude that the negative impact of caregiving on income is compounded over time, but that the impact of caregiving on long-term asset accumulation and decumulation is less clear. The characteristics of caregivers and the caregiving experience play an important role in determining whether caregiving has a long-term negative effect on household savings and retirement preparedness, and policies designed to buffer negative effects of caregiving need to take these characteristics into account by prioritizing support for vulnerable groups.

#### **SESSION 765 (POSTER)**

##### **ENVIRONMENT AND AGING**

#### **A REVIEW OF BUILT ENVIRONMENT MEASURES IN OLDER ADULT PHYSICAL ACTIVITY AND HEALTH STUDIES**

P. Allen<sup>1</sup>, C.M. Hoehner<sup>2</sup>, R.C. Brownson<sup>1,2</sup>, 1. *The Brown School, Washington University in St. Louis, St. Louis, Missouri*, 2. *Division of Public Health Sciences, Washington University School of Medicine, St. Louis, Missouri*

Background: Despite the growing interest in built environment (BE) research, sparse research exists on BE measures in older adult studies. The purposes of this review are to describe available BE measures, identify measurement gaps, and inform methodology improvement for future research. Methods: Multiple databases were searched for the literature review. Inclusion criteria were studies that quantitatively tested relationships of the BE with physical activity, physical or cognitive func-

tion, or health among adult samples with mean ages  $\geq 55$  years, published 2000-2011 in English in peer-reviewed journals. Reviews and qualitative studies were excluded. Results: One hundred fifteen studies met inclusion criteria for the review. Measures derived mostly from disability or non-gerontology ecological models, with variability in how measures were operationalized. Few of the 38 studies employing non-census GIS-based measures reported efforts to verify or improve completeness and accuracy of non-research archival data. Twenty of 80 studies with perceived BE measures used scales from the well-tested Neighborhood Environment Walking Survey (NEWS). NEWS and twelve additional questionnaires had test-retest scale reliability in the moderate to high range. The eight environmental audit instruments assessed multiple domains, including quality of street-scale features. Walkability and presence of recreational, retail, and service destinations were well assessed at a community-scale for urban design and land use policies but few street-scale measures addressed older adults' varying gait speeds and functional abilities. Conclusions: Future BE research with older adults can be enhanced through adaptation of well-studied perceived BE measures for older adults combined with modified environmental audit or GIS measures.

### **WISCONSIN RESIDENTS' PERCEPTIONS OF "AGING-FRIENDLY" COMMUNITY CHARACTERISTICS: DOES RURALITY MAKE A DIFFERENCE?**

C.E. Barber, *Human Development and Family Studies, University of Wisconsin-Madison, Madison, Wisconsin*

"Aging-friendly" refers to the extent to which a community possess the characteristics that make it an environment where people can live their entire lives, if they so desire, rather than having to relocate because of age-related changes (Scharlach, 2009). **RESEARCH QUESTION:** Does the degree of a county's rurality influence the extent to which residents perceive them to be "aging-friendly"? **METHODS:** The Index of Relative Rurality (Waldorf, 2007) was used to categorize Wisconsin counties as metropolitan, the rural-metropolitan, or rural. Data were collected from 120 focus group participants; 31 residing in metro counties; 47 in rural-metro sphere counties, and 32 in rural counties. Participants were given a list of "aging-friendly" characteristics for each of 13 areas (e.g. housing, transportation) and asked to indicate how many they perceived were present in the communities where they lived (1 = None of them; 2 = A few of them; 3 = About half of them; 4 = Most of them; 5 = All of them). **RESULTS:** One-way between groups MANOVA indicated a statistically significant difference among the three levels of rurality on the combined measures of aging-friendly community characteristics:  $F(2,117) = 4.035, p = .001$ . When the results of the ratings of aging-friendly community attributes in the 13 areas were considered separately, the only differences to reach statistical significance were: Transportation and accessibility:  $F(2,117) = 13.26, p = .001$ ; Health care services and preventative screenings:  $F = 29.07(2,117), p = .001$ ; and Community connectedness  $F(2,117) = 7.83, p = .001$ .

### **ENVIRONMENTAL INFLUENCES ON THE EXPECTATION TO AGE IN PLACE: EXPLORING THE EPA MODEL FOR AGE-FRIENDLY CITIES IN DETROIT**

A.J. Lehning<sup>1</sup>, R.J. Smith<sup>2</sup>, R. Dunkle<sup>1</sup>, 1. *School of Social Work, University of Michigan, Ann Arbor, Michigan*, 2. *Wayne State University, Detroit, Michigan*

Aging in place in has a number of potential benefits for older adults, their families and their communities, but there is little empirical evidence regarding the factors that contribute to an elder's ability to age in place, particularly in terms of relevant environmental characteristics. Based on the EPA Model for Age-Friendly Cities, this study examined the relationship between the social and physical environment and the expectation of aging in place using cross-sectional data from a representative sample of 1,372 older adults living in Detroit. Using exploratory factor analysis, we identified six factors that capture the

EPA Model: 1) access to business and leisure, 2) access to health care, 3) neighborhood problems, 4) social interaction, 5) social support, and 6) community engagement. In the final logistic regression model, only one of these factors was significant: those with higher scores on the neighborhood problems factor (i.e., those reporting more housing and neighborhood problems and lower perceived neighborhood safety) had lower odds of expecting to age in place. These findings may reflect the characteristics of our sample (i.e., urban, majority African American, and disproportionately low income) as well as contribute to a more general understanding of the influence of environmental characteristics on older adults' expectation of aging in place.

### **COORDINATED BED MOVES: A THERAPEUTIC TECHNIQUE FOR OLDER ADULT PRISONERS**

M.T. Harrison<sup>1,2</sup>, R. Macgirvin<sup>1</sup>, R. Papp<sup>1</sup>, D. Haycock<sup>1</sup>, L. Walsh<sup>1</sup>, W.O. Harrison<sup>3</sup>, 1. *Psychology, Nevada Department of Corrections, Carson City, Nevada*, 2. *Fielding Graduate University, Santa Barbara, California*, 3. *University of California San Diego School of Medicine, San Diego, California*

The burgeoning population of older adult prisoners is an active topic in both scientific and lay press. The Nevada Department of Corrections established a structured living program (SSLP) for older prisoners nine years ago. The purpose of the program was to provide humane and humanistic care while meeting physical, psychological and spiritual needs of these individuals. One aspect of that care is the location of the five-foot-by-eight-foot space the prisoner calls "my house", and who lives in the neighborhood. This paper will discuss how successful aging in place behind bars is facilitated by the location of each individual relative to the remainder of the prison housing unit, as well as by the support provided by those who share the unit. Research into home and community preferences among older adults has found that most favored aging in place in the home where they have lived for years, and that this brings life satisfaction to them. When 'home' becomes reduced to a small space in a cell or dormitory, it takes on even more importance. Coordinated bed moves play a critical role in the success of the structured living program. The Unit Management Team (correctional officers, caseworker and Program administrator) regularly discusses placement of individuals in SSLP and their progress in the Program. When individual problems related to physical or mental health occur, the strategy of bed reassignment is seen as the most effective therapeutic measure to ameliorate problems, and has developed into a successful aspect of Unit Management within SSLP.

### **AGING IN PRISON: THE NEGOTIATION OF INSTITUTIONALIZATION AMONG MEN 55 AND OLDER**

R. Filinson, D. Ciambone, *Sociology, Rhode Island College, Providence, Rhode Island*

An interview study was conducted of 67 inmates aged 55 years of age or older at a medium security facility. The focus of the qualitative one-hour interviews was on prisoner perceptions of aging while incarcerated. The findings indicated that inmates of this interview study were experiencing the physical changes that accompany aging but by virtue of their imprisonment, were removed from many of the conventional social transitions associated with aging such as retirement or interacting with grandchildren. The major themes that emerged in their narratives were largely not unique to an aged population and included issues with staff, health care, food, other inmates, dying in prison as well as loss of freedom, discomfort, and separation from family and a "normal life." Because imprisonment so powerfully governs every aspect of their life, old age and aging tended to diminish in significance. Differences between the inmates' current selves and younger selves—particularly if they have been incarcerated for a long time—and even differences between themselves and younger inmates appeared less salient in their current environment. Consequently, the concerns of aging and aging well seem to have taken a back seat to the much more pressing ones of

surviving institutionalization, proving their innocence, and/or maintaining their humanity. Inmate interest in program offerings indicated that they preferred programs whose value would endure outside of the prison environment (and were not age-specific) Programs that provided vocational training, education, life skills, or competencies for transitioning out of the prison were the most highly prized.

#### **INCORPORATING CULTURE INTO ENVIRONMENTAL ASSESSMENT OF COMMUNITY BASED FACILITIES FOR PERSONS WITH DEMENTIA**

Y. Hamasaki<sup>1</sup>, B. Young<sup>2</sup>, 1. *Social Welfare, Kurume University, Kurume, Japan*, 2. *Kwansei Gakuin University School of Human Welfare Studies, Nishinomiya, Japan*

Due to an aging population and recent changes in government policy, small scale multi-functional long-term care facilities in Japan are growing in number. The goal of this research is to establish a post-occupancy evaluation tool for these community-based facilities serving persons with dementia. Care workers and social workers recognize that persons with dementia are influenced by their environment and that improved care requires an environment catered to their needs. However, through our preliminary study, we found that the existing post-occupancy evaluation tool (Professional Environmental Assessment Protocol or PEAP) is not adaptable for small scale facilities in rural settings as it was specifically designed for Special Care Units for persons with dementia often set in large scale facilities in urban settings. This study investigated environmental conditions of group homes through a questionnaire and on-site interviews in rural Kumamoto Prefecture. Results show that attention should not be paid to physical environment alone but that care should make the most out of the natural, regional, and cultural environments as well. These components can improve quality of care by contributing to “the continuity of ordinary lives”, a key element of dementia care. Regarding “individualized care” centered on care recipients, results show that staff in good facilities made efforts to establish a desirable regional care environment (e.g. promoting neighbors’ understanding of dementia or developing a network among facilities). These findings will contribute to improving the existing PEAP and adapting its design to the evaluation of small scale multi-functional long-term care facilities.

#### **BUILT ENVIRONMENT CORRELATES WITH METABOLIC RISK IN MIDDLE-AGED ADULTS**

P. Allen<sup>1</sup>, C.M. Hoehner<sup>2</sup>, R.C. Brownson<sup>1,2</sup>, 1. *The Brown School, Washington University in St. Louis, St. Louis, Missouri*, 2. *Division of Public Health Sciences, Washington University School of Medicine, St. Louis, Missouri*

Background: Built environment characteristics of residential neighborhoods have been associated with physical activity and obesity, but few studies have examined metabolic risk. Methods: This was a cross-sectional study of adult volunteers aged  $\geq 50$  years that completed a preventive medicine examination at the Cooper Clinic in Dallas, Texas in 2000-2007 while living in 12 counties around Dallas-Ft. Worth and Austin, Texas. Secondary analyses were conducted on fasting blood glucose, triglycerides, and HDL; clinical measures of waist circumference and resting blood pressure; and self-reported physical activity. Established criteria for the dependent variable metabolic syndrome were applied. Twelve spatial independent variables included land use, sidewalk coverage, and vegetation in residential buffers, and distance to closest park and city center. Bivariate binary logistic regression models were adjusted for age, sex, smoking, and alcohol intake. Results: The 3,547 adults’ average age was  $57.2 \pm 6.3$  years with 74.4% male, 84.6% college graduates, 74.4% employed, 95.8% white, and 21.3% met criteria for metabolic syndrome. Meeting metabolic syndrome criteria was associated with increasing distance to city center, adjusted odds ratios (95% confidence interval) 1.22 (1.05, 1.41), decreasing numbers of private recreation facilities, .84 (.72, .97), and decreasing street

connectivity, .84 (.72, .99). Relationships with distance to city center and private recreation facilities remained after adjustment for meeting physical activity recommendations ( $\geq 500$  MET-minutes/week). Conclusions: Living far from the city center is associated with metabolic risk more than characteristics of the near residential environment in this sample of middle-aged and older adults. Future research is needed with more diverse populations.

#### **A DEMOGRAPHIC PROFILE AND ANALYSIS OF MEDICINE DISPOSAL HABITS AMONG OLDER ADULT USERS OF PRESCRIPTION DRUG MAILBACK PROGRAMS**

L.W. Kaye<sup>1</sup>, J. Crittenden<sup>1</sup>, J. Middleton<sup>3</sup>, D.C. Wihry<sup>1</sup>, S.D. Brachman<sup>2</sup>, 1. *Center on Aging, University of Maine, Bangor, Maine*, 2. *UW-Extension Solid and Hazardous Waste Education Center (SHWEC), Milwaukee, Wisconsin*, 3. *University of Maine School of Social Work, Orono, Maine*

The accumulation of unwanted drugs poses potential health risks for older adults. Various models for collecting and disposing of expired and unwanted medications have been established to address this issue. This poster will highlight older adult medicine disposal habits and construct a demographic profile of program participants through a cross-state analysis of data from medicine mail back programs in Wisconsin and Maine. Findings from the Wisconsin program reveal a relationship between age groups and the classes of drugs returned. Individuals age 65-74 and those 75+ returned a greater percentage of prescription drugs (88.0% and 95.2%, respectively) than those under 50 (71.1%) and between 50 to 64 (84.5%) [ $\chi^2(3) = 30.34$ ,  $p < .001$ ]. Among those 75+, anti-neoplastics (66.7%) and cardiovascular agents (53.8%) were the most frequently returned classes of drugs. Among the 65-74 age group, alternative medicines (50.0%) and coagulation modifiers (45.5%) were the most frequently returned classes of drugs. Age was a significant predictor of class of drug returned ( $\chi^2(42) = 132.17$ ,  $p < .001$ ). Based on the analysis of Maine survey data ( $n = 8,850$ ), the average age of mail back program participants is 60 and most participants (63%) are female. The majority of survey respondents (73%) were first time users of the program. In Maine, returned medicine commonly originated from the respondent (53%), a living relative (24%) or a deceased friend or relative (16%). This poster will highlight the most compelling reasons for older adult utilization of mailback programming.

#### **ENHANCING SOCIAL EQUITY BY CREATING A CAMPUS THAT IS FRIENDLY FOR ALL AGES AND ABILITIES**

M. Cannon, A. DeLaTorre, *Institute on Aging, Portland State University, Portland, Oregon*

In Spring 2011, researchers at the Portland State University’s (PSU) Institute on Aging were awarded a grant by PSU’s Institute for Sustainable Solutions (ISS) to complete a “Solutions Generator” project. In partnership with municipal and university organizations, an interdisciplinary team was formed to host two activities that would address social equity as a component of sustainability. The first activity was a forum titled “Designing a PSU for Everyone” that was intended to learn about accessibility issues around PSU campus and to educate those involved as to how they could help develop inclusive design solutions for people across the spectrum of different ages and abilities. The second activity, which was deemed to be an “inclusive design charrette” by participants, brought 32 participants with varying ages and abilities together to focus on pedestrian accessibility, traffic patterns, way-finding problems, and other issues associated with a planned area of redevelopment on PSU’s campus and to provide design suggestions such as “intuitive design” principles that make future developments usable for everyone. The forum and inclusive design charrette process is considered to be an innovative approach to community development, and urban planning and design, which may serve as a model that can be shared with other organizations looking at accessibility issues surrounding aging and disability. The outcomes of the project included a final report

to the ISS, preliminary design schematics, and other recommendations that were shared with both PSU's community and those involved in practice and implementation connected to local, regional, and statewide municipal agencies.

## **SESSION 770 (POSTER)**

### **FAMILY CAREGIVING**

#### **LIFESPAN RESPITE: DIFFERENCES IN NEEDS AND PERCEPTIONS BETWEEN CAREGIVERS OF CHILDREN AND OF ADULTS**

L.S. Noelker, M. Rose, *Katz Policy Institute, Benjamin Rose Institute on Aging, Cleveland, Ohio*

Respite is a high-priority issue for family caregivers who provide the bulk of long-term services and support for maintaining individuals of all ages with disabilities or chronic conditions in their homes. This study focuses on differences in perceptions and experiences of persons involved in respite care for disabled children compared to those caring for older persons and adults with disabilities. Information was gathered from structured discussion sessions, registration and evaluation data at a respite summit in northeast Ohio, under the state's AoA-funded Lifespan Respite Initiative. The initiative's goal is to create an integrated lifespan respite system by uniting and developing respite programs, services and resources for caregivers of children and adults of all ages with special care needs. The 69 summit attendees represented 8 counties, 24 respite service organizations, 12 family caregivers, and others with personal or professional interests in respite. Children and individuals of all ages were served by 10 of the organizations; the remainder served older or all adults. While there were many common issues raised with respect to respite across the lifespan, those involved with disabled children and younger families viewed respite services as less available and accessible. They expressed concerns such as guilt about respite use, distrust of providers, fears about custody if they admit to needing respite, gaps in age-eligibility requirements for disabled children, and the lack of respite services for medically complex and technology-dependent children. Findings indicate that public policy affecting respite services and respite program design must accommodate these differences.

#### **DOES SOCIAL SUPPORT PREDICT SELF-RATED HEALTH OF URBAN AND RURAL BLACK INFORMAL WOMEN CAREGIVERS?**

P.A. Rozario, *School of Social Work, Adelphi University, Garden City, New York*

There is theoretical and empirical evidence for the influence of both the structural and functional dimensions of social support on health. In this paper we seek to clarify whether or not the functional dimension, i.e., the perception of the quality, vis. the structural aspect of social support, is a better predictor of urban and rural Black informal caregivers' self-rated health. The Black Caregiver Project is a cross-sectional study of a community sample of 521 urban and rural Black informal female caregivers. Using logistic regression, we regressed self-rated health on a set of demographic, geographical, and four structural and one perceived social support variables by geographic location. We found significant differences in predictors of self-rated health between urban and rural caregivers, in that age negatively predicted self-rated health while income, church attendance and positive perceptions of one's family functioning positively predicted self-rated health for urban caregivers. However, only age and family functioning were significant predictors of rural caregiver self-rated health. No structural indicators of social support were significantly related with self-rated health. Our findings add to the literature on the importance of the perception of family functioning for Black caregivers on their self-rated health. Although a subjective measure, there is empirical evidence that self-

rated health is a powerful predictor of objective health outcomes including mortality. As such, we discuss the implications of our findings in the light of the differences in predictors of urban and rural caregiver wellbeing.

#### **CULTURAL VALUES, RELIGIOSITY AND FAMILY MEMBER'S CAREGIVING ON THE POSITIVE APPRAISAL OF CARING FOR ELDERS**

F. Epps, *Our Lady of the Lake College, Baton Rouge, Louisiana*

There is limited research on the impact of cultural values, religiosity, and family caregiving on the family member's positive appraisal of caring for a dependent elder. This is particular true in comparing the positive appraisal of caregiving among minority populations such as African American and Hispanic family caregivers. The purpose of this study was to examine the influence of cultural values and religiosity on the positive appraisal of caregiving among African American, Hispanic and Caucasian family caregivers of dependent elders. The Structural Model of Appraisal (Lazarus, 1991) and Roy Adaptation Model (Roy & Andrews, 1999) theoretical frameworks guided formulation of six hypotheses and the study design. A predictive correlational study design was employed to examine the relationship amongst variables for African American, Hispanic and Caucasian family caregivers that reside in south-eastern Louisiana. Study participants (N=69) completed a demographic tool and four instruments the: (1) Katz Index, (2) Obligation Scale, (3) Duke University Religion Index, and (4) Positive Appraisal of Care Scale. Overall, there was not a significant difference in cultural values, religiosity, and positive appraisal of caregiving for African American, Hispanic and Caucasian family caregivers as a whole. However, it was found that cultural values and religiosity was a significant factor in predicting the positive appraisal of caregiving for African Americans. Findings from this study indicate that more research is needed in order to plan and organize culturally responsive and spiritually sensitive interventions to assist not only the elderly family member, but the family caregiver.

#### **KINSHIP CAREGIVERS PERCEPTIONS OF BURDEN AND SUPPORT GROUP EFFICACY**

D.J. Monahan, C.J. Smith, *School of Social Work, Syracuse University, Syracuse, New York*

Kinship caregiving is an important role for grandparents whose grandchildren are often kept out of the child welfare system as a result of the care they provide. Researchers are beginning to understand the societal value of kinship care and the impact both on the children as well as the grandparents. These relationships are increasingly sought out to provide care for children as a mechanism for preventing them from entering the costly formal foster care system. Because of the concerns that older relative caregivers may become overburdened by their responsibilities, interventions have been developed, such as support groups to help reduce care burden. In this national study of KinNet funded by the Children's Bureau, U.S. Dept. of Health and Human Services relative caregivers (n=102) were surveyed to assess the extent of their perceived burden of care, their care tasks, expectations about their care responsibilities and their satisfaction with support group services. Results of the analysis revealed that one-fifth of those surveyed reported that they felt "burdened," and 40% reported that caregiving interfered with their health. However, they maintained their willingness to sustain their caregiving roles, in part, due to the assistance they received in their support groups. When asked if they expected the child in their care to remain with them until the child was 18 years of age or completed high school, 74% report, "yes." Sample design and study size limitations are discussed. Public policy and practice implications for the larger societal and family system issues are also presented.

## GRANDPARENTS AS FAMILY CAREGIVERS IN CHINA: IMPLICATIONS FOR POLICY AND PROGRAMS

A.C. Mui<sup>1</sup>, J. Sun<sup>2</sup>, H. Chen<sup>3</sup>, 1. *School of Social Work, Columbia University, New York, New York*, 2. *Renmin University, Beijing, China*, 3. *Washington University, St. Louis, Missouri*

Based on the 2005 Chinese Longitudinal Healthy Longevity Survey (CLHLS), this poster addresses the growing phenomenon of older adults who are assuming primary responsibility for the care and rearing of their grandchildren. In China, due to rapid modernization and urbanization, massive numbers of married adults have migrated to urban areas for economic opportunities and career development. Data show that as a result of this urbanization, there are 73.3 million left-behind children (aged 0-17). Due to economics, housing, and household issues in Chinese cities, 80% of the left-behind children are reportedly staying in rural areas under the care of their grandparents. Social scientists are investigating psychosocial issues associated with left-behind children, but little research has been done on the needs, and resiliency, of grandparent caregivers. In addition, data show that about 90% of the grandparent caregivers feel that they were incapable of effective parenting, particularly as it relates to providing education-related support to their grandchildren. This sense of failing to provide for their grandchildren's education is primarily due to their own low level of educational attainment. Economically, 80.9% of the grandparent caregivers still work to support themselves and their grandchildren. Data point to the need to design parenting and financial support programs to assist these grandparent caregivers. Skill-building and psychosocial support programs can enhance these grandparent caregivers' capacity in parenting and problem solving as well as address communication among members of these long-distance intergenerational families. Implications for research, policy, and programs to support the grandparent caregiver population will be discussed.

## USING TECHNOLOGY TO SUPPORT FAMILY-CENTERED CARE FOR VETERANS WITH DEMENTIA

M. Luptak<sup>1,2</sup>, B.L. Hicken<sup>4</sup>, C.M. Daniel<sup>2</sup>, R. Hill<sup>3,2</sup>, R. Zheng<sup>3,2</sup>, M. Grant<sup>2</sup>, K.W. Eagar<sup>2</sup>, R. Rupper<sup>2,4</sup>, 1. *University of Utah College of Social Work, Salt Lake City, Utah*, 2. *VA Salt Lake City Healthcare System Geriatric Research Education and Clinical Center, Salt Lake City, Utah*, 3. *University of Utah Department of Educational Psychology, Salt Lake City, Utah*, 4. *VA Office for Rural Health - Western Region, Salt Lake City, Utah*

The Supporting Caregivers of Rural Veterans Electronically (SCORE) project utilized in-home telehealth delivery of education and support to family caregivers of veterans with dementia and employed remote licensed clinical social workers as care managers. Technology-naïve participants were assigned to a group which employed a simple in-home telehealth device or a group which received telephone support. Technology-savvy participants were assigned to a web-based user group or a group which received telephone support. Outcome variables included caregiver burden, social network, family conflict, caregiver efficacy and care receiver health care utilization data. SCORE Participants (N=60) were primarily female (96%), Caucasian/non-Hispanic (88%), spouses (87%) ranging in age from 37 to 89 with a mean of 69. Scores on the Lubben Social Network Scale-R 18 ranged from 23 to 73, with a mean of 49. At baseline, 63% of the participants reported family conflict and 60% reported family hardship. At completion, 58% of the participants reported family conflict and 55% reported family hardship. Both technology-naïve and technology-savvy caregivers demonstrated a significant reduction in burden in the home telehealth device and web-based conditions respectively. In the phone condition, naïve caregivers showed no reduction in burden whereas the savvy caregivers showed a reduction. Initial findings reinforce the importance of family-centered interventions to assist family caregivers and suggest that a web-based approach to caregiver burden relief is at least as effective as traditional approaches like phone support and other technology-based

approaches. Furthermore, it can be cost effective and holds promise for future caregiver training and consultation.

## THE IMPACT OF PLACING SPOUSES IN A NURSING HOME ON DEPRESSIVE SYMPTOMS OF THEIR PARTNERS IN THE COMMUNITY

M. Kwak, H. Kim, *School of Social Work, Univ Michigan, Ann Arbor, Michigan*

Placing a spouse in long-term care facilities is a stressful experience for his/her partner in the community, sometimes described as married widowhood. This study examines how the nursing-home placement of a spouse affects his/her partner who lives in the community and whether changes in caregiving status and spousal functional impairment moderate the effects of placement on depressive symptoms. The sample consists of married older adults ages 51 and over and their spouses from the Health and Retirement Study from 2000 to 2010 (n=12,115). Multilevel modeling was used to estimate trajectories of depressive symptoms and their relationship to the nursing-home placement of spouses. Sociodemographic and health characteristics of the respondents were also controlled. The multilevel modeling analysis indicates a linear decline of depressive symptoms over time. However, spouses' levels of functional impairment are associated with higher levels of depressive symptoms ( $\beta=0.01$ ,  $p<.01$ ), and providing care to a spouse is associated with higher levels of depressive symptoms ( $\beta=0.19$ ,  $p<.001$ ). After controlling for effects of caregiving status and spousal functional impairment, having a spouse residing in a nursing home still increases depressive symptoms ( $\beta=0.89$ ,  $p<.001$ ). Caregiving status and spousal functional impairment do not moderate the relationship between nursing-home placement and depressive symptoms. These findings suggest that transition to living apart in later life resulting from a spouse's illness itself may increase risks of depression for the partner regardless of caregiving status and spousal functional impairment after placement. Discussions include practical implications to reduce adverse effects of placing a spouse in long-term care facilities.

## THE EFFECTS OF GOVERNMENT EXPENDITURES OF NATIONAL FAMILY CAREGIVER SUPPORT PROGRAM ON CAREGIVERS' STRAIN: A MULTILEVEL ANALYSIS

Y. Lee, *University of Georgia, Athens, Georgia*

The National Family Caregiver Support Program (NFCSP) is one of the few federal policy initiatives aimed at supporting caregivers. NFCSP was established in 2000 to improve caregivers' physical and mental health through the provision of three major services—caregiver counseling/support groups/training, respite care, and access assistance. The purpose of this study is to examine the effectiveness of this program on caregivers' well-being. Data from the 2004 National Long Term Care Survey (N=1615) are linked to data from the government expenditures on NFCSP in 2004. Hierarchical linear modeling was used to analyze the main effects and the moderating effects of government expenditures on the three NFCSP services on caregiving strain. Findings from the study indicate that expenditures on access assistance and respite care moderate the caregiving burden-caregiving strain relationships. Caregivers reporting higher caregiving burdens have more caregiving strain. Additionally, caregivers who live in states with less expenditure of access assistance and respite care and who report more problems with ADLs, have the most caregiving strain. Interestingly, the interaction between hours of caregiving spent and access assistance indicates that caregivers who report more caregiving hours show higher caregiving strain, but also that the caregivers' strain is even higher for those who report more caregiving hours and live in states with higher expenditure of access assistance services. Findings suggest that NFCSP may represent an important factor that influences the well-being of informal caregivers, and that studies which examine factors at only one level may underestimate the effect of the social environment.

## RURAL VERSUS URBAN RESIDENCE AND INDIVIDUAL VARIABILITY AS INFLUENCES ON GRANDPARENT CAREGIVERS' NEEDS FOR SERVICE

B. Hayslip, K.S. Page, C. Phillips, R. Knight, *Psychology, University of North Texas, Denton, Texas*

There exists an extensive literature exploring the impact of living in a rural versus an urban environment on social service use and mental health service accessibility among older adults. In contrast, such differences have yet to be explored among grandparent caregivers. The present study enlisted the participation of seventy-five grandparent caregivers (Mage = 58.7) who participated in focus groups of 5-10 grandparents conducted in the nearest small town adjacent to where each lived. Nearly 75% of the sample was female, and 73% were raising 1 or 2 minor children (Mage = 9). Twenty-six of these grandparent caregivers resided in a rural county in North Central Texas, wherein rurality was defined in terms of residence in counties varying by population density and distance from a major metropolitan area. A MANOVA comparing overall levels of needs for support, information, and services, overall difficulties in getting resources, and perceived factors interfering with receiving help ( $\alpha$ s > .70) across rural and urban samples of custodial grandparents surprisingly suggested substantial similarity ( $p > .05$ ) in the above needs for help and services, difficulties in getting such help, and factors hindering the receiving of help across the rural and urban samples here. In contrast, qualitative and quantitative findings reflected the tremendous variability among grandparent caregivers, irrespective of rural or urban residence. These findings at once underscore the individualized nature of grandparent caregiving as well as emphasizing the universality of concerns about needs for and access to a variety of social services that many custodial grandparents experience.

## THE USE OF RELIGIOUS COPING AMONG INFORMAL CAREGIVERS IN A NATIONALLY-REPRESENTATIVE POPULATION

J.L. Spilman, A. Cortese, *KJT Group, LLC, Honeoye Falls, New York*

Approximately 52 million Americans provide informal care to an ill or disabled family member or friend. Informal caregiving may have deleterious effects on the caregiver's own well-being, requiring caregivers to utilize various coping mechanisms. One such mechanism may be religious coping, or the use of religious beliefs or practices to deal with stress. The aim of this research is to determine the prevalence of religious coping among informal caregivers as compared with those who do not provide unpaid care, and to examine the association between religious coping and caregiver characteristics. Cross-sectional data were obtained from a web-based survey, collected April 27-May 5, 2011. Respondents from this nationally-representative sample are members of an online access panel. Of the 999 total respondents surveyed, 210 respondents (21%) self-reported providing unpaid care for an adult in the previous 12 month period. All 999 respondents surveyed were asked to complete the religious inventory of the COPE scale, in addition to questions regarding their religious behavior, demographics and psychographic items. The 221 respondents who self-identified as providing unpaid care to an adult were additionally asked a battery of questions related to the informal care they provide. Statistical testing was conducted to investigate significant differences. We find a statistically significant relationship between the use of religious coping and informal caregiving, with caregivers utilizing this mechanism more than non-caregivers. Among caregivers, use of religious coping varies significantly across religious denominations, gender and race, but is comparable regardless of the type of care provided or the caregiver burden experienced.

## FOREIGN DOMESTIC WORKERS LOWER THE NEGATIVE IMPACT OF OLDER ADULT IMPAIRMENTS ON THEIR INFORMAL CAREGIVERS

R. Malhotra<sup>1</sup>, T. Ostbye<sup>1,2</sup>, C. Malhotra<sup>1</sup>, A. Chan<sup>1,3</sup>, *1. Health Services and Systems Research, Duke-NUS Graduate Medical School Singapore, Singapore, Singapore, 2. Duke University, Durham, North Carolina, 3. National University of Singapore, Singapore, Singapore*

In Singapore, many families employ foreign domestic workers (FDWs) to help care for elderly family members. The current analyses, utilizing Pearlin's stress process model, assess the moderating effect of support by a FDW on the impact of four types of impairments (in physical function, memory, behaviour and mood) in older adults on their informal caregivers. Data for 1,190 care recipient (CR; aged 75+ with >1 activity of daily living [ADL] limitation)-caregiver (CG) dyads was utilized. Scores for severity of the four impairments were calculated. CGs, responding to a modified version of the Caregiver Reaction Assessment (CRA) scale, reported on the impact of caregiving on: 1) schedule and health (SH), 2) finances (FIN), 3) lack of family support (LFS) and 4) self-esteem (SE). FDW support was defined as assistance from a FDW in ADLs/Instrumental ADLs. Linear regression models, one for each CRA domain, with interaction terms of the four impairment severity scores with FDW support, were developed. Significant interaction terms were retained. FDW support reduced, or even reversed, the negative impact of physical impairment on SH, of memory impairment on SH and LFS and of behaviour impairment on LFS and SE. A positive impact of mood impairment on SE was observed in the absence of FDW support. Provision of instrumental support by a FDW appears to be beneficial for informal caregivers of the elderly, the benefit increasing with an increase in older adult impairment severity. The role of FDWs in elder care should be carefully considered by the families of elderly with impairments and by policy makers in Singapore.

## CARING FOR ELDERLY PARENTS: EVALUATING FAMILY LEAVE LAWS IN COMPARATIVE PERSPECTIVE

Y. Yang, G. Gimm, *George Mason University, Fairfax, Virginia*

As baby boomers age, the need for laws to enhance quality of life for the elderly and meet the increasing demand for family caregivers will continue to grow. This paper reviews the national family leave laws of seven major OECD countries and provides a state-by-state analysis of family leave laws in the U.S. We find that the U.S. overall has the least generous family leave laws among the seven high-income countries. With the exception of three U.S. states, the Family Medical Leave Act of 1993 does not guarantee paid family leave for caregivers. GSA participants will learn about the current evidence on how more generous laws can impact family caregivers' employment and health outcomes, as well as other arguments for and against such laws. We argue that a generous, gender-egalitarian, and flexible family leave law, financed through social insurance, would not only be more ethical, but also financially sustainable.

## EFFECTS OF PAID LEAVE POLICIES ON CAREGIVER HEALTH AND EMPLOYMENT: EVIDENCE FROM PANEL DATA

G. Gimm, T. Yang, *Health Administration & Policy, George Mason University, Vienna, Virginia*

Approximately 9.7 million adult children over the age of 50 currently provide care for their elderly parents. This paper analyzes the impact of state paid leave policies on the health and employment outcomes of family caregivers using a quasi-experimental study design. Quality of life for the elderly is related to the employment and well-being of caregivers who support their parents with time and financial

resources. Using panel data from eight waves (1992-2006) of adult caregivers and non-caregivers in the RAND Health and Retirement Survey, we find preliminary evidence of small effects on employment associated with paid leave laws. However, we find mixed evidence of effects on mental health and physical health. GSA participants will understand the extent to which state paid leave laws can influence family caregivers' employment and health outcomes. Participants will also be able to describe policy implications and next steps for future research.

#### **THE INFLUENCE OF PERSONAL NORMS AND DYADIC RELATIONSHIPS ON THE DECISION OF FAMILY MEMBERS TO ASSUME AND RETAIN THE CAREGIVING ROLE; IMPLICATIONS FOR PRACTICE AND POLICY**

R. Montgomery, J. Lang, C. Mathes, E. Collet, *Helen Bader School of Social Welfare, University of Wisconsin - Milwaukee, Milwaukee, Wisconsin*

Recognition of the crucial contributions that caregivers make to the long-term care system and the negative consequences of caregiving, have prompted the introduction of policies and programs to support family caregivers. Yet, specific information necessary to strategically target services has not been readily available to guide practice. To address this problem, the state of Washington adopted the TCARE® protocol to assess caregivers' needs and strategically allocate support services. A key assumption of the TCARE® protocol is that a caregiver's decision to continue providing care is strongly influenced by the caregiver's expectations for role performance and the relationship between the dyad. The goal of this study was to test this assumption. Linear regression analyses were conducted to: 1) identify factors related to caregiver's intentions to place a caregiver in a long-term care setting; 2) determine whether these factors differed by type of relationship (e.g., spouse vs. child); and 3) determine whether the factors that influenced caregivers' decisions changed over time. Data were taken from 2,863 initial TCARE® assessments conducted between June 2009 and December 2011 and from follow-up assessments conducted with 813 (28.4%) caregivers. Consistent with the assumption of TCARE®, we found the strongest predictors of a caregiver's intention to place their care receiver in a long-term care setting were identity discrepancy, relationship burden, and problem behaviors. The associations of these measures with intention to place were stronger for spouses than for other caregivers and were stronger at the six-month follow-up. Practice and policy implications are discussed.

#### **SESSION 775 (POSTER)**

##### **LONG TERM CARE; NURSING HOMES**

#### **NURSING HOMES' SUCCESS IN USING THE INFORMAL DISPUTE RESOLUTION FOR APPEALING DEFICIENCIES**

D.B. Mukamel<sup>1</sup>, D. Weimer<sup>2</sup>, C. Harrington<sup>3</sup>, W.D. Spector<sup>4</sup>, L. Bailey<sup>1</sup>, Y. Li<sup>5</sup>, *1. Medicine, Univ of California, Irvine, California, 2. University of Madison-Wisconsin, Madison, Wisconsin, 3. University of California, San Francisco, San Francisco, California, 4. Agency for Healthcare Research and Quality, Rockville, Maryland, 5. University of Rochester, Rochester, New York*

Nursing-homes' quality is subject to state and federal regulations. Those not meeting quality standards are cited and issued deficiencies (tags), which until 1995 could be appealed only through a formal judicial process. Since 1995 nursing-homes have had access to the Informal Dispute Resolution (IDR) process, which is faster, less costly, and easier to access. About 10% of nursing-homes avail themselves of IDRs. In this study we examine national IDR data for the 2005-2008 period (obtained from CMS), augmented with OSCAR data, to investigate the determinants of successful IDR appeals. The study included 19,738 tag appeals. Of those, 26% were successful. We estimated logistic regression models with fixed state-effects in which the dependent variable

was the log-odds of a successful appeal. The odds of success were significantly higher ( $p < 0.05$ ) for tags from surveys rather than complaints, for facilities with a higher number of deficiencies, and for larger facilities. They were significantly lower for more severe tags, and if the tag was a substandard or an abuse and neglect tag, when the number of tags disputed by the nursing-home was higher, when the severity of all tags in the IDR were higher, and the quality reputation of the facility was lower. Year, stringency of the quality regulation in the state, and facility ownership were not significant. This study is the first to offer insights into the workings of the IDR process.

#### **THE ROLE AND RESPONSIBILITY OF FULL-TIME AND PART-TIME CARE MANAGERS IN NURSING FACILITIES IN JAPAN**

K. Kageyama<sup>1</sup>, Y. Sawada<sup>2</sup>, M. Kunisada<sup>3</sup>, H. Ishida<sup>4</sup>, H. Sumii<sup>3</sup>, D. Mori<sup>3</sup>, *1. Prefectural University of Hiroshima, Mihara, Hiroshima, Japan, 2. Nihon Fukushi University, Nagoya, Aichi, Japan, 3. Prefectural University of Hiroshima, Mihara, Hiroshima, Japan, 4. NPO Japan Kaigo Research, Mihara, Hiroshima, Japan*

Purpose: To compare the roles and responsibilities of full-time and part-time care managers in nursing facilities in Japan. Methods: A self-report time study of services provided to residents by care managers (CMs) in nursing facilities in Japan was conducted for two consecutive days between October and December 2010. During the study, 799 CMs recorded start and end times of their activities on timesheets using the Residential Social Work Codes that can be divided into 2 categories (16 large and 110 small categories). Nearly 60% of participants ( $n=457$ ) hold the dual positions of care manager and nursing assistant. Results: As for large categories among full-time CMs, "creation of care plans ( $210.1 \pm 147.8$ ,  $p < 0.001$ )," "assessment ( $87.7 \pm 93.3$ ,  $p < 0.001$ )" and "team management ( $141.8 \pm 99.6$ ,  $p < 0.01$ )" were the most common activities, and as for small categories, "assessment for discharge planning ( $37.3 \pm 49.3$  min.,  $p < 0.001$ )," "discharge planning ( $104.4 \pm 107.3$  min.,  $p < 0.001$ )," "staff meetings ( $39.9 \pm 29.0$  min.,  $p < 0.001$ )" and "quality assurance meetings ( $39.1 \pm 23.7$  min.,  $p < 0.001$ )" were the most common activities. As for large categories among part-time CMs, "direct care ( $212.3 \pm 233.62$  min.,  $p < 0.001$ )" was most common, and as for small categories, assistance with "transferring and changes in position ( $72.4 \pm 90.7$  min.,  $p < 0.001$ )" and "problem behaviors" were most common. Discussion: The results suggest that although Long-Term Care Insurance Law in Japan requires CMs to participate in assessment and care planning, many of them involve in direct resident care. In order to increase roles and responsibilities of CMs, it is important to change the work environment for them to concentrate fully on the duties of CMs.

#### **THE AMOUNT OF TIME NURSING STAFF SPEND ON DIRECT AND INDIRECT CARE IN NURSING FACILITIES IN JAPAN**

M. Kunisada<sup>1</sup>, Y. Sawada<sup>2</sup>, H. Sumii<sup>1</sup>, K. Kageyama<sup>1</sup>, *1. Health and Welfare, Prefectural University of Hiroshima, Mihara, Hiroshima, Japan, 2. Nihon Fukushi University, Nagoya, Aichi, Japan*

Purpose: To examine the amount of time that nursing staff spend caring for residents (both direct and indirect care) and to provide implications to revise the payment system for long-term care insurance (LTCI) certified nursing facilities in Japan. Methods: A self-report time study was conducted in 7 nursing care facilities in Japan. Both nurses ( $n=50$ ) and nurse's aides ( $n=172$ ) of those facilities were asked to record the amount of time they spent in each of their activities during 24 consecutive hours between March 2007 and September 2008. Using a new version of the "Care Code," created by the Ministry of Health, Labour and Welfare of Japan in 2006, the reported activities were then coded and grouped into 10 large and 64 smaller categories of nursing care services (e.g., assistance with bathing and toileting). Results: Approximately 40% of their time was spent on indirect care services that do not require interaction between nursing staff and residents. Of those, the highest

average amount of time was observed for “documentation and charting (25.58 min.),” followed by “communication and reporting (13.76 min.),” “cleaning dining room and hallway (12.65 min.),” “passing out and cleaning up of meal trays (5.86 min.)” and “other services (5.09 min.)” Discussion: Although LTCI currently takes into account only the amount of time that nursing staff spend on direct resident care for the payment system, the results suggest that it may be fair to include the amount of time they spend on both direct and indirect resident care in the system.

### **DRUG USE REVIEW AMONG ELDERLY RESIDENTS IN NURSING HOMES THROUGH COMPREHENSIVE GERIATRIC ASSESSMENT**

H. Shin<sup>1</sup>, H. Park<sup>1</sup>, Y. Suh<sup>2</sup>, E. Lee<sup>2</sup>, K. Kim<sup>2</sup>, B. Lee<sup>1</sup>, *1. Ewha Womans University, Seoul, Republic of Korea, 2. Seoul National University Bundang Hospital, Seongnam, Republic of Korea*

As Korea’s population is aging rapidly, the number of elderly requiring long-term care due to age-related chronic diseases is increasing. According to a study, 48 percent of residents in long-term care facilities had potentially inappropriate medications, and residents with a higher number of potentially inappropriate medications had a higher likelihood of being hospitalized. This study is intended to assess medication use of residents in elderly health care facility and the effect of pharmacist intervention on their medications through comprehensive geriatric assessment (CGA) tool. Among inpatients at geriatric center of Seoul National University Bundang Hospital who were hospitalized from January 1, 2007 through September 30, 2011, 42 patients from elderly health care facilities were involved. Pre-admission medication lists and discharge prescriptions were collected from the database of CGA and electronic medical record (EMR), and analyzed retrospectively. All of the patients were taking 4 or more medications before the admission, and 35.7 percent were taking one or more potentially inappropriate medications. By the implementation of CGA, the average number of drugs taken and the ratio of polypharmacy patients each decreased from 8.8 ( $\pm 1.1$ ) to 7.2 ( $\pm 1.0$ ) and from 100.0% to 88.1%, respectively. Also, patients with potentially inappropriate medications decreased significantly from 35.7% to 14.3%. It is considered that the pharmacist intervention can help to reduce the potentially inappropriate medication use in geriatric patients and that the role of consultant pharmacist in the elderly health care facility is necessary.

### **SOCIAL ENGAGEMENT AMONG NURSING HOME RESIDENTS: EFFECT OF FACILITY RACIAL COMPOSITION**

D. Tyler, S. Cai, Z. Feng, M. Clark, M. Fennell, *Center for Gerontology, Brown University, Providence, Rhode Island*

Purpose: Social engagement (SE), defined as interactions with others and participation in social or individual activities, has been linked to health outcomes among the elderly. Community dwelling Blacks report higher levels of SE than Whites. However, no studies have examined racial differences in SE among nursing home (NH) residents or the effect of NH racial composition on SE. Methods: Using 2000-2008 national MDS data, we stratified NHs into 3 groups based on their racial compositions (% white). We calculated the proportion of residents with low SE for each NH and compared this across the 3 groups. We then used 3 types of logit (base, fixed-effects and random-effects) models to examine the within- and between-facility differences in the likelihood of having low SE between Blacks and Whites. Results: The proportion of residents with low SE decreased across all categories of NHs from 2000 to 2008. However, NHs with higher proportions of Blacks or Hispanics consistently had higher proportions of residents with low SE. The base and conditional fixed-effects models indicated that Blacks’ higher likelihood of having low SE was mostly attributable to between-facility differences rather than within-facility differences. The random-effects model revealed that residing in facilities with the highest proportions of white residents was related to substantially lower risk of low

SE, regardless of race. Implications: In addition to other known disparities, residents in minority-concentrated facilities are at risk for low SE. Additional research is needed to determine the causes of low SE in these NHs and interventions to address this issue should be identified.

### **ALL IN A DAY’S WORK: STAFF RETENTION AND TURNOVER WORKING WITH PERSONS WITH DEMENTIA**

R.J. Karasik<sup>1</sup>, J. Berry<sup>2</sup>, P. Woischke<sup>1</sup>, *1. Gerontology, St. Cloud State University, St. Cloud, Minnesota, 2. Dementia Care Foundation, Darwin, Minnesota*

Staff turnover rates in nursing homes are notoriously high, with some rates topping 70- 100 percent (Castle & Engberg, 2006; Riggs & Rantz, 2001). Turnover is particularly challenging in dementia care with the added stress of managing behavioral and psychological symptoms of dementia (BPSD) (Brodaty et al., 2003). Specialized training has been shown to reduce staff turnover while simultaneously improving quality of care (Chrzescijanski, et al., 2007; Coogle et al., 2007). Type of training, however, makes a difference (Hughes et al., 2008; Kemeny et al., 2006). The current study examines the impact a holistic model of staff training and support has on staff turnover and retention decisions. The training model includes extensive orientation, individual mentoring of new staff, and on-going education in person-centered care. Additionally, the model limits the full-time work week to 32-hours and teaches staff to monitor their stress levels. Ten-year staff turnover rates for the model were 48.01%. A survey of staff (n=48) identified several factors that contributed to their work decisions. Respondents rated several factors, including higher staff ratios; specialized training in dementia; on-going support & training; feeling valued by management; and teamwork with peers as being particularly important to their decisions to remain on the job. Additional factors included job flexibility, food, and distance from home. Surprisingly, these factors were generally rated as being more important than wages and benefits. These findings are currently serving as the basis for a larger regional study examining dementia care staff perceptions regarding training, support, and factors of employment.

### **THE OLDER PERSONS’ TRANSITIONS IN CARE (OPTIC) STUDY: A PILOT TEST OF THE TRANSITION TRACKING TOOL (T3)**

G. Cummings<sup>1</sup>, C. Reid<sup>2</sup>, C.A. Estabrooks<sup>1</sup>, P. Norton<sup>3</sup>, J. Konnert<sup>4</sup>, G. Coleman-Miller<sup>5</sup>, *1. University of Alberta, Edmonton, Alberta, Canada, 2. Health and Exercise Sciences, University of British Columbia, Kelowna, British Columbia, Canada, 3. University of Calgary, Calgary, Alberta, Canada, 4. Alberta Health Services, Calgary, Alberta, Canada, 5. University of Alberta Hospital, Edmonton, Alberta, Canada*

Introduction: OPTIC is a mixed method researcher/decision-maker partnership study focused on care for nursing home residents requiring emergency transfers to emergency departments and back to the nursing home. In this paper, we present pilot data collected via the Transition Tracking Tool (T3), an instrument developed to record data relevant to determining successfulness of such transitions in care. The main purpose of the pilot test was to assess tool validity and feasibility of use. Method: Data were collected for 86 residents at study sites in Canadian provinces, British Columbia (n=27) and Alberta (n=59) over a 3 month period. The T3 tool comprises 750+ data elements including resident characteristics, reasons and precipitating factors for the transfer, advance directives, family involvement, healthcare services provided, communication handovers among healthcare personnel, disposition decisions, and dates/times and timing. Results: Findings confirm the ability of the T3 to discriminate between known service distinctions between sites. For example, more licensed practical nurse involvement in transfer processes was expected and observed in British Columbia, compared to more registered nurse involvement in Alberta. Regarding feasibility,

a majority of the T3 data elements from nursing home, emergency medical services and emergency department sites were accessed and recorded for each transition. Discussion: Transitions of residents from nursing homes to and from emergency rooms are not universally successful. The T3 will provide valuable evidence to allow for improvement of the transition experience for seniors, their families and the professional caregivers involved in the process.

## SESSION 780 (POSTER)

### RESEARCH METHODS AND ISSUES

#### ASSOCIATION BETWEEN HEALTH LITERACY, CARE TRANSITIONS INTERVENTION PARTICIPATION AND HOSPITAL READMISSION

S. Gravenstein<sup>1,2</sup>, R. Baier<sup>1,2</sup>, K. Butterfield<sup>1</sup>, H. Shamji<sup>1,2</sup>, R. Voss<sup>1</sup>, R. Gardner<sup>1,2</sup>, 1. *Healthcentric Advisors, Providence, RI, Rhode Island*, 2. *Warren Alpert Medical School of Brown University, Providence, RI, Rhode Island*

Because RCT volunteers represent as little as 20% of the overall target population asked to participate, results may not be generalizable when applied to broader populations in quality initiatives. To assess the characteristics of patients who consent vs. decline interventions, Healthcentric Advisors implemented a five-item survey (adapted from validated tools) to evaluate self-perception for likelihood of recovery and stress, advance care planning and health literacy. We administered this tool to a consecutive convenience sample of 294 FFS Medicare patients in medical wards at five Rhode Island hospitals, immediately prior to consent for a coaching intervention. We examined patients' subsequent consent based on their screening tool answers. Among 260 (88.4%) patients who completed the tool, 160 (61.5%) subsequently consented to the coaching intervention. Compared with those who ultimately consented to the intervention, patients who declined were less likely to be confident about their recovery (33.7% vs. 74.6% consent rates for low vs. high confidence,  $p < 0.05$ ), less likely to have an advance care planning discussion (39.5% vs. 70.7% consent rates for no discussions vs. discussions,  $p < 0.05$ ) and more likely to incorrectly interpret a medication label (41.7% vs. 77.2% consent rates for incorrect vs. correct interpretation,  $p < 0.05$ ). Researchers can incorporate these findings by asking simple questions to assess patients' health literacy and other key factors. Understanding which patients are at risk for failing to take part in an intervention can help researchers and clinicians differentially tailor recruitment or education, expanding to patients not represented in RCTs and unlikely to volunteer.

#### AGING AND THE DEMAND FOR HEALTH

M. Doyon<sup>1</sup>, H. Payette<sup>1,2</sup>, 1. *Gerontology, Université de Sherbrooke, Sherbrooke, Quebec, Canada*, 2. *Research Centre on Aging, Sherbrooke, Quebec, Canada*

Regarded as the founder of health economics, the Grossman health capital model provides mathematical and theoretical foundations for quantifying health determinants from the perspective of individual choices, scarcity of resources and health investments. Considering health as a depreciating stock over time, individuals seek to maximise their well-being based on the equilibrium between present (and future) benefits of health investment, required efforts, monetary constraints and consumption. Objectives: To develop an adaptation of the Grossman health capital model to the reality of longitudinal quantitative studies aiming at understanding determinants of health and functional autonomy in elderly populations. Methods: In contrast to previous empirical studies on the demand for health, we introduced three important aspects of aging in our theoretical Grossman-type model: 1) the perception of individual's health, 2) the direct satisfaction (utility) of good health, and 3) the dissatisfaction (disutility) of time and physical investments in presence of progressive functional decline. Results: Using maximiza-

tion methods, we theoretically demonstrated the relevance of using prior demands for health as a valuable control variable for the perception of health, and proposed mathematical foundations of the negative relationship between age and health in relation to time preferences and the depreciation rate of health. Conclusion: We derived an applicable biopsychosocial log-linear model of the demand for health based on our theoretical results. This will lead to a future empirical investigation of significance of prior demand for health, as well as a better understanding of coping and adaptation to health changes in the elderly.

#### IS LANGUAGE A PROBLEM? RESEARCHING OLDER ETHNIC MINORITIES

C. Victor, A. Ahmet, *Brunel University, Uxbridge, United Kingdom*

Within the UK there is a growing field of research exploring ageing and ethnicity. Our research in England and Wales focuses on a Leverhulme Foundation funded project exploring caring amongst older ethnic minorities. The project focuses on two age groups: 40-64 year olds and 64+ and six ethnic groups: black African, black Caribbean, Chinese, Pakistani, Indian and Bangladeshi. This is a mixed-methods project using both a quantitative survey of 1200 participants and 60 qualitative in-depth interviews. Given the difficulties of accessing these populations and the variety of languages spoken we contracted a specialist research company to conduct the survey and interviews for using the preferred language of the participant. The interviews were transcribed and then translated into English. There is an emerging literature examining issues such as accessing participants, language, ethnicity and cross cultural research. The first part of the paper will explore the issue of accessing participants and the issues associated with using a specialist research company and the challenges encountered as researchers. In the second part of the paper we explore the additional challenges of researching 6 ethnic groups and the use of 6 different languages. Translation presents a number of issues in qualitative interviewing, for example, in one transcript a participant stated "He almost looks after me very much". The meaning and interpretation based on language differences and cultural understandings of terms such as 'looked after' are central to any cross language research. We conclude by discussing some of the issues associated with translation and analysis

#### PARTICIPATION IN RESEARCH: EXPLORING THE COLLABORATION BETWEEN OLDER PERSONS AND RESEARCHERS

J. Bindels<sup>1</sup>, V. Baur<sup>2</sup>, K. Cox<sup>1,3</sup>, S. Heijing<sup>4</sup>, T. Abma<sup>2</sup>, 1. *CAPHRI Research School, Maastricht University, Maastricht, Netherlands*, 2. *Medical Humanities, VU University Medical Centre, Amsterdam, Netherlands*, 3. *Fontys University of Applied Sciences, Eindhoven, Netherlands*, 4. *Co-researcher, House of the Care, Sittard, Netherlands*

Researchers and policy makers are increasingly convinced that user involvement is necessary to adjust research and its findings to the needs of older people. To gain a better understanding of aging and its implications older people can be involved in research in numerous ways; as participants, advisors, interviewees or as co-researchers. Little is known about the quality of collaborations between older people as co-researchers and academic researchers. This study demonstrates a collaboration between older persons and researchers and systematically evaluates this by using qualitative research methods. Three older men participated as co-researchers in a study which evaluated the experiences of frail older people. In duo-teams (one co-researcher and one academic researcher) they conducted interviews with frail older people. In order to evaluate the collaboration, the co-researchers and academic researchers took part in individual in-depth interviews (after 6 months) and two reflection meetings (after 6 and 12 months). Throughout the collaboration, field notes were taken by both academic researchers and co-researchers. Thematic analysis of the data revealed

that age related prejudice and implicit ideas about a proper task division inhibit a successful collaboration between older people as co-researchers and academic researchers. Working in the field together and the reflection meetings helped to overcome these tensions. Co-labouring, expressing mutual expectations, discussing role divisions, and information sharing proved helpful in achieving a successful collaboration. Interim reflection on the collaboration was found to be necessary to achieve similar conditions.

### **RETAINING OLDER ADULTS AND OTHER DIVERSE PARTICIPANTS IN COMMUNITY-BASED HEALTH STUDIES**

D.H. Odierna, *Clinical Pharmacy, University of California, San Francisco, San Francisco, California*

Background: Longitudinal and clinical research studies are often hampered by poor retention of participants, which can bias results and lead to inaccurate findings. The individuals and groups most vulnerable to social inequalities and poor health may also be more difficult to recruit and retain in studies. Practice guidelines and policies that are based on research that does not adequately include older adults, minorities, and low-income populations risk perpetuating health disparities because findings may apply more to advantaged populations than those that experience social disadvantage. Methods: A social epidemiology framework was applied and six focus group interviews with 48 researchers and outpatient research subjects were conducted at three San Francisco research centers, including a center with a focus on dementia and cognition research, to identify multilevel factors in retention of research participants. Results: While a portion of the data confirms information available in the literature, new information emerged regarding factors at the contextual level (e.g., funding policies, bureaucratic and institutional barriers), the study level (e.g., hiring protocols, participant recruitment procedures, placement and integration of the study into the larger community, availability and use of resources), and participant-level (e.g., employment/retirement status, caregiver issues, perceived benefit, desire for access to information, a sense of community, and perceived connection to the healthcare delivery system). Conclusions: The context in which research is conducted, and the characteristics of research participants and studies may interact to affect retention rates. Investigators should explore multilevel strategies to improve retention of diverse participants in health studies.

## **SESSION 785 (SYMPOSIUM)**

---

### **SEX, LONGEVITY & SOCIETY**

Chair: *B.A. Carnes, Geriatric Medicine, U. of Oklahoma Health Sciences Center, Oklahoma City, Oklahoma*

Discussant: *B.A. Carnes, Geriatric Medicine, U. of Oklahoma Health Sciences Center, Oklahoma City, Oklahoma*

The Butler Symposium this year is based on an important theme developed by Dr. Butler during his career, and it provides an interdisciplinary examination of the relationship between reproductive biology, longevity and society. One lecture will take an evolutionary/anthropological perspective on how reproductive strategies influence longevity. The centenarian talk will take a reverse look at this issue by seeing whether centenarian females sacrificed reproductive output for enhanced longevity. The third lecture will examine the health and societal implications of delayed reproduction, and the final lecture will focus on a topic of interest to nearly everybody; sex after 60.

### **INTER-GENERATIONAL TRANSFERS, SEX ROLES AND LONGEVITY IN HUMAN LIFE HISTORY EVOLUTION**

H. Kaplan, *University of New Mexico, Albuquerque, New Mexico*

This paper begins by reviewing the demography of extant hunter-gatherers and forager-horticulturalists, showing the relative uniformity in the length of post-reproductive life in such small-scale societies. It then delves into the details of the aging process among Tsimane forager-horticulturalists, with respect to both behavior and physiology. Data will be presented on time allocation, productivity and resource transfers, as a function of age, sex and family composition. Those data show that Tsimane men and women remain net producers until about age 70, the modal age at death for traditional populations, with significant downward transfers to descendants. They also show that men and women adjust their time use as they age, adapting to physical decline and reproductive cessation. Most males cease reproducing when their wives undergo menopause, and both sexes engage in significant grandparental investment. The paper concludes with a discussion of the theory of human lifespan evolution, and important new directions for research.

### **AGE AT LAST CHILDBIRTH AS A MARKER OF MATERNAL RATE OF AGING**

T.T. Perls, *Medicine & Geriatrics, Boston University School of Medicine, Boston, Massachusetts*

Previously published findings from the New England Centenarian Study revealed that centenarian women were more likely to have had children later in life than the average noted for their birth cohort. We found that a woman who had a child after the age of 40 was 4 times more likely to live to 100 than women who did not do so. This birth cohort (born around 1900) did not benefit from either estrogen supplementation or modern day fertility assistance. It is likely that the natural ability to have children beyond the age of 40 is a marker of a very healthy and slowly aging reproductive system and of the absence of age related diseases that would decrease fertility. I will discuss the ramifications of this finding in light of the disposable soma theory and the evolutionary forces that facilitate exceptional longevity.

### **THE SOCIETAL CONSEQUENCES OF DELAYED REPRODUCTION**

B.A. Carnes<sup>1</sup>, I. Schlupp<sup>2</sup>, *1. Geriatric Medicine, U. of Oklahoma Health Sciences Center, Oklahoma City, Oklahoma, 2. University of Oklahoma, Norman, Oklahoma*

The inevitability of death creates the equivalent of a race between reproduction and death. This race exists in virtually all organisms with one exception - humans. As humans gain control over their environment and its associated mortality risks, the age of first reproduction has been progressively delayed. This delay is not a natural delay, but a cultural response. The costs of delayed reproduction (e.g., congenital anomalies, genetic diseases) are chronicled in the scientific literature. The objective of this seminar is to summarize the biological consequences but to also explore the broader societal consequences of this clash between biology and culture.

### **SEX AFTER 60**

B.A. Carnes, *Geriatric Medicine, U. of Oklahoma Health Sciences Center, Oklahoma City, Oklahoma*

Aging has many manifestations. In this presentation, an overview will be provided on how aging affects sex life and relationships in people older than 60. The intent is to identify the challenges posed by biological changes and how those changes can be mitigated. Further, the presentation will examine this issue through the perspective of both the male and female.

## STEM CELLS, CELLULAR SENESENCE AND AGING

## HUMAN MESENCHYMAL STEM CELLS FOR REPAIR OF THE AGING SKELETON: REGULATION BY ISOFORMS OF P63 AND P38

G.A. Howard<sup>1,2,3</sup>, K.M. Curtis<sup>1,2</sup>, K.K. Aenlle<sup>1,2</sup>, K. Chen<sup>1,2</sup>, B.A. Roos<sup>1,2,3</sup>, I. GRECC and Research Service, Veterans Affairs Medical Center, Miami, Florida, 2. Geriatrics Institute, University of Miami Miller School of Medicine, Miami, Florida, 3. Departments of Medicine, Biochemistry & Molecular Biology, and/or Neurology, University of Miami Miller School of Medicine, Miami, Florida

Human mesenchymal stem cell (hMSC) maturation is regulated by hepatocyte growth factor (HGF) and 1,25-dihydroxyvitamin D (1,25OHD). HGF secretion by hMSCs promotes their migration/proliferation. p63, a member of the p53 family, mediates the cooperative actions of HGF and 1,25OHD, up-regulates the vitamin D receptor (VDR), and drives hMSC differentiation. 1,25OHD activates VDR and p63 gene expression. HGF induces p63 binding to the VDR promoter increasing VDR gene expression. p63 has multiple variants via alternative promoters and RNA splicing, forming TA- and ΔNp63 isoforms and α,β,γ splice variants. While hMSCs progress toward the osteogenic phenotype, p63 switches from TA-p63α,β to TA-p63γ. 1,25OHD up-regulates ΔNp63 isoforms, while 24,25-dihydroxyvitamin D (24,25OHD) increases TA/ΔNp63γ mRNA and TA-p63α protein expression — linking 1,25OHD up-regulation of ΔNp63, required for differentiation, and 24,25OHD up-regulation of p63γ, known to regulate VDR expression. HGF signaling promotes osteogenic markers and mineralization — likely due to activation of one or more p38 isoforms (α,β,γ,δ). p38α and p38β are important for skeletogenesis, and their inhibition in hMSCs causes reduced alkaline phosphatase activity and decreased mineralization. HGF promotes phosphorylation of total p38 and differential regulation of specific isoforms. HGF increases p38α, -β and -δ, while decreasing p38γ mRNA. HGF treatment also increases p38β protein. We conclude that the actions of vitamin D on hMSC osteogenic differentiation are likely due to HGF priming hMSCs through activation of specific p38 isoforms, which then allows for a regulatory relationship between p63 gene products and unique 24,25OHD / 1,25OHD effects subsequently responsible for repair of the aging skeleton.

## STRESS RESPONSE AND HIGHLY SUCCESSFUL AGING: CLUES FROM THE HPA AXIS OF CENTENARIAN ROTTWEILER DOGS

D.J. Waters<sup>1,2</sup>, A.H. Maras<sup>2</sup>, H. Xu<sup>3</sup>, S.S. Kengeri<sup>2</sup>, E.C. Chiang<sup>2</sup>, N.N. Kariuki<sup>1,2</sup>, I. Purdue University, West Lafayette, Indiana, 2. Gerald P. Murphy Cancer Foundation, West Lafayette, Indiana, 3. Indiana University, Indianapolis, Indiana

An age-related loss of hypothalamic-pituitary-adrenal (HPA) axis resilience can result in hypercortisolism, which has been linked to an array of adverse outcomes including immune suppression, cognitive impairment, insulin resistance, and cancer growth. To better understand the biological mechanisms and adaptive capacities that contribute to highly successful aging, we studied exceptionally long-lived Rottweiler dogs that, similar to human centenarians, had achieved a duration of longevity that exceeds by more than 30% their breed-specific norm. We hypothesized that highly successful aging might be associated with a preservation of HPA resilience and life-long avoidance of hypercortisolism. The HPA axis of 18 canine centenarians was evaluated by determining: basal plasma cortisol, aldosterone, and ACTH concentrations; post-ACTH challenge plasma cortisol and aldosterone concentrations; and urine cortisol:creatinine ratios. HPA axis evaluation revealed three categories of canine centenarians. Fifty percent of dogs had normal basal cortisol and aldosterone levels with youthful response to ACTH chal-

lenge. Forty percent of dogs had low basal cortisol levels, yet preserved a youthful response to ACTH challenge. Only 10% of dogs showed a deterioration of ACTH response and none of the canine centenarians had hypercortisolism. Taken together, our results from canine centenarians suggest that hypercortisolism resulting from impairment of the HPA axis is not an obligate phenotype intrinsic to the aging process. Further, the discovery of an adaptive, low basal cortisol endophenotype in some of these dogs emphasizes the importance of studies that rely upon challenge, rather than basal measures, to understand the link between physiological resilience and highly successful aging.

## APPROPRIATE REGULATION OF SUBNETWORK OF PROTEOSTASIS IS NECESSARY FOR LONG-TERM HEALTHY SURVIVAL

P.L. Larsen, A.R. Sanchez, S. Takano, Department of Cellular & Structural Biology, The University of Texas Health Science Center at San Antonio, San Antonio, Texas

Animals have evolved to survive ambient temperature fluctuations. A conserved response to cool is an increased life span. Of the twenty thousand *C. elegans* genes, we found significant differential expression of only 338 genes in a microarray analysis of adults acclimatized to 15 C or 25 C (unpublished S. Takano, C. Curtis, S. Tavaré and P. L. Larsen). The largest functional category of the differentially expressed genes was proteostasis. The apparent specificity of the temperature-dependent regulation raised the possibility that the particular proteostatic changes are causal for healthy long-term survival in a cool environment. To test this for several genes in the category, adult worms were fed RNAi *E. coli*. The gene knockdown at 15 C caused severe herniation or paralysis in middle-aged adults, yet retained the long life. This suggests that while thermodynamics may play a role in benefits of cool conditions, it is not sufficient. The up-regulation of specific proteostasis genes is necessary for healthy long-term survival in cool conditions. We investigated whether the defects arose from muscle or neuron dysfunction by subjecting individuals to a daily functional examination from health into paralysis. Our longitudinal studies show that the initial defect is in backward locomotion and paralysis progresses from posterior to anterior, frequently concurrent with vulva herniation. Considering anatomical details, our model is that degeneration of cholinergic motor neurons likely underlies these phenotypes in proteostasis RNAi treated worms. In conclusion, we have found a signature for appropriate regulation of subnetwork of proteostasis necessary for long-term healthy survival in different environments.

## TELOMERASE AND STRESS RESISTANCE: LINKING KEY REGULATORS OF LONGEVITY AND SENESENCE

J. Smith-Sonneborn, University of Wyoming, Zoology and Physiology, Laramie, Wyoming

Stress resistance pathways, requisites for survival and longevity, surface as regulators of elderly vulnerability to acute and chronic diseases. Known functions of telomerase, independent of its role in telomere length, implicate telomerase as a regulator of stress resistance pathways, also activated by hormetic agents and their mimetics. Telomerase actively promotes changes global patterns of gene expression in growth promoting genes, and cell cycle progression, the antithesis of the cell cycle regulation inhibitor p16/INKA, the “senescent gene”. The catalytic protein of telomerase, TERT, physically occupies the upstream promoter regions of the Wnt pathway, active in stem cell development, and maintenance. Over-expression of TERT in various cellular systems confers higher resistance to physiological signals including chemotherapeutic drugs, UV and ethidium bromide, whereas knockdown of telomerase, increases sensitivity to damage. Oxidative stress causes 80–90% of all telomerase to enter the mitochondria and associates with resistance to oxidative stress in mtDNA from peroxide and beta amyloid peptide. Mitochondrial protection provides conservation of the cell powerhouse and maintenance of energy homeostasis in oxida-

tive stress, a common denominator in stress resistance pathways. Environmental and chemical stressors of exercise, starvation, radiation, and their mimetics, trigger hibernation and metabolic pathways to adjust alterations in energy metabolic states, and share upregulation of key regulator molecules NO, and PGC-1 upregulated by telomerase. How telomerase integrates with these hormetic induced pathways is unknown, but elucidation of their connections promises to target agents to shift metabolic states in favor of repair, function, and regeneration, rather than apoptosis, disease and death.

#### **ENDOTHELIAL CELLULAR SENEESCENCE IS INHIBITED BY LIVER X RECEPTOR AGONISTS**

T. Hayashi, K. Ina, H. Nomura, *Geriatrics, Nagoya University Graduate School of Medicine, Nagoya, Japan*

**Objective)** As endothelial senescence proceeds atherosclerosis, finding the anti-senescent molecule is important. Although nuclear receptors (NRs) affect many age related pathophysiological status, their effect on senescence was not known. **Background)** NRs are ligand activated transcription factors working in concert with co-activators and co-repressors to regulate various gene expressions. Its ligands are low molecular weight compounds like retinoic acid, vitamin D3, and thyroid hormone and was suggested to play pathophysiological roles in Atherosclerosis and Diabetes mellitus. However, there are no reports on the role of NRs in aging. **Methods)** Endothelial senescence was induced by exposure to high glucose (Hayashi T, Ignarro LJ et al. PNAS 2006). The effects of LXR agonists like TO901317 and its mechanism were investigated using LXR receptors-siRNA, endothelial NO synthase (eNOS)/ superoxide anion signals and cholesterol transport signals like ABCA1. **Results)** Exposure of human endothelial cells to high glucose (22mM) for 3 days increased senescence-associated- $\beta$ -galactosidase activity, a senescence marker, and decreased telomerase activity, a replicative senescence marker, which LXR agonist, TO901317 prevented in a dose-dependent manner. The effect was associated with reduced reactive oxygen species and increased NO. eNOS-siRNA reduced the anti-senescent effects of LXR agonist. High glucose treatment reduced eNOS expression, and LXR agonist recover it. In the experiment of endothelial senescence evaluated by SA $\beta$ galactosidase, LXR $\alpha$  and  $\beta$  siRNA showed the role of LXR $\beta$  in anti-endothelial senescence. LXR $\beta$  binded to ABCA1, which plays critical roles in endothelial cholesterol efflux. Finally, streptozotocin-induced type 1 diabetes model rats showed more senescent cells and decreased HDL function in aortic endothelium of aged rats compared with age-matched control and LXR agonist-treated animals.

#### **SESSION 795 (SYMPOSIUM)**

##### **AGING AND PEOPLE OF THE MIDDLE EAST: OLD COUNTRY VERSUS NEW WORLD EXPERIENCES**

Chair: *K.J. Ajrouch, Sociology, Eastern Michigan University, Ypsilanti, Michigan*

Co-Chair: *M. Aydin, University of California, Los Angeles, California*

Discussant: *S. Salari, University of Utah, Salt Lake City, Utah*

New frontiers in aging include growing interest in immigrant experiences and the cultural aspects of aging. In this symposium, we raise questions about how aging experiences in homeland countries compare to experiences among those living in the U.S. First, Abdulrahim and colleagues present data from the Family Ties and Aging Study collected in Beirut, Lebanon during 2009 to examine social relationships and health. Results indicate that women's health, but not men's, is vulnerable to negative quality relations with children. Next Aydin and colleagues take advantage of unique data available from the California Health Interview Survey collected from 2001-2009 to provide a health portrayal of Arab Americans aged 50+. Gendered patterns are detected among Arab Americans to reveal more smoking and obesity among Arab American men than women. Comparisons are also made with other

recent immigrant groups including Asian and Latino Americans. Ajrouch and colleagues then compare and contrast Arab Israeli and Arab American attitudes toward care in later life. Drawing from two separate studies of adults aged 60+, the authors carry out parallel analysis to uncover the extent to which gender, education, religion, religiosity, and filial obligation predict attitudes about living preferences, and the role of family and the state. These papers are then discussed by Salari to identify similarities and differences, and to illuminate the gaps in aging research among these populations. In sum, the symposium aims to initiate a discussion about old country versus new world experiences, with special focus on those with ancestry in the Middle East.

##### **CARE PREFERENCES AND NATIONAL CONTEXT: ARAB MINORITIES IN THE U.S. AND ISRAEL**

K.J. Ajrouch<sup>1</sup>, T.C. Antonucci<sup>2</sup>, A. Lowenstein<sup>3</sup>, R. Katz<sup>3</sup>, M. Silverstein<sup>4</sup>, J. Jackson<sup>2</sup>, *1. Sociology, Eastern Michigan University, Ypsilanti, Michigan, 2. University of Michigan, Ann Arbor, Michigan, 3. University of Haifa, Haifa, Israel, 4. University of Southern California, Los Angeles, California*

It is now widely established that among Arabs ethnicity is a prominent factor in explaining family norms, above and beyond religious affiliation. To begin to disentangle cultural beliefs from stratification factors, we compare and contrast Arabs living in two countries: the United States and Israel. Drawing from two datasets with parallel measures we examine Arab Americans (N=101) and Arab Israelis (N=200) aged 60+. Multivariate analyses show that among Arab Americans, Muslims were more likely than Christians to report preferring help from family than government. Among Arab Israelis, however, being Muslim, low religiosity and high filial obligations were associated with agreement that the family should have a larger role than the government in caring for older adults. The diversity of Arabs is discussed as a key feature to better understand care preferences

##### **A GENDERED PROFILE OF HEALTH AMONG OLDER ARAB AMERICANS LIVING IN CALIFORNIA**

M. Aydin, T. Sadegh-Nobari, D. Grant, K. Abanilla, *UCLA Center for Health Policy Research, Los Angeles, California*

This study uses data from CHIS (2001-2009) to provide a comparative gendered health portrait of Arabs (50+ years) living in California (n=526). Population estimates suggest smoking history is more prevalent among older Arabs (50.6%, CI: 44.7-56.4) compared to older Asians (30.6%, CI: 29.2-31.9), and Arab males are more likely to have a smoking history (59.9%, CI: 52.3-67.7) than Arab females (39.1%, CI: 29.9-48.4). Rates of diagnosed diabetes are more than double among Arab males (19.6%, CI: 13.4-25.7) compared to Arab females (7.8% CI: 4.3-11.2). Notable is the high rate of overweight and obesity among Arabs (71.2%, CI: 65.7-76.6), compared to 35.8% of Asians (CI: 34.3-37.4) and 59.7% of non-Arab Whites (CI: 59.2-60.1). Among Arab males, 78.0% (CI: 71.7-84.3) are overweight or obese compared to 62.8% (CI: 53.9-71.7) of Arab females. The impact of acculturation and lifestyle on health risks, especially among older Arab males, will be discussed.

##### **SOCIAL RELATIONSHIPS AND SELF-RATED HEALTH IN LEBANON: THE INFLUENCES OF AGE AND GENDER**

S. Abdulrahim<sup>1</sup>, K.J. Ajrouch<sup>2</sup>, T.C. Antonucci<sup>3</sup>, *1. American University of Beirut, Beirut, Lebanon, 2. Eastern Michigan University, Ypsilanti, Michigan, 3. University of Michigan, Ann Arbor, Michigan*

International research has shown that the quantity and quality of social relationships influence health outcomes differentially for older versus younger adults and for women versus men. Employing data gathered during the summer of 2009 in the Greater Beirut Area (N = 369), we tested the association between social relationship quality (with spouse and child) and self-rated health (SRH). Regression results revealed that, overall, positive relationship quality with spouse exhibited the strongest significant association with

SRH. High negative relationship with child was an important determinant of poor SRH among older women. Results suggest in Lebanon, positive relationship quality with spouse hold primacy in determining subjective health. On the other hand, negative relationship quality with child gains importance as a predictor of SRH among older women.

## SESSION 800 (SYMPOSIUM)

### DEEPENING UNDERSTANDINGS OF OLDER ADULTS' LEARNING AND USE OF THE INTERNET

Chair: *B. Xie, University of Maryland, College Park, Maryland*

Co-Chair: *I. Watkins, University of Maryland, College Park, Maryland*

Discussant: *S.J. Czaja, University of Miami, Miami, Florida*

Research during the past decade has been accumulating increasing amounts of evidence regarding older adults' learning and use of the Internet. Some areas, however, have received relatively little attention. This proposed symposium aims to address some of these gaps by introducing to session attendees recent advances made in deepening existing understandings of older adults' learning and use of the Internet. Specifically, we plan to present four quantitative studies that used a range of data collection and analysis techniques to explore previously understudied areas. Using data from the 2004 graduate sample of the Wisconsin Longitudinal Study (WLS), Berkowsky examined the relationship between Internet use, social integration, and mental well-being among older adults, focusing in particular on social integration as a possible mediator between Internet use and mental health. Cotten examined similarities and differences between the types of Internet use among older adults by comparing data from the Pew Internet & American Life Project and a randomized trial designed to help older adults learn to use computers and the Internet. Using pre/post data from nearly 10,000 older adults who completed a self-paced computer/Internet training program, Harootyan used descriptive and multivariate analyses to examine the effects of peer coaching by participants of the Senior Community Service Employment Program on the learners' skills as well as their attitudes and morale. Finally, Xie and Watkins' theory-driven randomized trial examined the effects of senior-oriented collaborative and individualistic learning strategies on older adults' learning of the technology for health-related purposes.

### GOING ONLINE: EXAMINING TYPES OF INTERNET USE AMONG OLDER ADULTS

S.R. Cotten, W. Anderson, B. McCullough, *Sociology, UAB, Birmingham, Alabama*

Internet use among older adults is much lower than among younger age groups. Although some limited literature suggests that families are one of the key 'pulls' for older adults to begin going online, little is known about the specific types of Internet use among older adults. Data from the Pew Internet & American Life Project and a randomized trial designed to teach older adults how to use computers and the Internet are compared to illustrate similarities and differences between the types of Internet use depending upon sample type. Results are divided according to social/communicative, health, leisure/entertainment, and other types of use. Implications for designing interventions for older adults that are tailored to particular types of Internet use are discussed.

### EXAMINING INTERNET USE, SOCIAL INTEGRATION, AND PSYCHOLOGICAL WELL-BEING IN A COHORT OF OLDER ADULTS

R.W. Berkowsky, *Sociology, University of Alabama at Birmingham, Birmingham, Alabama*

Information and communication technologies (ICTs), such as the Internet, have the potential to enhance social cohesion as well as promote social isolation, and these changes in social integration can have significant effects on mental well-being. This study uses data from the 2004 graduate sample of the Wisconsin Longitudinal Study (WLS) to examine the relationship between Internet use, social integration, and mental well-being in a sample of older adults. Results from OLS regression analyses indicate positive relationships between Internet use and measures of mental well-being including autonomy, environmental mastery, personal growth, positive relations to others, purpose in life, self-acceptance, and overall psychological well-being. Social integration partially mediates the effects of Internet use on well-being, with the strongest mediation effects seen for the positive relations to others outcome. The results of this study may help motivate and direct the distribution of ICT-related resources that will benefit this growing segment of the population.

### PEER COACHING FOR OLDER COMPUTER LEARNERS YIELDS IMPROVED SKILLS AND BETTER OUTLOOK ON LIFE

B. Harootyan, *Research, Senior Service America, Inc., Silver Spring, Maryland*

Peer coaching of older computer learners effectively improves their internet skills, computer confidence, and outlook on life. Results are presented from responses of senior learners in the Digital Inclusion Initiative, a computer/internet coaching program. Senior Community Service Employment Program participants assist other seniors using a self-paced tutorial program at public sites in 16 states. Learners (median age 68; two-thirds female; one-fourth some college; two-thirds with incomes <\$30,000) answered surveys at their first and subsequent sessions regarding computer use, internet skills, and attitudes. Descriptive and multivariate analyses of pre/post data for nearly 10,000 learners who completed the tutorial (graduates) indicate that the DII effectively improves computer skills, confidence in computer use, and comfort level in using the internet. In addition, graduates showed statistically significant improvement across 10 attitudinal/morale scales, including life satisfaction. Regression analysis indicates that the peer coaching experience itself (e.g., number of sessions) enhances learners' morale, self-efficacy and attitudes.

### DEVELOPING AND TESTING COLLABORATIVE LEARNING STRATEGIES FOR OLDER ADULTS' LEARNING OF E-HEALTH LITERACY

B. Xie, I. Watkins, *College of Information Studies, University of Maryland, College Park, Maryland*

Social interdependence theory predicts collaborative learning (CL) outperforms individualistic learning (IL). We modified two CL strategies, Jigsaw and Constructive Controversy, testing their effects on older adults with a randomized trial using a 2 (learning method: CL; IL) x 2 (time of measurement: Pre; Post) mixed factorial design. 119 older adults (age range: 53-87;  $M = 68.31$ ;  $SD = 7.66$ ) were randomly assigned to either condition (CL: 67; IL: 52). The intervention included four 2 hour-long instructions. Multivariate analyses revealed a significant interaction,  $F(3, 78) = 6.43, p = .001$ . Univariate analyses found a significant interaction on computer/Web knowledge,  $F(1, 80) = 101.85, p < .001$ , with participants in the IL condition outperforming those in the CL condition. No significant interaction was found on e-health literacy skills. These results suggest that, contrary to the prediction of social interde-

pendence theory, IL was more effective than CL in improving older adults' e-health literacy.

## SESSION 805 (SYMPOSIUM)

### DEVELOPMENTAL ASSOCIATIONS BETWEEN SHORT-TERM VARIABILITY AND LONG-TERM CHANGES

Chair: G. Hüllür, *Institute of Psychology, Humboldt University Berlin, Berlin, Germany*

Co-Chair: D. Gerstorff, *Institute of Psychology, Humboldt University Berlin, Berlin, Germany*

Discussant: C. Hertzog, *Georgia Institute of Technology, Atlanta, Georgia*

Behavioral changes manifest over many different time scales. Within-person changes extracted from repeated measures taken at yearly or bi-yearly intervals are indicators of individuals' developmental trajectory (e.g., cognitive aging). Within-person variability extracted from repeated measures taken at weekly, daily, or hourly intervals are indicators of individuals' dynamic characteristics (e.g., cognitive plasticity, emotional lability). The major objective of this symposium is to bring together a collection of papers examining whether and how the short-term dynamics of change in individuals' abilities or environments are connected to their long-term developmental trajectories. Hüllür and colleagues use data from the Berlin Aging Study to investigate antecedent-consequent links between micro-longitudinal cognitive plasticity and long-term cognitive change. Almeida et al. examine associations between real-life stressors and salivary cortisol in the National Study of Daily Experiences using diary methods. Chui and Luszcz investigate the links between salivary cortisol, and present and long-term depressive symptoms in the oldest-old in the Australian Longitudinal Study of Ageing. Finkel examines genetic variance in intraindividual variability in reaction time and cognitive functioning using data from the Swedish Adoption/Twin Study of Aging. The discussion by Christopher Hertzog will integrate the four papers and focus on the viability of integrated micro- and macro-longitudinal designs as an effective way to examine how short-term and long-term developmental processes are linked with one another.

### DEVELOPMENTAL ASSOCIATIONS BETWEEN COGNITIVE PLASTICITY AND LONG-TERM COGNITIVE CHANGES IN THE BERLIN AGING STUDY (BASE)

G. Hüllür<sup>1</sup>, N. Ram<sup>2,3,4</sup>, D. Gerstorff<sup>1,2,3</sup>, *1. Institute of Psychology, Humboldt University Berlin, Berlin, Germany, 2. The Pennsylvania State University, University Park, Pennsylvania, 3. German Institute of Economic Research (DIW Berlin), Berlin, Germany, 4. Max Planck Institute for Human Development, Berlin, Germany*

Developmental change spans different time scales. Although theory explicitly suggests that both long-term changes manifesting over the period of several years and short-term changes manifesting over days or weeks contribute to individuals' developmental trajectories, the associations between short- and long-term changes are not well understood. The Berlin Aging Study (BASE) assessed individuals' cognitive ability on 8 roughly bi-yearly occasions (20 years of macro-time). Sub-samples participated in micro-longitudinal "bursts" at Waves 4 and 7 (1 month of micro-time). Combining these data, we provide empirical evidence for how short-term cognitive plasticity serves as both an antecedent and a consequent of long-term cognitive aging. We discuss our findings regarding the importance of short-term variability for understanding individual development, some of the twists inherent in combined micro-macro designs, and suggest possible mechanisms responsible for associations among short- and long-term developmental changes.

### LONGITUDINAL PATTERNS OF DAILY STRESS PROCESSES AND DIURNAL CORTISOL

D. Almeida<sup>1</sup>, J. Mogle<sup>1</sup>, J.R. Piazza<sup>1</sup>, R.S. Stawski<sup>2</sup>, *1. Pennsylvania State University, University Park, Pennsylvania, 2. University of Michigan, Ann Arbor, Michigan*

Current stress theories suggest that chronic exposure to hormones elicited by stressors leads to accumulated wear and tear on the body, referred to as allostatic load. In this presentation we use diary methods that obtain repeated measurements from individuals during their daily lives to assess associations between real-life stressors and salivary cortisol in the National Study of Daily Experiences. Respondents completed nightly interviews about daily stressors at two time points across a 10 year period. The analyses differentiated between individuals who were high at both occasions versus low at both occasions in stressor exposure, reactivity and residue (prolonged affective stressor response). The results showed that individuals who were high in their exposure to stressful events at both time points had dysregulated cortisol rhythms. Compared to their younger counterparts, chronically stressed older adults showed the greatest amount of cortisol dysregulation. Discussion will focus on how daily stress processes and physical well-being.

### DIURNAL CYCLES OF SALIVARY CORTISOL, PRESENT AND LONG-TERM DEVELOPMENT OF DEPRESSION IN THE OLDEST-OLD

H. Chui, M.A. Luszcz, *Psychology, Flinders University, Adelaide, South Australia, Australia*

We examined the association between salivary cortisol, and present and long-term depressive symptoms in the oldest-old in the Australian Longitudinal Study of Ageing. Salivary cortisol samples were collected across seven days from 48 participants (M age = 88.9 years). Present depressive symptoms were assessed at the same time as salivary cortisol collection. Long-term development of depression was assessed four times over 12-years. More present depressive symptoms were associated with a higher level of cortisol at waking and a steeper decline during the day. A long-term increase in depressive symptoms was associated with a lower level of cortisol at waking, a higher level of Cortisol Awakening Response, and a flatter decline during the day. Findings demonstrate that present and long-term developmental patterns of depressive symptoms show differential associations with cortisol in the oldest-old. These findings may shed light on the inconsistent patterns of association between depression and cortisol in previous research.

### INTRA-INDIVIDUAL VARIABILITY IN REACTION TIME SHARES GENETIC VARIANCE WITH COGNITIVE FUNCTIONING IN LATE ADULTHOOD

D. Finkel<sup>1</sup>, N.L. Pedersen<sup>2</sup>, *1. School of Social Sciences, Indiana University Southeast, New Albany, Indiana, 2. Karolinska Institutet, Stockholm, Sweden*

Intra-individual variability (IIV) in reaction time has been related to cognitive decline, but questions remain about the nature of this relationship. Previous twin analyses suggest modest genetic influences on measures of IIV (Finkel & McGue, 2007). Twin analysis of reaction time measured at the fifth wave of the Swedish Adoption/Twin Study of Aging allowed us to extend our understanding of the relationship between IIV and cognitive aging. Mean and range in movement and decision time for simple and choice reaction time tasks were available from over 400 individuals aged 56 - 90. Cognitive performance on four factors was also available: verbal, spatial, memory, and speed. Analysis of twin similarity indicates that all of the genetic variance on the speed and spatial factors is acting via influences on mean and range in reaction time. The largest component of shared genetic variance is between IIV in movement time and the cognitive factors.

## SESSION 810 (SYMPOSIUM)

### NATIONWIDE DISSEMINATION OF THE CHRONIC DISEASE SELF-MANAGEMENT PROGRAM (CDSMP)

Chair: *M.L. Smith, The University of Georgia College of Public Health, Athens, Georgia, Texas A&M Health Science Center School of Rural Public Health, College Station, Texas*

Co-Chair: *M.G. Ory, Texas A&M Health Science Center School of Rural Public Health, College Station, Texas*

Discussant: *M.L. Boutaugh, U.S. Administration on Aging, Atlanta, Georgia*

Since the early 2000s, the Administration on Aging has supported the widespread delivery of evidence-based disease prevention programs for seniors. Simultaneously, the Healthy Aging Research Network of the CDC Prevention Research Centers has examined factors that can facilitate or impede the widespread dissemination and sustainability of evidence-based programming. This symposium will present various planning, dissemination, and effectiveness aspects associated with the Communities Putting Prevention to Work: Chronic Disease Self-Management Program, an initiative reaching nearly 87,000 participants across 45 states and two territories from April 2010 through February 2012. The first presentation (Lorig) will discuss the principles of designing scalable interventions within the context of the Chronic Disease Self-Management Program (CDSMP). The second presentation (Patton) will provide an overview of the national Communities Putting Prevention to Work: Chronic Disease Self-Management Program initiative including a graphic display of the rapid spread of CDSMP across the country to reach this large number of heterogeneous participants. Using data from this national dissemination, the third presentation (Smith) will present findings from a study comparing personal characteristic and workshop attribute profiles by delivery site type to illustrate the ability of CDSMP to reach a diverse set of participants utilizing a diverse network of delivery site organizations. The fourth presentation (Ory) will discuss outcome findings from a national study to show the effectiveness of CDSMP to improve health-related indicators over a 6-month period. To conclude, the Discussant (Boutaugh) will provide perspective about the CDSMP initiative in context of federal and private partnerships for future growth and sustainability.

### REACHING DIVERSE CDSMP PARTICIPANTS UTILIZING A DIVERSE DELIVERY INFRASTRUCTURE

M.L. Smith<sup>1,2</sup>, B. Belza<sup>3</sup>, M. Altpeter<sup>4</sup>, J.B. Dickerson<sup>2</sup>, S. Ahn<sup>5,2</sup>, M.G. Ory<sup>2</sup>,  
1. *College of Public Health, The University of Georgia, Athens, Georgia*, 2. *Texas A&M Health Science Center School of Rural Public Health, College Station, Texas*, 3. *University of Washington, Seattle, Washington*, 4. *University of North Carolina, Chapel Hill, North Carolina*, 5. *The University of Memphis School of Public Health, Memphis, Tennessee*

Background: Participant reach and program adoption are indicative of successful translational research efforts. Organizations typically serve older adults with varying characteristics, thus more diverse groups of older adults may enroll in evidence-based programs if a diverse set of delivery sites offer the intervention. Method: Nationwide data from 50,503 CDSMP participants were analyzed using multinomial logistic regression to generate profiles by delivery site type. Results: Approximately 66% of workshops were delivered at senior centers/AAA, 20.1% at healthcare organizations, 6.2% at community/multi-purpose organizations, 4.6% at county health departments, and 3.0% at educational institutions. Significant variation in participant characteristics (e.g., age, sex, race/ethnicity, rurality) and workshop attributes (e.g., class size, attendance) were observed by delivery site type. Conclusion: CDSMP has capacity to serve large numbers of heterogeneous participants through a growing delivery site organization network. Findings may inform program deliverers to offer CDSMP in settings reaching participants most likely to enroll in workshops.

### DESIGNING BEHAVIORAL INTERVENTIONS FOR SCALING

K. Lorig, *Stanford University School of Medicine, Palo Alto, California*

There are now many evidence-based programs for seniors being disseminated throughout the country. Scalability is a new frontier in evidence-based theory and research. Many researchers think that the work is over after proving an intervention is evidence-based. However, if you build it they will come but only if well-designed. Using the Chronic Disease Self-Management Program (CDSMP) developed at Stanford as a case study, this presentation will overview principles for designing scalable interventions. These include: (1) keeping it simple; (2) building a strong evidence base; (3) integrating mechanisms to assure fidelity standards; (4) supporting strong leadership and governance; (5) fostering active engagement of a range of implementers and communities; and (6) tailoring approaches (not interventions) to local situations. Dr. Lorig will share her twenty year plus experience of disseminating CDSMP providing lessons learned for others in bringing evidence-based programs for seniors to scale.

### MAINTAINING POSITIVE OUTCOMES IN A NATIONAL ROLL-OUT OF CDSMP

M.G. Ory<sup>2</sup>, S. Ahn<sup>4,2</sup>, M.L. Smith<sup>1,2</sup>, L. Jiang<sup>2</sup>, P. Ritter<sup>3</sup>, K. Lorig<sup>3</sup>,  
1. *College of Public Health, The University of Georgia, Athens, Georgia*, 2. *Texas A&M Health Science Center School of Rural Public Health, College Station, Texas*, 3. *Stanford University School of Medicine, Palo Alto, California*, 4. *The University of Memphis School of Public Health, Memphis, Tennessee*

Background: Despite the recent roll-out of CDSMP in most states through aging and health networks, there have been no studies about the effectiveness at the national level. This presentation addresses the impact of CDSMP on quality of life and role functioning outcomes from a national perspective. Method: 1170 participants from 22 different organizational delivery settings in 17 states were enrolled in CDSMP workshops as part of an outcome study within the broader ARRA initiative. Six-month assessments were available for 903 participants. Linear Mixed Models analyses were used to assess health indicator changes, controlling for key socio-demographics. Results: Participants were an average of 65 years, primarily female (82%), racially diverse (45%), with an average of 3 co-morbidities. Significant improvements were seen in overall quality of life, reduced pain and fatigue, and improved role function. Conclusion: The national dissemination of CDSMP replicated previously documented positive health outcomes found in previous research studies.

### AN OVERVIEW OF COMMUNITIES PUTTING PREVENTION TO WORK: CHRONIC DISEASE SELF-MANAGEMENT PROGRAM

K. Patton<sup>1</sup>, M.L. Smith<sup>2</sup>, M.G. Ory<sup>3</sup>, K. Lorig<sup>4</sup>, W. Zenker<sup>1</sup>, N. Whitelaw<sup>1</sup>,  
1. *National Council on Aging, Washington, District of Columbia*, 2. *University of Georgia, Athens, Georgia*, 3. *Texas A&M University, College Station, Texas*, 4. *Stanford University, Palo Alto, California*

Purpose: This presentation will provide an overview of the Communities Putting Prevention to Work: Chronic Disease Self-Management Program, an initiative led by the U.S. Administration on Aging in collaboration with the Centers for Disease Control and Prevention and the Centers for Medicare and Medicaid Services. Method: Evidence-based programs were disseminated in 45 states, Puerto Rico and District of Columbia by state units on aging or state health departments. Grantees developed a distribution and delivery system that increased CDSMP workshop availability and participant enrollment. Results: From April 2010 through February 2012, nearly 87,000 CDSMP participants were reached. Nearly 8,000 workshops were offered at community-based organizations nationwide, impacting a diverse, vulnerable group of older adults. Conclusion: This initiative was highly successful in terms of the rapid expansion and scaling of an evidence-based, community-based self-management intervention. Additionally, a variety of replicable best practices were identified and promoted.

## SESSION 815 (SYMPOSIUM)

### NEW DIRECTIONS IN THE STUDY OF GENERATIVITY

Chair: *R. Rubinstein, University of Maryland, Baltimore County, Baltimore, Maryland*

Discussant: *K. de Medeiros, Miami University, Oxford, Ohio*

Generativity is an important life-span developmental and cultural concept. This Symposium offers new directions in its study and understanding. The notion of generativity originally was developed to reflect parental energies towards the next generation, but this term has been reframed more recently to deal with a variety of nurturing or mentoring behaviors and with a concern for the self through time. Papers in the Symposium are based on the results of two research projects: an ethnographic study of cognitively-impaired older persons living in an assisted living and nursing home facility and a qualitative study of 192 older women, the majority of whom have never had children and have needed to deal with generative issues through non-parental means (called the GLOW Study). The five papers develop new interpretations of generativity. These include: a discussion of generative activities by victims of Alzheimer's disease in long-term care; an examination of how chronically-ill older persons continue generative actions; the development of a comprehensive framework for discussing generativity and contrasting it with exchange theory; a discussion of self-reliance among older women and its relationship to generative action; and, the construction of long-term care planning by childless older women in relationship to generative concerns. Each of these themes is substantively and theoretically developed to show how the scope of generativity can be enlarged to incorporate important activities by older persons.

### GENERATIVE ACTS OF PEOPLE WITH DEMENTIA IN A LONG-TERM CARE SETTING

P.J. Doyle, R. Rubinstein, *Center for Aging Studies, Sociology/Anthropology Department, University of Maryland Baltimore County, Baltimore, MD*

Erickson stated that "not being needed may be felt as a designation of uselessness...if one should withdraw altogether from generativity, from creativity, from caring for and with others entirely, that would be worse than death." The progression of dementia and entry into long-term care settings have not been examined as transitions that could impede generative activities. This paper uses data from an 8-month ethnographic project within a dementia-specific long-term care setting to examine the issues of generativity. Field notes from over 400 hours of observations as well as interviews with 20 residents with dementia were thematically analyzed to identify 1) instances of generative acts of people with dementia; 2) barriers to generativity (e.g., lack of recognition/encouragement of generative acts); and 3) common expressions by residents regarding ways they wish to be generative. This paper concludes by critically discussing the implications of generativity on the provision of person-centered dementia care.

### CHRONICALLY ILL OLDER WOMEN AND GENERATIVITY; A STUDY OF CHILDED VERSUS CHILDLESS WOMEN

S.M. Hannum, R. Rubinstein, *Sociology and Anthropology, University of Maryland, Baltimore County, Baltimore, Maryland*

The ability of chronically ill older women to continue generative activities into the third and fourth age, and the impact on quality of life, are important areas that have been largely ignored in the literature. As women age, and social relationships decline, engagement in meaningful activities becomes even more important to one's ability to achieve a satisfactory sense of one's life quality, helping to decrease feelings of loneliness and depression, increasing feelings of life satisfaction. This analysis of data from the GLOW study compares a subsample of chiled versus childless older women (aged 65+), investigating how morbidity affects a person's abilities to continue generative activities and, fur-

ther, how it impacts each woman's overall subjectively defined quality of life. Findings will be presented, including key themes regarding generative activities for older women, both with and without children. These themes will be discussed and applied utilizing an overall illness model.

### LONG-TERM CARE PLANNING AND CONCERNS AMONG GLOW (GENERATIVITY AND LIFESTYLES OF OLDER WOMEN) STUDY PARTICIPANTS

A. Mosby, *University of Maryland, Baltimore County, Baltimore, Maryland*

Across the population of people 65 and over in the U.S., approximately 35% need formal or informal long-term care services, and approximately 75% of the elderly receiving these services are women. Many institutions and support systems assume that elders receive a great deal of care from family. However, little is known about the concerns and future planning of people without children or familial support. The purpose of the GLOW study is to gather the perspectives on a variety of issues of women who are childless, including life story, views of later life, health care plans, outlets for generativity and events that have been important in their lives. This paper will report on the demographics of study participants and discuss general themes on their preferences for health care and caregiving services. The findings have significant implications for community planners, formal and informal long-term care providers, and support resources for seniors.

### GENERATIVITY THEORY: DEVELOPMENT OF A COMPREHENSIVE FRAMEWORK

L. Girling, M. Brazda, R. Rubinstein, *University of Maryland, Baltimore County, Baltimore, Maryland*

While earlier theories of generativity have been used in research, there is a need to expand upon these theories to develop a more comprehensive framework for understanding generativity. The theoretical approach proposed in this paper extends previous definitions of generativity by defining four foci of generativity (people, groups, things, and activities) and four spheres of generativity (historical, familial, individual, and relational). This new framework will allow researchers to answer critical questions about generativity and self-concept among the elderly. These questions include: 1.) What have older people done over their life spans that may be considered generative? 2.) What are the types of generativity and how do these compare among various older persons? And 3.) How do forms of self-expression, creativity, and even self-involvement relate to generativity?

## SESSION 820 (SYMPOSIUM)

### NEW FRONTIERS: ADVANCEMENT OF THE REDUCING DISABILITY IN ALZHEIMER DISEASE (RDAD) PROGRAM

Chair: *H.L. Menne, Margaret Blenkner Research Institute, Benjamin Rose Institute on Aging, Cleveland, Ohio*

Discussant: *L. Teri, University of Washington, Seattle, Washington*

Reducing Disability in Alzheimer Disease (RDAD) is a unique exercise and behavior management program. First, it has an evidence base supporting the benefit of the program for dementia caregiving families. Second, it involves both the person with dementia and the family caregiver while most evidence-based dementia programs focus solely on the caregiver. Third, RDAD encourages exercise with the goal of improving physical functioning for the person with dementia and reducing the physical burden on the caregiver. This symposium presents the RDAD trajectory from development and randomized controlled trial, to community-based replication, to enhanced versions of the program, and to a comparative efficacy trial. First, Teri provides background and history about the development of RDAD at the University of Washington. Next, Menne and colleagues describe the translation of RDAD from an evidence-based program to a community-based program offered across the State of Ohio. Enhanced versions of RDAD have also been

developed and Primetica and Bollin describe the rationale, modifications, and progress of a) having RDAD implemented by home health aides and b) developing and testing a group version of the protocol. Logsdon presents her study which tests the comparative efficacy of a shortened RDAD program and early stage memory loss support group. Discussion by Teri will provide reaction about the progress of RDAD as well as insights for further advancement of evidence-based programs.

### **REDUCING DISABILITIES IN ALZHEIMER'S DISEASE (RDAD): FROM EVIDENCE-BASE TO COMMUNITY TRANSLATION**

L. Teri, *U. Washington — School of Nursing, Seattle, Washington*

RDAD, Reducing Disabilities in Alzheimer's Disease, a patient-focused, caregiver-based program of exercise and behavioral change was developed to help family caregivers alleviate the behavioral problems prevalent among their care-recipients while simultaneously increasing their level of physical activity. Findings from an RCT of 153 community-dwelling patient-caregiver dyads RDAD significantly increased level of activity ( $p < .01$ ), improved their physical (SIP  $p < .001$ ) and affective function (CDDS,  $p < .02$ ) and reduced restricted activity days ( $p < .001$ ), improvement maintained two years post-treatment and institutionalization due to behavioral disturbance was less (19% vs. 50%). RDAD has been implemented in three states (Ohio, Oregon and Washington). This presentation will provide an overview of RDAD, describing salient findings and aspects of the intervention, and discuss issues considered during development to facilitate translation. It will provide a basis for subsequent presenters to address how RDAD has (or has not) been modified to fit their unique community-based agency needs.

### **OHIO'S REPLICATION OF REDUCING DISABILITY IN ALZHEIMER DISEASE**

H.L. Menne, J.D. Johnson, D.M. Bass, *Margaret Blenkner Research Institute, Benjamin Rose Institute on Aging, Cleveland, Ohio*

In 2008, the Ohio Department of Aging obtained support from the Administration on Aging to offer the program Reducing Disability in Alzheimer Disease (RDAD). Program modifications were needed to replicate RDAD as a community-based program. Core RDAD components (e.g., session topics, handouts) were not modified in the community replication; however, in collaboration with the original researcher, program administration components were modified (e.g., eligibility, different depression measures). Preliminary replication results are available from over 550 participating families in Ohio. In the original treatment group and in the Ohio replication there is an increase in the percentage of persons with dementia (PWD) who exercise for 60 minutes or more in a week (Ohio, T1 = 59.5%; T2=73.8%). Whereas Teri and colleagues (2003) note improvement in PWD depression during the first 3 months, in Ohio no difference in depression has been found. Program sustainability in the seven participating agencies will be discussed.

### **REDUCING DISABILITY IN ALZHEIMER DISEASE (RDAD), A HOME HEALTH AIDE TRAINER MODEL**

B. Primetica, H.L. Menne, *Benjamin Rose Institute on Aging, Cleveland, Ohio*

Reducing Disability in Alzheimer Disease (RDAD), a home health aide trainer model, was implemented at the Benjamin Rose Institute on Aging in September 2011. Four home health aides were trained as RDAD trainers, as opposed to nurses and social workers, using standard RDAD manual and protocols. To support the HHA implementation, the program administration guidelines were modified, such as providing dementia training to ensure common knowledge, administering quality assurance surveys with the families after six sessions, and offering additional supervision sessions. Trainer Survey results outline trainer characteristics (e.g., 100% female, 100% African American), and trainer satisfaction with RDAD administrative processes, content of sessions, documentation, and communication with supervisors. In addition, Family

Quality Assurance Surveys show satisfaction with trainers' knowledge and skills, timeliness, and communication about the program. This compilation of data demonstrates administrative challenges and successes with the RDAD Home Health Aide Trainer Model.

### **RDAD ENHANCED GROUP SESSIONS - A NEW COURSE IN THE FRONTIER**

S. Bollin<sup>1</sup>, H.L. Menne<sup>2</sup>, 1. *Alzheimer's Association, Northwest Ohio Chapter, Toledo, Ohio*, 2. *Benjamin Rose Institute on Aging, Cleveland, Ohio*

Agencies struggle with having the necessary resources to offer in-home interventions like the Reducing Disability in Alzheimer Disease (RDAD) program. In addition, families often benefit and build skills when interacting with peers who have similar experiences. To serve families in a manner that may be more cost effective, RDAD in Ohio staff developed a group format of RDAD that covers the identical topics over the same number and sequence of sessions as the in-home RDAD. RDAD Group is first implemented and closely monitored in one site. Initial groups will consist of 3-6 families and be facilitated by 2-3 staff members who are trained in RDAD and group dynamics. After gathering session-by-session feedback from facilitators and families, modifications will be made to the group implementation and re-tested in four additional sites in Ohio. It is hoped that RDAD Group will yield results similar to the current in-home version.

### **A RANDOMIZED TRIAL OF SOCIAL SUPPORT AND PHYSICAL ACTIVITY INTERVENTIONS FOR EARLY STAGE DEMENTIA**

R.G. Logsdon, L. Teri, S.M. McCurry, *Psychosocial & Community Health, University of Washington, Seattle, Washington*

This presentation describes the development and early stages of a randomized controlled comparative efficacy trial of modified versions of two evidence-based interventions: Early Stage Memory Loss support groups (ESML) and Reducing Disability in Alzheimer's Disease (RDAD). Each has been modified into a 4-week, group format involving both individuals with early stage dementia and family care partners. These modified interventions are being compared to each other and to a usual care (UC) control group. The aims of this investigation are to evaluate the comparative efficacy of each condition to: improve social participation and family communication; improve physical activity participation and physical function; and improve quality of life and depression for both persons with dementia and care partners. If successful, these 4-week programs may be developed into "modules" that can be incorporated into programming for individuals with early stage dementia in a variety of community settings.

### **SESSION 825 (SYMPOSIUM)**

#### **OLDER ADULTS AND DISASTERS: ARE GERONTOLOGISTS PAYING ATTENTION?**

Chair: *L.M. Brown, School of Aging Studies, University of South Florida, Tampa, Florida*

Co-Chair: *M. Gibson, Veterans Care Program Parkwood Hospital St. Joseph's Health Care London, London, Ontario, Canada*

Discussant: *R. Roush, Former President of the National Association of Geriatric Education Centers*

Disasters are increasing worldwide, and mounting evidence suggests that older people are disproportionately vulnerable. This begs the question, "Are gerontologists paying attention?" In this symposium, the importance of gerontology in disaster planning and response will be presented. These data driven presentations will highlight recent international initiatives, including a web-based training program for Canadian dementia care providers, coping and resilience among older adults affected by the 2011 Triple Disaster in Japan, and the adaptation of a disaster mental health initiative, psychological first aid (PFA), for nurs-

ing home residents. This symposium will highlight the critical issues driving the push towards more attention to emergency management among those whose professional identities include a gerontology or geriatric focus. We will describe issues that need attention such as building capacity for health care providers and organizations to protect older adults, the engagement of older adults fully as a resource within emergency planning and response, and the delivery of age appropriate mental health care that meets the needs of both providers and older adults. The presentation will draw on recent disasters across the world to illustrate the challenges and opportunities for gerontologists.

### **SERVICES FOR TREATING OLDER RESIDENTS' MENTAL HEALTH: USING PSYCHOLOGICAL FIRST AID**

L.M. Brown, K. Hyer, *School of Aging Studies, University of South Florida Tampa, Florida*

Psychological First Aid (PFA) is a flexible, culturally informed, evidence-based intervention that is now widely used by first responder organizations, such as the American Red Cross and the Medical Reserve Corp to reduce distress and promote adaptive functioning and coping in affected populations. This presentation will describe the findings from two research projects that evaluated the feasibility of using PFA with older adults. The first study examined the potential of using nursing home staff to administer a modified version of PFA after a disaster. PFA, like medical first aid, does not have to be delivered by a licensed mental health clinician. Our findings indicate positive staff evaluation of the training and a high degree of confidence in delivering the intervention. The second study describes how the PFA materials were modified and pilot tested. We also will discuss challenges in conducting efficacy research on PFA with vulnerable populations.

### **MERGING METHODS IN KNOWLEDGE EXCHANGE TO PROMOTE DISASTER RISK REDUCTION FOR OLDER ADULTS**

M. Gibson<sup>1</sup>, S. Clark<sup>2</sup>, *1. Veterans Care Program, Parkwood Hospital, St. Joseph's Health Care, London, Ontario, Canada, 2. Canadian Dementia Resource and Knowledge Exchange (CDRAKE), Canada*

E-learning is a growing method for delivering education across geographic, temporal and professional boundaries. However, it is known that many people prefer a combination of self-study and group process to support their learning journey. The Public Health Agency of Canada's Division of Aging and Seniors, the Canadian Dementia Resource and Knowledge Exchange (CDRAKE) and the lead developer (MG) of the e-learning series, "Frailty, Dementia and Disasters: What Health Care Providers Need to Know" partnered to deliver a four part Facilitated E-learning series to participants from across Canada. Learning interactions were built into the e-learning modules and implemented as group processes. Participant evaluations (n=39) were positive for both content and process. Potential applications of this merged methodology to build capacity in interprofessional education about seniors and disaster risk reduction will be presented.

## **SESSION 830 (SYMPOSIUM)**

### **SUICIDE RISK AND CHALLENGES OF OLDER ADULTHOOD**

Chair: *E. Price, West Virginia University, Morgantown, West Virginia*  
Co-Chair: *P. Bamonti, West Virginia University, Morgantown, West Virginia*

Discussant: *M.J. Heisel, University of Western Ontario, London, Ontario, Canada*

Older adults are at increased risk for death by suicide; therefore factors that may increase suicide risk need to be examined. Cognitive, emotional, and health challenges commonly faced by older adults may contribute to risk. This symposium will highlight these connections through presentations of empirical work and critical reviews of the lit-

erature. First, Madeleine Mellqvist will present a study of the relation between functional disability and death wishes across European populations. Second, Sarra Nazem will present a critical review of the literature examining the relations among cognitive impairment, dementia, and suicide risk. Third, Dr. Mark Kaplan will present research from the National Violent Death Reporting System examining the presence of alcohol in older suicide decedents. Fourth, Jay Gregg will critically review empirical support for the relation between hopelessness and suicide risk in late life. Lastly, Dr. Alisa O'Riley will present research examining rates and correlates of suicide and death ideation in older adults accessing community-based aging services. To conclude, Dr. Marnin Heisel will serve as the discussant summarizing the present findings and ideas for future research.

### **HOPELESSNESS AND SUICIDAL BEHAVIOR IN LATER LIFE: A CRITICAL REVIEW**

J.J. Gregg, A. Fiske, *Psychology, West Virginia University, Morgantown, West Virginia*

Older adults have high rates of suicide across the world. The identification of psychological risk factors for suicide in late life is crucial for prevention and intervention efforts. One such risk factor identified in younger adults is hopelessness, defined as a system of negative beliefs about one's self and one's future. In order to clarify the current state of this literature with regard to older adults, 16 studies were reviewed. Based on this critical review, hopelessness appears to be related to suicidal ideation and prior suicide attempts in older adults. However, the evidence regarding the relative strength of hopelessness as a risk factor for suicidal behavior in later life compared to depression and other variables is inconclusive. In addition, there are limitations associated with current measures of hopelessness among older adults (e.g., Geriatric Hopelessness Scale). Overarching strengths and limitations of the current literature and future directions will be discussed.

### **A CRITICAL EXAMINATION OF THE RESEARCH ON COGNITIVE IMPAIRMENT, DEMENTIA AND SUICIDAL BEHAVIORS**

S. Nazem<sup>1</sup>, A. Fiske<sup>1</sup>, M.R. Nadorff<sup>1,2</sup>, *1. Department of Psychology, Morgantown, West Virginia, 2. Baylor College of Medicine, Houston, Texas*

Rates of both suicide and dementia are elevated among older adults. A better understanding of whether individuals with dementia or cognitive impairment are at increased risk for suicidal behavior is imperative for identification, intervention and prevention efforts. The authors will present a critical analysis of the literature on the association between cognitive impairment and suicidal behaviors. Findings suggest that dementia is not associated with increased risk for suicidal behaviors (e.g., Chiu et al., 1996; Erlangsen et al., 2006; Peisah et al., 2007) but that early dementia or cognitive impairment may be common in individuals who have died by suicide or attempted suicide (e.g., Barkak & Aizenberg, 2002; Leuret et al., 2006; Osvath et al., 2005). The authors will provide an overview on the limitations of this research, providing explanation for results and inconsistencies across studies. Suggestions for future research, as well as implications for clinical practice will be addressed.

### **FUNCTIONAL DISABILITY AND DEATH WISHES IN ELDERLY EUROPEANS – RESULTS FROM THE EURODEP CONSORTIUM**

M. Mellqvist Fä sberg, K. Bä ckman, S. Östling, I. Skoog, M. Waern, *Neuroscience and Physiology, Mölndal, Sweden*

Background: Physical illness has been shown a predictor of suicide in the elderly. The association between functional disability and suicidal behaviour is less clear. Aims: To examine the relationship between functional disability and death wishes in late life. We hypothesized that the association between functional disability and death wishes is stronger

in countries with high suicide rates and test this in a large cohort of elderly Europeans. Methods: Data from 11 population studies on depression in late life were pooled, yielding a total of 16 487 respondents (65+). Level of functional disability was trichotomised (no, intermediate, high). A person was considered to have death wishes if the death wish/suicidal ideation item of the EURODEP scale was endorsed. Odds ratios for death wishes associated with functional disability were calculated in a multilevel logistic regression model. Results: Both intermediate and high functional disability predicted death wishes. No sex differences could be shown.

#### **SUICIDE AND DEATH IDEATION IN OLDER ADULTS OBTAINING AGING SERVICES**

A. O'Riley, K.A. Van Orden, H. He, C. Podgorski, Y. Conwell, *University of Rochester Medical Center, Rochester, New York*

Research suggests that late life suicide prevention programs need to be centered in organizations and institutions outside of the mental health system. One potential venue for instituting interventions designed to decrease late life suicide is organizations that provide services through the Aging Services Network (ASN); however, at the current time, little is known about levels of suicide risk among older adults who access aging services. This presentation will present data from a study examining the prevalence and correlates of death and suicide ideation in older adults accessing aging services. This study of 377 older adults (60+) who accessed an aging service organization in Monroe County, NY indicated that death and suicide ideation were common among Aging Services Network clients (14% endorsed current death or suicide ideation, 27.9% endorsed death ideation in the past year, and 9.3% endorsed active suicide ideation in the past year). In multivariate models, current and past suicide and death ideation were differentially associated with depressive symptoms, anxiety symptoms, medical comorbidity, demographic variables, alcohol misuse, and lower levels of social support. The results of this study provide evidence that aging service organizations may be ideal settings for intervention programs designed to reduce suicide ideation in late life.

### **SESSION 835 (SYMPOSIUM)**

#### **TOWARDS EFFECTIVE PROGRAMS ON FALLS PREVENTION AND FEAR OF FALLING IN DIFFERENT POPULATIONS**

Chair: *G.I. Kempen, Maastricht University, CAPHRI - Dept. of Health Services Research, Maastricht, Netherlands*

Co-Chair: *G. Zijlstra, Maastricht University, CAPHRI - Dept. of Health Services Research, Maastricht, Netherlands*

Discussant: *H. Lach, Saint Louis University, St. Louis, Missouri*

Falls and fear of falling are highly prevalent among aged people and their impact can be substantial. They can lead to reduced quality of life, reduced social and physical functioning, and increased costs following required health care. Falls and fear of falling are different constructs, yet related as they share particular risk factors and each is a determinant of the other. Reviews of the literature have shown that a variety of programs can prevent falls and fear of falling (or related concepts, such as balance confidence) in community-dwelling older populations. In this symposium we focus on the effects of prevention programs on fear of falling in different older populations, i.e. people with dementia and pulmonary disease, and on new findings that may contribute to the improvement of existing programs, e.g. people's perceptions and delivery of the program. Researchers from Germany, the US, and the Netherlands will present new data. Their presentations focus on: 1) objective assessments and subjective perceptions of fear of falling in people with dementia, 2) the effects of a pulmonary rehabilitation program on balance confidence, 3) the effects of a fall prevention program on fear of falling, 4) objective and subjective outcomes regarding the delivery of a fear of falling program, and 5) the effects of the imple-

mentation of a fear of falling program translated into practice. Our discussion from the US will reflect on the presentations in view of GSA's theme 'Charting New Frontiers in Aging' and will facilitate a discussion on-site.

#### **MISMATCH OF OBJECTIVE FALL RISK AND CONCERNS ABOUT FALLING IN PATIENTS WITH DEMENTIA**

K.A. Hauer<sup>1</sup>, M. Schwenk<sup>1</sup>, I. Dutzi<sup>1</sup>, S. Tüerner<sup>1</sup>, S. Englert<sup>2</sup>, *1. Geriatric Research, Bethanien-Hospital at the University of Heidelberg, Heidelberg, Germany, 2. Institute for Medical Biometry, University of Heidelberg, Heidelberg, Germany*

Objective: to determine the mismatch of objective fall risk and subjective concerns about falling and differences between subgroups of patients. Methods: Subgroups of mismatch were identified by Chi square automatic interaction detection analysis (CHAID) in geriatric patients with dementia (n=173) Results: Among the objective high risk group (HR, n=100) 65 patients were identified as mismatch (low subjective concerns, LSC). Among the objective low risk group (LR, n=74) 50 patients were classified as mismatch (High subjective concerns, HSC). In the LR group, mismatch patients (HSC) showed significantly increased anxiety, activity restriction, external support, denial of falls, concerns about falling and cognitive performance in some (verbal fluency, immediate recall) cognitive sub-domains and decreased Quol (SF-12) and balance and gait performance (Tinetti, sway area). In the HR group, mismatch patients (LSC) showed significantly decreased: reports of falls, activity restriction, external support, fall related concerns about falling, and depression and increased motor performance (Tinetti, TUG).

#### **BALANCE CONFIDENCE AND FUNCTIONAL MOBILITY AMONG PULMONARY REHABILITATION PARTICIPANTS: A PILOT STUDY**

D. Klima, M. Layshock, J. Chalmers, M. Goodwin, C. Martins, M. Treuth, *UMES, Princess Anne, Maryland*

Pulmonary disease is a significant health problem in the US. The purpose of the study was to examine the relationship between balance confidence, gait performance, and pulmonary function in a hospital-based Pulmonary Rehabilitation (PR) program. Twenty-three patients (mean age 71.1±8.5 years) with chronic obstructive or restrictive lung disease participated. Pulmonary function included parameters of forced vital capacity (FVC), forced expiratory volume (FEV1), and FEV1/FVC. Patients completed the Timed Up and Go (TUG), the 4 m walk, and the Activities Specific Balance Confidence Scale (ABC). Pulmonary function tests revealed a FVC of 2.5±0.7L, FEV1 of 1.5±0.5L, and FEV1/FVC of 59.3±13.8%. Patients reported low balance confidence (68.6±23.3%). A wide range in the TUG was evident (8-21 sec). The ABC scale was negatively related to TUG performance (r=-0.82, p<0.001), and negatively related to FEV1/FVC (r=-0.59; p<0.005). Balance confidence is related to lung function and functional mobility among pulmonary rehabilitation participants.

#### **THE EFFECTS OF N'BALANCE® ON THE FEAR OF FALLING AND PERCEPTIONS OF LEISURE IN COMMUNITY-DWELLING OLDER ADULTS**

C.M. Headley, *Exercise & Sport Science, Judson University, Elgin, Illinois*

This study examined the effects of a community-based fall prevention intervention (N'Balance®) for adults 55 and over, exploring fear of falling, balance and leisure self-efficacy. N'Balance®, a multi-factorial, multidimensional intervention, focuses on challenging and improving the sensory systems. This quasi-experimental intervention had both treatment and control groups using two sites. This 6-week program met twice weekly for 50 minutes, and included pre- and post-test physical and psychosocial assessments. Measures included the 30-second chair stand, 8-foot Up-and-Go, 50-foot Gait Analysis, Modified Clinical test of Sensory Interaction in Balance, Fullerton Advanced Bal-

ance Scale, postural analysis, and a questionnaire. Results of pre- and post-test assessments indicated that N'Balance© participation was associated with improved balance (.00), the fear of falling (.04), and approached significance with leisure self-efficacy (.06). Overall, results indicated that N'Balance©, a promising intervention, seems to reduce the fear of falling and improve perceptions in leisure self-efficacy in older adults.

#### **DELIVERY OF A FEAR OF FALLING PROGRAM: COMPARING FACILITATORS' SELF-REPORTS TO AUDIO RECORDINGS**

T. Dorresteijn<sup>1</sup>, G. Zijlstra<sup>1</sup>, J.C. van Haastregt<sup>1</sup>, J. Vlaeyen<sup>2,3</sup>, G.I. Kempen<sup>1</sup>,  
1. Department of Health Services Research, CAPHRI, Maastricht University, Maastricht, Netherlands, 2. Department of Clinical Psychological Science, Maastricht University, Maastricht, Netherlands, 3. Research Group Health Psychology, University of Leuven, Leuven, Belgium

This study compares facilitator's self-reported performance to audio recordings on the delivery of a cognitive-behavioral in-home program to manage concerns about falling in frail older people. For each session facilitators reported on a registration form the extent to which program components were delivered: fully (score 1), partly (score 2), or not achieved (score 3). Two independent reviewers scored the program components based on audio recordings. According to the reviewers 43% of the 38 program components were fully, 42% partly, and 15% not achieved (mean score = 1.7). Facilitators' self-reported data indicated that 86% was fully, 4% partly and 3% not achieved (mean score = 1.1). A Wilcoxon signed-ranks test showed a significant difference in the outcomes of the two assessment methods for program delivery ( $z = -9.50$ ,  $p < .01$ ). This study shows that self-reported data and audio recordings may lead to different findings regarding the delivery of a program.

#### **THE EFFECTS OF A FEAR OF FALLING PROGRAM TRANSLATED INTO PRACTICE**

G. Zijlstra<sup>1</sup>, M.F. Du Moulin<sup>1,2</sup>, J.C. van Haastregt<sup>1</sup>, M.C. de Jonge<sup>3</sup>, G.I. Kempen<sup>1</sup>, A. van der Poel<sup>3</sup>, 1. Maastricht University, CAPHRI - Department of Health Services Research, Maastricht, Netherlands, 2. Zuyd University of Applied Sciences, Heerlen, Netherlands, 3. Trimbo Institute, Program Mental Health, Utrecht, Netherlands

Results of an RCT showed the effectiveness of a multifaceted cognitive behavioral program on concerns about falling, daily activity, and recurrent falls in community-living older people. The present study explored the program effects after translation into daily practice. The sample comprised 125 community-living people aged 70 years and older who participated in the program between April 2009 and April 2011. Data was collected by questionnaires prior to the start of the 8-week program and at 2 and 4 months. Non-experimental pre-post test analyses showed significant differences at 4 months on several outcomes, e.g. concerns about falling (1-item:  $p < .01$ ; scale:  $p < .05$ ), avoidance behavior ( $p < .01$ ) and number of fallers ( $p = .01$ ). No significant improvements were shown on daily activity ( $p = .13$ ) and feelings of loneliness ( $p = .47$ ). These outcomes were largely similar to the outcomes of the RCT indicating that the program is not only effective in an experimental setting but also in regular practice.

### **SESSION 840 (PAPER)**

#### **CAREGIVERS**

#### **INTERMARRIAGE AND SOCIAL SUPPORT IN MIDDLE AND LATER LIFE**

M.J. Penning, Z. Wu, *Sociology/Centre on Aging, University of Victoria, Victoria, British Columbia, Canada*

Despite widespread attention to the implications of population aging and contemporary increases in intermarriage, little is known regarding

the implications of intermarriage for social support received in middle and later years of life. Drawing on data from the 2007 General Social Survey (GSS-21) conducted by Statistics Canada on intermarried (or cohabiting) and endogamously married (or cohabiting) adults aged 45 and over ( $N = 12,345$ ), this study examined the effects of intermarriage on the receipt of social support (instrumental, emotional). The results, generated by two simultaneous probit models used to correct for potential selection bias, revealed that while intermarriage was accompanied by a reduced likelihood of receiving instrumental forms of support and assistance from others outside the household, this was not the case when it came to emotional support. These findings indicate that intermarriage is not uniformly positive, neutral, or negative in terms of its implications for social support. Future theoretical and empirical work will need to address the complexities of these and other relationships in order to enhance our understanding of these emergent family structures.

#### **ARE AFRICAN AMERICANS CAREGIVERS REALLY LESS BURDENED? AN INTEGRATED LITERATURE REVIEW**

D.Y. Stevens, K. Hepburn, *Emory University, Atlanta, Georgia*

Background: Caregiver burden has repeatedly been linked with poor health outcomes in those caring for older adults with Alzheimer's disease. Despite having greater financial hardship, keeping elders at home longer, and perceiving greater needs, African American (AA) caregivers are reportedly less burdened than whites. The purpose of this review was to examine how burden has been conceptualized and measured in AA caring for adults with Alzheimer's dementia. Methods: CINAHL, PubMed, and Web of Science databases were comprehensively searched. Articles were limited to primary research reports involving human adults and published in English. The search strategy produced a total of 163 journal titles. Further review of the full text articles was conducted to identify studies that focused exclusively on caregiver burden in AA caring for adults with Alzheimer's dementia, resulting in a final selection of 17 quantitative and 11 qualitative studies. Results: Results from the quantitative studies show a difference in levels of caregiver burden by race. AA caregivers consistently reported lower levels of burden on a variety of measures, although such results were not seen in very recent studies. Qualitative reports, however, show a very different picture. Several qualitative studies suggest that AA are, indeed, burdened by caregiving responsibilities, but may express burden differently. Conclusion: The review provides a way to broaden the discourse about burden among AA caregivers, raises the possibility that there are cohort differences among AA caregivers, and poses questions about whether standard measures of burden or stress account sufficiently for the cultural context of AA caregiving.

#### **FAMILY DISAGREEMENT AS A STRESS EXACERBATOR FOR HISPANIC AND NON-HISPANIC WHITE CAREGIVERS**

S.S. Koerner<sup>1</sup>, Y. Shirai<sup>2</sup>, 1. Div. of Family Studies and Human Development, University of Arizona, Tucson, Arizona, 2. Dept. of Family and Community Medicine, University of Arizona, Tucson, Arizona

The amount of research attention devoted to the positive influence of family in the context of caregiving (e.g., studies of the buffering effects of family social support) far outweighs exploration of family's potential negative impact. Limited extant research suggests, however, that family conflict may be a critical factor in understanding caregiver well-being. Framed within a caregiving-stress model, and using a daily stress-reactivity perspective, the current study examined (a) whether family conflict, in particular, family disagreements about care-related issues, exacerbates the impact of daily caregiving stressors on caregivers, and (b) whether that exacerbating effect varies as a function of caregiver ethnicity; we hypothesized that the exacerbating impact of family conflict may be especially evident for Hispanic caregivers because of the salience of family in Hispanic/Latino culture and identity. Caregivers ( $n = 76$ , Hispanic;  $n = 51$ , non-Hispanic White) reported

their daily experiences of caregiving primary stressors (tasks, care-recipient problem behaviors), depressive symptoms, feelings of burden, and physical health symptoms on 8 consecutive survey days; and, in a separate one-time survey, reported on care-related family disagreements. Multilevel-modeling that controlled for age indicated significant moderating (i.e., exacerbating) effects of care-related disagreements: on days when caregivers were faced with more than their usual number of care-assistance tasks, they experienced increases in depressive symptoms and physical health symptoms, but this was especially true for those caregivers who reported relatively high levels of care-related family disagreements ( $b=.03$ ,  $p<.05$  and  $b=.09$ ,  $p<.05$ , respectively); contrary to expectation, this pattern was similar across ethnic groups. Implications for research and intervention will be discussed.

#### **FAMILY CAREGIVING, MENTAL HEALTH, AND MARITAL QUALITY: EVIDENCE FROM MIDUS II**

S. Kang<sup>1,2</sup>, N.F. Marks<sup>1</sup>, 1. *South Dakota State University, Brookings, South Dakota*, 2. *UW-Madison, Madison, Wisconsin*

Guided by a life course perspective, this study aimed to add to a population perspective on family caregiving and mental health by examining how providing caregiving for a child, spouse, parent, or parent-in-law due to their illness or disability (in contrast to not providing caregiving for any kin or nonkin) is linked to three dimensions of mental health (negative affect, positive affect, Ryff's psychological well-being), and evaluating how gender and marital quality (spousal support and/or spousal strain) might moderate these linkages. Data from married respondents in the National Survey of Midlife in the U.S., 2005 ages 34 to 83 ( $N = 1157$ ; 598 men, 559 women) were used to estimate multivariate models. Results revealed that providing caregiving for a child was associated with a higher level of negative affect, a lower level of positive affect, and a lower level of psychological well-being (Ryff) among women (but not men). Providing caregiving for a parent was linked to higher levels of negative affect in the presence of poorer marital quality (low support or high strain). Women caregivers for parents-in-law reported less positive affect than men caregivers. Caregiving for a parent-in-law was linked to more negative affect among women in the presence of low marital support or higher marital strain. Women providing caregiving for their parents-in-law also reported poorer psychological well-being in the presence of higher spousal strain. Overall, results revealed that married women experience more problematic mental health impact from family caregiving, and poorer marital quality exacerbates this negative impact.

#### **BURDEN AMONG CAREGIVERS OF HOSPITALIZED OLDER ADULTS WITH COGNITIVE IMPAIRMENT**

K.B. Hirschman<sup>1</sup>, K.N. Shankar<sup>2</sup>, A.L. Hanlon<sup>1</sup>, M.D. Naylor<sup>1</sup>, 1. *School of Nursing, University of Pennsylvania School of Nursing, Philadelphia, Pennsylvania*, 2. *University of Pennsylvania, Robert Wood Johnson Foundation Clinical Scholars, Philadelphia, Pennsylvania*

Caregiver burden is a multidimensional outcome of the chronic stress associated with care giving. Little is known about burden among caregivers of cognitively impaired older adults during a hospitalization. The purpose of this study was to describe the predictors of burden among a cohort of caregivers of cognitively impaired hospitalized older adults at the time of admission for an acute illness. We performed a secondary data analysis using cross-sectional data collected from family caregivers within 24 hours of the start of a hospitalization for their relative with cognitive impairment. Independent variables were selected through a priori decisions and bivariate analyses ( $p<0.20$ ). Multivariate linear regression was performed to analyze the effect of the independent variables on caregiver burden during the hospitalization. In this cohort of hospitalized, cognitively impaired, older adults, caregiver burden was highly associated with the presence of caregiver depressive symptoms ( $p<0.001$ ), lower self-efficacy to manage the patient's symptoms

( $p=0.04$ ), distressing neuropsychiatric symptoms ( $p<0.001$ ), the presence of delirium ( $p=0.001$ ) and higher deficits in basic activities of daily living for the hospitalized older adult ( $p<0.001$ ). These findings suggest that caregivers of patients with cognitive impairments experience high levels burden around the time of hospitalization. Understanding these contributing factors can advise the hospital team how to apply targeted caregiver interventions during the hospitalization to position the caregiver and the patient for a smoother transition back to the community.

### **SESSION 845 (PAPER)**

#### **INTERVENTIONS FOR OPTIMAL AGING**

##### **THE DEVELOPMENT AND EFFECTIVENESS OF AN INTERDISCIPLINARY, BEHAVIORAL INTERVENTION FOR MANAGING CHALLENGING BEHAVIORS IN RESIDENTS OF VA NURSING HOMES**

B. Karlin<sup>1</sup>, L. Teri<sup>2</sup>, S. Visnic<sup>3</sup>, 1. *Office of Mental Health Services, Department of Veterans Affairs Central Office, Washington, District of Columbia*, 2. *University of Washington, Seattle, Washington*, 3. *VA Serious Mental Illness Treatment and Evaluation Center, Seattle, Washington*

There is significant need for effective clinical interventions for managing challenging dementia-related behaviors, such as agitation, aggression, vocalization, and wandering. Antipsychotic medications have, in many settings, been the mainstay interventions for managing such behaviors. However, increasing research in recent years has revealed significant limitations, including limited efficacy and increased death risk, associated with the use of antipsychotic medications for managing challenging dementia-related behaviors (Schneider, Dagerman, & Insel, 2005; Schneider et al., 2006; Sink, Holden, & Yaffe, 2005). In an effort to bridge research and practice in this area, the Veterans Health Administration has developed and piloted an adapted psychosocial intervention for managing challenging dementia-related behaviors of residents in VA nursing homes [now called as "Community Living Centers" (CLCs)], known as STAR-VA. STAR-VA is a multi-component psychosocial intervention that involves working to identify and change activators of and consequences to challenging dementia-related behaviors and behavioral activation. In addition, the protocol involves enhancing front-line staff knowledge of dementia and promoting realistic expectations of residents with dementia. The protocol also involves promoting effective communication with individuals with dementia. Evaluation of training outcomes indicates that training in STAR-VA led to significant increases in clinical knowledge, skills, and competencies. Evaluation of patient outcomes indicates that the intervention led to significant reductions in the frequency and severity of challenging behaviors, as well as significant reductions in resident anxiety and depression. The program evaluation results further reveal key issues and challenges associated with successfully implementing this innovative, interdisciplinary intervention in a nursing home-type setting.

##### **BE MINDFUL: CONTEXTUAL SENSITIVITY CAN PREDICT COGNITIVE IMPROVEMENTS OBSERVED FROM SYNAPSE, A LIFESTYLE INTERVENTION**

S. Haber<sup>1,2</sup>, M.Y. Chan<sup>1,2</sup>, L.M. Drew<sup>1,2</sup>, D. Park<sup>1,2</sup>, 1. *Center for Vital Longevity, University of Texas, Dallas, Dallas, Texas*, 2. *Center for Vital Longevity, Dallas, Texas*

There is considerable interest in the impact of interventions and lifestyle changes on cognitive decline, but experimental data is sparse. Although the effects of intervention on cognition are clinically significant, understanding how individual characteristics are related to changes in cognition may help reveal what makes someone more or less susceptible to interventions. The Langer Mindfulness Scale (LMS; Langer, 1989) measures individual's tendency to seek and produce novel expe-

riences, challenge the limits of situational boundaries, and engage in the surrounding environment. Thus, it is hypothesized that measures of contextual sensitivity, like mindfulness, will be predictive of observed cognitive improvements for individuals placed in a novel intervention environment. A total of 110 senior participants were assigned to one of three cognitive interventions within the Synapse program that required an average of 15 hours a week for 14 weeks. The groups involved learning digital photography, quilting, or a combination of both. Participants completed a battery of pre- and post- cognitive and psychosocial test. A significant positive correlation between gains in cognitive performance and gains on the LMS was found. Additionally, regression analysis revealed that initial performance on the LMS was predictive of observed cognitive improvements. The results indicate that initial mindfulness scores and changes in mindfulness are related to changes in cognition. In sum, contextual sensitivity, as measured by the LMS, may influence the impact of cognitive interventions because it is related to how much an individual may interact with the ascribed intervention.

### **THE FAMILY SERIES WORKSHOP: A PSYCHOEDUCATIONAL INTERVENTION FOR CAREGIVERS OF PERSONS WITH DEMENTIA**

S. Llanque<sup>1</sup>, M. Niedens<sup>2</sup>, M. Enriquez<sup>1</sup>, *1. Nursing, University of Missouri-Kansas City, Overland Park, Kansas, 2. Alzheimer's Association Heart of America Chapter, Prairie Village, Kansas*

**BACKGROUND:** Currently, 14.9 million caregivers provided unpaid care to persons with Alzheimer's disease or related dementias (ADRD). Past research has uncovered positive results related to psychoeducational interventions for caregivers of persons with ADRD. **PURPOSE:** The purpose of this study was to examine the impact of a psychoeducational intervention, the Family Series Workshop, on levels of coping, caregiving competence, and stress among caregivers of community-dwelling individuals with dementia. The Stress Process Model served as the conceptual framework of this intervention. **DESIGN AND METHODS:** A 6-week intervention was implemented utilizing the Stress Process Model of Alzheimer's caregiving as the conceptual framework to help caregivers enhance care to persons with dementia. This study employed a non-controlled, pretest-posttest research design, which included 35 caregivers. Convenience sampling was used to recruit caregivers from three sites in a Midwestern metropolitan area: two churches and a hospital. **RESULTS:** Analyses using paired t-tests with random effect for site differences revealed that caregiving competence significantly increased ( $p = 0.036$ ) from Time 1 ( $M = 11.6$  points) to Time 2 ( $M = 14.6$  points). There were no significant differences between caregiver's coping and stress from pre- to post-intervention. Regression analysis showed a significant association was found concerning the mediator coping and its association with caregiving competence ( $p < 0.001$ ) and stress ( $p = 0.008$ ). **IMPLICATIONS:** The findings indicate that the Family Series Workshop can be an effective resource for enhancing caregiving competence. Both coping and stress are significant concepts of the caregiving process.

### **THERAPEUTIC COMPUTER ACTIVITY INTERVENTION FOR NURSING HOME RESIDENTS WITH DEMENTIA**

S.H. Tak<sup>1</sup>, S. Hong<sup>2</sup>, *1. University of Arkansas for Medical Sciences, Little Rock, Arkansas, 2. University of Tennessee Health Science Center, Memphis, Tennessee*

Nursing home residents with dementia lack activities for cognitive stimulation and enjoyment. The study examined the feasibility of a 7-week therapeutic computer activity intervention (TCAI) for cognitively impaired elders in nursing homes. Twenty six residents with dementia completed TCAI. Data were collected using 604 observational logs of computer sessions. The mean age of participants was 85 (S.D., 6.0) years. Their cognitive impairment ranged from moderate to mild dementia with a mean Mini Mental State Exam score of 15.8 (S.D. 4.2). On average, participants had 23 (S.D., 8.6) sessions and spent 562.9 min-

utes in the program. Sessions lasted 25 minutes on average. Participants neither had previous computer experience nor received computer training. With the use of adaptive accessories such as track ball or touch screen, all of them were able to point or click on the screen. They needed technical assistance in opening/closing an activity program or requiring directions on how to play a game. Participants engaged in various computer activities including slide shows with music, emailing/internet search, or various computer games. They exhibited positive verbal and non-verbal expressions and showed a high level of acceptance and openness to the computer during the TCAI. Identifying and selecting a computer activity for an individual was influenced by cognition and physical health status, computer literacy, and general activity preferences. Based on the findings, a model for tailoring computer activities for persons with dementia is detailed.

### **APPLICATION OF VALIDATION THERAPY IN DEMENTIA CARE WITH CHINESE NURSING HOME RESIDENTS**

A.M. Chong, *Applied Social Studies, City University of Hong Kong, Kowloon, Hong Kong*

**Introduction:** Problem behaviors and communication difficulties in residents with dementia are major sources of caregiver stress in nursing homes. Validation Therapy (VT), one of the psychosocial interventions in dementia care, has received increasing attention in the West but is seldom studied in the East. This article reports a clinical study of the application of VT on three Chinese nursing home residents suffering mild to moderate cognitive impairments. **Methods:** For half a year, in each alternate day, three times a day, a clinician applied VT through chatting with each of the three residents for at least 10 minutes on topics of interests such as their health and the weather. It was audio-recorded for data analysis with the clients' and the superintendents' consent. The effectiveness of VT intervention was assessed quantitatively through changes in the participants' cognitive competence as measured by the Chinese version of Mini-Mental State Examination, and their life satisfaction as measured by the 9-item Life Satisfaction Scale (LSS), and qualitatively through changes in problem behaviors and mood before and after intervention as reported by the staff. **Findings:** Clinical experiences found VT practice principles applicable to older Chinese with dementia. VT could not reduce the clients' levels of cognitive impairment, however, VT was found to enhance their life satisfaction and reduce problem behaviors. **Discussion:** The study provides some preliminary evidence to support the use of VT with older Chinese suffering cognitive impairments, because VT was found to restore communication, reduce problematic behaviors and enhance the clients' subjective well-being.

## **SESSION 850 (SYMPOSIUM)**

### **ALZHEIMER'S DISEASE AND HEALTH OUTCOMES**

Chair: *S.A. Hartikainen, School of Pharmacy, University of Eastern Finland, Kuopio, Finland*

Alzheimer's Disease and Health Outcomes Session 1 Alzheimer's Disease and Mortality - Risk of death after initial diagnosis of Alzheimer's disease: a national register-based study other studies about mortality Session 2: Association between Alzheimer's Disease and Fractures - Association between Alzheimer's disease and hip fractures in a Finnish register-based cohort - other abstracts about fractures among Alzheimer patients Session 3. Association between Alzheimer's Disease and Cardiovascular Outcomes -Incidence of stroke in people with Alzheimer's disease - a national register-based approach - other studies concerning cardiovascular outcomes

## ASSOCIATION BETWEEN ALZHEIMER'S DISEASE AND HIP FRACTURES IN A FINNISH REGISTER-BASED COHORT

S.A. Hartikainen, A. Tolppanen, *School of Pharmacy, University of Eastern Finland, Kuopio, Finland*

**Objective:** We investigated whether Alzheimer's disease (AD) is associated with prevalence or incidence of hip fractures. **Methods:** We performed a nested case-control study within a register-based cohort study including all community-dwelling persons with verified AD diagnosis in Finland on 2005 and single age-, gender and region of residence-matched comparison person per AD case (N=56,186, mean age 79.9 (SD 6.8) years, range 42-101 years). The diagnosis of AD was based on prescription reimbursement register. Data on hip fractures was extracted from Finnish National hospital discharge register on years 2002-2009. The analyses of incident hip fractures (n=2,981) were restricted to years 2006-2009 and four age and gender-matched controls per fracture case were identified. **Results:** Persons with AD were twice as likely to have previous hip fracture (OR, 95% CI 2.00, 1.82-2.20). In the nested case-control study, AD was associated with over two-fold increase in risk of incident hip fracture (adjusted RR, 95% CI 2.28, 2.08, 2.49). The increased risk associated with AD decreased linearly across age groups. Although people with AD had higher risk of hip fractures regardless of gender, the risk increase was larger in men than women. **Interpretation:** Persons with AD, regardless of disease duration have higher risk of hip fracture in comparison to general population. Although there was some suggestion of effect modification by age or gender, AD was consistently associated with doubling of the risk of incident hip fracture

## INCIDENCE OF STROKE IN PEOPLE WITH ALZHEIMER'S DISEASE - A NATIONAL REGISTER-BASED APPROACH

S.A. Hartikainen, A. Tolppanen, *School of Pharmacy, University of Eastern Finland, Kuopio, Finland*

**Objective:** Stroke increases the risk of dementias, including Alzheimer's disease (AD), but it is unknown whether AD increases the risk of stroke. We investigated whether non-institutionalized persons with AD have increased risk of stroke and whether there are differences in the incidence of ischemic or hemorrhagic strokes. **Methods:** We performed a register-based nested case-control study within a cohort including all community-dwelling persons with verified AD diagnosis in Finland on December 31, 2005 and a single age-, gender and region of residence-matched comparison person without AD for each individual with AD (N=56,186, mean age 79.6 (SD 6.9) years, range 42-101 years). Diagnosis of AD is based on prescription reimbursement register and diagnosis of stroke on hospital discharge register of Finland. The analyses were restricted to incident strokes (n=3,093) occurring between during years 2006-2009. **Results:** AD was not associated with risk of all strokes or ischemic strokes, but the risk of hemorrhagic strokes was higher among persons with AD (adjusted RR, 95% CI 1.39, 1.14-1.68). When the associations were analyzed according to age groups (<75, 75-79, 80-85 and ≥86 years), AD was associated with higher risk of all strokes, regardless of etiology, in the two youngest age groups, but not in the older groups. Similar associations were observed when the results were categorized according to AD duration. **Interpretation:** Our findings suggest that persons with AD, especially younger AD patients, have higher risk of strokes, mainly due to increase in bleeds

## SESSION 855 (SYMPOSIUM)

### EAST MEETS WEST FOR HEALTHY AGING

Chair: *K. Chee, Department of Sociology, Texas State University, San Marcos, Texas*

Co-Chair: *S. Diwan, San Jose State University, San Jose, California*

This symposium addresses multiple cultural issues related to health and wellbeing among older Asians in different Asian countries and

older Asian immigrants in the United States. Four studies conducted in China, South Korea, Japan, and the United States attend to culture-oriented factors and implications for health promotion. First, Leung discusses the development, reliability and validity of the Chinese Health Literacy Scale for Diabetes among elders in Hong Kong, with implications for health promotion. Second, Kim examines the prevalence of hypertension among elders in South Korea and discusses unemployment and lower consumption of vegetables, fruits, and dairy products as correlates of hypertension. Third, Katagiri describes the prevalence of depressive symptoms among older workers in Japan, using the Kessler-6 scale. Despite their lower status jobs, they gain benefit from employee-friendly environments and having colleagues as confidants. Finally, Diwan, based on focus group interviews, describes various barriers to health-promoting activities among older Asian Indian immigrants in the US, and suggests culturally-relevant approaches to promoting health in this group. The co-chairs will lead the discussion on how these findings contribute to a better understanding of Asian culture-specific factors associated with health and wellbeing of older adults; and how researchers may capitalize on existing Western research for future health promotion studies in the Eastern context.

## PSYCHOMETRIC PROPERTIES OF CHINESE HEALTH LITERACY SCALE FOR DIABETES AMONG ELDERS IN HONG KONG

A. Leung<sup>1,4</sup>, V. Lou<sup>2,4</sup>, M. Cheung<sup>1</sup>, S. Chan<sup>1</sup>, I. Chi<sup>3,4</sup>, *1. School of Nursing, The University of Hong Kong, Hong Kong, China, 2. Department of Social Work and Social Administration, The University of Hong Kong, Hong Kong, China, 3. School of Social Work, University of Southern California, Los Angeles, California, 4. Sau Po Centre on Aging, The University of Hong Kong, Hong Kong, China*

Patients with low health literacy (HL) often hide this from health-care providers, friends and relatives. This study developed and tested psychometric properties of the Chinese Health Literacy Scale for Diabetes (CHLSD). The Revised Bloom's Taxonomy Model was used to develop the CHLSD. Validity (content, construct, concurrent) and internal consistency were assessed with a sample (n=137) of Type-II diabetic patients aged 65 or older in Hong Kong. Cronbach's alpha for CHLSD and its four subscales (remembering, understanding, applying, analyzing) was 0.88, 0.88, 0.66, 0.65 and 0.71 respectively. CHLSD was significantly correlated with the following scales: Diabetic Knowledge (r=0.39), Diabetic Management Self-efficacy (r=0.25), Preschool and Primary Chinese Literacy (r=0.82), and Chinese Value of Learning (r = 0.30). This 34-item instrument took about 7 minutes to complete. CHLSD is a reliable and valid instrument for measuring Chinese diabetic patients' HL which would be important for clinicians to assess prior to conducting health promotion activities.

## PREVALENCE OF HYPERTENSION AND ITS CORRELATES AMONG COMMUNITY-DWELLING OLDER ADULTS IN SOUTH KOREA

H. Kim<sup>1</sup>, H. Kim<sup>2</sup>, A. Kim<sup>3</sup>, *1. Nursing, Inje University, Busan, Busan, Republic of Korea, 2. University of Michigan, Ann Arbor, Michigan, 3. Inje University, Busan, Busan, Republic of Korea*

This study investigates the prevalence of hypertension and its correlates among community dwelling older adults in South Korea, using data from the Korean National Older Adults Life Survey (n=15,146). The prevalence of hypertension was found to be 44.4%. Multivariate logistic regression analysis shows that hypertension was more prevalent as people became older; in females; in elderly who were previously employed or have never been employed as compared to those currently employed; elderly with obesity, diabetes and hypercholesterolemia as compared to those without these health conditions; elderly who consumed fewer than recommended vegetables, fruits, and milk products;

elderly with periodical health check-ups than those without these behaviors. Significant associations between the occurrence of hypertension and its correlates such as unemployment and lower consumption of vegetables, fruits, and milk products have implications for screening and developing strategies to promote the health of elders who are at the risk of hypertension in South Korea.

#### **MENTAL HEALTH OF OLDER JAPANESE WORKERS: CONSTRUCTION OF HEALTHY WORKING ENVIRONMENTS**

K. Katagiri<sup>1</sup>, I. Sugawara<sup>2</sup>, 1. *Institute for Social Gerontology, Nipponkoa Welfare Foundation, Tokyo, Japan*, 2. *Institute of Gerontology, the University of Tokyo, Tokyo, Japan*

The shortage of labor force owing to the aging population and declining birthrate is a social problem in developed countries. In 2004, the Japanese Elderly Employment Stabilization Law was revised to raise the retirement age to 65. This study examines the well-being of older workers (N = 496), using data collected in 2008 from five Japanese companies. The Kessler 6 scale was utilized to assess depression. The ANOVA result revealed that older workers were less depressed than younger ones. Logistic regression to determine whether the depression scale scores were above the cut-off point suggested that employee-friendly conditions and having colleagues to confide in have alleviating effects on depressive symptoms. Despite the stresses of working full time combined with low salaries and low status, older workers appear to be less depressed than younger ones. Implications for developing employee-friendly work environments to promote mental well being are discussed.

#### **CULTURALLY RELEVANT STRATEGIES TO ENGAGE ASIAN INDIAN IMMIGRANT ELDERS IN HEALTH PROMOTION**

S. Diwan, S. Krishnagiri, *San Jose State University, San Jose, California*

Asian Indian (AI) immigrants to the U.S. have elevated risk for heart disease, diabetes, and hypertension; increased mortality; low engagement in physical activity; increased depression from acculturative/intergenerational stress. We conducted three focus groups with service providers from three AI cultural/religious groups to understand barriers to health promoting activities and culturally relevant strategies to address them. Thematic analysis of qualitative data suggested psychological, cultural, and environmental barriers including: elders' fatalistic expectations of aging; non-awareness of need for specific health-promoting activities; low motivation to change; adult children's attitudes towards aging; transportation access; language proficiency; time constraints due to caregiving duties; and social isolation. Culturally relevant strategies suggested were: educating the family on health promotion and aging; developing intergenerational health programs; providing culture-specific advice re: diet, physical, and social activity; following up with seniors after educational presentations; and, presenting health promotion programs in culturally relevant ways. Implications for health promotion programming are discussed.

### **SESSION 860 (SYMPOSIUM)**

#### **IMPROVING OUTCOMES**

Chair: *L.W. Cohen, Cecil G. Sheps Center for Health Services Research, The University of North Carolina at Chapel Hill, Chapel Hill, North Carolina*

Discussant: *C. Beck, University of Arkansas, Little Rock, Arkansas*

This symposium presents the findings of four innovative studies conducted to understand and improve outcomes of individuals with and without dementia in long-term care settings and in the community. Together, they highlight the diversity of promising opportunities to change care practices and also the importance of rigorous research

designs to do so. Based in the community, the first presentation will discuss the efficacy of a randomized-controlled trial testing the effects of a blue-spectrum light treatment on sleep and mood among older adults with dementia and their informal caregivers; it showed positive effects for both individuals. The next two presentations are of projects intended to change care in long-term care settings. One targeted prescribers and caregivers to reduce potentially inappropriate antibiotic prescribing and found modest benefit to promote prescribing that is more consistent with guidelines; the second, an Mouth Care Without a Battle, showed strong benefit related to oral hygiene. All three interventions have clear indications regarding implementation and system change for adoption and sustainability. The final presentation focuses on the importance of the rigor of the research design on which these and other studies are grounded. It presents the results of an evidence-based review regarding which organizational characteristics, structures, and processes relate to better outcomes, and highlights the paucity of high quality data to inform this area despite the amount of research that has been conducted. The discussion will frame the opportunities to improve care and establish the evidence to change policy and practices.

#### **A HOME-BASED THERAPEUTIC LIGHTING INTERVENTION TO IMPROVE OUTCOMES IN DEMENTIA**

L.W. Cohen<sup>1</sup>, M. Figueiro<sup>2</sup>, D.A. Reed<sup>1</sup>, J. Preisser<sup>1</sup>, C. Williams<sup>1</sup>, S. Zimmerman<sup>1</sup>, P. Sloane<sup>1</sup>, 1. *Cecil G. Sheps Center for Health Services Research, The University of North Carolina at Chapel Hill, Chapel Hill, North Carolina*, 2. *Rensselaer Polytechnic Institute, Troy, New York*

Disturbed nighttime sleep affects older adults with dementia, and its disruptive effects are a leading cause of long-term care placement. Medications are commonly used to manage the problem, but lack efficacy and present dangerous side effects. Based on prior studies and laboratory findings, we conducted a randomized, controlled trial with crossover to examine the effects of a blue-spectrum light intervention on sleep and psychological well-being for older adults with dementia and their family caregivers. After six weeks of the in-home blue-spectrum light intervention, proxy-reported sleep efficiency for persons with dementia significantly improved ( $p < .05$  in dose-dependent analyses). Family caregivers recognized more widespread benefits across several measures of nighttime sleep ( $p < 0.05$ ). Well-being consistently (although non-significantly) improved on most measures, including depression and caregiving hassles and burden. Although light may be an effective treatment to improve sleep and well-being, future work must first address the challenges related to its delivery and fidelity.

#### **EVALUATING OUTCOMES OF AN INTERVENTION TO IMPROVE MOUTH CARE IN NURSING HOMES**

P. Sloane, S. Zimmerman, D.A. Reed, A. Barrick, X. Chen, L.W. Cohen, *Cecil G. Sheps Center for Health Services Research, The University of North Carolina at Chapel Hill, Chapel Hill, North Carolina*

Research has linked poor oral health to adverse outcomes including pneumonia, poor diabetic control, chronic pain, and reduced intake. Concomitantly, mouth care has been documented to be often deficient in nursing homes (NHs), especially among persons with dementia or physical impairment. To address these issues, a multidisciplinary team developed evidence-based guidelines for best practices. The care model involved dedicated oral care aides, used a variety of products and techniques that are not common in long-term care, and individualized care to manage behavioral symptoms. This session will overview techniques used and discuss the results of an 8-week trial of the intervention in three NHs (N=6) nursing assistants, 93 NH residents). Results identified strong, significant improvement in oral hygiene, reduced gingival inflammation and high satisfaction among the staff. Challenges to dissemination include controversy regarding specialized workers, provision of adequate time, organization of care, and inadequate data on costs and benefits.

## REDUCING POTENTIALLY INAPPROPRIATE ANTIBIOTIC PRESCRIBING IN NURSING HOMES

S. Zimmerman<sup>1</sup>, P. Sloane<sup>1</sup>, A.S. Beeber<sup>1</sup>, C. Kistler<sup>1</sup>, R.M. Bertrand<sup>2</sup>, L. Olsho<sup>2</sup>, L. Hadden<sup>2</sup>, C. Mitchell<sup>1</sup>, *1. Concern regarding antibiotic-resistant organisms has reached global proportions, and attention now focuses on nursing home populations in which prescribing is high and may be inappropriate. To examine potentially inappropriate antibiotic prescribing and the ability to reduce it, we conducted a quality improvement program in six North Carolina nursing homes that trained prescribers and staff indications for antibiotic use; how to communicate signs and symptoms to better recognize situations in which use was inappropriate; and educated residents and families. At baseline, the number of monthly antibiotic prescriptions ranged from 26-52. Within three months, five of the six settings evidenced reduced prescribing ranging from 19-41%. Adherence to prescribing guidelines increased for urinary tract infections (8% to 12%), respiratory infections (2% to 8%) and especially skin infections (41% to 82%). While antibiotic prescribing may be reduced through concerted effort, more focused staff-prescriber communication and patient and family education are indicated.
